Next in rank are the silicate with 195,320 tons, value $4,320,200 in 1921, and 286,791 tons, value $6,052,318 in 1919; the bichromate, with 15,760 tons, value $3,343,300 in 1921, and 22,992 tons, value $5,337,389 in 1919; the phosphate, with 26,190 tons, value $3,048,900 in 1921, and 22,351 tons, value $2,438,917 in 1919; the bicarbonate with 109,860 tons, value $2,988,900 in 1921, and 141,556 tons, value $3,695,417 in 1919.

Then follow, in the order named as to value, the biborate (borax), salt soda (crystallized), salt cake, sulphide, glaubers salt and thiosulphate.

Detailed statistics for 1921, 1919, and 1914 are given in Table I. The figures for 1921 are preliminary and subject to such change and correction as may be necessary from a further examination of the original reports.

Tarnish on Silver

An investigation at the Bureau of Standards has shown that the tarnish ordinarily observed on silver is the sulphide film, of which certain colors are characteristic and indicative of the extent of the tarnish. The effect of hydrogen sulphide gas by itself on silver is relatively small, but if small amounts of moisture and sulphur dioxide are present, the action is greatly accelerated. Tarnishing is also made more rapid by the presence of alkaline films and soap films.

Friction Testing of Lubricating Oils

Extended Investigations at the Bureau of Standards Indicate That Journal Friction Testing Machine Is Not a Convenient Instrument for Measuring Oiliness, Because the Clearance Changes With Wear

BY WINSLOW H. HERSCHEL
Associate Physicist, Bureau of Standards

THE relation between viscosity and friction has been considered by numerous investigators,[1] but oiliness has never been defined in c.g.s. units and is much more difficult to investigate. Among the many suggestions of possible methods of test, there is the tentative conclusion of Wilson and Barnard[2] that differences in oiliness are indicated by a difference in the conditions under which a minimum coefficient of friction may be obtained on a journal oil friction testing machine.

A considerable amount of work has been done at the Bureau of Standards to investigate the possibility of measuring oiliness with a friction testing machine, and although the machine used had an incomplete bearing, it is believed that the conclusions reached will apply to all machines with journal bearings.

DESCRIPTION OF TESTING MACHINE

The oil friction testing machine used in the tests to be described was of the "Cornell" type. The journal has a diameter of 3.748 in. (9.5 cm.) and is 3.48 in. (8.84 cm.) long. The width of bronze bearing block is 2.01 in. (5.1 cm.). If the area of the oil grooves is deducted, the net projected area is 6.10 sq.in. (39.4 sq.cm.). The maximum load ordinarily used was 5,000 lb., or 715 lb. per sq.in. (50 kg. per sq.cm.). The speed could be varied from 43 to 814 ft. per minute (2.2 to 41.3 cm. per second). Temperatures were taken from readings of a thermometer inserted in the bearing block.

The arc of contact of the bronze bearing block was 65 deg., or less than half the arc of 163 deg. used by Tower[3] in most of his tests. This shortness of arc made it improbable that complete film lubrication could be obtained, although the bottom of the journal was allowed to dip into an oil bath.

Since the most interesting results are obtained near the point of seizure, it was necessary to provide that as little damage as possible should be done when seizure occurred, as indicated by the slipping of the belt. In order to guard if possible against roughening of the journal, a special bearing block of Ulco hard metal was used. This consisted mainly of lead and was 2x3⅛ in. (5.08x9.37 cm.), without oil hole or grooves, the excess length as compared with the journal being necessary because the latter is given a slow reciprocating motion by an eccentric, while the bearing block remains fixed. This arrangement serves to spread the lubricant.

It was found that the coefficient of friction was about 0.0007 less on decreasing than on increasing loads, but the cause was never determined. When tests were made with decreasing load, the calculated values of the coefficient of friction were therefore corrected by this amount.

Results of Friction Tests

In a previous paper[4] a new method was proposed for plotting results of tests on friction testing machines, and this method, which will be used in this paper, may be briefly described as follows. The coefficient of friction is calculated as usual and is plotted against Sommerfeld's criterion, S.

$$S = \frac{\mu n}{p}\left(\frac{d}{2\Delta}\right)^2 \qquad (1)$$

where μ = viscosity in poises
n = speed, in revolutions per second
p = pressure, in dynes per square centimeter
$\frac{d}{2\Delta}$ = ratio of diameter of journal to difference between diameters of bearing and journal.

These units have been used in calculating S throughout this paper.

In the first series of tests, with speed of 111 r.p.m. and pressure of 714 lb. per sq.in. (50.2 kg. per sq.cm.), three oils were selected, a mineral oil of paraffine base, a second of naphthene base, and cottonseed oil, and all three were diluted with 300 deg. mineral seal oil, or in some cases with kerosene and gasoline, in order to vary the viscosity. The results are shown in Fig. 1, the minimum coefficient of friction being 0.00094 at a value of S = 0.00173 for a mixture of petroleum oil and kerosene of approximately the same viscosity as straight 300 deg. oil.

It will be noted that this value of S is much lower than the theoretical value, and it is believed that this is not due, primarily, to error in estimating the clearance, but to the fact, pointed out by Harrison,[5] that Sommerfeld's equations apply only when the friction is calculated from the moment of the journal, but that when, as is usual in friction machines, the measured moment is that of the bearing block, there is theoretically no value of S except zero, at which f is a minimum. Thus when, with decreasing values of S, the friction begins to increase rapidly, this should be taken as an indication that the oil film is ruptured and that there is metallic contact.

In a second series of tests, shown on Figs. 1 and 3, a certain 5-gal. can of a mineral oil known as "Viscolite"

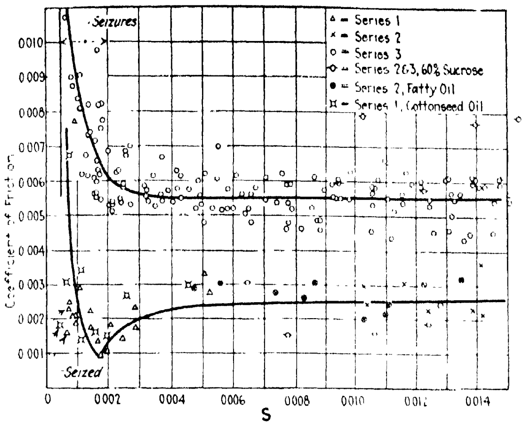

FIG 1—FRICTION TESTS, SERIES 1 TO 3, NEAR POINT OF MINIMUM FRICTION

was selected as a standard of comparison, so that by a repetition of tests under the same conditions it would be shown whether an apparent change in friction due to changing oils was due to variations in oiliness or to change in smoothness of the rubbing surfaces. The pressure was the same as in series 1, but the speed was varied.

The tests failed to show any superiority of fatty as compared with mineral oils, or even as compared with sucrose or glycerol solutions. The minimum value of the coefficient of friction was 0.00152, or somewhat higher than in series 1, and happened to be obtained with 60 per cent sucrose solution with a viscosity of 0.37 poise, the speed being 62 r.p.m. The point of minimum friction was, however, not reached in this series.

In series 3, shown in Figs. 1 and 4, most of the tests were made with Viscolite diluted with kerosene. In general the coefficient of friction, or location of the characteristic curve, is higher than in series 1 and 2, and the marked increase in friction, due to metallic contact, occurs at a higher value of S. The tests of this series, shown in Fig. 4, were not concordant enough to indicate the slope of the characteristic curve, and this was estimated from a few tests, made toward the end of the series, with blends of Viscolite and steam engine cylinder oil. The high friction in these tests may be due to failure of the highly viscous lubricant to reach the rubbing surfaces in adequate amounts.

Of special interest are the tests in which seizure occurred, concerning which data are given in Table I. The limits of S between which seizure occurred have been indicated on Fig. 1. Seizure would of course have occurred at values of S below the lower limit, which

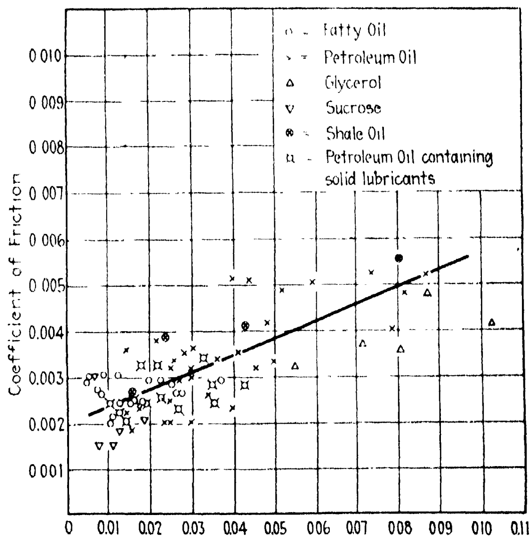

FIG 3—FRICTION TESTS, SERIES 2, ABOVE POINT OF MINIMUM FRICTION

merely indicates the boundary of the region in which the attempt to measure friction was made.

Leaving the last three lines of the table out of consideration, it will be seen that the maximum value of S at which seizure occurred was about half its value at the point of minimum friction. Series 1 shows a very similar result. It should be noted in considering the last column of the table that these values were not calculated from momentary observations, but each speed and pressure was maintained until a constant difference of temperature between the room and bearing was reached. Presumably if smaller increments of pressure, speed and viscosity had been used, lower values of S could have been reached without seizure, but even under the conditions of the investigation seizure sometimes occurred at higher values of S than the lowest attained.

In series 4 a comparison was made between the white metal bearing used in the previous tests and the regular bronze bearing supplied with the friction machine, a variety of lubricants being used as in series 2. Both

19	Petroleum oil	0.1140	117	429	30.2	0.00752	0.00794

speeds and pressures were varied. The results in Fig. 4 show a higher friction than in series 3, and a higher friction with bronze than with white metal. Using increments of 143 lb. per sq.in. (10.1 kg. per sq.cm.), a pressure of 572 lb. per sq.in. (40.2 kg. per sq.cm.) was reached only once with the bronze bearing, with speed of 56 r.p.m. The lubricant was a straight petroleum oil of 0.872 poise viscosity at the temperature of the bearing, and gave a value of $f = 0.0120$ with $S = 0.0207$.

Table II is similar to Table I and gives data concerning the tests in series 4 in which seizure occurred. The first two tests were with white metal, the others with the bronze bearing.

In test 1 seizure was obtained by gradually increasing the pressure, while in the other tests, as in those of Table I, the increments of speed and pressure were fairly large.

The limits of S between which seizure occurred are shown on Fig. 4 for the bronze bearing, omitting test 5, in which it is believed seizure was caused by the oil being too viscous to reach the rubbing surfaces. Even with the white metal bearing, seizure occurred at much higher values of S than in series 3, and the evidence appears to be that the material and smoothness of the bearing and journal have a much greater influence upon the point of seizure than does the nature of the lubricant. It will be noted that seizure took place with fatty oils on a bronze bearing at a value of S two or three times as high as could be reached without seizure on a white metal bearing, using an emulsion of 50 per cent soluble cutting oil as a lubricant.

SUPERIORITY OF WHITE METAL

To determine whether the difference in friction between the white metal and the bronze bearings was due to a difference in radius of curvature or of film thickness, careful measurements were made of both bearings. No difference would be detected, the radius varying from 1.873 to 1.875 in. on either bearing. It might of course be considered that the advantage of the white metal bearing was due to superior smoothness or fit, or to the lubricating power of the lead contained in it, but the possibility of obtaining a good fit with a given metal is just as truly a characteristic of that metal as any peculiar lubricating property which may be ascribed to it.

Other tests made with this same white metal[6] showed that the friction was about 60 per cent of that of "genuine babbitt of composition 89 per cent of tin, 7½ of antimony and 3½ of copper," so that these tests should be taken as confirming the superiority of this particular white metal, rather than as disproving the generally accepted belief that the coefficient of friction with bronze is less than with babbitt.

In order if possible to get a better fit between the journal and the white metal bearing, the attempt was made to run in a new white metal bearing by reversing it end for end after each increase of pressure. Theoretically, if the journal were a mathematically perfect cylinder, this would be the equivalent of reversing the direction of rotation, as is done in the Riehlé testing machine. It was found, however, impossible to raise the pressure to over 429 lb. per sq.in. (30.2 kg. per sq.cm.) or to get as low a coefficient of friction as with the white metal bearing previously employed.

EXPLANATION OF TOWER'S RESULTS

It is noteworthy that Tower obtained complete film lubrication with a machine similar to the Cornell except in length of arc of contact and in absence of reciprocating motion of the journal. Tower says of his machine: "A railway axle has a continual end play while running which prevents the brass from becoming the perfect oil-tight fit which it became in this apparatus."

To test this point, the eccentric which imparts the reciprocating motion to the journal was disconnected and the journal held rigidly in position as far as end play was concerned. A new journal was made of hardened steel and was provided with a magnolia metal bearing. With this new equipment the coefficient of friction was found at first to be about 0.009, as with the bronze bearing, but after 3 days' running it increased about 50 per cent, and examination showed that the bearing had worn in ridges which were easily visible and could also be perceived by the sense of touch. The tests were accordingly discontinued.

The most plausible explanation seems to be that Tower obtained complete film lubrication, which could not be obtained with the Cornell machine, because he had a longer bearing and a greater arc of contact, rather than because he had a better fit between bearing and journal.

If, as the above-described tests appear to indicate, the value of S at the point of minimum friction is decreased as the smoothness is increased, it might be

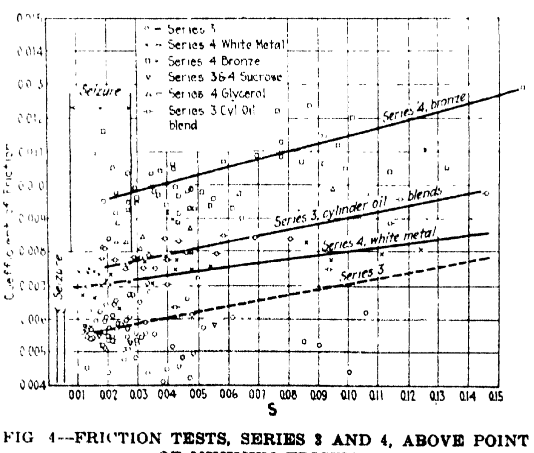

FIG. 4—FRICTION TESTS, SERIES 3 AND 4, ABOVE POINT OF MINIMUM FRICTION

[6] G. K. Burgess and R. W. Woodward, U. S. Bureau of Standards Technologic Papers, No. 109 (1919).

expected that S would vary with the oiliness of the lubricant or with its ability to smooth over inequalities in the rubbing surfaces. This replacing of the rubbing surfaces with new, smoother surfaces is undoubtedly the action of graphite,[7] and the adsorbed films from oils of good oiliness might be assumed to have a similar effect. Wilson and Barnard, basing their opinion upon the tests of Archbutt and Deeley[8] and of Heimann,[9] conclude: "The use of lubricants of high oiliness tends to lower the critical point, probably because the presence of an adsorbed semi-solid film on the metal surfaces helps to prevent rupture of the fluid lubricating film, even after it has become extremely thin."

Fig. 5 shows characteristic curves for various bearings, including those from Figs. 1 to 4, and the results

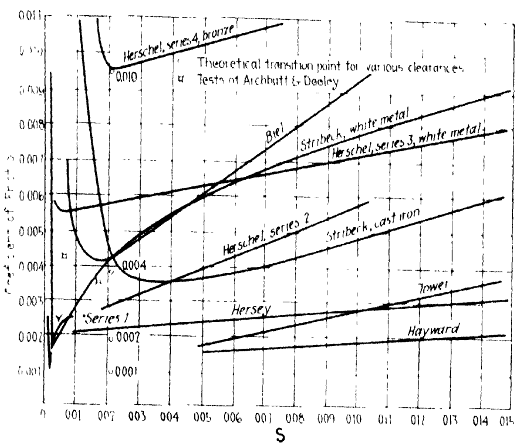

FIG. 5—COMPARISON OF FRICTION TESTS OF VARIOUS EXPERIMENTERS WHERE CLEARANCE WAS UNKNOWN

of Biel, shown separately in Fig. 6. Data concerning tests of Hayward, Tower, Hersey and Stribeck[10] were scaled from diagrams of Wilson and Barnard. Lasche's[11] tests have been omitted, because they covered only high values of S.

Examination of Wilson and Barnard's curve from tests of Archbutt and Deeley shows that the data were taken from table XCI E, assuming that tests were made at 60 deg. F., the temperature for which viscosities are given. Archbutt and Deeley do not state that this was the temperature of friction tests, and the present writer was unwilling to make this assumption and accordingly has omitted these tests from Fig. 5. Only in the case of tests with special red engine oil and rapeseed oil, in table XCI D, did it seem possible to identify the oils and to determine the viscosity at the temperature of the oil film, from data given elsewhere in the book. These two points are shown on Fig. 5, but merely serve to indicate the coefficient of friction at points presumably not very far from the point of minimum friction. For all curves of Fig. 5, $\frac{2\Delta}{d}$ was assumed to be equal to 0.001.

It will be noted that although there is considerable variation in the value of S at the point of minimum friction, the average is not far from the theoretical value of 0.0211 at the transition point for any clearance. This tends to prevent detection of the error, pointed out by Harrison, in applying Sommerfeld's formula for transition point to friction tests where, theoretically, there should be no point of minimum friction, and the critical point actually observed is due to rupture of the film and metallic contact.

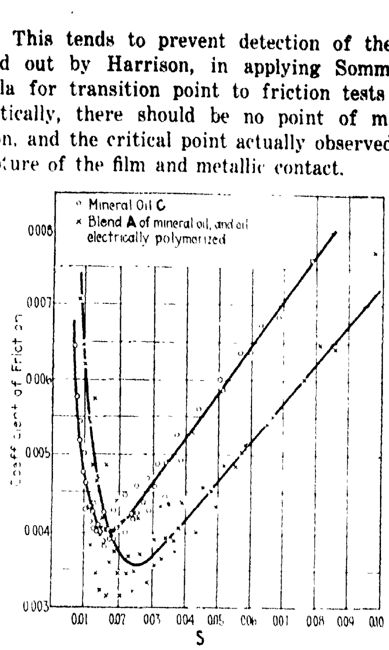

FIG. 6 FRICTION TESTS ON TWO OILS BY BIEL

In Fig. 7 are shown the very few tests in which all data, including clearance, are given. Kingsbury[12] gives complete data concerning his tests with a compressive lubricant, air, but special formulas, given by Harrison, are necessary, and these tests have been omitted from Fig. 7.

Both Heimann and Hersey state that $\frac{2\Delta}{d}$ is equal to 0.004 (although Hersey[13] adds the caution, "when the

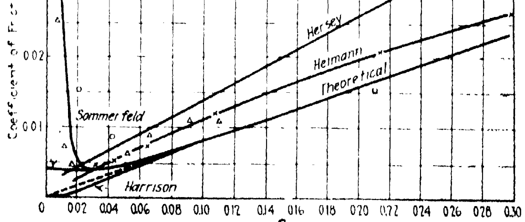

FIG. 7 FRICTION TESTS WHERE CLEARANCE WAS KNOWN

bearing was new"), and this makes it possible to compare the slope of the experimental curves with the theoretical slope. The necessary equations are given by Sommerfeld and by Harrison and may be written

$$\beta = \frac{2\pi a'}{\sqrt{a^2 - 1}\,(2a^2 + 1)} \qquad (2)$$

$$S\beta = \frac{1}{6} \qquad (3)$$

$$f = \frac{2\Delta}{d}\,\frac{(a^2 + 2)}{3a} \qquad (4)$$

$$f = \frac{2\Delta}{d}\,\frac{(a^2 - 1)}{3a} \qquad (5)$$

[7] See for example, C. F. Mabery, *Jour.*, A.S.M.E., vol. 32, pp. 163 803 (1910).

[10] R. Stribeck, *Z. Ver. deut. Ing.*, Ingr., vol. 46, p. 1341 (1902)
[11] O. Lasche, *Z. Ver. deut. Ing.*, vol. 46, p. 1181 (1902).
[12] A. Kingsbury, *Jour.*, Am. Soc. Naval Engineers, vol. 9, p. 267 (1897)
[13] M. D. Hersey, *Jour.*, Washington Academy of Sciences, vol. 4, p. 549 (1914).

In using the above equations it is simplest to assume values of α, the ratio of the radial clearance Δ to the distance between centers of bearing and journal, remembering that $\alpha = \sqrt{2}$ at the transition point. When f is calculated from the moment of the journal, as in Heimann's deceleration tests, equation (4) should be used in connection with equations (2) and (3), giving a curve concave upward. If f is calculated from the moment of the bearing cap, as in Hersey's tests and is usually the case, equation (5) should be used instead of equation (4), giving a curve concave downward except at very low values of S. Both curves approach asymptotically to the straight line passing through the origin, the tangent of slope being

$$\frac{f}{S} = 2\pi^2\left(\frac{2\Delta}{d}\right) \tag{6}$$

For the Bureau of Standards tests in Fig. 5, the variation of f with S is indicated by straight lines above the point of minimum friction, but it is realized that the law of variation might be more accurately indicated by curved lines which the accuracy of tests was not sufficient to detect. In Hersey's tests also there is no indication of curvature. But in the great majority of tests, including those of Tower and Hayward when considered over a wide enough range, the curves are concave downward.

In Figs. 6 and 7 the points merely indicate the places at which data were scaled from the original diagrams. It will be seen that even in Heimann's tests, where, theoretically, equation (4) should apply, end leakage or other circumstance not considered in the equation has caused the curves to be concave downward. Fig. 7, where the clearance is known, as well as Fig. 5, where it is assumed, both show that the theoretical transition point serves fairly well to indicate the average value of S which may be expected at the point of minimum friction.

Results of Various Investigators

It is believed that Wilson and Barnard overlooked the effect of clearance upon the location of the point of minimum friction in coming to their conclusion that its location varied with the oiliness of the lubricant. Table III gives the small amount of available information upon which to base a conclusion.

With the exception of the Bureau of Standards tests, all the tests of Table III were made on complete bearings. It will be seen that in general S varies from about 0.02 to 0.04 no matter what lubricant is used, but that there appears to be a tendency toward lower values of S when the bearings are short. Hersey is the only experimenter to get a low value of S with a long bearing. While it might be expected that the bad effects of leakage would be more noticeable with a short bearing, it is possible that this is compensated for by the greater ease of getting a good fit on a shorter bearing.

Biel compared a mineral oil with a blend of electrically polymerized oil with mineral oil, expecting to show that the blend had superior oiliness. It will be noted that the blend did show a lower coefficient of friction, but the value of S at the point of minimum friction was higher than with the straight mineral oil.

Stribeck's comparison of a cast-iron and a white metal bearing is difficult to interpret, because the former was 3.29 diameters and the latter only 1.00 diameter in length. But he gives a comparison between the short white metal bearing and the original bearing from which it was cut and which was 1.96 diameters in length: "The shortened bearing showed at medium and high speeds almost exactly the same friction curves as for the 137-mm. long bearing which was run in. At low speeds (64 r.p.m. and less) and high enough pressures, there was an increase in the coefficient of friction with increasing pressure, and there was the difference that with the longer bearing the increase began sooner than with the shorter." He then goes on to say that his published data concern only the shorter bearing, which he selected because of the wider range in his tests of both speed and pressure. Thus the fact that the cast-iron bearing showed a higher value of S at the point of minimum friction than did the shortened white metal bearing is at least partly due to the greater length of the cast-iron bearing.

TABLE III—VALUE OF SOMMERFELD'S CRITERION, S, AT POINT OF MINIMUM FRICTION

Experimenter	Ratio Of Length To Diameter Of Bearing	Assumed Clearance, $\frac{2\Delta}{d}$	Metal Of Bushing	Lubricant	Coef of Friction	S
Heimann	1.67	0.004	Bronze	96 per cent glycerol	0.0087	0.0422
Heimann	1.67	0.004	Bronze	80 per cent glycerol	0.0047	0.0321
Heimann	1.67	0.004	Bronze	66⅔ per cent glycerol	0.0047	0.0161
Hersey	3.00	0.004	Brass	Mineral and fatty oils	0.0030	Note
Stribeck	3.29	0.001	C. I.	Mineral oil	0.0035	0.0315
Stribeck	1.00	0.001	White	Mineral oil	0.0016	0.0024
Biel	1.14	0.001	White	Electrically polymerized mineral oil	0.0035	0.0250
Biel	1.14	0.001	White	Mineral oil	0.0040	0.0170
Herschel						
Series 1	0.93	0.001	White	Mineral and fatty oils	0.0009	0.0017
Series 3	0.93	0.001	White	Mineral and fatty oils	0.0055	0.0040
Series 4	0.93	0.001	White	Mineral and fatty oils	0.0070	0.0140
Series 4	0.93	0.001	Bronze	Mineral and fatty oils	0.0090	0.0220

Note. A value of 0.0086 was attained without reaching the point of minimum friction

Conclusions

The conclusion which may be drawn from Table III is that there is little or no evidence available to show that the value of S at the point of minimum friction decreases as the oiliness improves. If the location of S does vary with the oiliness, this variation could be detected only with a friction machine, possibly of the disk type, in which wear of the rubbing surfaces would not cause a variation in smoothness or of clearance during the series of tests necessary to locate the point of minimum friction.

It is believed that the present paper justifies the following conclusions:

1. There is little probability that a journal friction testing machine will ever prove convenient for testing oiliness, because the clearance changes with wear.
2. There is no experimental evidence that the value of Sommerfeld's criterion at the point of minimum friction varies with the oiliness.

Lignite Utilization

Experiments have recently been made at the lignite utilization plant at Bienfait, Sask., for the purpose of testing a special retort designed at the Bureau of Mines in Washington, as the process of the Canadian Lignite Utilization Board has proved too delicate. The form of carbonization which is being tested at the Beinfait plant has been tried out in the United States with satisfactory results. It is believed that when the Canadian Lignite Utilization Board has completed the work for which it was established low-grade lignites can be placed on the market in healthy competition with anthracite.

Technical Education In Metallurgy

BY CARLE R. HAYWARD
Associate Professor of Metallurgy, Massachusetts Institute of Technology

IT IS DIFFICULT to say anything new about technical education, yet every conference on the subject, such as that held in New York on Feb. 21 by the Mining and Metallurgical Society of America and the A.I.M.E., stimulates interest, and even old ideas dressed in new phraseology and marshaled in a new order help to crystallize conviction on the subject.

The scathing statements regarding metallurgical courses in recent editorials in *Chemical & Metallurgical Engineering* and repeated by Mr. Thum with additions at the conference referred to above cause some of us to think, even if we don't agree with them. The experiences of men like E. P. Mathewson with large numbers of metallurgical graduates is evidence that must be considered in making final decisions, while the long years of experience of teachers like President McNair must also be weighed very carefully.

PROBLEMS OF EDUCATION

The writer is a teacher because he likes teaching and the satisfaction which comes from helping to prepare young men for their life work. It is probably fair to say that a majority of men have the same motives in teaching. All such are continually searching for methods which will enable them to send their students out better prepared. We think and talk about the problems which confront us and are continually trying experiments to see if improvements can be found. We don't all agree on everything by any means, and it is well that we don't, but it seems fair to assume that the experienced metallurgical teacher knows more about the problems of teaching than the average engineer. The engineer specifies certain qualities in his materials, but he usually leaves the methods of manufacture to the manufacturer. Why not apply the same principles in educating men to meet given requirements?

There is one point which must always be considered. It is one of the greatest problems in education. The manufacturer can go into the market and select his raw materials, while the school must take whatever comes to it after going through forms of examination which everyone recognizes are inadequate. Give us some method of selecting our stock that is as accurate as the manufacturer uses in selecting his raw materials and our finished product will not need the apologies that much of it gets now. Furthermore, the steel maker can take an ingot and with mathematical precision roll it to a given shape and size, but if anyone has the illusion that a technical school can perform a similar process with a student he has little conception of teaching.

There are four major subjects of discussion regardin technical education: 1. What should be taught? 2. How should it be taught? 3. How long should the course be? 4. Who should be admitted to technical schools?

WHAT SHOULD BE TAUGHT?

Practically everyone is agreed that every branch of engineering requires a thorough grounding in mathematics, and although there is not complete unanimity on the subject, probably most would agree that the metallurgist should go at least through calculus. It is becoming increasingly evident that the chemical training of the metallurgist should include a thorough course in physico-, thermo- and electrochemistry if he is to be adequately fitted to cope with leaching and electrodeposition problems and the pressing problems of furnace efficiencies. The metallurgical engineer should also know something of mechanical engineering and electrical engineering, but it is a mistake to attempt to make him a designer of mechanical or electrical machinery. With a thorough grounding in physics and chemistry, enough mineralogy and geology to understand the sources of his raw materials, a very brief course in mining to give him a background for first costs and a course in ore dressing the student is prepared for his study of metallurgy proper.

Certain principles of metallurgy are doubtless taught in all schools; beyond that there is inevitably a wide divergence in practice. Some stress copper, some gold and silver, some iron and steel, each with good reason. Some have much laboratory work, some very little; probably the proper amount lies between the two extremes. At M.I.T. we require a well-balanced course covering the entire field of metallurgy and then allow optional specialization along either ferrous or non-ferrous lines. An increasing demand for principles of accounting and economic consideration of processes must have an effect on metallurgical instruction and will inevitably modify some courses. The Massachusetts Institute of Technology has from the first insisted on a certain minimum of so-called general or cultural subjects, which necessarily cut the time allowed for technical subjects, and careful thought is necessary to make this limited time count to the greatest advantage. Non-essentials must be eliminated and the students given a proper perspective.

HOW SHOULD IT BE TAUGHT?

First and foremost a subject must be made interesting. Any art or artifice to bring this about is legitimate. Time spent in trying to instruct a class that is not interested is practically wasted. The student should be taught to use the library freely, not as a slave driven to a task but with a real thirst for knowledge that has been stimulated in the laboratory or the class room. Successfully to stimulate this interest is extremely difficult, but on it hangs success or failure as a teacher. The metallurgical laboratory can never teach practice, but it is invaluable for illustrating principles; here also the research spirit may be developed and the two words "Why" and "How" should be ever kept in the ears and minds of the students.

It is unfortunately necessary to devote a large proportion of the class-room time to teaching facts and describing operations, but the writer has found that the time which is most profitably spent is that used in discussing reasons for various operations. A class which can be induced to give theories or explanations of existing processes or suggestions for possible improvements in procedure or apparatus is doing some real thinking and even the most severe critics of present technical education agree that this is one of the most important things which should be accomplished.

It has been suggested that different branches of metallurgy be taught by bringing in specialists in each of these fields. The objection to this is that few of the specialists know how to teach or how to dress up their subject in a way in which it can be assimilated by the student who knows nothing about it in advance. A far

better way would be to have such specialists give one or two lectures after the student has learned the fundamentals of the subject from his regular teacher. In most cases these eminent specialists can do more good by speaking informally to the students about their personal experiences than by giving a formal lecture. We have tried both methods at M.I.T. and I feel sure that this is true.

How Long Should the Course Be?

There are many arguments in favor of taking a college course before attending technical school, especially if the student is ready for college by 16 or 17. Also in the exceptional case where a student knows definitely what line of work he is to follow on graduation an additional year of specialized technical study may be wise, but after weighing all the evidence that has come to my attention I am convinced that for the vast majority of students it is wise to start on life's real problem at once after 4 years of technical training. The metallurgical graduate who is going into the producing end must start at the bottom of the ladder. If he is too old or has spent too long a time in school, he does not adapt himself as readily to the trying conditions under which he must begin his career and thus labors under a severe handicap. The 4-year man who has been properly trained has a good technical foundation. If he has the right stuff in him, he will erect a durable superstructure on this foundation. If he hasn't the right stuff in him, a few additional years in school will do him little or no good.

Summer work in plants should be urged or required. Visits to various plants are desirable and it may be advantageous to work out a co-operative arrangement whereby certain work is done at plants under direct supervision of instructors.

Who Should Be Admitted to Technical Schools?

Some come because their parents want them to. Some because they expect to acquire great wealth in the engineering profession. Some because they think they will like engineering subjects. Some because some friends have gone or are going. About 50 per cent fall by the wayside before the degrees are conferred. Fifty per cent or more of the remainder do not practice engineering or amount to little in the profession. A small percentage become eminent or reach the goals they seek. Why did the first 50 per cent fail? The reasons are many and need not be enumerated. Many were improperly prepared and were unable to overcome the handicap. Should they have been excluded? Perhaps so, but many a man with inadequate preparation has finished with distinction. Many were wholly unfitted for engineering work. Should they have been excluded? They probably would have been if we knew fully how to apply intelligence tests, yet even many of these have received some benefit from their experience. Many have just ordinary ability and no amount of education will increase it. Should they be excluded? Some think so, but most of us think they have a right to all they can get and we can offer them.

What a joy teaching would be if we had to deal only with a handful of picked men! What encomiums would be heaped on the institutions whose alumni were all enrolled in "Who's Who"! Apparently this is the result expected by some of our critics, but there are some facts which should not be forgotten: 1. An engineering education is not wasted just because a man does not follow engineering as a profession. 2. No school can produce finished engineers. The patience and co-operation of industrial organizations is necessary to produce a finished product. 3. The biggest factor in ultimate success is a man's personal characteristics and mental ability. Such men will become successful without a technical training. The school can merely enhance that success. 4. Even at graduation there is no way yet available to predict surely the future success of the student. Often the least promising has undiscovered powers which will send him ahead of his apparently more able companion. Furthermore it should be pointed out that although curricula differ widely, men from different schools are everywhere coping successfully with the problems which confront them in greatly diversified fields.

All the above and many other points should be considered before criticising too harshly our technical schools. Their graduates are doing a magnificent work and many of them freely give fair credit to the schools. There will always be room for improvement, and improvements will continually be made if employers of graduates will co-operate in a broad and liberal spirit with those who are trying hard to turn out men who will fit in to a multitude of positions in a multitude of plants to the honor and profit of all concerned.

Use of Flash in Forgings

In the course of a lecture delivered before the British Association of Drop Forgers and reported in *The Engineer*, Leslie Aitchison pointed out that if the steel for making a forging was cut too short or of too small stock superfluous steel will not be forced out between the dies in sufficient quantity, and consequently there will be little or no flash. This might appear to be a benefit; actually it is a very serious danger because there is no cushion of steel between the dies. As a result the dies come together on their faces and mutually give each other a blow which is frequently of sufficient intensity to break one of them or badly damage some portion of the cylinder.

If too much steel is taken to make the forging, there is a gross waste of material. Excess steel is forced out between the dies in a comparatively thin squirt. This fin of metal is in close contact with the upper and lower dies, and consequently becomes chilled fairly rapidly, and the excess of material lying in the pattern cannot easily be squeezed out. A further consequence is that as the scrap becomes cold very readily it tends to split under the impact of the dies. The splits in the flash tend to spread inward and may actually proceed into the stamping itself.

Production of Rolled Zinc in 1922

The reports made to the United States Geological Survey by producers show that the output of rolled zinc in the United States in 1922 gained 76 per cent over that of 1921. At the beginning of 1922 the market quotation on rolled zinc in mill lots at the rolling plants was 8.5c. a pound, declining to 7.5c. by the middle of the year and rising to 9.5c. at the close of the year.

The large imports of zinc, which were a feature of the first half of 1921, were not repeated in 1922. Approximately 400 tons was imported during the early part of the year. The average declared value at the foreign mills was 7.1c. a pound, as compared with 3.7c a pound in 1921.

Synopsis of Recent Chemical & Metallurgical Literature

"Chem. & Met.'s" List of Reviewed Publications

Below are listed the publications that are reviewed by the staff of *Chem. & Met.* The important articles are listed in the synopsis box and the most significant contributions are abstracted and published on these pages:

American Fertilizer, 1010 Arch St., Philadelphia, Pa.
Blast Furnace and Steel Plant, 108 Smithfield St., Pittsburgh, Pa.
Brass World and Platers' Guide, Elm and Duane Sts., New York.
Brick and Clay Record, 610 Federal St., Chicago, Ill.
Canadian Chemistry and Metallurgy, 57 Queen St., West, Toronto, Ont., Canada
Chemical Abstracts, 1709 G St., N. W., Washington, D. C.
Chemical Age (New York), 381 Fourth Ave., New York
Chemical Age (London), 8 Bouverie St., London, E. C. 4, England
Chemiker Zeitung, Cothen, Anhalt, Germany
Chemistry and Industry, 46-7 Finsbury Square, London, E. C. 2, England
Chimie et Industrie, 49 Rue des Mathurins, Paris, France
Color Trade Journal, 21 East 40th St., New York.
Commerce Reports, Department of Commerce, Washington, D. C.
Drug and Chemical Markets, 3 Park Place, New York
Factory, 342 Madison Ave., New York
Facts About Sugar, 132 Front St., New York City.
Federal Reserve Bulletin, Government Printing Office, Washington, D. C.
Forging and Heat Treating, 108 Smithfield St., Pittsburgh, Pa.
Gas Age-Record, 52 Vanderbilt Ave., New York
Gas Journal, 11 Bolt Court, Fleet St., London, England
General Electric Review, General Electric Co., Schenectady, N. Y.
Glückauf, Essen, Germany.
Illustrated Official Journal, 168 Fleet St., London, E.C. 4, England.
India Rubber World, 25 West 45th St., New York.
Industrial and Engineering Chemistry, American Chemical Society, 810 15th St., N. W., Washington, D. C.
Industrial Digest, 25 West 45th St., New York.
Industrial Management, 120 West 32nd St., New York.
Industrial Survey, Kirby Bldg., Cleveland, Ohio
International Sugar Journal, 2 St. Dunstan's Hill, London, E. C. 3, England
Iron Age, 239 West 39th St., New York
Iron and Coal Trade Review, Bessemer House, Adelphi, Strand W. C. 2, London, England.
Journal of American Chemical Society, 810 18th St., N. W., Washington, D. C.
Journal of the Institution of Petroleum Technologists and Record of Transactions, 5 John St., Adelphi, Strand, London, W. C. 2, England
L'Echo des Mines et de la Métallurgie, 7 Rue d'Offemont, Paris, France.
L'Industrie Chimique, 8 Rue de Miromesnil, Paris, France
Management Engineering, 20 Vesey St., New York.
Metall und Erz, Berlin, S. W. 11, Königgrätzen Strasse 106.
Mining and Metallurgy, 29 West 39th St., New York.
National Provisioner, 407 South Dearborn St., Chicago, Ill
New Jersey Ceramist, 170 Roseville Ave., Newark, N. J.
Official Gazette of the United States Patent Office, Washington, D. C.
Oil, Paint and Drug Reporter, 100 William St., New York
Paper, 36 West 44th St., New York.
Pulp and Paper Magazine, Gardenvale, Que., Canada
Revue de Métallurgie, 5 Cité Pigalle, Paris, France.
Revue Universelle des Mines, 16 Quai des Etats-Unis, Liege, Belgium
Rock Products, 542 South Dearborn St., Chicago, Ill
Rubber Age, 225 Fourth Ave., New York.
Stahl und Eisen, Verlag Stahleisen m. b. H. Düsseldorf, Schlieszfach 664.
Sugar, 153 Waverly Place, New York
Taylor Society Bulletin, 29 West 39th St., New York

Road Tar Specifications

Gas Journal (London) for Feb. 21 gives a rather complete review of the new specifications for tar treatment of roads which has been adopted by the British Ministry of Transport (Roads Department). Copy of the full directions can be secured from His Majesty's Stationery Office, Imperial House, King's Way, London, W. C. 2, for 1s. each.

Important Articles in Current Literature

More than fifty industrial, technical or scientific periodicals and trade papers are reviewed regularly by the staff of *Chem. & Met.* The articles listed below have been selected from these publications because they represent the most conspicuous themes in contemporary literature, and consequently should be of considerable interest to our readers. Those that are of unusual interest will be published later in abstract in this department, but since it is frequently impossible to prepare a satisfactory abstract of an article, this list will enable our readers to keep abreast of current literature and direct their reading to advantage. The magazines reviewed have all been received within a fortnight of our publication date

SULPHATE OF AMMONIA MANUFACTURE. *The American Fertilizer*, March 10, 1923, pp. 25-32.

TIN DEPOSITS IN THE MALAY. J. B. Newsom. *Eng. & Min. Jour.-Press*, March 17, 1923, pp. 485-491.

THE LAWS OF CRUSHING. J. Herman. *Eng. & Min. Jour.-Press*, March 17, 1923, pp. 498-499.

MANUFACTURE OF VARNISH. G. N. Hill, *Can. Chem. & Met.*, March, 1923, pp. 60-63.

REFRACTORY MATERIALS (IV). *La Technique Moderne*, March 1, 1923, pp. 144-148.

FALL RIVER GAS PLANT. A. C. Klein. *American Gas Association Monthly*, March, 1923, pp. 188-191.

FACTS CONSIDERED AS INDUSTRIAL STABILIZERS. R. H. Booth. *Iron Age*, March 8, 1923, pp. 673-677.

CHROME-NICKEL STEEL IN TRACK WORK. F. G. Hillbard. *Iron Age*, March 15, 1923, pp. 753-757.

RETORT VACUUM AND QUALITY CONTROL. W. H. Warren. *Gas Journal*, March 7, 1923, p. 619.

STUDY OF THE PLASTICITY OF PAINT. Eugene C. Bingham, Herbert D. Bruce and Martin O. Wolbach, Jr. *J. Franklin Inst.*, March, 1923, pp. 303-317.

OXIDATION OF HYDROCARBONS WITH SPECIAL REFERENCE TO FORMALDEHYDE PRODUCTION. Part II. Action of O_3 on CH_4. T. Sherlock Wheeler and E. W. Blair. *J. Soc. Chem. Ind.*, March 9, 1923, pp. 81-86T.

Low-Grade Oils in Water-Gas Making

In the carburetted water-gas plant that was designed and constructed by the Fall River (Mass.) Gas Works Co. by Stone & Webster in 1922, an attempt was made to anticipate gas-making conditions that may be expected within the next decade, particularly with respect to the supply of enriching oil. A. C. Klein describes this in the *American Gas Association Monthly* for March, 1923.

Due to the present condition in the supply of petroleum and future prospects of this supply, the gas industry well may ask itself what sort of enriching oil it may have to handle in the near future. It will undoubtedly be necessary to use such distillates and crudes as cannot be economically converted into gasoline. The two principal sources of these oils will be, first, the residuum from mid-continent crudes which remains after all the fractions that can be converted into gasoline have been removed; second, topped or untopped crudes of an asphalt base such as the heavy crude California and Mexican oils which are not desirable for use in cracking plants because the gasoline yielded is low and the residuum practically unsalable. These oils are low in gravity, viscous, high in sulphur and high in coke.

FIXED SULPHUR FORMATION

It has been found that the use of high-sulphur oils in enriching water gas results in high-hydrogen sulphide content and a high content of fixed sulphur impurity. The Stone & Webster heavy oil process is based upon the theory that the formation of such sulphur compounds takes place only in the presence of incandescent carbon. That is, the sulphur in the oil enters first into the form of hydrogen sulphide and in the presence of incandescent carbon the hydrogen sulphide is reduced and carbon bisulphide, a fixed form of sulphur, is formed. The formation of sulphur compounds in the carburetor appears to be proportional to the sulphur content of the oil used, equilibrium being reached, apparently, when the fixed sulphur in the gas is somewhat in excess of 10 per cent of the hydrogen sulphide content.

This maximum can be attained only in the presence of an excess of incandescent coke in the carburetor. This coke would be formed from the use of an oil high in coke.

This coke is formed during the carburation process and is deposited on the checkerwork in the carburetor. During the run in which it is deposited it is too cool to react with the hydrogen sulphide. If permitted to remain, however, it becomes incandescent during the succeeding blow-run and on the following run is active in the formation of carbon bisulphide. This makes it apparent that the way to keep fixed sulphur compound out of the carbureted gas is to remove the coke from the carburetor after every run,

hence starting each run with clean checkerwork.

STONE & WEBSTER PROCESS IS USED AT FALL RIVER

The water-gas installation at Fall River embodies some features of design which have been worked out especially for handling low-gravity, high-sulphur oils. A carburetor blast connection has been made 24 in. in diameter, and a meter is installed for the measurement of carburetor air used. A connection is installed between the top of the generator-carburetor angle connection and the top of the superheater. This connection is of 42-in. diameter pipe, brick lined, containing a hydraulically operated hot valve. In the lower generator connection an additional 24-in. hot valve has been installed alongside of the regular one, and the hydraulic cylinder of this valve has been interconnected with the extra 42-in. hot valve so that one valve will always be closed and the other always open.

This connection enables the generator to be isolated from the carburetor so that air may be admitted under the generator grate and to the top of the carburetor at the same time, the generator blast heating the fuel bed while the carburetor air consumes the carbon on the checker brick, thereby heating the brick. The generator gases bypass the carburetor and superheater and meet the carburetor gases at the superheater stack, where they are burned by the excess oxygen in the carburetor blast products, the heat so generated being recovered in waste heat boilers. Oils of 15 per cent coke content generate enough heat to restore the checker brick to the proper gas making temperature. With oils of lower coke content it may be necessary to burn the generator gases in the carburetor for a short time at the end of each blow run. The system here described provides for this.

Composition and Properties of Diaspore, Bauxite and Gibbsite

High-alumina refractories may be made from three ores—diaspore, bauxite and gibbsite. Diaspore is the monohydrate of alumina, gibbsite the trihydrate and bauxite is a mixture of the two. A careful study of the composition and properties of these ores, made by Raymond M. Howe and R. F. Ferguson, has been published in the *Journal* of the American Ceramic Society, March, 1923, p. 496.

It was found that the ores vary considerably in chemical composition, except in magnesia, alkalis and titania. Their fusion points are lowered most by lime and least by ferric oxide and silica. The burning shrinkages of the minerals high in silica were lowest, while those high in ferric oxide shrank the most. Gibbsite was found to have a higher burning shrinkage than diaspore. Some general data for bauxite and diaspore are given in the accompanying table.

On page 501 of the same issue is an article by D. C. Wysor on "Diaspore Clay of Arkansas and Missouri," followed by discussions which bring out many points of interest in connection with diaspore deposits.

Hot Drawing on a Mandril

This article[1] was read by Eugene Schneider at the autumn (1921) meeting of the Iron and Steel Institute, and can be considered as a sequel to one published in the journal of that Institute in 1920, No. 2, p. 223, under the title "An Investigation of Various Forging Operations Carried Out Under Hydraulic Presses."[2]

Drawing on a mandril has for its object the lengthening of a hollow blank obtained by punching or casting, while keeping it, by means of a mandril, at the required internal section. The operation is relatively simple, but the conditions under which the work is actually carried out are but little known.

In the present contribution the relation is worked out between the resistance of the metal to displacement and the strain per square millimeter carried by the remaining section.

It is necessary, of course, that in order for a blank to be drawn the strain per square millimeter of remaining section be less than the breaking strain at the working temperature. It is demonstrated that if we operate under the same conditions of temperature and with dies whose surfaces of contact are in the same state, the resistance to displacement increases as the angle of contact between hot metal and die decreases.

The strain in the material varies according to the temperature at which the drawing is done, but is further a direct function of the elongation effected during the operation. The maximum elongation that can be given a blank is much greater as the blank becomes thinner.

In a general manner it is better to keep a little below the maximum elongation obtainable and thus avoid the consequences which may be caused by large differences of temperature.

The dies should have as nearly as possible the ideal section indicated and should be very smooth and very hard.

The punches require every care, both as to finish and quality; tool marks and rough surfaces should be scrupulously avoided. The tensile strength should be 65 to 70 kg. per sq.mm. (100,000 lb. per sq.in.).

A very large number and variety of blanks of all dimensions were manufactured and studied in this investigation and enabled the author to make numerous observations especially applicable to the needs of the shop. Following these results the method of working no longer need follow empirical lines.

Book Reviews

CRYSTALLIZATION OF METALS By *Colonel N T. Belaiew, C B*, published by the University of London Press, Ltd, 17 Warwick Square, London, England. 5 x 7¼ in 113 pp, with 37 illustrations in the text and 21 plates Price, 7s 6d. net.

Colonel Belaiew is quite well known for his researches on Damascene swords and various curious stable structures in iron and steel. He was also perhaps the first to produce Widmanstättian structure—well known in meteorites—in artificial alloys. His researches were started in 1906 at the Michael Artillery Academy, Petrograd, under the guidance of Professor Tschernoff. Having been invalided from the Russian Army during the great war, he was sent to England to serve with the inspection staff on Russian munitions. Advantage was taken of his presence in Great Britain by the University of London to enlist him as a special lecturer, and one course of these lectures forms the basis of this little volume.

The author's researches on crystallization of steel were animated by the idea of bringing into closer harmony the processes of crystallization with various areas of the iron-carbon diagram. Studying the works of Sorby, who gradually was brought from the study of the macrostructure of meteorites to the microstructure of steel, and learning how Anossoff likewise started from the macrostructure of Damascene blades, the author felt deeply impressed by the importance of macrostructure, and directed his early efforts toward obtaining large structures easily discernible with the naked eye.

In view of the growing realization that macrostructure and "fiber" have a great but not as yet understood influence on the quality of finished pieces, this little book should prove interesting reading to a large number of men charged with technical control of metallic manufacturing. E. E. THUM.

Recent Chemical & Metallurgical Patents

Production of Metal Hydrates and Gas, Including Acetylene—J. H. Reid has assigned to Thomas Q. Hogan, of Boston, his patent on a process and material for the production of sodium or potassium hydroxide, together with carbide materials "suitable for the generation of acetylene or the preparation of nitrified material" and also simultaneous production of large quantity of fuel gas. This invention requires a mixture of cokable carbonaceous material (preferably bituminous coal) with either sodium or potassium feldspar in about the proportions of 100 lb. of the feldspar to 41 lb. of the coal, the feldspar and the coal having been previously reduced to a finely divided condition and intimately mingled. This mixture is subjected in retorts, such as are used in the manufacture of gas or coke ovens, to a temperature of from 1,400 to 2,800 deg. F. to convert the coal into coke and to obtain a strong coke-like aggregate of the feldspar and coke "capable of most efficient reduction in an electric furnace."

In such furnace, the material will be reduced to aluminum carbide, aluminum oxycarbide or to a material of the nature of silicon carbide, but harder than the latter, dependent upon the temperature and other conditions within the furnace. During the carbide reaction, Na_2O or K_2O will be evolved, depending upon the use of sodium or potassium feldspar, together with a gas consisting mainly of carbon monoxide.

"With the proportion of feldspar and coal as given, the most probable solid products in the electrical furnace will be $Al_4C_3 10SiO_2$; but, by increasing the proportion of carbon, the oxygen of the SiO_2 may be taken up, leaving aluminum silicon carbide—of the nature of carborundum, but probably harder." (1,445,645. Feb. 20, 1923.)

Coke Manufacture From Coal Blends—S. R. Illingworth's process for the manufacture of coke by heating a blend of two coals "which is such that its resinic content is not less than 5 per cent but preferably not less than 8 per cent of its weight" to a temperature not exceeding 500 deg. C. The resinic constituents are defined as those portions of the coal soluble in boiling phenol or boiling pyridine and also soluble in chloroform. (1,445,954. Feb. 20, 1923.)

Bauxite Refractory Bonded With Bentonite—For use in crucibles or furnace linings, the amount of clay required to produce a workable mix may be reduced from over 20 per cent to 5 per cent by substituting bentonite for ordinary plastic clay. (1,442,413. Zacharias Alsson, of New York, assignor of six-tenths to August Rust-Oppenheim, of New York. Jan. 16, 1923.)

Manufacture of Anhydrous Aluminum Chloride—Aluminum bromide is first formed in this process (described by Bernard H. Jacobson, of Charleston, W. Va., and assigned to E. C. Klipstein & Sons Co.) by treating small pieces of aluminum with liquid bromine in a closed vessel provided with a reflux con**denser and cooling facilities for removing the heat of reaction. Through the liquid anhydrous aluminum bromide (m.p. 93 deg. C., b.p. 263 deg. C.) thus** formed a stream of chlorine gas is passed, forming anhydrous $AlCl_3$ and liberating bromine vapor, which is condensed for re-use. (1,445,082. Feb. 13, 1923.)

Increasing Emulsifying Properties of Sulphite Waste Liquor—For many applications of neutralized and concentrated sulphite waste liquor, it is desirable to emulsify the liquor with various oils. While the lignonesulphonates contained in solution in the liquor are in themselves fairly good emulsifying agents for oils of fatty and hydrocarbon nature, the permanency of the emulsions is much improved by the addition of small amounts, say 1 per

American Patents Issued March 13, 1923

The following numbers have been selected from the latest available issue of the *Official Gazette* of the United States Patent Office because they appear to have pertinent interest for *Chem. & Met.* readers. They will be studied later by *Chem. & Met.'s* staff and those which, in our judgment, are most worthy will be published in abstract. It is recognized that we cannot always anticipate our readers' interests and accordingly this advance list is published for the benefit of those who may not care to await our judgment and synopsis.

1,447,973—Treatment of Clay. William Feldenheimer and Walter William Plowman, London England.

1,448,010—Artificial Magnesia Spinel and Process of Manufacture. Frank J. Tone, Niagara Falls, N. Y., assignor to the Carborundum Co., Niagara Falls.

1,448,011—Sagger Structure. Frank J. Tone, Niagara Falls, N. Y.

1,448,036—Reduction of Oxides of Metals of the Chromium Group. Richard Edgar Pearson and Eustace Neville Craig, London, England, assignors to Dureleo, Ltd., London.

1,448,037—Electrolysis of Water. Rodolphe Pechkranz, Geneva, Switzerland.

1,448,038—Apparatus for the Carbonization of Woolen Rags, Combings and the Like. Vittorio Piana, Turin, Italy.

1,448,084—Method of Producing Lubricating Oils. Thomas F. Ott, Berkeley, Calif.

1,448,091—Purification of Cellulose Ether. Paul C. Seel, Rochester, N. Y., assignor to Eastman Kodak Co., Rochester.

1,448,110—Purification of Manganiferous Material. Harold de Olaneta, New Haven, Conn., assignor to Winchester Repeating Arms Co., New Haven.

1,448,128—Method of and Apparatus for Cracking Petroleum Products. Cornelius Kroll, Tulsa, Okla.

1,448,155—Waterproofing Element. Karl Schutte, Rutherford, N. J., assignor to the Flintkote Co., Boston, Mass.

1,448,245—Liquid Fuel. Miguel Llompart y Valdés and Vincente Bacallas y Villar, Havana, Cuba.

1,448,246—Lubricating Oil. Edward Goodrich Acheson, New York, N. Y.

1,448,251—Product for Dyeing and Printing Textile Materials. Marcel Bader and Charles Sunder, Alsatia, France, assignors of one-half to Durand & Huguenin, S. A., Basel, Switzerland.

1,448,276—Composition of Matter and Method for Preserving Organic Porous Materials. Max Landau, Berlin, Germany, assignor, by mesne assignments, to the Chemical Foundation, Inc.

1,448,278—Tanning Means, Their Preparation and Use. Willy Moeller, Hamburg, Germany, assignor by mesne assignments to the Chemical Foundation, Inc.

1,448,284—Paint. Alonzo C. Tutt, Galena, Kan., and Levi F. Snelson, Joplin, Mo.

1,448,340—Process and Furnace for Reducing and Roasting Ores. Emil Fleischer, Dresden, Germany, assignor by mesne assignments to the Chemical Foundation, Inc.

1,448,386—Alkali and Heat Resistant Insulation. Gordon Q. Barr and John R. McClain, Wilkinsburg, and Leslie E. Frost, Pittsburgh, Pa., assignors to Westinghouse Electric & Manufacturing Co.

1,448,387—Method of and Apparatus for the Direct Synthesis of Ammonia at Very High Pressures. George Claude, Paris, France, assignor to L'Air Liquide, Société Anonyme pour l'Etude et l'Exploitation des Procédes Georges Claude, Paris, France.

1,448,390—Apparatus for Burning Pulverized Fuel. Charles P. Crawford, Salt Lake City, Utah.

1,448,391—Process of Treating or Retting and Curing Hemp, Flax, Perini, Jute or Other Fibrous Material. Harry L. Cromer, Oak Park, Ill.

1,448,421—Process of Purifying Raw Cane Juice. Carl J. J. Sorensen, Frederiksted, St. Croix, Virgin Islands.

1,448,432—Process of Dyeing Cellulose Acetate or Products Made Therewith. René Clavel, Basel, Switzerland.

1,448,512—Method of Dehydrating Vegetable, Animal and Other Materials. George Hillard Benjamin, New York, N. Y.

1,448,514—Wet Process of Classifying Comminuted Material. Walter O. Borcherdt, Austinville, Va., assignor to the New Jersey Zinc Co., New York.

1,448,515—Treatment of Minerals. Walter O. Borcherdt, Austinville, Va., assignor to the New Jersey Zinc Co., New York.

1,448,556—Synthetic Gum and Process of Making Same. James McIntosh, Norristown, Pa., assignor to Diamond State Fibre Co., Elsmere, Del.

1,448,557—Dumbturner for Sugar-Cane Mills. Charles McNeil, Glasgow, Scotland.

1,448,571—Alloy. Andrew O'Rourke, Chicago, Ill., assignor to Crane Co., Chicago, Ill.

1,448,581—Process of Purifying Oleaginous Substances. Francis M. Turner, New York.

1,448,586—Process of Manufacturing Aluminous Abrasives. Thomas B. Allen, Hamilton, Ont., Canada, assignor to Abrasive Co., Philadelphia, Pa.

1,448,593—Method and Apparatus for Separating Water From Coal Tar. Paul Jaworski, Bismarckhutte, Germany.

1,448,643—Method for Treating Hydrocarbons and Particularly Crude Petroleum. Peter von Ditmar, Hamburg, Germany.

1,448,709—Art of Oil Distillation. John E. Schulze, Chicago, Ill., assignor to Red River Refining Co., Inc., Shreveport, La.

Complete specifications of any United States patent may be obtained by remitting 10c. to the Commissioner of Patents, Washington, D. C.

cent, of sulphonates of more oily or hydrocarbon nature, as set forth by Karl P. McElroy, of Washington, D. C., in a patent assigned to Robeson Process Co., of New York. Either the free sulphonic acids or their salts may be used, the soda sludge from petroleum refining having been found particularly adaptable for this purpose. The emulsions formed with linseed oil, for example, may be used as core binders, road binders, briquet binders, etc. (1,444,844. Feb. 13, 1923.)

Treatment of Sulphite Cellulose Liquors—Neutralization of sulphite waste liquor with lime according to the usual practice has certain disadvantages. If the liquor is completely neutralized a lime organic compound separates as a bulky precipitate and the liquor is so changed as materially to decrease its adhesiveness. Furthermore, the neutralized liquor still contains acid sulphites. Jacob S. Robeson, of Pennington, N. J., in a patent assigned to J. S. Robeson, Inc., of Wilmington, Del., first sprays the unconcentrated liquor into a current of air, so that all of the free SO_2 and loosely combined sulphur are almost instantly permitted to escape or are oxidized to firmly bound condition. The liquor is then neutralized with magnesia, an excess of which precipitates only magnesium hydroxide and not an organic compound. As a result it is found that the adhesiveness of the evaporated liquor is increased. It is also possible to concentrate the liquor after oxidation to about 1.11 to 1.15 sp.gr. in the first two effects of a quadruple effect evaporator, ferment this liquor, return it through counter current heat exchanges to the third effect for the removal of alcohol, and complete the concentration of the residual liquor in the last effect. (1,445,603. Feb. 13, 1923.)

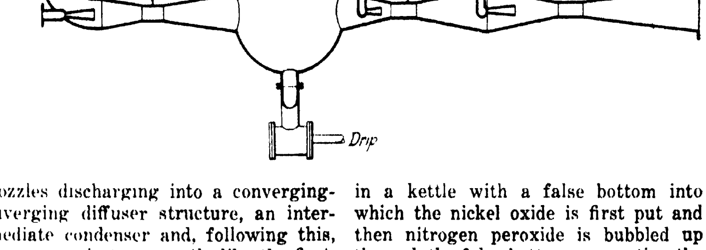
Fume Control—This invention is for the purpose of shielding, controlling and removing fumes from devices used in heating organic matter, such as paint vehicles, varnishes and similar products. When products of this type are heated, the volatile constituents are converted into fume and it is necessary to remove these fumes from the container and from contact with the residue.

These fumes are often of considerable value, and it is desirable to remove them in such a way that they may be saved and the smallest loss possible may occur. In the ordinary distillation of products such as mentioned above, the volatile portions are often decomposed by the high temperatures necessary. It has been the custom to complete the distillation of the material being distilled and still not decompose the volatile matter by resorting to a reduction of gas pressure and a consequent dropping of the temperature of distillation by the use of some sort of vacuum apparatus. The invention here discussed aims to conserve fume values and protect the fumes from destructive temperatures within the heating container and also to protect the container itself from the action of the fumes while the distillation is in process.

The method of this invention is to admit a current of air into the heating container in such a way as to form a pressure and cause the current of air to circulate over the interior surfaces of the container between the fumes which are distilled and the surfaces. This serves to protect the surfaces, and in case any portion of the fume penetrates this blanket of air, it will be sucked up to the outlet with the air and diffused. This circulation of air also enables the fume to be removed from the container without any return by condensation to the charge and without any decomposition of unstable portions of the fume. The current introduced into the container may be any other inert gas besides air. (1,446,480. Robert S. Perry and Paul W. Webster, assignors to Perry & Webster, Inc., of New York, Feb. 27, 1923).

Apparatus for Exhausting Air—The object of this invention is to increase the efficiency of apparatus used for exhausting air and liquids from condensers or other similar pieces of equipment. The improvement embodied here consists in having, as shown in the accompanying drawing, two stages to the ejector beyond the small condenser which is included in the injecting apparatus for the purpose of removing liquid from the air.

By reference to the drawing it will be noticed that this apparatus consists of an ejector, comprising a nozzle or nozzles discharging into a converging-diverging diffuser structure, an intermediate condenser and, following this, two more ejectors exactly like the first. This differs from the usual construction of such ejectors by having two ejectors following the intermediate condenser. The inventor claims that as the result of the use of two ejectors, he is able to attain considerably more efficient operation and superior economy in steam used. It is claimed for this type of exhauster that with a pressure less than 2 in. of mercury, air can be exhausted from a main condenser with an expenditure of at least 25 per cent less steam than that used by any previous equipment. Or that with a given exhauster pressure, the improved apparatus will exhaust a far greater amount of air from the main condenser than could be done with former designs. (1,447,014. Raymond N. Ehrhart, of Pittsburgh, assignor to Elliott Co. of Pittsburgh, Pa. Feb. 27, 1923.)



Colloidal Fuel—Lindon W. Bates has been granted a patent on his mixture of liquid hydrocarbon and solid carbonaceous substance which he prepares in "a composite usable for atomizable fuel purposes" and calls a "colloidal fuel." This patent covers the product and the method of producing it. The product is described by the patentee in one of his claims as "a stable mobile atomizable liquefiable fuel comprising solid particles of carbonaceous substance, liquid hydrocarbon, and saponified resinous matter." The method of producing the product is defined in another claim as consisting "essentially in mixing liquid hydrocarbon and particles of solid carbonaceous substance in amounts which will produce a composite of specific gravity greater than that of water without destroying the atomizable character of the composite; and colloidalizing the components." (1,447,008. Feb. 27, 1923.)

Revivifying Nickel Oxide—Thomas Midgley, Jr., of Dayton, Ohio, has developed a process and an apparatus for revivifying spent nickel oxide which is used in the hydrogenation processes. This is done by treating with water and oxide (NO_2). The resulting solution contains nickel nitrate, and the nitrated material is then heated to a sufficiently high temperature to break down and drive off the NO_2 gas, leaving the oxide behind.

This oxide has been found to have the same degree of catalytic activity as that originally used. The apparatus used for carrying it out consists largely in a kettle with a false bottom into which the nickel oxide is first put and then nitrogen peroxide is bubbled up through the false bottom, converting the material into nickel nitrate. (1,446,984, assigned to the General Motors Research Corporation, of Dayton, Ohio. Feb. 27, 1923.)

Guanidine Salts—J. S. Blair and J. M. Braham have patented a process for the preparation of guanidine salts. Their process involves the use of cyanamide solutions treated with an ammonium salt under pressure. Lime nitrogen is first treated with a mineral acid and the resulting solution is heated in an autoclave at a temperature of 150 to 180 deg. with ammonium nitrate. Reaction should be completed within 3 hours under normal conditions. Good yields are reported obtained and conditions distinctly different from those specifically mentioned can be used. (1,441,206. Jan. 9, 1923.)

British Patents

For complete specifications of any British patent apply to the Superintendent British Patent Office, Southampton Buildings, Chancery Lane, London, England.

Chromium Compounds — Chromium compounds free from iron are prepared by dissolving ferrochromium in sulphuric acid, adding calcium carbonate or its equivalent in quantity insufficient to precipitate all the chromium, dissolving out the chromium from the precipitate by an acid, such as sulphuric acid and, when chrome alum is desired, adding potassium sulphate to obtain the alum. The filtrate is treated with another quantity of calcium carbonate or the like to precipitate the rest of the chromium together with some iron and the precipitate is treated with sulphuric acid to dissolve the chromium and iron. The solution is then mixed with sulphuric acid to be used in dissolving more ferrochromium. (Br. Pat. 188,338; not yet accepted. Kinzlberger & Co., Prague, Czecho-Slovakia. Dec. 29, 1922.)

Lubricants—Derivatives of polyhydric alcohols or phenols in which the hydroxyl groups are partly replaced by fatty or other acid radicles are added to mineral oils or to saponifiable oils, fats or waxes, to increase their lubricating and emulsifying properties and to give them greater consistency. The mono-glycerides of oleic and lauric acids may be used, and in an example, 5 per cent of mono- or di-glyceride of oleic acid is added to a mineral lubricating-oil. (Br. Pat. 188,364. Technical Research Works, Ltd., and R. G. Pilly, London. Dec. 30, 1922.)

Organo-Mercury Compounds — Aromatic mercury cyanide compounds are prepared by treating complex mercury compounds of phenol and its homologues with alkali cyanides in aqueous solution, or by heating phenol and its homologues with mercury cyanide in alkaline solution or with mercuric oxide in alkali cyanide solution. The products are efficacious against plant diseases. According to examples, (1) mercury cresol cyanide is obtained by dissolving mercuric oxide in dilute sulphuric acid, adding o-cresol, boiling the resulting precipitate with sodium cyanide solution and evaporating the filtrate *in vacuo;* (2) o-cresol is boiled with mercury cyanide and dilute sodium hydroxide and the mercury cresol cyanide separated by carbon dioxide or dilute acids; (3) mercury phenol cyanide is prepared by boiling phenol with mercuric oxide in sodium cyanide solution and treating the cooled solution with carbon dioxide or dilute acids. (Br. Pat. 188,376. A Klages and Saccharin-Fabrik Akt. Ges. vorm. Fahlberg-List & Co., Magdeburg. Dec. 30, 1922.)

Gas Producer—In a gas producer the whole or part of the gases generated is carried to pass through a considerable depth, say 14 ft., of fresh fuel, which is thereby distilled in stages and at low temperature so that the gases leaving the upper part of the producer have a temperature of between 150 and 300 deg. C. and a calorific value of about 170 B.t.u., high yields of ammonia and low-temperature distillation products being obtained. The temperature of the upper fuel zone may be controlled by removing part of the gases generated in the lower part of the producer prior to their reaching the upper zone. A central gas off-take comprises a bell situated near the top of the upper zone so that the ascending gases are distributed evenly over the cross-sectional area of the descending column of fresh fuel. (Br. Pat. 188,607. W. Beswick and N. E. Rambush, Stockton-on-Tees, England. Jan. 10, 1923.)

Extracting Metals—Vapors of metallic chlorides are passed over a heated mixture of carbon and alkalis, alkaline earths or magnesia; or the vapors of the chlorides mixed with excess of a gaseous or liquid reducing agent may be passed over the alkaline substance alone. The temperature is kept sufficiently high to melt the metal and the alkali chloride, which are both discharged in a molten state. The process may be carried out in a producer charged with carbonaceous fuel and burnt or unburnt limestone or dolomite, the chloride vapor being supplied thereto mixed with air. (Br. Pat. 188,657; not yet accepted. S. J. Vermaes and L. L. J. Van Lijnden, The Hague. Jan. 10, 1923.)

Active Carbon for Drying Gases—A process of drying gases or separating mixtures of gases consists in treating them with active carbon, preferably of vegetable origin and dehydrated by ignition or by heating in vacuo before use, and in drying the gases or separating them by adsorption. One method of carrying out the invention consists in passing the gases through containers filled with granules of active carbon and arranged in series so that as one container becomes exhausted it can be cut out of the series and the saturated carbon reactivated by heated inert gas, the inert gas being passed directly into the container or into a perforated tube in the container with means for closing the perforations. The containers may be cooled to remove the heat of adsorption, the last containers of the series being cooled more than the first, and the cooled gas used for cooling the moist gas on the countercurrent principle. The drying is facilitated if the gas is compressed or its temperature reduced to about 0 to 5 deg. C. The process can be used to separate light and heavy hydrocarbons, or to remove impurities such as hydrocarbons and carbon dioxide from hydrogen. (Br. Pat. 188,666; not yet accepted. Algemeene Norit Maatschappij, Amsterdam. Jan. 10, 1923.)

Activated Carbon in Gaseous Reactions—The treatment of liquids with gases is rendered more effective by carrying out the treatment in the presence of activated carbon. The carbon is preferably obtained from vegetable raw material in such a manner that the structure of the raw material is retained. Powdered carbon may be mixed with the liquid and the mixture then treated with the gas, preferably under pressure. Or the liquid and gas may be passed in countercurrent fashion through a column of granular carbon. Or the carbon may be caused to adsorb the gas and then used to treat the liquid. Such adsorption may be secured by treating the carbon with gas under pressure at a low temperature, or with a solution of the gas in a portion of the liquid to be treated or in another liquid. The carbon may before use be treated to remove gases either by ignition or by heating in a vacuum. The process is stated to be applicable in bleaching liquids, in oxidizing drying and semi-drying oils, in the decomposition or oxidization of mineral oils for the purpose of converting them into fatty acids and other products, and in purifying and sterilizing water or other liquids with chlorine. (Br. Pat. 188,667; not yet accepted. Algemeene Norit Maatschappij, Amsterdam, Jan. 10, 1923.)

Tanning—A starch-tannin preparation is made by heating starch with a tanning extract, at or near the boiling point of the liquor but well above 180 deg. F., if necessary with the addition of a weak acid, until the starch is highly dispersed beyond the jelly stage—that is, it remains in the form of a colloidal solution and does not form a jelly on cooling. Tanning extracts of the pyrogallol class, such as chestnut wood, oakwood and myrabalans, can be used without acid, while those of the catechol class, for example mimosa bark and quebracho, require the more vigorous treatment. Weak acids specified are such as acetic, lactic, sulphonic acids and sulphur dioxide. Gallic and tannic acids may be substituted for the mixture of acid and tanning material. According to examples, Japanese farina is dispersed by vigorous boiling with myrabalan extract, with quebracho extract and sodium bisulphite or with mimosa bark and gallic acid. The preparation is applicable for tanning hides or, according to the provisional specification, for pharmaceutical purposes. Specification 110,470 is referred to. (Br. Pat. 189,236. R. R. Howroyd, Liverpool, and A. Turnbull, Helsby, Cheshire. Jan. 17, 1923.)

Formaldehyde—Formaldehyde is produced by passing a mixture of methylene chloride vapor and water vapor at a raised temperature over a porous body, such as pieces of clay, infusorial earth, ordinary or activated wood charcoal. The condensate consists of a hydrochloric acid solution of formaldehyde. (Br. Pat. 189,432; not yet accepted. Farbwerke vorm. Meister Lucius and Brüning, Hoechst-on-Main. Jan. 17, 1923.)

Varnishes and Polishes—Chlorinated montan or other mineral wax is used as an ingredient of varnishes and polishes. It may be used alone in solution or mixed with oils, pigments, other waxes and resins. (Br. Pat. 189,104. A. Schmidt, Paris. Jan. 17, 1923.)

Technical News of the Week

Current Events in the Chemical, Metallurgical and Allied Industrial Fields
Legislative Developments—Activities of Government Bureaus, Technical Societies and Trade Associations

New Haven Meeting Plans of A.C.S. Are Announced

Large Attendance Expected at Spring Gathering—Full Program Is Now Available

ANNOUNCEMENT of the final program for the spring meeting of the A.C.S. promises a session of great interest. The various divisions have arranged several symposiums in connection with the usual presentation of papers. Social as well as technical activities for the week at New Haven from April 2-7 have been carefully planned.

It is requested that on arrival all members and guests go direct to Byers Memorial Hall, where full information regarding reservations, etc., may be obtained and where registration should be made.

Outline of Monday's Events

The first day's general activities will open with a Council meeting in the afternoon, followed by a complimentary dinner given to the councilors by the New Haven Chamber of Commerce, at which the president of that body will preside. Other members may also attend, tickets being obtainable at Byers Hall. Speakers at the dinner will include the president of Yale, James R Angell; E. C. Franklin, president of the A.C.S.; Brigadier-General A. A. Fries, and A. D. Little.

Tuesday's Meetings of General Interest

On Tuesday, the second day, a general public meeting will be held at Woolsey Hall in the morning at which Francis P. Garvan will speak on "Chemistry and the Public." In the afternoon a general scientific meeting will be held, when special addresses will be given by the following speakers: Carl L. Alsberg, "Chemistry and Our Food Resources;" C. O. Johns, "The History and Status of Petroleum Chemistry Research;" H. E. Barnard, "The Baker Turns to the Chemist;" Oskar Baudisch, "The Influence of Light on Inorganic Material and Life Processes;" W. O. Mitscherling, "Cellulose Silk;" and Arthur Hirschfelder, "The Influence of Modern Chemistry on Pharmacology."

On Tuesday evening the men are to stage a smoker at the university dining hall, while the women will visit the Shubert Theater.

Wednesday's program will be devoted largely to functions arranged by Yale University, the most important being the dedication of the new Sterling Chemistry Laboratory. The time set for this event is 11 a.m., when among other speakers Past President E. F. Smith will give a special address entitled, "The History of Chemistry in America, With Special Reference to Yale." Following a complimentary luncheon at which foreign guests will speak, the laboratory will be open to inspection. In the evening a special dinner will be in charge of the Rubber Division. At the public evening meeting Sir J. J. Thompson, F.R.S., will speak.

Calendar

The following important technical meetings are scheduled for the immediate future

AMERICAN CHEMICAL SOCIETY
New Haven, Conn., April 2-7

AMERICAN ELECTROCHEMICAL SOCIETY
New York City, May 3-5

AMER SOCIETY MECHANICAL ENGRS
Montreal, May 28-31

AMERICAN FOUNDRYMEN'S ASSOCIATION
Cleveland, O., April 28-May 4

AMERICAN OIL CHEMISTS' SOCIETY
Hot Springs, Ark., April 30-May 1

AMER SOCIETY MECHANICAL ENGRS
Montreal, May 28-31

CANADIAN INSTITUTE OF CHEMISTRY
Toronto, May 29-31

SOCIETY OF CHEMICAL INDUSTRY
Canadian Section
Toronto, May 29-31

SOCIETY OF INDUSTRIAL ENGINEERS
Cincinnati, O., April 18-20

SOCIETY OF CHEMICAL INDUSTRY
New York, Joint meeting with other societies, April 13

Special Sessions Begin Thursday

On Thursday, following the morning and afternoon sessions of the divisional and sectional meetings, there will be fraternity and college alumni dinners. The women of Iota Sigma Pi have arranged a special 5 o'clock meeting at Sheffield Hall. In the later evening entertainment will be provided by an indoor polo game of the Yale R.O.T.C. at the armory.

Friday will be given over largely to special meetings. In the evening a reception is to tendered visiting members and guests by the New Haven Section. Dancing will be in order from 9 to 12, with supper at 10:30.

Several plants in the vicinity of New Haven will be open to inspection on Saturday. Throughout the week regular and special exhibits will be on display in the various Yale halls. The ladies' time is well arranged for with several teas, auto excursions, etc., provided.

Divisional Meeting Program

Division of Petroleum Chemistry, Thursday and Friday; 19 papers.

Section of Gas and Fuel Chemistry, Thursday; 7 papers.

Division of Industrial and Engineering Chemistry, Thursday and Friday; 27 papers.

Division of Rubber Chemistry, Thursday and Friday; 15 papers.

Division of Cellulose Chemistry, Thursday and Friday; 19 papers.

Section of History of Chemistry, Friday; 12 papers.

Section of Chemical Education, Thursday and Friday; 16 papers.

Division of Water, Sewage and Sanitation, Thursday; 10 papers.

Division of Chemistry of Medicinal Products, Thursday; 8 papers.

Division of Biological Chemistry, Thursday and Friday; 38 papers.

Division of Sugar Chemistry, Thursday and Friday; 15 papers.

Division of Physical and Inorganic Chemistry, 1. Section of Inorganic and Physical, Thursday and Friday; 42 papers. 2. Section of Colloids, Friday; 12 papers.

Division of Organic Chemistry, Thursday and Friday; 63 papers.

Division of Agricultural and Food Chemistry, Thursday and Friday; 35 papers.

Educational Movies Made by U. S. Bureau of Mines

An industrial film picturing the manufacture of heavy clay products is to be made by the Bureau of Mines in cooperation with manufacturers. The bureau has been very successful in the development of other industrial moving pictures. Among those already made are: Story of Petroleum; Story of Sulphur; Story of Ingot Iron; Saving Coal at Home; Story of Asbestos; Story of Rock Drilling; Story of Abrasives; Mexico and Its Oil; Story of Heavy Excavating Machinery; Oxygen, the Wonder Worker; Story of the Electric Beater; Story of an Automobile; Story of Compressed Air; Water Power; Transportation; Story of Alloy Steel; Story of Machine Tool Manufacture; Story of Steel, and Story of Portland Cement.

Federal Restrictions Cause Action By Industrial Alcohol Users

Committee Calls on Commissioner Blair Urging Revision of Present Rules

EXASPERATION on the part of many users of industrial alcohol has been growing. Recently a committee representing the industries that have had difficulty in obtaining the supply required for their business made an earnest plea for revision of present methods of handling the situation. As a result Commissioner D. H. Blair has announced that he will name a committee representing producers, dealers and consumers in the industry to advise with bureau officials regarding all regulations and matters affecting the industry. The ultimate object of this move is to separate industrial alcohol from the general police activities of the prohibition unit and at the same time to comply with the letter and spirit of the Volstead act, which purports to provide for the encouragement of legitimate uses of industrial alcohol.

Tendency Toward Undue Restriction

It was pointed out to the commissioner that while no special complaint was being lodged against the orders or actions of Prohibition Commissioner R. A. Haynes, the tendency in the prohibition unit has been to issue restrictive regulations rather than to devote attention to the development of the legitimate business of producing, selling and using industrial alcohol. For this reason, it was suggested that the activities in this matter be placed in a special division with a technical man at its head.

Attention was called to the fact that section 13 of the Volstead act has been virtually overlooked. This section provides methods for the bonding and operation of plants manufacturing industrial alcohol, denaturing plants and such matters "to prevent diversion of the alcohol to illegal uses and to place the non-beverage alcohol industry using alcohol . . . upon the highest possible plane of scientific and commercial efficiency consistent with the interests of the government, and which shall insure an ample supply . . . and promote its use in scientific research and the development of fuels, dyes and other lawful uses."

Not only have the regulations been restrictive of development, the commissioner was told, but it has been made difficult to obtain promptly a supply required by legitimate industries.

Personnel of Committee

Included among the committee calling on the commissioner were Dr. Martin H. Ittner, of the American Chemical Society; A. Homer Smith, secretary of the American Drug Manufacturers' Association and of the National Drug Trade Conference; W. L. Crounse, of the National Wholesale Druggists Association; Harry B. Thompson, of the Proprietary Association of America; James P. McGovern, of the U. S. Industrial Alcohol Co. and the U. S. Industrial Chemical Co.; Horace W. Bigelow, of Parke, Davis & Co.; Mortimer Bye, of Frederick Stearns & Co., and others.

Resolutions of the National Wholesale Druggists Association and of the National Drug Trade Conference, asking appointment of an advisory committee, were presented to Commissioner Blair.

Blair Announces Intention to Act

In an announcement after the conference, stating that he had the appointment of an advisory committee "under consideration" and indicating that it would be approved and the personnel then made public, Commissioner Blair said that the proposal contemplated a committee of ten members representing the retail and wholesale druggists, toilet manufacturers, flavoring manufacturers and chemists representing other consumers and producers.

Fuel Utilization Discussed

Several Speakers at Chemical Industry Meeting Present Ideas

The American Section of the Society of Chemical Industry held its regular monthly meeting on March 23 at the Chemists' Club, New York City. The topic of the evening was the latest developments in the utilization of fuel.

The first of the speakers, H. O. Loebell, vice-president of the Combustion Utilities Corporation, spoke on the complete gasification of coal. Mr. Loebell's thesis was that coal, to be used most efficiently, must be completely gasified. In developing this subject he described the present systems of complete gasification, detailed the methods by which results were obtained and pointed out that a market must be found for the greatly increased production of tar that would result from complete gasification.

Prof. J. J Morgan, of Columbia University, the next speaker, gave a description of the make-up and character of tars obtained by complete gasification and low-temperature distillation methods. This tar, he stated, may best be regarded as primary tar and is not a substitute for petroleum. A complete development of this subject by Professor Morgan can be found in *Chem. & Met.*, vol. 26, pp. 923, 977, 1025.

A. C. Fieldner, of the Bureau of Mines, the last speaker of the evening, recounted the bureau's work on producing lignite chars and described the successful experimental plant built in conjunction with the University of North Dakota. He concluded his remarks with a short account of the characteristics and methods of utilization of this fuel.

Announce Applicants for Tariff Revision

The Tariff Commission has just made public the names of the firms seeking changes in the existing tariff. As announced in last week's *Chem. & Met.* these commodities are to be especially investigated. The list follows:

Oxalic acid, Victor Chemical Works, Chicago.

Diethyl barbituric acid, Abbott Laboratories, Chicago

Barium dioxide, increase asked by the J. H. R. Products Co., Willoughby, Ohio; decrease asked by John Bene & Sons, Inc., Brooklyn, N. Y.

Casein, committee representing various coated paper manufacturers

Logwood extract, American Dyewood Co., New York

Potassium chlorate, increase asked by the National Electrolytic Co., Niagara Falls, and the North American Chemical Co., Bay City, Mich. decrease asked by the Diamond Match Co.

Sodium nitrate, American Nitrogen Products Co., Seattle, Wash

Boll Weevil Reports Sought by Agricultural Bureau

In its fight on the boll weevil the Department of Agriculture is preparing to send out notice to 100,000 farmers this season advising them they will be asked to give detailed information next fall as to the efficacy of the various methods of fighting the pest.

In the past the department has been handicapped by lack of detailed data as to what the relative effects of different methods are. Three expert statisticians, H. R. Tolley, D. B. Smith and D. R. Pettit, have been sent to Tallulah, La., to check over field observations of entomologists.

China to Produce Cement

China is to meet her own demands for cement. According to a report from Consul J. K. Daves, Nanking, a new plant is being erected in the Yangtze Valley. This plant, midway between the two greatest markets of China, will have an initial output of four hundred 375-lb. barrels per day. The China Cement Manufacturing Co., the first to produce in this vicinity, has invested approximately $380,000 in the enterprise.

With the completion of this plant, which is to begin operations soon, and of another in Shanghai, China's demands for cement will be met by domestic production to a large extent.

Antipodean Shale Oil Industry Fails

Due to the high cost of production the shale oil operations of John Fell & Co., in New South Wales, have been discontinued, according to official consular reports. It is stated that the cost of putting the oil on the market is approximately five times that of importing crude oil; that the small government bounty is insufficient to protect the industry. The plant which has been used in shale-oil recovery is being remodeled and will be opened in the near future as a crude oil refinery.

Standards Bureau Research Should Be Fundamental

Distinguished Board of Visitors Makes This Finding After Investigation

"It is of the highest importance to the future of American industry and scientific progress that the activities of the Bureau of Standards should continue more and more devoted to scientific research of a profound and fundamental character, beyond the means of most college laboratories, where instruction to students is the chief purpose, and that these investigations should be of a broader scope than can be expected from research and testing laboratories in the service of special industries."

The foregoing is a portion of the findings of the board of visitors to the bureau after a careful survey of the establishment's current activities. The board of visitors is composed of John R. Freeman, former president of the American Society of Civil Engineers; Ambrose Swazey, former president of the American Society of Mechanical Engineers; F. W. McNair, president, Michigan School of Mines; S. W. Stratton, president, Massachusetts Institute of Technology, and Wilder D. Bancroft, professor of chemistry, Cornell University.

"The determination of the physical constants of materials and the more thorough investigation of the properties of substance, apart from immediate applications seen in the industries," continues the report of the board of visitors, "seem particularly appropriate under the organic act creating this bureau. We venture to suggest specific appropriations in the budget for such research."

Explosion Hazard Met With Little Loss

Losses have greatly decreased in transporting explosives, according to a recent report of the Bureau for the Safe Handling of Explosives and Other Dangerous Articles. The following extract shows to what a remarkably low level this loss has been reduced:

"During the year 1922, the railroads of the United States transported 168,301 tons of commercial explosives, and in addition a very large but unknown tonnage of fireworks and salvaged war ammunition. The total losses were one man injured and $75 property loss. This is much below the average of previous records. Moreover, it is encouraging in showing what can be accomplished."

Old Explosives Being Used

Additional large quantities of surplus explosives, left from the war period, have reached the point where their value as a *military reserve* is becoming impaired. Steps now are being taken to allocate these supplies for use in highway building, reclamation and other construction in which the

Fed'l government is interested.
the de.

Arsenic Stays in Limelight

The attention of several government departments is focused upon the calcium arsenate situation. The production, the possible shortage and means of immediate augmentation of the supply are being looked into. The Bureau of Mines, the United States Geological Survey and the Bureau of Entomology and the Bureau of Chemistry of the Department of Agriculture are co-operating in studying the problem. This interdepartmental investigation is the outgrowth of the recent Senate resolution directing an inquiry into the subject.

Producers, manufacturers, consumers and federal bureaus are also engaged in making a study of possible means of stabilizing the arsenic market to encourage production. Data and a suitable bibliography with reference to the storage of arsenic trioxide as an intermediate material for the manufacture of calcium arsenate are being compiled by Dr. Andrew Stewart. Obtaining arsenic from ores will be studied following the investigation of the problems upon which the various bureaus are now engaged.

Italy Liquidates Sulphur Debts

In view of the agreement said to have been reached between the American Sulphur Export Association and the Italian sulphur producers, there is particular interest in the advices to the Department of Commerce that the Italian Government has guaranteed a bond issue for 100,000,000 lire. The proceeds of the bond issue are to be employed in liquidating debts contracted by the Sicilian Sulphur Consortium and the redemption of certificates issued to cover advances made on sulphur delivered during the fiscal year 1920.

The basic security for the bonds is the stock of 273,740 tons of sulphur held in the warehouses of the consortium on April 30, 1922. The consortium will calculate that one-ninth of the stock in question has been sold during each period of 12 months. In case sales exceed production plus one-ninth of the stock, an appropriate adjustment will be made. In addition, the bonds are guaranteed by the net assets of the consortium, including its reserve fund, as well as other assets of the consortium and of the individual producers of sulphur.

Tariff Board Plans Hearings

Work on the investigation of the production costs of the chemicals listed in last week's *Chem. & Met.* is under way. Although it is expected that months will elapse before the data *sought are complete, plans are already* being made for public hearings. Rules of procedure and regulations for government are being drawn up. As soon as any investigation is complete it is planned to give all interested parties a chance to appear in defense of an increase or decrease of the existing rate of duty.

Colloid Symposium Coming in June

Svedberg to Give Summer Course in Colloidal Chemistry—Many Noted Speakers to Be Present

Plans are rapidly maturing for the national symposium on colloid chemistry to be held at the University of Wisconsin in June. Professor Svedberg intends to follow the symposium with a course of about thirty lectures on colloid chemistry in the summer school, which commences June 25 and closes Aug. 4. Research will be continued under his direction during this period.

Since this is to be the first national symposium on this subject to be held in America, the program has been arranged with the idea of having the whole field represented as far as possible. With one or two exceptions the papers will be presented in person by the author and ample time will be afforded for discussion. According to present plans these papers and discussions will be published in monograph form. Following is the tentative program for the symposium:

Alexander, J., "The Colloidal State in Metals and Alloys."
Bancroft, W. D., "Precipitation of Sols by Alcohol."
Bartell, F. E., "Some Adsorption Studies."
Bogue, R. H., "Conditions Affecting the Hydrolysis of Collagen to Gelatin."
Browne, F. L., "Thermochemistry of Sulphur Sols."
Burton, E. F., "General Considerations of the Forces Determining the Limiting Size of the Colloidal Particle in Any Given Solution."
Fischer, Martin, "On the Theory of the Lyophilic Colloids."
Gortner, R. A., "The Application of Colloid Chemistry to Agricultural Problems."
Holmes, H. N., "Gel Formation."
Kahlenberg, L., "On the Precipitation of Colloidal Metals by Means of Metals in the Solid State."
Klein, D., "The Colloid Chemical Problems in the Manufacture of Enzymic and Animal Glandular Products."
Mathews, J. H., and Rowland, B. W., "The Thermochemistry of Protein Behavior."
Sheppard, S. E., "Dispersity of Silver Halides in Relation to Their Photographic Behavior."
Spear, E. B., "Colloidal Properties of Rubber and Compound Ingredients."
Svedberg, The, "Demonstrations of Colloid Chemistry Technique."
Taylor, H. S., "The Problem of Adsorption From the Standpoint of Catalysis."
Weiser, H. B., "The Formation of Inorganic Jellies."
Wilson, John A., "The Swelling of Protein Jellies."
Wilson, Robert E., "Surface Films as Plastic Solids."

Papers are expected from T. R. Briggs, C. W. J. Frazer, Jacques Loeb and W. A. Patrick.

Pottery Men Face Trial

The alleged "potteries combine," composed of twenty-three corporations and twenty-four individuals, faces trial in the Federal District Court. The charge, made in the form of a Sherman law *indictment, is that of violation of the* criminal provisions of the anti-trust law.

The indictment was returned by the United States Grand Jury on Aug. 8, last, and a month later all of the individual defendants excepting J. F. Slater and J. W. Bowers appeared and entered pleas of not guilty.

Presents American View of Rubber Situation

Horace DeLisser, President of American Rubber Association, Answers Winston Churchill

That present British policy threatens industry is the belief of H. DeLisser, president of the American Rubber Association. In a recent reply to the speech of Colonial Secretary Winston Churchill, referred to in last week's *Chem. & Met.*, he says:

"Mr. Churchill in a recent statement published in London and this country declared that the British rubber growers were 'under no obligation to supply the United States with rubber below the cost of production' and that it was 'impossible for the Colonial Office to witness the financial ruin of the rubber producing colonies owing to the continued sale of their products below the cost of production.'

No Unfairness Intended

"In the first place the Rubber Association of America, which represents 95 per cent of the rubber manufacturers in the United States, does not seek a supply of crude rubber below the cost of production, nor does the association have the slightest intention of causing or witnessing the financial ruin of plantation owners. No industry can prosper on the adversity of another.

"It is because the Rubber Association of America, the largest consumer of rubber in the world, is convinced, after a most thorough investigation, that the policy of the British colonies in restricting the exports of crude rubber threatens the whole rubber industry here and abroad, and the association is pressing the Rubber Growers' Association of London for a repeal of the restriction order or an immediate modification to permit greater flexibility in the supply of rubber.

Stevenson Plan Induces Speculation

"The Stevenson plan for restricting the export of crude rubber today threatens to introduce wide speculation in rubber prices. Its ultimate effect will be to curtail rubber production on the plantations. Such a course would be ruinous to the rubber growers.

"Members of the Rubber Association are looking forward to a greater consumption of rubber during the summer. To take care of our needs this year and in the future, it is imperative that the planting of new rubber be encouraged. This association believes that the policy of the British colonies today will be far more injurious to the plantations than to the rubber industries of this country."

Helium Plant Goes West

The helium repurification plant at Langley Field, Va., is to be moved to Scott Field, near St. Louis. This is made necessary by the fact that the army is transferring most of its lighter-than-air work to Scott Field, where conditions have been found to be most favorable.

Canadian Prairie Provinces Yielding Commercially Valuable Salts

Range of Resources Broad and Little Worked—Development Now Beginning in Several Localities

COMPARATIVELY unworked sources of mineral wealth exist in the western provinces of Canada. Areas which have been considered valuable only from an agricultural standpoint are proving to be fairly rich in non-metallic mineral resources. Clays, coal, oil, gas and the sodium and magnesium salts, which occur in the numerous alkali lakes and sloughs throughout the area, are attracting the attention of capital with the result that considerable activity is evidenced in all these lines. The increased interest in the alkali deposits of western Canada has induced the Canadian Department of Mines to institute a detailed investigation of these deposits with a view to determining their possible economic value and the extent of reserves.

Salt Deposits Already Worked

Natural occurrences of soluble mineral salts are known in the provinces of Manitoba, Saskatchewan, Alberta and British Columbia, either in the form of bedded deposits or as brines. Some are of considerable extent and are probably of sufficient size to warrant commercial exploitation, provided economical methods of recovery can be developed and sufficient markets can be established. Three of these deposits are being operated or will shortly be operated in the prairie provinces and plans are under way for the development and operation of a fourth deposit.

Salt Cake Extraction

At Dana, Sask., a half million dollar plant is nearing completion, to extract salt cake and other chemical products from the brines of Muskiki Lake, 23 miles west of Humboldt, Sask. The company operating this deposit is Salts & Chemicals, Ltd., controlled by Canadian and United States interests. The main plant of this company is at the deposit at the lake and it has a refining plant at Kitchener, Ont. When this plant is in operation it is estimated that the output will be 30,000 tons of salt cake per year besides the output of magnesium sulphate and other salts recovered as byproducts.

At Frederick Lake, 5 miles southwest of Dunkirk, Sask., and 38 miles from Moose Jaw, Sask., another salt cake recovery plant has been erected by the Bishopric & Lent Co. with head-offices at Cincinnati, Ohio. This plant is practically completed with a capacity of 50 tons of salt cake per day, and as soon as it proves commercially successful further units are to be added to increase the output to 200 tons per day.

Magnesium Sulphate and Sodium Carbonate

In British Columbia the Basque Chemical Co. is operating on a series of five lakes situated 15 miles west of Ashcroft. From these lakes the company is excavating crude magnesium sulphate, which is shipped to Vancouver, where it is refined and sold to the pharmacal trade and to the tanning industry. Plans are now under way for greatly extending the development of this deposit.

In the vicinity of Meadow Lake, 50 miles north of Clinton, B. C., the Lillooet Soda Co. is operating a sodium carbonate lake and shipping the product to Vancouver. This material is being disposed of at the present time to the soap manufacturers of the Pacific coast, but plans are under way to dry the material at the lake and increase the output.

American Relief Association Makes Announcement

The extension of the work of the A.R.A. to cover home activities has been announced by its chairman, Herbert Hoover, in the following circular letter:

Dear Friend.—I wish to bring before you, as a supporter of the American Relief Administration, a problem in connection with our own American life.

As you are aware, the American Relief Administration has at one time or another during the last four years found support necessary to maintain life in upwards of 15,000,000 children. It has thereby acquired great experience in problems of child health, which it seems to be important should be translated into American child life, more particularly in relation to the children in backward sections and in large industrial centers of the country. Our physicians report that over 80 per cent of all children in America are born normal, whereas less than 20 per cent reach maturity in normal physical health. Much constructive work has been done by public agencies and by voluntary agencies in endeavoring to develop the proper care of normal children as distinguished from the care of those who have fallen by the wayside and require actual medical treatment, but the field in many sections of our country is as yet almost untouched.

With a view of furthering these efforts and translating our experience in Europe into the most effective service to our own American children, the important personnel of the American Relief Administration have joined in a consolidation of the American Child Hygiene Association and the Child Health Organization of America, in the formulation of a new, stronger, voluntary agency for the advancement of these questions. The American Relief Administration can give no more complete indorsement and expression of its confidence in the national necessity for such action. The name of the new organization is the American Child Health Association.

The American Relief Administration has undertaken as a voluntary service to guide the executive effort of the new organization in its endeavor to provide the essential finances necessary to carry on this most important work. I am therefore taking the liberty of appealing to you who have supported our past efforts, for support in this new activity of the American Relief Administration. The matter is one of national importance and of urgent character. I trust you may find it possible to contribute to the American Relief Administration for this purpose. HERBERT HOOVER.

Denaturing Rule Revised

An error in the regulations of 1915 covering the amount of caustic soda sufficient to denature 100 gal. of olive oil has been corrected by the Treasury to provide for the use of 114 lb. of caustic soda instead of 15 lb.

Fire Does Not Stop Work

Mines Bureau at Cornell Carries On Investigation Despite Loss of a Building

Fire recently destroyed one of the Cornell laboratories of the Bureau of Mines. The loss, however, is not such as to interfere seriously with the interesting work on alloy steels being carried on there.

The tests being made deal chiefly with endurance under repeated bending of various steels containing the rarer elements. Especial attention is being given to molybdenum as an alloying element.

About fifty steels, each with various heat-treatments, ranging in composition through plain C, Ce, Mo, V and CrCrMo, CrCe, CrV, NiCr, to various NiCrMo, NiCrCe and NiCrV steels are being studied. The ordinary tensile, impact and repeated impact tests have been made and a good deal of endurance data has been collected. Over 1,000 endurance test bars will be required, and nearly all of these are ready for testing. Two endurance machines are running night and day, and it will take all the present fiscal year and probably more to obtain the data desired.

While the work is aimed primarily to show the effect of Mo on endurance in comparison with other alloying elements, it is planned also with the view of getting as much information as possible on the general problems of endurance and endurance testing.

Flotation Process Case Heard by Commission

Three firms in the minerals separation industry are charged with unfair trade practices. To determine whether or not Minerals Separation, Ltd., Minerals Separations North American Corporation, Ltd., and Beer, Sondheimer & Co. have established a monopoly in connection with the leasing to American mining interests patents for the separation of minerals by the flotation process, the Federal Trade Commission heard final arguments recently on its complaint against these concerns.

In prosecution of the case the counsel for the commission charged that the respondents have set up a monopoly in the United States, compelling operators to surrender improvements, charging excessive royalties, and that they have been guilty of other unfair practices.

In defense, counsel for the respondents asserted that the services rendered the American mining industry have been of vast value in reclaiming ores.

Seeking More Import Data

To have immediately available detailed information as to dye imports has proved of such value that an insistent demand has arisen in the chemical industry for the expansion of that service to all of the coal-tar products. In various quarters hope is expressed that eventually the service may be extended to all synthetic organic chemicals.

Alabama to Produce Arsenic

Large quantities of calcium arsenate are to be manufactured at Anniston, Ala., this spring. The plant of the Federal Phosphorus Co. has recently added machinery for the extraction of the arsenic from arsenical pyrites ore.

Chemists in the vicinity of Anniston are making other experiments with different poisons for the extermination of the boll weevil. Although the results of their work indicate the possible development of a better poison than calcium arsenate, no definite information regarding its composition has been made public. In the meantime the arsenate industry at Anniston is expected to grow because of its availability of pyrites in almost unlimited quantities in close proximity to the plant.

Chemical Warfare Program of Secretary Davis

Country Divided Into Four Districts—Emergency Output of Industries Planned

The recommendations of J. M. Wainwright, retiring Assistant Secretary of War, as outlined in last week's *Chem. & Met.*, form the basis of a definite program of the War Department. Peace-time planning for the handling of industries during war has progressed further than ever before. Assistant Secretary Davis, who succeeds Colonel Wainwright, announces that he will carry forward this program actively.

Progress Already Made

Just what has been done in the way of chemical preparedness is indicated by extracts from the following C.W.S. report:

The country has been divided into four districts. The first district, which includes the New England States, will have its headquarters in Boston; the second district, which includes New York, New Jersey and Delaware, will have headquarters in New York City; the third district, with headquarters at Pittsburgh, will include Ohio, Pennsylvania and all states south of these two and east of the Mississippi and Ohio Rivers; the fourth, with headquarters in Chicago, will include all other states, those lying west of the Mississippi and Ohio Rivers and the state of Ohio. Each district will be assigned a chief, who will be a reserve officer Each chief will have two assistants, both to be reserve officers and, if practicable, one to be a chemical engineer and the other a mechanical engineer

In addition to this military organization, which will have direct charge of procurement planning, there are to be appointed civilian advisers to assist the officers in securing information and work out the details of the planning. There are to be eight such advisers for each district, one on manufacturing chemicals and one each for fine chemicals, rubber, charcoal, die castings, sheet metal stampings, war gases and chemical engineering equipment. Each of these men is to be an expert in the particular line assigned to him

Present Procurement Plans

The work on procurement planning for the coming year is based on the war plans which have just been completed These plans are the first attempt to work out in detail the quantities of each and every item which the Chemical Warfare Service would be required to furnish in case of war. With these requirements as a basis there has also been worked out the sources of supply of both raw materials and finished products necessary to meet the requirements. This information, on sources of supply, has been obtained in part from statistical tables prepared by various government bureaus and in part by dealing directly with the various industrial organizations concerned In all, about eighty plants have been visited and estimates of their present production and possibilities for expansion have been obtained.

Allotment of War-Time Production

To these and other manufacturers have been allotted definite quantities of the various items which they will be expected to deliver in case of war. It is probable that some of these allotments cannot be filled, and in other cases manufacturers will be able to do much more than meet their allotments

The Chemical Warfare Service will furnish each district chief with a list of manufacturers in his district allocated to the Chemical Warfare Service and the quantities of the various items which we have estimated each manufacturer can deliver. With this information as a basis, any errors in the estimates are to be corrected, in part by conference with the advisers in the districts and also by dealing directly with the manufacturer concerned.

U. S. Timber Going Fast

Reforestation Stated to Be the Only Hope of Future Pulp Supply by Secretary Wallace

That only one-third of America's timber supply remains is the finding of the special Senate committee appointed to look into wood and pulp problems. This committee is endeavoring to devise a workable plan for reforestation to submit to Congress. H. P. Baker, executive secretary of the A.P.P.A., and Secretary Wallace have given the committee figures showing the significance of the present situation.

Of our original supply of approximately 5.2 trillion board feet not over 1.6 trillion remains. Secretary Wallace estimates a possible reforestation of from 25 to 30 million feet per year.

Views of Mr. Baker

Mr. Baker, speaking for the pulp and paper manufacturers, gave it as his opinion that many "lean years," due to the depletion of the raw materials, were ahead of the industry in this country. The problem of the forests, he added, was entering the economical stage, and in the future the spruces and other pulp woods would bring such increased prices as to make forest conservation a paying business.

Another problem now being worked upon, as pointed out by Mr. Baker, is the utilization of Southern pine for pulp. He believes the South is to be the home of a great paper industry once a method is discovered for removing the resin from pine timber.

Canadian Paper and Pulp Exports Show Increase

A special report just issued by the Canadian Pulp and Paper Association shows that the total value of pulp and paper exports for January was $10,298,243, being an increase of $1,466,763 over January, 1922. Of this amount pulp and paper to the value of $9,286,186 went to the United States. Exports of pulpwood for January were 133,328 cords, valued at $1,195,886, compared with 66,094 cords, of the value of $696,943, in January, 1922.

Figures for the first 10 months of the fiscal year show newsprint exports were nearly 50 per cent greater than in the same period of the previous year.

German Dye Trade Faces No Immediate Shortage

Sufficient stocks to meet market demands for at least 6 months are on hand, according to Dr. Carl Duisberg, director of the Leverkusen Dye Works. In discussing the condition existing in the dye industry he said in part:

"The chemical industry also has taken part in the price reduction movement and has cut the prices of a number of its products, especially such as exceeded the world market prices.

"The situation in the chemical industry at present is completely different in the various districts. As is known, Ludwigshafen already lies idle, and the other works have no great supplies of fuel. For the present they will not get new coal in sufficient quantities, since they refuse to pay the taxes demanded by the French. The workmen will continue to be employed at other labors in case production is brought to a standstill.

"The Badische Soda und Anilin Fabrik faces this condition, as well as the Oppau works. Hoechst already is working with heavy curtailments. In Elberfeld, the parental plant of the Leverkusen works, the circumstances are even more difficult.

"The works in Leverkusen itself, which lies in part in the English zone, are not so severely stricken by the Ruhr war, and favorable conditions still prevail. They have chiefly lignite coal obtained in the English zone itself."

After his assertion that the dye industry is well supplied with stocks, Dr. Duisberg says that, in case of necessity, one source of supply could help another out and that, "during the French boycott on exports," the workmen will be engaged in handling the stocks on hand and keeping the plants in operating order.

Chemistry Chief to Be Selected

Congress having failed to act on the proposal to increase salaries for chiefs of bureaus and scientific investigators in the Department of Agriculture, it has been determined to fill the vacancy in the office of chief of the Bureau of Chemistry at the earliest possible time. The place has been held open in the hope that a salary higher than $5,000 could be offered to those best qualified to fill the position.

Dr. E. D. Ball, director of scientific work for the department, will appoint a consulting committee on which he hopes to induce some of the outstanding men in the chemical industry to serve. With this committee he will discuss not only the filling of the vacancy but the whole program of future work for the Bureau of Chemistry.

Constants Meeting Held

The board of editors of the International Table of Physical and Chemical Constants held a meeting at the National Research Council in Washing-

Would Give Prize for Oil Disposal Method

Interesting Bill Introduced Into New York Legislature for Solution of Knotty Problem

Considerable agitation has recently arisen for finding a solution to the vexing problem of what to do with the oil refuse dumped into New York harbor and the waters adjacent thereto. The State Senate not long ago passed a resolution memorializing Congress to adopt appropriate legislation to prohibit such practice.

In order to combat the nuisance a cheap economical method of disposal of this waste must be obtained. That inducement for research along this line may be offered a bill has been introduced into the New York State Legislature offering awards or prizes of $20,000 for the solution of the problem.

Annual Convention Business and Technical Librarians

The Special Libraries' Association, which is a national organization of all business and special librarians in the country, will hold its fourteenth annual convention in Atlantic City, Tuesday, May 22, to Friday, May 25, at the Hotel Chelsea. On Monday evening, May 21, the New York Special Libraries' Association will hold its last monthly meeting of the year, to which all delegates to the convention are invited. On Tuesday all the special libraries of New York City will be open to visitors. Saturday, May 26, following the convention at Atlantic City, the Special Libraries' Council of Philadelphia and the District of Columbia Library Association will have local meetings to which all the librarians are cordially invited, and an opportunity is thereby given to visit the special libraries in these two cities.

All librarians, special and public, are cordially invited. Business men and research workers and statisticians are also urged to meet at the Special Libraries' Association Convention.

Norway to Hold Industries Fair

Norway is to have an industries fair this year This is in keeping with the custom inaugurated in 1920, which has been followed in successive years and which each year has proved to be a great success. Keen interest both in the home country and abroad has been aroused in these fairs. The number of entries last year was very large. Practically every branch of Norwegian industry and handicraft was represented and exhibits were sent in from every manufacturing center throughout the country.

This year the fair is to be held the week of Sept. 2 to 9. It is planned to give foreign buyers a good opportunity of acquainting themselves with Norwegian products and manufactures of every description and of getting into closer personal contact with firms in various lines of trade.

Illinois Alumni to Gather at New Haven

Chemists from the University of Illinois are not to be outdone by the alumni of Harvard, Ohio State and other institutions who in the past have held their luncheon reunions in connection with the semi-annual meetings of the American Chemical Society. On April 5 at 1 p.m. in Woolsey Hall at Yale University the Illinois alumni will gather for the first of their reunions. Dr. C. S. Palmer, Box 1811, Yale station, New Haven, Conn., is in charge of the preparations for this event.

City Air Pollution by Auto Exhaust Is Menace

Chemical engineering may be required to solve the problem of handling the carbon monoxide in city streets. Automobiles in New York City are giving off so much of this gas that it has become a menace to health, according to the public health committee of the New York Academy of Medicine.

According to a report issued by this body:

"The increasing concentration of motor traffic in New York City has resulted in contamination of the air with carbon monoxide in certain sections of the city which has reached the point where it is regarded as deleterious to health. Carbon monoxide constitutes from 7 to 12 per cent of the exhaust gas, depending upon the mixture of the gasoline. It oxidizes very slowly, if at all, and the rate of rapidity of its diffusion in the streets varies with atmospheric conditions and the velocity of the winds.

"The studies of J. S. Haldane in London have led to the formulation of a safety standard in the London underground railways of not more than one part of carbon monoxide in 10,000 parts of air. The standard adopted for the New York-New Jersey vehicular tunnel is a maximum of four parts of carbon monoxide to 10,000 parts of air, provided no one is exposed for more than thirty or forty minutes.

"The committee engaged the services of Prof. Yandell Henderson to study the extent of contamination of the air in New York City streets. This study has not been completed, but the preliminary indications are that at certain periods of the day and in certain areas of the city the concentration of carbon monoxide is such as to require remedial measures."

Mines Bureau Loses Building

The building of metallurgy at the Michigan College of Mines, Houghton, Mich., was destroyed by fire, March 15, with loss estimated between $250,000 and $275,000. Valuable records were lost in the disaster, including those of the United States Bureau of Mines, occupying offices in the building. It is said that the structure will be rebuilt as soon as plans are prepared and arrangements perfected.

Chemical Production Figures Coming Soon

Many replies to the Tariff Commission's questionnaire are being received from domestic producers. Present indications show that the annual census of production of coal-tar and synthetic organic chemicals and dyes for 1922 will be issued this year considerably earlier than previously.

Last year, for the 1921 census, there were 201 producers of coal-tar chemicals, some of whom also produced synthetic organic chemicals from other than a coal-tar base, and there were about forty manufacturers who produced the latter only. There is a slight reduction in the number of manufacturers this year, several small plants having gone out of business. Up to March 21, replies had been received by the commission from 189 manufacturers. If reports for 1922 production continue to be received with satisfactory speed, there will be no preliminary report this year, but the final report will be ready some time in May.

Develops Leaching System

Dr. J. W. Turrentine, formerly in charge of the experimental kelp-potash plant of the Bureau of Soils at Summerland, Calif., has developed a lixiviating system for industrial use, involving some new principles of counter-current leaching, for which a public patent is being sought. This process and apparatus was given a thorough try-out and demonstration in the extraction of potash and iodine from kelp. It is applicable to several industrial processes where continuous and economic leaching is desired.

To Dismantle Chlorine Plant

Officers of the Chemical Warfare Service announce that a portion of the chlorine plant at Edgewood Arsenal must be dismantled. Plans are being made at present to engage a competent chemical engineer to direct this work so that the equipment can be taken down and stored with the certainty of subsequent reassembly when the need arises without technical difficulty or damage to the equipment. It is hoped that this work can begin at an early date, but the time is contingent upon finding a proper chemical engineer to direct the job.

Obituary

LEWIS E. RANSOM, of Hempstead and New York, and president and founder of the L. E. Ransom Co., importer of dyestuffs, died recently.

WALL EDWARD SMOTHERS passed away in Denver, Jan. 31, 1923. Although but 29 years of age, he had attained unusual prominence in his chosen profession, that of radium technology. Upon his graduation from the University of Colorado in 1916 as a bachelor of science, he entered the employ of the Schlesinger Radium Co. of Denver. For some time he was occupied with radium measurements by both emanation and gamma-ray methods, with considerable analytical work connected with proposed processes for the treatment of carnotite. Later he was placed in charge of the refining and crystallizing of the radium product and its distribution into the many types of therapeutic applicators. He conducted many courses of instruction in the physics and therapy of radium for physicians and surgeons. Tireless energy and painstaking care were characteristic of all his work. His untimely death is a great loss to the science of radio-activity. He was married to Elizabeth L. Hoskin, of Denver, June 15, 1917. He was a member of Alpha Tau Omega and the national chemical fraternity, Alpha Chi Sigma.

Personal

WILLIAM B. BOYD has been elected president of the Dominion Alloy Steel Co., Ltd. Mr. Boyd was formerly electrical engineer of the Illinois Steel Co., Chicago; chief electrical engineer of the Dominion Iron & Steel Co., Sidney, N. S., and chief engineer of many large Canadian industries.

CHARLES T. BRAGG, formerly chief metallurgist of the Michigan Smelting & Refining Co. and more recently president of the Michigan Valve & Foundry Co., has resigned from the latter position.

W. J. COPE, Akron, Ohio, has been elected treasurer of the Mohawk Rubber Co., to succeed C. W. MCLAUGHLIN, resigned. Mr. Cope has been assistant treasurer for a number of years.

Prof. T. E. DONNAN, of the University College of London, has accepted an invitation to attend the New Haven meeting of the American Chemical Society.

R. E. DOOLITTLE of Chicago, chief of the central food and drug inspection district of the Bureau of Chemistry, attended a meeting of the joint committee on definitions and standards in Washington during the week of March 19.

WILLIAM HAYNES has accepted the chairmanship of the chemical division in the forthcoming Home Service Appeal of the Salvation Army for a $500,000 fund with which to maintain and extend its activities in Greater New York.

Dr. KUNO B. HEBERLEIN has left for Europe on business.

O. P. HOOD, chief engineer of the U. S. Bureau of Mines, spoke March 23, at Akron, Ohio, on "Smoke Abatement and Smokeless Combustion."

G. F. MOULTON has resigned his position at the Bureau of Standards to accept a place as chemist of the research department of F. C. Huyck & Sons, Albany, N. Y.

Dr. WALTER ROSENHAIN, chief of the metallurgical department of the National Physical Laboratory, Teddington, England, addressed the members of the Detroit, Mich., chapter of the American Society for Steel Treating at its regular monthly meeting March 19, on "Strain and Fracture in Metals." He also spoke recently before a joint meeting of the scientific and technical societies of Schenectady, under the direction of the Eastern New York Section of the American Chemical Society, on "The Relation Between the Properties and Structure of Metals." Dr. Rosenhain expects to reach Washington, D. C., March 30 for a 5-day visit. On the afternoon of that date he is scheduled to speak at the Bureau of Standards. On the following day he will be tendered a banquet at the Cosmos Club which will be under the auspices of the Washington Academy of Sciences. Following the dinner he will speak on "The Structure and Constitution of Alloys." He expects to spend April 2 and 3 exclusively at the Bureau of Standards, where he hopes to gather a detailed idea of the manner in which that bureau is conducting its research.

JEROME STRAUSS, chief chemist of the U. S. Naval Gun Factory, Washington, D. C., addressed the Washington chapter of the American Society for Steel Treating on March 16. His topic was "Performance of High-Speed Cutting Tools."

LEONARD SUMNER was elected president of the British Institute of Metals at the annual general meeting on March 7.

Sir J. J. THOMPSON, of Cambridge University, is to give a series of lectures at Franklin Institute during the week of April 9.

Dr. F. C. WEBER, chemist in charge of the Animal Physiological Laboratory, Bureau of Chemistry, has resigned to accept a position with the Fleischmann Laboratories, New York. Dr. Weber entered the Bureau of Chemistry as a scientific aid in 1902 and after receiving an M.D. degree from George Washington University assisted in experimental work to determine the effect of preservatives on health. He was placed in charge of the Animal Physiological Laboratory in 1907 and directed the work of that laboratory until his resignation, except for a short period of detail to the Tariff Commission.

W. R. M. WHARTON of New York, chief of the Eastern food and drug inspection district of the Bureau of Chemistry, was in Washington recently conferring with officials of the bureau regarding regulatory campaigns.

Market Conditions

In Chemical, Metallurgical and Allied Industries

A Survey of the Economic and Commercial Factors That Influence Trade in Chemicals and Related Commodities. Prevailing Prices and Market Letters From Principal Industrial Centers

Better Business Conditions Are the Result of Increased Productive Activity

Expansion in Output of Basic Industries a More Substantial Basis for Prosperity Than Increasing Credits or Rising Prices

IT IS especially significant in the view of many of our leading economists that the prosperity being enjoyed by many of our industries is based on expanding production rather than expanding credit—the principal cause of the inflation of 1919 and 1920. The production figures obtained by the Department of Commerce indicate record industrial activity during the first two months of the current year.

One of the industries reflecting this stimulation to marked extent is the manufacture of textiles—important as a basic industry and a large consumer of chemicals and allied products. The daily rate of cotton production was even higher than the January high record and silk consumption was the highest with one exception since 1919. Wool receipts at Boston were the highest since April, 1921, except for July, 1922. Stocks of cotton at mills were the lowest reported for this season of the year since 1914.

The construction industry, a market for oils and paints, steel, glass and other products, also made new records. The volume of building contracts awarded in February, contrary to an expected seasonal decline, increased in twenty-

"Chem. & Met." Weighted Index of Chemical Prices

Base = 100 for 1913-14

This week	**181.44**
Last week	179.51
March, 1922	156.00
March, 1921	157.00
March, 1920	252.00
April, 1918 (high)	286.00
April, 1921 (low)	140.00

The effect of the many price advances and the continued strength of the chemical market is reflected in this week's index number. Potassium carbonate and hydroxide and linseed and cottonseed oils were the index commodities to show advances.

TABLE I—PRODUCTION AND PRICES OF CHEMICALS, 1913-1922

(Compiled by the *Survey of Current Business* from government and non-government sources.)

(Base year in bold-faced type.)

Year and Month	A.—INDEX NUMBERS: Production[1] Acetate of Lime (Relative to 1920)	Production[1] Methanol (Relative to 1920)	Consumption[1] Wood, Carbonized (Relative to 1920)	Stocks[1] Wood (Relative to 1920)	Wholesale Prices: Drugs and Pharmaceuticals[3] (Relative to August, 1914)	Essential Oils[3] (Relative to August, 1914)	Crude Drugs[3] (Relative to August, 1914)	Chemicals[4] (Relative to 1913)	Sulphuric Acid 66° New York[5] (Relative to 1913)	B—NUMERICAL DATA: Production[1] Acetate of Lime Thousands of Pounds	Production[1] Methanol Gallons	Consumption[1] Wood, Carbonized Cords	Stocks[1] Wood Cords	Wholesale Price Sulphuric Acid 66° New York[5] Dollars Per 100 Lb.

[1] Compiled from reports of the National Wood Chemical Association to which are added reports from the principal non-member firms. Total reports for each month vary from firms with a capacity of 3,200 cords to 4,500 cords daily; all months are therefore prorated to a daily capacity of 4,500 cords, representing about 90 per cent of the industry, on the basis of capacity reporting each month.

[2] August, 1914.

[3] Compiled from weekly wholesale quotations by the *Oil, Paint and Drug Reporter*.

[4] The chemical price index from *Chemical & Metallurgical Engineering* includes quotations on 25 commodities selected on the basis of their importance as representing both qualitatively and quantitatively the principal branches of the chemical industry. These prices are weighted on the basis of total production plus total imports in the year 1919. The figures are averages of weekly prices.

[5] Wholesale average monthly price of sulphuric acid from United States Department of Labor, Bureau of Labor Statistics.

seven northeastern States to 41,611,000 sq.ft. All classes of buildings except residential and public buildings participated in this increase, which has continued into March. The week of March 10 showed the highest total of building awards of any week since July, amounting to $78,411,000.

Trend of Chemical Production

In Table I are given the Commerce Department's figures for the production and prices of those chemicals and groups of products which are included in the monthly compilations of the *Survey of Current Business*. Statistics for 1923 are not given in this tabulation, but in a statement made on March 23 the department declared that the production of acetate of lime and of methanol declined slightly in January from the high mark set in December. Acetate of lime output amounted to 16,544,000 lb., as against 16,814,000 lb. in December, and methanol production was 933,171 gal., as against 942,008 gal. in December. Consumption of wood, however, increased to 104,180 cords, while stocks of wood at chemical plants declined to 833,767 cords, the lowest since November, 1921.

Wholesale Prices Rise in February

A slight rise in the general level of wholesale prices in February as compared with January is shown by the Bureau of Labor Statistics in its weighted index numbers. The all commodity index, based on 404 price series, stands at 157 for February, or one point higher than in January.

The principal increases were in the case of metals and metal products, although the chemicals, building materials and miscellaneous groups recorded advances. The bureau's index numbers for May, 1920, which was practically the month of peak prices, are compared with the more recent figures in the accompanying table.

Group	May 1920	Jan 1922	Nov 1922	Dec 1922	Jan 1923	Feb 1923
Farm products	241	122	143	145	143	142
Food, etc.	248	131	143	144	141	141
Cloths and clothing	328	176	192	194	196	199
Fuel and lighting	239	195	218	216	218	212
Metals and metal products	202	112	133	131	133	139
Building materials	293	157	185	185	188	192
Chemicals and drugs	213	124	127	130	131	132
House furnishing goods...	247	178	179	182	184	184
Miscellaneous	208	117	122	122	124	126
All commodities	247	138	156	156	156	157

Comparing prices in February with those of a year ago, the report of the Bureau of Labor Statistics points out that the general level has risen over 11 per cent. Metals and metal products show the largest increase, 26¼ per cent. Building materials follow next with an increase of 23 per cent. Cloths and clothing have increased 14¼ per cent, fuel and lighting 11 per cent, and farm products 8½ per cent in price in the year. Food articles, chemicals and drugs, housefurnishing goods and miscellaneous commodities all show smaller increases compared with prices of a year ago.

Higher Quotations on Potash Salts Feature New York Market

Potassium Permanganate, Carbonate and Bichromate Figure in General Advance Said to Be Due to Importing Difficulties

NEW YORK, March 26, 1923.

MATERIAL improvement was noted in the chemical market during the past week in the case of many imported commodities. Importers reported higher cables from abroad on all potassium salts and stated that round-lot shipments were quite difficult to locate. The feature of the week's activities was the sharp advance in permanganate of potash. Dealers were not anxious to quote large quantities, due to the extremely high foreign quotations and the strong domestic demand. Importers of carbonate of potash advanced quotations on 80-85 per cent calcined material. Dealers in arsenic also announced an advance.

Costs Are Mounting

Manufacturers of amyl acetate reported higher quotations on account of increased production costs and heavier demand. Resale oxalic acid was not as plentiful, as previously noted, and spot goods were sharply advanced. Producers and importers announced higher prices on powdered and crystal tartaric acid. Manufacturers of bichromate of potash raised their prices, due to the strong domestic and foreign demand. Resale supplies have been gradually absorbed. Second hands in formaldehyde were anxious to book business at concessions and the general range was fractionally lower. The alkali market continued with prices practically unchanged. The demand was said to be quite satisfactory to the leading producers. Manufacturers of salicylic acid announced advances on the technical and U.S.P. varieties. The market in general has already begun to show the long-contemplated spring activity and those close to the pulse of trading were firm in their belief that the beginning of a general swing toward increased trading has already shown itself.

Many Price Advances

Amyl Acetate — Leading producers announced a sharp advance, due to the increased cost of production and strong domestic inquiry. Prices range around $3.25@$3.50 per gal.

Arsenic—Dealers were inclined to advance prices to 15½c. per lb. on spot and 15c. for future arrivals. Consumers have shown some desire to purchase at the new levels.

Bichromate of Potash—Large producers announced an advance, due to increased export demand. Prices range around 10⅜@11c. per lb. for immediate shipment.

Bleaching Powder — **Activity was along former lines, with producers quoting $2.20 per 100 lb., f.o.b. works,** large drums. Spot material was rather scarce at $2.50 per 100 lb.

Carbonate of Potash— Leading importers reported an advance on 80-85 per cent calcined, due to the difficulty in obtaining any round-lot shipments from abroad. Consuming demand has shown material increase and dealers were not inclined to offer any spot goods below 6c. per lb. The range was around 6@6½c. per lb.

Caustic Soda—Export inquiries continued along moderate lines, with leading dealers quoting $3.45@$3.50 per 100 lb., f.a.s. Domestic goods held around 3¾c. per lb. ex-store. Contracts were quotably unchanged.

Formaldehyde — Resellers were inclined to shade prices on actual business. Quotations ranged around 14½@15c. per lb. on spot. Producers quoted 16c. per lb. for carload lots and 16½c. for lesser quantities.

Permanganate of Potash — Importers reported a sharp increase in foreign cables, due to the present unstable conditions in Germany. Quotations on spot were sharply advanced by local dealers and the general range was 25@26c. per lb. for limited quantities. Shipments were quoted at 18c. per lb., duty unpaid.

Salicylic Acid — Manufacturers announced increases in technical and U.S.P. goods. Quotations for U.S.P. range around 50@52c. per lb., with technical at 47@48c. per lb. Demand continued along moderate lines.

Naphthalene—A very active market exists for this article, with quotations on all grades sharply higher. Naphthalene balls were quoted at 10@10½c. per lb., with flakes at 9@9½c. per lb. on spot. Futures were quoted around 8¾c. per lb. Crushed material was difficult to locate for any shipment.

Phenol—Demand continued quite active at 50c. per lb. on spot. Trading was mostly for small quantities.

Vegetable Oils

Linseed Oil—Leading crushers announced several advances during the past week. Prices changed from $1.01 per gal. to $1.03 and another advance brought quotations up to $1.05 per gal. on spot. Demand has been quite active at the present high levels.

Cottonseed Oil—Crude oil advanced early in the week to 11c. per lb. in tanks, but receded later to 10¾c. per lb. f.o.b. mills, southeast and valley. The demand has not been unusually strong due to the high prices. Prime summer yellow was quite active around 12¾@13c. per lb. in barrels.

China Wood Oil—**Prices have again been advanced on spot. Quotations range around 25@26c. per lb. in barrels.**

Price Advances Rule in St. Louis Market

Indications Point to Firmer Market for Some Time to Come

ST. LOUIS, MO., March 22, 1923.

Price advances on some of the important chemicals during the past few weeks have stimulated buying, and the volume of business tranacted in the St. Louis market has been very satisfactory. Prices today are firm, and indications are for an advancing market for some time to come. Imported materials are much higher today than for some time past, and in view of conditions abroad further advances would not be surprising.

Firm Alkali Market

The market for alkalis continues firm and a good volume of business is being transacted. However, the last 2 weeks have not been as good as the months of January and February. *Caustic soda* is maintaining the regular schedule, though a slight decline in volume is reported. Flake caustic in 5- and 10-drum lots is generally quoted at \$4.25 per 100 lb. and one producer is holding the price at \$4.30. Solid caustic in like quantities is offered around \$4.85@\$4.90 per 100 lb. These prices are delivered buyer's door. *Soda ash* 58 per cent light can be had in round lots at \$2.25 in barrels and \$2.10 in bags. These quotations are on a 5- or 10-package basis and are usually shaded from 5 to 10c. per 100 lb. when bought in truckloads. *Bicarbonate of soda* is maintaining its strength, the recent advance in price apparently not affecting the volume of business. *Sal soda* has shown some life recently and better business on this item is expected.

General and Special Chemicals

Heavy mineral acids, particularly *muriatic*, are moving in large volume. It is reported that the production has been increased, but manufacturers have little to dispose of above their contract requirements, and supplies have become very tight. The movement of *sulphuric* and *nitric* has also been very good. Inquiry for *citric acid* has been somewhat better; however, trading is not so good. Importations have been very light and stocks are also low of both the foreign and domestic article. The *cresylic acid* market is almost bare of stocks. The output of domestic producers is very small and has been sold up for some months to come, and with the present cost of importing foreign goods there is no relief looked for in the immediate future. *Oxalic acid* has shown no unusual activity and trading is being done only through regular channels. *Tartaric acid* has been showing more life and some fairly large sales are being made. Trading in *white arsenic* has quieted down as far as spot goods are concerned, and consumers apparently have sufficient supplies for their immediate need. *Cream of tartar* is in better demand. The demand for *copperas* has been very good and supplies have been absorbed as quickly as they became available. Quotations are firm, with the sugar grade quoted at \$1.13 per 100 lb. in bulk in carload lots f.o.b. St. Louis, and \$1.38 per 100 lb. in barrels in carload lots f.o.b. St. Louis. *Glycerine* continues to hold its own very well at 18¾c. in drums. As previously reported, this is a buyers' market and the price is not expected to decline in the face of a lively demand. In fact a higher level on this commodity is not beyond the bounds of possibility. The *phenol* market is exceedingly strong and supplies continue to be very scarce. Large quantities are not available and only occasional small lots are heard of. *Potassium bichromate* is moving in a fair way. The demand for *cyanide of potash* is normal. *Permanganate* prices are going up steadily, with spot stocks very small and held in firm hands.

The *zinc* market is advancing and *spelter* is now quoted at \$8 per 100 lb. f.o.b. St. Louis and \$8.35 per 100 lb. f.o.b New York. *Zinc sulphate* has had no change since our last report and is still quoted at 3¼c. f.o.b. St. Louis in carload lots and 3½c. f.o.b. St. Louis in less than carload lots, with a very good demand. *Zinc dust* is offered today at 11c. per lb. f.o.b. St. Louis, with a very good demand.

Rumors of Wage Advances Affect Steel Market

Prices Are Stiffening All Along the Line, Although Production Is Still High

PITTSBURGH, March 23, 1923.

Production of steel continues to run very heavy. The rate of ingot production at this time is probably well above 45,000,000 tons a year, which until recently was the record high since the armistice, reached in March, 1920, but by no means sustained.

The steel mills will make every effort to maintain their present high rate of production. Earlier in the year there were fears that the labor shortage of last October would reappear in greater strength in the spring, with resumption of outdoor work on a larger scale. While labor shortage would of course tend to restrict the consumption of steel, the production of steel would hardly escape feeling an influence. In this connection there are now two points. It is the prevalent expectation among independent steel producers that the Steel Corporation, which always leads in such matters, will announce a general wage advance shortly, probably to be effective April 1. There is absolutely no confirmation of this view from any Steel Corporation source, but such announcements are not unusually preceded by unofficial information leaking out. In some steel circles prognostication goes farther, to the effect that such a wage advance might be followed by another in mid-summer. Undoubtedly there will be strenuous bidding for labor on the part of many contractors, but wage advances would help to retain men. Another point is this, that a steel mill once operating smoothly and with large tonnage output does not need as large a force to maintain operations as it did to get going, and the steel industry has now got the start.

Steel Prices Stiffening

At various points the steel market is growing stronger in the matter of prices. Recently bars, shapes and plates reached 2.25c. as a basis market for late or extended delivery, while premiums have been ruling on small lots for early shipment. On shapes and plates the minimum for any delivery may now be considered 2.35c., or \$2 a ton advance. Premiums are greater. Plates do not stop at 2.60c., but command 2.75c. frequently and perhaps 3c. in some cases. One mill is quoting bars at 3c., and many obtain the price.

Sheets show a variegated market. Reports to the association of independents, covering about 70 per cent of the productive capacity, show order books March 1 for the reporting mills representing about 2 months of work, but this is merely a composite. Some mills are fairly well sold up through the second quarter at what may be denominated conservative prices, say 3.60c. on common black, while other mills have correspondingly less business ahead. These mills, able to offer relatively early deliveries, are out for premiums. Some are quoting as high as 4c. on black, 5.25c. on galvanized and 7c. on automobile sheets, and are presumably effecting sales. A wire mill has put out a price of \$3 a keg on nails, although stating it is fully sold up, while the common market, for late delivery, is nearer \$2.80.

Pig Iron and Coke

One additional second quarter contract in Connellsville furnace coke has been made since last report, for 10,000 tons a month, at \$7.50 or perhaps a trifle more. The total in the movement a week ago was about 300,000 tons a month, chiefly at \$7, with perhaps a fourth of the total at \$7.25. Export demand has lately been a factor in the coke market, between 75,000 and 100,000 tons having already gone, chiefly from the Connellsville region, at an average of not much under \$7.50.

Valley pig iron has advanced a straight dollar a ton in the week, bessemer, basic and foundry being now quotable at \$31 valley on the basis of latest sales, while \$32 is predicted as a probability within a week. It is to be noted, however, that the bulk of the second quarter business was done before prices advanced above about \$28. There is now a delicate balance between uncovered consumption and unsold production for the second quarter. Furnaces would like to push the market to \$32, or perhaps \$33, but not higher, the chief end to be gained being to have a ready made market when the time comes for third quarter business.

Current Prices in the New York Market

FOR CHEMICALS, OILS AND ALLIED PRODUCTS

Although these prices are for the spot market in New York City, a special effort has been made to report the American manufacturer's quotations whenever available. In many instances these are for material f.o.b. works or on a contract basis and these prices are so designated. Quotations on imported and resale stocks are reported when of sufficient importance to have a material effect on the market. Prices quoted in these columns apply to large quantities in original packages.

General Chemicals

Acetic anhydride, 85%, drums	lb.	$0 36 - $0 38
Acetone, drums	lb.	22 - 23
Acid, acetic, 28%, bbl	100 lb.	3 15 - 3 40
Acetic, 56%, bbl	100 lb	6 25 - 6 50
Glacial, 99½%, carboys	100 lb.	12 00 - 12 50
Boric, crystals, bbl	lb	11½ - 11½
Boric, powder, bbl	lb	11 - 11½

Industrial

Financial, Construction and Manufacturers' News

Construction and Operation

Alabama

ACIPCO—The American Cast Iron Pipe & Foundry Co. will rebuild the portion of its testing department, destroyed by fire March 8. An official estimate of loss has not been made.

Arizona

PHOENIX—The Riverside Portland Cement Co., Riverside, Calif., has tentative plans under consideration for the construction of a new cement plant in the vicinity of Phoenix, estimated to cost in excess of $750,000, including machinery. Harry Welch, secretary of the Phoenix Chamber of Commerce, is co-operating with the company in connection with site selection. Loren Barton is assistant general manager.

California

McPHERSON—The Orange Belt Oil Refining Co., McPherson, near Orange, will commence the immediate erection of a new local refinery, estimated to cost $55,000.

ANTIOCH—The Paraffine Companies, Inc., 34 1st St., San Francisco, has awarded a contract to Fred Stamm, 25 A St., Antioch, for the erection of its proposed new 1-story plant addition, estimated to cost $40,000. Leland Rosener, Insurance Bldg., San Francisco, is architect.

SAN DIEGO—The Vitrified Products Co. is completing plans for the construction of a new plant on site at Old Town, near San Diego, totaling 17 acres, for the manufacture of vitrified brick. It will be equipped for an initial output of 50,000 bricks daily. The company has extensive clay deposits in the vicinity of Linda Vista. Victor Kremer is president.

MARICOPA—The Pacific Midway Oil Co., which heretofore has had a topping plant in operation on its property, is expanding its operations and installing a new separate "jitney refinery" unit for a complete rundown of its crude. H. F. Everard and E. D. Goldsmith are the designers and E. D. Goldsmith has charge of the construction.

ONTARIO—The Interlocking Tile & Sewer Pipe Co. is considering the construction of a local plant for the manufacture of special burned clay products. The purchase of an extensive tract of land at Indio, in the same district, is planned, to be used for raw material supply. J. F. Gale and D. E. Badger represent the company in connection with the project. B. W. Spencer, secretary of the Ontario Chamber of Commerce, is interested in the new plant.

SUNNYVALE—The Sunnyvale Concrete Products Co. has commenced the erection of an addition to its plant, to be equipped for the manufacture of concrete pipe. It will cost about $15,000.

LOS ANGELES—A 1-story foundry addition, 40x100 ft., will be erected at the plant of the Union Tool Co., Torrance, near Los Angeles, for iron casting production.

Connecticut

WATERBURY—The Connecticut Brass Foundry Co., 660 East Main St., will build a new addition to its plant, 1-story, 25x40 ft. Henry F. Wenzel, Waterbury, is architect.

Illinois

CHICAGO—The Alberene Stone Co., 214 North Clenton St., manufacturer of soapstone products for domestic and other service, has purchased the plant of the United States Industrial Alcohol Co., Elston and Wabansia Aves., 100x150 ft., improved with a 1- and 2-story building. The property was acquired for a consideration of $45,000, and will be used by the new owner for its plant. The present works will be removed to the location and a number of extensions made.

Indiana

INDIANAPOLIS—The Lilly Varnish Co., 670 South California St., has filed plans for a 1-story factory addition.

BROOKLYN—The Brooklyn Brick Co. has work under way on improvements in its plant to include the construction of new down-draft kilns, and the installation of considerable equipment. It is proposed to establish a department for the manufacture of face brick. The common brick output will be maintained on a basis of 60,000 bricks per day.

Kansas

EMPORIA—The Common Council is completing plans for extensions and improvements in the municipal waterworks, to include the installation of a new chlorinator and other equipment. E. T. Mendel is clerk.

Kentucky

LOUISVILLE—The Louisville Gas & Electric Co. has purchased a 70-acre site for the construction of a new artificial gas plant. The structure will be arranged in a series of individual units, capable of expansion as desired, estimated to cost more than $5,000,000. Plans for the first unit will be prepared and work placed in progress at an early date. Donald McDonald is vice-president.

PADUCAH—The Tucker Chemical Mfg. Co., recently organized with a capital of $250,000, has tentative plans under consideration for the establishment of a local plant for the manufacture of chemical products for the textile industry, as well as other service. The new company is headed by E. C. Pace, W. C. Richman and T. A. Miller.

CHINNVILLE—The Kentucky Refractories Corp., Ironton, Ky., has plans under way for the construction of a local plant for the manufacture of firebrick, refractory linings and other refractories. A 12-acre site has been acquired for the plant, which is estimated to cost $80,000, with machinery. C. K. Turtley is president.

Louisiana

NEW ORLEANS—Godchaux Sugars, Inc., 527 Canal St., has abandoned plans for the rebuilding of its refining plant at Elm Hall, destroyed by fire several months ago, and will enlarge its Reserve and Raceland refineries to make up the necessary capacity. Work will be commenced at once on an addition to the first noted plant, and considerable new machinery will be installed.

WEST BATON ROUGE—The Glynn Planting Co., operating the local Kelson plant for the manufacture of sirups, is planning for the erection of an addition to be equipped as a sugar refinery. Work will be commenced at an early date.

Maryland

BALTIMORE—Johns Hopkins University has filed plans for the immediate erection of its proposed new chemical laboratory at Charles St. and the University Parkway, to be 3 story, 118x160 ft., estimated to cost about $400,000. Contract for the work was awarded recently to the Consolidated Engineering Co., Calvert Bldg.

Massachusetts

ROCKPORT—The Board of Selectmen has plans under consideration for the installation of a filter system at the municipal waterworks. John Dennis is head of the board.

EAST BOSTON—The East Boston Pottery Co. is planning for enlargements in its plant, including the installation of additional equipment and three new kilns. Work will be placed under way at an early date.

WESTFIELD—The H. B. Smith Co. is planning for the early erection of a new 1-story foundry at its local boiler-manufacturing plant, to be equipped for the production of iron castings. Monks & Johnson, 99 Chauncey St., Boston, are engineers.

WATERTOWN—The Hood Rubber Co., Nichols Ave., is completing the erection of a 3-story addition to its tire and rubber plant, 64x128 ft., and plans for the installation of machinery at an early date. The Aberthaw Construction Co., 27 School St., Boston, is the general contractor. F. C. Hood is general manager.

Michigan

ESCANABA—The Universal Magnesite Products Co., recently organized, has leased a local building and will commence the immediate installation of machinery for the manufacture of composition materials for construction service, magnesite stucco, wall plaster and affiliated products. L. K. Edwards is president; and P. L. Sullivan, vice-president and general manager.

MUSKEGON—A 1-story foundry, 120x220 ft., estimated to cost about $175,000, will be constructed at the plant of the Piston Ring Co., to be used for the production of steel castings.

ONTONAGON—The Ontonagon Fiber Co., now being organized, has taken over the former local plant of the Northern Fiber Co., temporarily abandoned in 1921. The mill is designed for the manufacture of unbleached soda pulp, and will be remodeled by the new owner for the production of bleached and unbleached sulphate pulp and soda pulp. Equipment will be installed for a daily capacity of about 75 tons of material, and it is expected to have the plant ready for service before the close of the year. D. Clark Everest, one of the heads of the Ewing-Everest Pulp Co., Merrill, Wis., and secretary and general manager of the Marathon Paper Co., Rothschild, Wis., is one of the principal organizers of the new Ontonagon company.

New Jersey

FORDS—The Fords Art Stone Co., Inc., has commenced the erection of a new 1-story plant addition, and plans for the installation of additional equipment.

NEWARK—The Metal Products Co., 134 Lafayette St., is arranging for the immediate rebuilding of the portion of its lacquer department, damaged by fire, march 12. An official estimate of loss has not been made.

NEWARK—J. Hague Armitage & Sons, Inc., Thomas and Dawson Sts., manufacturer of waterproofing products, coated specialties, etc., has acquired the vacant plot of land, 100x225 ft., at Dawson and Parkhurst Sts., in the vicinity of its plant, for proposed future additions.

New York

NIAGARA FALLS—The Pittsburgh Metallurgical Co., Highland Ave., is planning for the rebuilding of the portion of its plant, destroyed by fire, March 12.

GLEN PARK—The National Paper Products Co., Carthage, N. Y., has negotiations in progress for a lease of the C. R. mill of the International Paper Co., located at Glen Park. It is purposed to improve the plant upon acquisition, with the installation of equipment for the manufacture of tissue and other papers.

ITHACA—Cornell University is planning for the rebuilding of the portion of the laboratory of the Sibley College of Engineering, destroyed by fire March 13, with loss estimated at $10,000.

BALSTON SPA—The Adirondack Paper Corp., recently organized, has leased the local mill of the Island Paper Co. for a new plant, and will take immediate possession. Improvements will be made and necessary equipment installed. The company is headed by F. B. Oldham, Newtonville, B. G. MacDonald, Albany; and L. C. Case, Guilderland.

North Carolina

KERNERSVILLE—The American Iron Works, P. O. Box 138, recently formed with a capital of $75,000, is planning for the erection of a 1-story foundry in connection with its proposed local plant, to be equipped for the manufacture of iron castings. A 2-ton cupola will be installed. O. L. Smith is secretary.

Ohio

COSHOCTON—The Pope Gosser China Co. will soon commence the erection of an addition to its plant to cost about $25,000.

Oklahoma

ARDMORE—The Monterey Glass Co., Monterey, Mex., is considering plans for the construction of a branch plant at Ardmore. A site is being selected in the vicinity of glass sand properties.

Oregon

PORTLAND—The Astoria Brick & Building Material Co. has purchased a portion of the former property of the Northern Pacific Brewing Co., and plans for the erection of a new brick-manufacturing plant, with initial capacity of 65,000 bricks daily. The main building will be 100x200 ft.

Pennsylvania

HARRISBURG—The Harrisburg Gas Co. is planning for extensions and improvements in its artificial gas plant, to include the installation of new compressors and other machinery.

CORAOPOLIS—The Vulcan Refining Co., is planning for the rebuilding of the portion of its local oil refinery and byproducts plant, destroyed by fire, March 12, with loss estimated at close to $60,000, including machinery. The wax plant was destroyed. Thomas Allen is general manager.

READING—The Consumers' Gas Co., a subsidiary of the United Gas Improvement Co., Broad and Arch Sts., Philadelphia, has purchased additional property at Willow Grove, as a site for the construction of a new artificial gas plant.

PITTSBURGH—The Federal Enameling & Stamping Co., McKees Rocks, has plans in progress for the rebuilding of the portion of its plant, destroyed by fire, March 12, with loss estimated at $250,000, including buildings and machinery.

South Carolina

GREENWOOD—The J. W. Sprole Oil Co. is considering plans for the rebuilding of the portion of its local plant, recently destroyed by fire. An official estimate of loss has not been made.

Tennessee

GALLATIN—The Gillespie Oil Corp. is planning for the installation of additional machinery at its local oil refinery. The capacity will be increased.

MEMPHIS—The Railway Paint Products & George M. Tagg Paint Companies, Consolidated, Inc., recently formed by a merger of the two local companies of names noted, is planning for the installation of additional machinery at its plant for large increase in output. George M. Tagg heads the company.

LEWISBURG—The City Council is considering plans for the installation of a new filtration plant at the municipal waterworks.

Texas

ELECTRA—The Griswold Oil Co. will soon commence the construction of a new refining plant, with daily capacity of about 2,500 bbl., estimated to cost close to $500,000, with machinery. A gasoline refinery will also be built, costing approximately $100,000, with "cracking" machinery and other operating equipment.

EASTLAND—The Arab Gasoline Co. has plans in progress for the construction of a new gasoline refinery, with daily capacity of 10,000 gal., estimated to cost approximately $150,000, with machinery.

WHITE CASTLE—L. N. Folse, operating a sugar cane mill, is planning for the installation of new crushing machinery and other equipment.

DALLAS—The Dallas Refining Co., recently incorporated with a capital of $175,000, has purchased property on the West Dallas Pike for the construction of a new *gasoline refinery. An oil-refining plant* will also be erected, with initial daily production approximating 1,000 bbl. The installation is estimated to cost about $150,000. O. F. Kullenberg heads the company.

ABILENE—R. K. Wooten, Chickasha, Okla., and R. M. Simmons, Sweetwater, Tex., have organized a company to construct and operate a local cotton oil mill. Plans will be prepared and work placed in progress at an early date. The plant is estimated to cost $350,000, with machinery.

AUSTIN—J. W. Hassell, formerly chief of the gas and oil division of the State Railroad Commission, is at the head of a new company which purposes to construct and operate a plant in Stephens County for the production of carbon black, utilizing residue natural gas from casinghead gasoline plants. The initial installation is estimated to cost $300,000, with machinery. It will be located in the vicinity of Breckenridge.

FORT WORTH—The General Foundry Co., lately organized, has acquired property at 607 North Main St., and plans for the immediate installation of equipment for the production of grey-iron castings. B. N. Wadley is president, and T. H. Stewart, secretary-treasurer.

Virginia

RICHMOND—The Standard Paper Mfg. Co., Hull and Canal Sts., has awarded a contract to the Wise Granite & Construction Co., American Bank Bldg., for the erection of a 2-story plant addition, 64x110 ft., to cost about $35,000. M. E. Wright, American Bank Bldg., is architect.

RICHMOND—The Southern Crockery Co. is planning for the rebuilding of the portion of its plant, recently destroyed by fire with loss of about $25,000. F. F. Socoloff is president.

Vermont

RUTLAND—The Rutland Fire Clay Co. has plans under consideration for the erection of an addition to its plant on Curtis Ave., including the installation of additional equipment.

West Virginia

KEYSER—The City Council is perfecting plans for the installation of a new filtration plant at the municipal waterworks, estimated to cost about $90,000. L. D. Warner is city clerk.

FAIRMONT—The Consolidation Coal Products Co. will soon commence the installation of a byproducts coke plant at its local properties.

Canada

MERRITTON, ONT.—The Garden City Paper Mills, Ltd., St. Catherines, specializing in the production of tissue and light-weight papers, is planning for the early erection of a new mill at Merritton. L. H. Gardner is president.

Industrial Developments

CERAMIC—The Colfax Drain Tile Co., Colfax, Ind., is planning to resume production within the next few weeks. The works have been idle for about 3 years past.

The Hocking Valley Products Co., Columbus, O., manufacturer of brick and hollow tile, is arranging for immediate increase in production, and will place the plant on a capacity basis.

Due to natural gas scarcity in the East Liverpool, O., district operations have been curtailed at a number of the general ware plants during the past few weeks. Orders on hand are said to warrant maximum output, and resumption on full schedule will be carried out as soon as fuel is available.

The Mid-Continent Clay Co., Peru, Kan., will devote its entire production to roofing tiles and purposes to develop a maximum output in this line. The manufacture of face brick will be discontinued.

The Acme Brick Co., Forth Worth, Tex., is running full at its plants at Denton, Millsap and Bennetts. A portion of the output is devoted to firebrick and special molded shapes. The plants have a gross output of 15,000,000 bricks per year. The present schedule will be maintained for an indefinite period.

The Hazleton Brick Co., Hazleton, Pa., has arranged for the immediate resumption of operations at its plant, and will run on a *full capacity schedule until further notice.* Recent orders aggregate close to 1,000,000 bricks for immediate delivery. A full working force will be employed.

PAPER—The Flower City Tissue Mills, Scottsville, N. Y., *is arranging for the resumption* of production at an early date and will make a number of improvements in plant and machinery. The mill has been closed for more than 12 months past.

The St. Lawrence Paper Mills, Ltd., Three Rivers, Que., will soon start the second machine at its mill. The first paper machine at the plant is now in full operation. The working force will be increased.

Paper mills in Wisconsin are increasing production, and the majority are giving employment to full working forces. Orders on hand are said to insure capacity for several months to come.

The Grass Fibre Pulp & Paper Co., Leesburg, Fla., is maintaining full operations at its new local mill, which was placed in service early in February. The bulk of production is devoted to newsprint, utilizing saw-grass as raw material. The working force will be advanced.

The Provincial Paper Mills, Ltd., Port Arthur, Ont., has commenced operations at its new local mill and will gradually advance production. A large working force is being employed. The plant will be devoted to the manufacture of fine papers.

CEMENT—The Lehigh Portland Cement Co., Allentown, Pa., is pushing construction on its new mill at Tarrant City, Ala., and expects to have the plant ready for operation late in May. The company is maintaining active production at its Lehigh Valley mills.

The Atlas Portland Cement Co. is running full at its large mill at Northampton, Pa., with regular working force, and will maintain this schedule for an indefinite period.

The International Cement Co., Kansas City, Mo., is advancing production at its different mills. Plans are being perfected for early enlargements in the plant of the Bonner Portland Cement Co., Bonner Springs, Kan.

The Phoenix Portland Cement Co., Nazareth, Pa., is making ready for early operations at its new plant at North Birmingham, Ala., and it is expected to have the unit running full within 60 days. The plant was originally scheduled to commence manufacture in June. It has a rated capacity of more than 1,000,000 bbl. per year. The company is maintaining full operations at its Nazareth plant.

GLASS—The Inland Glass Co., Chicago, Ill., specializing in the production of illuminating glassware, is advancing operations at its new local plant at 6101 West 65th St. The factory was placed in operation about the middle of February. The working force will be increased.

The American Plate Glass Co., James City, Pa., recently acquired by the Durant Motor Co., is giving employment to about 500 operatives on a full time basis. Wages have been advanced 10 per cent since the acquisition of the property by the Durant interests.

Window glass plants in Western Pennsylvania are running at maximum capacity, with heavy orders on hand to insure this schedule for a number of months to come. Plate glass plants also report an unprecedented demand for material and are giving employment to every available worker.

The National Plate Glass Co., Blairsville, Pa., an interest of the Fisher Body Co., Detroit, Mich., manufacturer of automobile bodies, is running at full capacity with full working force and will keep to this schedule indefinitely. Employees have been given an advance in wages, averaging about 6 cents an hour.

IRON AND STEEL—The Stewart Furnace Co., Cleveland, O., is making ready to blow in its stack at Sharon, Pa., at an early date.

The Tennessee Coal, Iron & Railroad Co., Birmingham, Ala., is preparing its old Oxmoor furnace for the torch, and expects to blow in the unit at an early date.

The McKeefrey furnace, Leetonia, O., is planning to go into blast at an early date. The unit has been made ready for service.

The Jones & Laughlin Steel Corp., Pittsburgh, Pa., has all of its blast furnaces on the active list, and purposes to maintain this schedule for an indefinite period.

The Woodward Iron Co., Birmingham, Ala., will soon place its second blast furnace in operation at Vanderbilt. The unit has been repaired and made ready.

The Reliance Coke Co., Youngstown, O., will blow in its Ella furnace in this district at once. The stack has been idle for about 36 months.

Steel ingot and pig-iron production in the Pittsburgh, Pa., district is exceeding the best war-time records. Every furnace now on the active list will be continued in blast for several weeks to come.

The East Rolling Mills, Inc., Baltimore, Md., *specializing in the manufacture of steel* sheets, is running at maximum capacity, and will adhere to this schedule for many weeks to come.

Twenty of the thirty steel mills of the Carnegie Steel Co., at Farrell, Pa., were forced to curtail operations for 3 days during the past fortnight owing to shortage of raw materials. Resumption has now been effected. Employment is being given to full working forces.

MISCELLANEOUS—The Sinclair Consolidated Oil Corp., New York, is running full at its East Chicago, Ind., refinery [illegible] breaking previous production [illegible]

Glazed kid tanneries at [illegible] are being forced to [illegible] due to a shortage of raw skins [illegible]

Coke plants in the vicinity of Connellsville, Pa., are running at maximum capacity, and the highest production record during the past 3 years is being made on a basis of 250,000 to 260,000 tons weekly.

The Tennessee Copper & Chemical Corp., 61 Broadway, New York, is maintaining capacity production at its sulphuric acid plants in different parts of the country.

Manufacturers' Catalogs

THE RUGGLES-COLES ENGINEERING CO., New York, in a 4-page bulletin covers the principles of operation of the various types of Ruggles-Coles driers and gives information on drying problems in a concrete way so as to save time and yet present facts which are of particular importance to engineers and allow them to get preliminary information, at least, on the class of drier they would require for the particular problem at hand.

THE MINE SAFETY APPLIANCES CO., Pittsburgh, Pa., has issued a new circular describing the Burrell Gas Mask for the commercial needs in the chemical, dye, paint, paper, etc. industries. It describes the various types of masks for various gases. There has also been published by the same company a circular describing particularly the Burrell Ammonia Gas Mask.

THE DELAVAL STEAM TURBINE CO., Trenton, N. J., has issued a folder on De Laval equipment for the Marquette Cement Co. and another on equipment in the Crown Willamette Paper Mill. It has also published two bulletins. "Plants and Product" is the title of one booklet, which briefly describes the single and multi-stage steam turbines, centrifugal pumps, blowers and compressors and speed-reducing gears in which that concern has specialized since its establishment in 1901. The other booklet is on small single-stage centrifugal pumps for motor or belt drive. These pumps are made in 1½ and 2-in. sizes, and are designed for capacities ranging from 5 gal. per minute against 10 ft. head up to 130 gal. per minute against 150 ft. head. They contain few and simple parts, which are manufactured to limit gages to insure interchangeability. The booklet gives complete tables and instructions for selecting pumps for different conditions, and explains how to determine the proper speeds, and how to select piping, valves, fittings and driving pulley or motor to secure an efficient and satisfactory installation.

THE INTERNATIONAL COMBUSTION ENGINEERING CORP., New York, in a condensed pamphlet describes all its products.

SKINNER, SHERMAN & ESSELEN, INC., 248 Boylston St., Boston, 17, Mass., has issued a booklet entitled "An Introduction. Mr. Banker, Meet Old Man Chemistry." This is a reproduction of an article by James H. Collins published in a recent issue of *Forbes' Magazine*.

H. S. B. W. COCHRANE CORP., Philadelphia, Pa., has issued a booklet entitled "Feed Water Heaters in Their Relation to Steam Plant Efficiency." It informs us that "The text matter is not primarily descriptive of apparatus, but rather a presentation of the theory and practice of boiler feed water heating. After showing that the most efficient steam cycle is the one in which the feed water is heated from hot well temperature to boiler temperature by the use of steam withdrawn during expansion, various practical forms of apparatus and their uses are taken up, including vacuum deaërating heaters, back pressure heaters, heaters in conjunction with make-up water evaporators, feed water heating by stages, different methods of control for obtaining continuous heat balance, heaters in connection with exhaust steam heating system, heaters in conjunction with hot water heating and service systems, including heaters operated at temperatures below 212 deg. F., combined heaters and softeners and combined heaters and feed water meters. The feed water temperature best for plant efficiency is not a sharply defined quantity, as it is found that the temperature can vary through quite a wide range without seriously affecting overall economy. With the vacuum deaërating type of heater, this becomes entirely practicable—that is, the temperature of the feed water rises and falls according to the relative supplies of condensate and auxiliary exhaust steam or bled steam, without requiring close control by the attendant. The pamphlet should be of lively and timely interest to designers, managers and operators of steam plants."

THE LOUIS ALLIS CO., Milwaukee, Wis., has issued Bulletin 406, describing and giving full information with regard to the L. A. Type H. D., heavy duty motor.

THE ALEXANDER MILBURN CO., Baltimore, Md., calls attention to a miniature catalog covering the Milburn line of welding and cutting equipment, ranging from the smallest torch to a large compressing plant. Copy will be supplied upon request.

DOMESTIC LAUNDRY EQUIPMENT CORP., New York City, announces a new catalog illustrating and describing superdrying equipments for extracts, logwood, fustic, gambier, etc., vegetables, fruit and foods (dehydrating), aniline dyes and pigments, papier mache forms and products, oxblood and packing house materials, drug extracts, candy, glue, silks, enamels, white lead, etc.

HERMAN A. HOLZ, New York City, is distributing a catalog entitled "The Holz Thetascope," which describes an apparatus for the reliable and convenient measurement of the characteristic "angle of contact" ("theta") between liquids and solids and is particularly useful for the determination of the "lubricating efficiency" of oils and greases based upon their adhesive forces to metal surfaces.

THE FULTON CO., Knoxville, Tenn., in a 16-page booklet illustrates and describes Sylphon temperature regulators for automatically and accurately regulating temperature of liquids.

New Companies

THE MONROE PAPER CO., Monroe, Mich., has been incorporated with a capital of $50,000, to manufacture paper specialties. The incorporators are E. A. Mitchell, Toledo, O., and Frank L. A. Mitchell, 211 South Washington St., Monroe.

STANSHOFFERS' CHEMICAL LABORATORIES, INC., Brooklyn, N. Y., care of E. A. Deutschman, 44 Court St., Brooklyn, representative, has been incorporated with a capital of $15,000, to manufacture chemical products. The incorporators are C. G. Unger, M. Kupler and M. L. Nathanson.

THE GENERAL PRODUCTS CO., 306 South Sharp St., Baltimore, Md., has been incorporated with a capital of $100,000, to manufacture laboratory glassware and other laboratory products. The incorporators are Roland R. and Edward W. Harmon, and O. R. Benson, Jr.

THE CENTURY VARNISH REMOVER CO., 3830 Indiana Ave., Chicago, Ill., has been incorporated with a capital of $25,000, to manufacture chemical and affiliated specialties. The incorporators are John Stone, P. C. Pack and Frank Tomsak.

THE BIG STONE GAP BRICK & TILE CO., INC., Big Stone Gap, Va., has been incorporated with a capital of $100,000, to manufacture brick, tile and other burned clay products. The incorporators are W. W. and J. C. Taylor, Big Stone Gap, who will act as president and secretary, respectively.

THE FIRE ZONE LUBRICATING CO., College Point, L. I., care of Guernsey & Guernsey, Jamaica, L. I., representatives, has been incorporated with a capital of $20,000, to manufacture oil products. The incorporators are T. H. Doremus, G. S. Miller and G. A. Guernsey.

THE RAPAH CHEMICAL CO., Philadelphia, Pa., has been incorporated with a capital of $110,000, to manufacture chemicals and chemical byproducts. L. H. Gerhold, 668 North 19th St., Philadelphia, is treasurer and representative.

THE SOUTHWEST TANNING CO., Springfield, Mo., has been incorporated with a capital of $100,000, to manufacture leather products. The incorporators are W. R. Wolfe, E. M. Mitchell and W. E. Ogston, all of Springfield.

THE REUTHER FOUNDRY CO., Harrison, N. J., has been incorporated with a capital of $500,000, to manufacture gray iron castings. The company will take over the foundry heretofore operated under the name of Reuther Brothers, 7th and Bergen Sts. The incorporators are Frank, Frederick and Francis Reuther.

THE KORNOFF CHEMICAL CO., 22 West Quincy St., Chicago, Ill., has been incorporated with a capital of $10,000, to manufacture chemicals and chemical byproducts. The incorporators are Morris Honorof, S. Ruthstein and George J. Teller.

THE BUCKEYE TILE CO., York, Pa., care of the Delaware Registration Trust Co., 900 Market St., Wilmington, Del., representative, has been incorporated with a capital of $650,000, under Delaware laws, to manufacture tile and other ceramic products. The incorporators are M. W. Elesser, C. J. Grove and J. C. Strayer, York.

THE MAJOR OIL & REFINING CO., Indianapolis, Ind., has been incorporated with a capital of $100,000, to manufacture refined petroleum products. The incorporators are Fred Cline, E. E. Perry and John Elliott, all of Indianapolis.

THE CHESTER BRICK CORP., Chester, Pa., has been incorporated with a capital of $50,000, to manufacture brick, tile and other burned clay products. Edward C. Burton, 415 East 13th St., Chester, is treasurer and representative.

Coming Meetings and Events

AMERICAN ASSOCIATION OF CEREAL CHEMISTS will hold its ninth annual convention at Hotel Sherman, Chicago, June 4 to 9.

AMERICAN ASSOCIATION OF ENGINEERS will hold its annual convention in Norfolk, Va., May 7 to 9.

AMERICAN CHEMICAL SOCIETY will hold its spring meeting April 3 to 7, 1923, at New Haven, Conn.

AMERICAN ELECTROCHEMICAL SOCIETY will hold its spring meeting May 3, 4 and 5, 1923, at the Commodore Hotel, New York.

AMERICAN FOUNDRYMEN'S ASSOCIATION will hold a meeting in Cleveland, O., April 28 to May 4.

AMERICAN GAS ASSOCIATION will hold its annual convention the week of Oct. 15 at Atlantic City. An elaborate exhibition of gas-making and gas-utilization equipment is planned.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS will hold its summer meeting June 20-23 at Wilmington, Del.

AMERICAN LEATHER CHEMISTS ASSOCIATION will hold its twentieth annual convention at the Greenbrier, White Sulphur Springs, W. Va., June 7, 8 and 9.

AMERICAN OIL CHEMISTS' SOCIETY will hold its annual meeting at the Eastman Hotel, Hot Springs, Ark., April 30 and May 1.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS will hold its spring meeting May 28 to 31 in Montreal, Canada.

AMERICAN SOCIETY FOR TESTING MATERIALS will hold its twenty-sixth annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, beginning Monday, June 25, 1923, and ending either Friday or Saturday of that week.

CANADIAN INSTITUTE OF CHEMISTRY will hold its annual meeting in Toronto, May 29 to 31.

ENGINEERING SECTION of the National Safety Council will hold a mid-year safety conference April 17 in the auditorium of the Western Society of Engineers.

IRON AND STEEL INSTITUTE (London) will hold its annual meeting May 10 and 11 at the House of the Institution of Civil Engineers, London, S. W. 1.

NATIONAL ASSOCIATION OF MANUFACTURERS OF THE UNITED STATES OF AMERICA will meet in annual conference May 14 to 16, inclusive, at the Waldorf-Astoria, New York City.

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (NINTH) will be held in New York Sept. 17-22.

NATIONAL FOREIGN TRADE COUNCIL has postponed its annual conference from April 25, 26 and 27, to May 2, 3 and 4. It will be held in New Orleans, La.

NATIONAL LIME ASSOCIATION will hold its fifth annual convention at the Hotel Commodore, New York City, June 13 to 15.

NATIONAL SYMPOSIUM ON COLLOID CHEMISTRY will be held at the University of Wisconsin, June 12 to 15.

SOCIETY OF CHEMICAL INDUSTRY, Canadian Section, will meet in Toronto, May 29 to 31.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stetters Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month.

SOCIETY FOR STEEL TREATING — Eastern sectional meeting will be held June 14 and 15, in Bethlehem, Pa.

SOCIETY OF INDUSTRIAL ENGINEERS, with headquarters in Chicago, will hold its spring convention in Cincinnati, April 18, 19 and 20, 1923. The major subject will be "Management Problems of the Smaller Plants."

A PAPER INDUSTRIES EXPOSITION will be held in Grand Central Palace, New York City, during the week of April 9, 1923, by the International Exposition Co.

The following meetings are scheduled to be held in Rumford Hall, Chemists' Club, East 41st St., New York City: April 20—Society of Chemical Industry (in charge), American Electrochemical Society, Société de Chimie Industrielle, American Chemical Society, joint meeting. May 4—American Chemical Society, regular meeting. May 11—Société de Chimie Industrielle (in charge), American Chemical Society, American Electrochemical Society, Society of Chemical Industry, joint meeting. May 18—Society of Chemical Industry, regular meeting. June 8—American Chemical Society, regular meeting.

CHEMICAL & METALLURGICAL ENGINEERING

A consolidation of
ELECTROCHEMICAL & METALLURGICAL INDUSTRY *and* IRON & STEEL MAGAZINE

H. C. PARMELEE, Editor

Volume 28 | New York, April 9, 1923 | *Number* 14

Economic Statesmanship

FROM some quarters comes the comment that the preliminary report of the Committee on Business Cycles and Unemployment just off the press is merely an attempt to lock the stable door after the mare is gone. These critics are ill advised, we believe, even though in many industries unemployment has long since given way to labor shortage. The fact remains, as Secretary HOOVER points out in introducing the committee's report, that "the slumps are in the main due to wastes, extravagance, speculation, inflation, overexpansion and inefficiency in production developed during the booms." The strategic point of attack, therefore, is during a period such as the present when rising markets and rapidly expanding operations threaten to precipitate us into another trough of depression and hard times.

This report is from a committee of prominent business men and economists, appointed in September, 1921, during the President's Conference on Unemployment. For over a year it has been engaged in a most exhaustive investigation into the underlying causes of periodic business depression. Its conclusions, therefore, are of more than passing importance, even though the committee proposes no startling new remedies or economic panaceas.

The suggested measures fall into two classes—those designed for the control of excessive expansion during the boom periods and those that will reduce the extent of the subsequent decline. In the former category are the recommendations for measures which will impress the business executive with a better understanding of the business cycle. This implies a knowledge of the fundamental data of business—the intimate and complete statistics of production, stocks, consumption and employment. Stress was also laid upon checking credit expansion by the banks and the possible control of inflation by the judicious exercise of power already held by the Federal Reserve system. But of basic importance, it would seem, is the recommendation that the individual should conduct his own business so as to avoid dangerous overextension of inventories and fixed capital—the two primrose paths to business failures and unemployment. Stabilized operation on the part of all industries is, of course, the keynote of the whole program.

The committee finds several methods for breaking the fall during the decline in the business cycle. It points out that construction can act as a sort of balance wheel on the ups and downs of business. A large program of governmental and public utility construction in times of depression is a well-known remedy of recognized effectiveness, and we are now reaching a period when the opposite policy of retardation is perhaps in order. Other suggestions applying more directly to unemployment during depression refer to the use of unemployment reserve funds, and the expansion of federal, state and farm employment bureaus.

Apart from its conclusions and recommendations the report is significant in that it forms a part of a vast program of national issues that we like to place in the category of economic statesmanship. The guiding influence in this movement is Secretary HOOVER, to whom the public is indebted for his efforts to replace politics with business judgment and constructive economics.

Scrap the Obsolete

WHEN the comedy financier buys into a manufacturing concern, votes himself onto the board and into authority, he requires, first of all, something to boast about. Most of us grow vain with success, and we should not begrudge vanity in others; it is therefore natural and to be expected that such a new authority "wallah" should feel his oats and step high. The chances are that he knows practically nothing of the business and he will be quick to declare that he does not propose to address himself to "details." There is but one thing he can do besides drawing the salary that he provides for himself, and that is to cut out what he calls "dead wood." Stockholders love to hear of the elimination of expenses, because expenses inhibit dividends. Something must be cut out to enable him to announce his slogan, and if the scientific adviser does not beware, the research laboratory will be the first thing to go. Indeed, it is up to the scientific adviser to find something that he can spare without the sequel of commercial tragedy; something that the new dictator can call dead wood, and cut out to heart's content.

But there is another side to this problem that old manufacturers who know their business, and experienced technologists as well, all too often neglect for fear of the venture. This is to scrap important parts of a plant as they become antiquated. Apparatus ceases to be *perfectly* good as soon as it is improved upon. The mere fact that an apparatus functions as well as it did several years before does not suffice if something to produce a better yield or a better quality has been invented in the meantime. Soon other apparatus is likely to show the same defect, and when a whole plant is out of date it usually requires an issue of bonds to save it—provided always, first that the bonds may be sold, and second that the banking house that sells them does not want a perpetual grip on a large part of all possible profits in the future.

In one important industry in the United States the average life of a layout is from 15 to 20 years. In Germany it has been the custom to renew the same type of plant about once every 5 years.. Now, how on earth

can an old works of 20 years' standing compete with an establishment that has been renewed three times during the same span? It is out of the question. It takes both courage and understanding to scrap an apparatus that is unimpaired by wear. What to put on the scrap heap is one of the hardest decisions to make in industry. Results are likely to be fatal if ignorance enters into the discussion. It takes a real man to choose.

Apropos of this very problem let us quote a sentence from a late address on education by Dr. STEARNS of Andover before a group of newspaper and magazine editors and writers. We think it fits "It is the very abyss of error," he exclaimed, "to hold that the purpose of education is to teach boys to obey. Our business is to teach them to choose!"

"The Heathen Chinee Is Peculiar"

"WHEN I lived in China," said a companion at dinner lately, "I had very little difficulty in getting things done. That is, I had practically no more difficulty after I learned how to give instructions. This consisted in announcing what I wanted or the thing I desired done, and saying no more about it Trouble came whenever I attempted to tell a Chinaman *how* to do a thing. That invariably confused him, because in every possible way the East differs from the West. The carpenter draws his plane toward him instead of pushing it away; he draws his saw up instead of forcing it down, and the saw-teeth are adjusted to this practice; the new-born infant puts the flat of his hands up to his eyes when he cries, and not his knuckles the way our babies do; indeed every method seems to be as different from ours as it can be made to be. Tell a Chinaman what you want, and he will get it or do it for you in his own way, but do not undertake to tell him how. He is competent and practical, but also in his own way."

This brought to mind a little 94-page book, called "Inorganic Chemistry," by Z. C. DAZE, paper-covered, printed in English in China. Mr. DAZE is now teaching chemistry in his native country, but a number of years ago he was a student under Prof RALPH H. MCKEE, now of Columbia University but then stationed at the University of Maine, at Orono. It was Professor MCKEE who showed us the little books of his erstwhile pupil.

The "Inorganic Chemistry" steps right into the subject by means of a case system, very like the method of teaching law which is current at some of our universities. Standard text-books are recommended, but no reference is made to them. The first chapter deals with general principles and contains 100 questions. Anyone who can answer 100 questions correctly has the very groundwork in chemistry that we want him to have. They are for beginners, but they are fundamental. The student has no chance to learn his lesson by rote.

Let us cite a few of them to indicate this scope. "Compare," says Question 23, "the energy contents, pressure, volume and rate of molecular action of gaseous ammonia with liquid ammonia." Question 26 wants to know if balanced reactions are of any value to a chemical manufacturer. "What conditions favor him?" is asked, and "Define chemical manufacture in terms of equilibrium," is demanded. "What relative positions do silver and gold occupy in the e.m.s., and give reasons for your answer," is Question 32. Under 9, "According to Hess' law of constant heat summations does the law of mass action hold good for matter and energy as well?" And so on. Chapter II is given over to calculations, and they are fair slices out of a chemist's life. Chapter III is devoted to carbon. Then come experiments, and after that a list of remarkably good definitions.

It is an excellent book, designed for young men who are resolved to master the subject, and it is also an effective discourager to those who would like to pass for chemists without paying for the privilege in thought and work. It is cheaply printed and bound; we doubt if it sells for over a quarter in China, but it has the stuff in it.

Professor MCKEE showed us three other booklets by Mr. DAZE, printed in Chinese. These we hesitate to expound for reasons that would attack the theory of editorial omnipotence to acknowledge. They are little works on technology that sell for about 10 cents each. One is on Pigments and Lakes with references up to date of publication in 1922. Another is on Paints and Varnishes of the same year. One was the second of two volumes called Talks on Oils, dated 1920, also containing references. The two former are illustrated with drawings. The drawings are curious, but they are all right.

"The heathen Chinee is peculiar," said BRET HARTE. He is indeed peculiar. He is also intelligent and worth while. He has imagination and the gift to do things in his own way. We believe that when our Chinese neighbors get themselves established in the science and the art of chemistry, their contributions will be immense.

Patents, Patenting And Publicity

A DISCUSSION of patents and patenting with an industrial chemical engineer recently brought out several important aspects of the question. In the first place, he emphasized that he secured patents covering processes in operation in his plant for no other purpose than to prevent the unwelcome attention of pirate "inventors"—individuals or companies whose tactics indicated a disregard of professional ethics, who made it a practice to study the patent records and, when possible, to file claims for an idea that another person had evolved and put into practical operation but which was apparently not covered by existing patents. These crooks would then forbid the original inventor from operating his own process, or allow him to do so only after payment of royalty. Disorganization in industrial work that follows such reprehensible practices is deplorable; the pirate usually has no difficulty, if the court demands it, in detailing his own researches. Only a simple outline is necessary, and the secrecy usually surrounding research is used as a camouflage. Disproof of his statement is difficult.

Science in industry is on a firm foundation, however, and our informant cited more than one instance in which, after being thus deprived of its moral right to benefit from its own initiative, a company had set to work and developed an alternative process. This was promptly patented, and technical progress was not delayed.

If the story can be made to point a moral, it is that emphasis should be paid to the necessity for corporations employing technical processes to see that future

developments are not hampered by fruitless patent litigation. The importance of adequate legal protection to permit continuous use of processes and equipment that have been developed within the organization cannot be overemphasized. The fascination of scientific achievement sometimes overshadows the need for commercial caution, but it is essential that the chemical industries, especially those in process of change and development, should take advantage of the best legal talent available for their patent problems.

Classroom Specialists

IT IS truly amazing how many things a modern engineer—even a metallurgical engineer—must know, if you listen to everybody. He must first of all have a well-rounded education in order to be an ornament to society. He must know business and business law, because he should be fitted for executive positions. He must be well trained in economics, because his opinion may be asked on the desirability of competing for foreign trade, and it certainly takes an economist and an expert mathematician even to compute the values of common articles in European currency. Oh, yes, accountancy would help here.

So it is. The engineer must be littérateur, financier, business man, accountant, lawyer, economist. And the funny part of it is that eminent educators who are advocating these things in one breath are in the next bewailing the pressure brought to bear on them by neighboring factories, making spinning tops or carpet tacks, to turn out students who have specialized on the problems of manufacture of spinning tops or carpet tacks. What we need, says the manufacturer, is a carpet tack engineer. Oh, no, says the educator, what you need is a human engineer, a management engineer!

It is hard to tell which is the more absurd. Every one has met all kinds of men appropriating to themselves whatever virtue may accrue with the use of the word engineer, like "efficiency engineer," or "sales engineer," or "management engineer," or "carpet tack engineer." The other day a big van passed by with the sign "Finnerty & Glattwitz, Moving Engineers." Moving, indeed!

These thoughts lead up to the observation that the education of the metallurgist should be more on fundamentals and less on specialties. It is impossible to become a specialist by studying in college—it is even impossible to predict what specialty a student will need in after life.

We might cite the history of a good friend. Educated as an electrical engineer, he was associated for several years with a traction company, but as an avocation he investigated many problems in magneto design and operation. When the war came he enlisted in the British army, was assigned to technical service, and spent 4 years in the air service on developmental, test and instruction work. When he was in school, what crazy person would have predicted the importance of flying machines?

Then when the war was over, there appeared to be little demand for aviation experts, so he got a job with a Cleveland engineer as an ordinary draftsman. The first task given him was to work up a machine for the manufacture of automobile license tags. It would have been absolutely impossible for either the student or the instructor, during the days when that man was in school and when there were a few two-lung Cadillacs chugging about the streets, to have conceived by the wildest stretch of the imagination the day when Fords, trucks, and automobiles would be so numerous that they have to be licensed, and that by the million.

Engineering, after all, is the application of the laws of mathematics, chemistry and physics through machines and structures for the benefit of man. What more obvious, then, that a great effort should be made toward instructing the student in these laws, and, what is equally important, by well-directed experiments teaching him how these laws are applied through various machines and instrumentalities—in other words, instructed not only in the laws themselves, but given enough practice so he can use these laws as tools? If there is any spare time, let him specialize in the literature of the Italian Renaissance or the art of the early Sumerians.

One Way to Finance New Ventures

ON A main thoroughfare of the Biggest City a relative of our old friend Mr. QUICKTURN CAPITAL is doing his bit for progress and humanity. A big sign on the door in 1,000 point type shouts "RADIUM" to the passing world. "Free exhibit of radium ores" is the gist of another poster. Sure enough, there is a table and pieces of minerals thereon. After you have gazed your fill you notice a small electric train going into a tunnel and around a track to show you how the ore is brought to the surface. Next there are some pictures of the Rocky Mountains, apparently all owned by this radium company, which, you begin to realize, must be quite an organization. There follows a more modern appeal: charts. What things do we get from our ore? Lead, silver, uraninite (sic, hic or hick?), radium! Each word printed in pink and lavender to emphasize perhaps the unique property of the ore. Pink lead and lavender radium! And yet another chart which says that according to government reports railroads, industrials and other stocks bring in from 4 to 14 per cent, whereas mining stocks pay 162 per cent! Think of it! That being the end of the exhibit, we turn to go out and are faced with an imposing line of desks each bearing the nameplate of an alert, intelligent looking young man seated behind it. We could not help cursing ourselves for being suspicious of the whole thing. It was a well-conceived and interesting sales effort.

Yet even if the project is honest and the men behind it capable and trustworthy, there is a point in the ethics of such selling that is bad. If we might borrow from P. T. BARNUM, it is a "sucker" appeal which is made. It is not an effort to interest intelligent investors nor to satisfy those who do invest of the soundness of the venture. The casual passerby is lured into the store out of curiosity. A certain percentage of these will by the law of probability have money to invest. Some of them can even be persuaded by Mr. QUICKTURN CAPITAL'S cousins to part with their money by the use of meaningless technical phrases that lend an air of substantiality and by means of glowing pictures of large profits. The cupidity of the investor does not excuse the method. There is no question of legality, but of ethics. For this reason the practice will most probably continue—for it seems to be successful wherever the sky is blue.

"The Modification" of Aluminum-Silicon Alloys

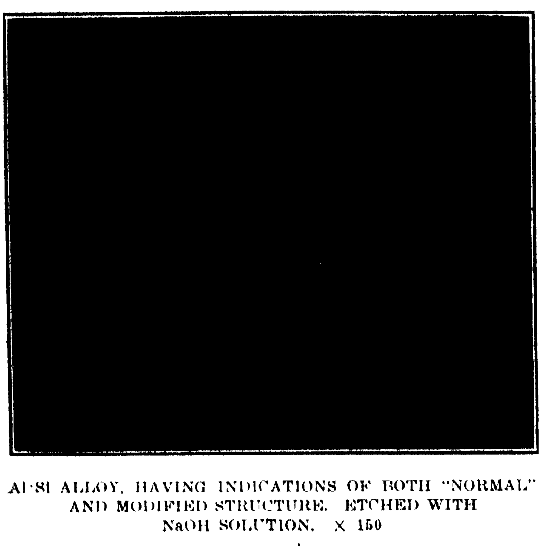
To the Editor of Chemical & Metallurgical Engineering

SIR: —In an article, "'Modification' of Aluminum-Silicon Alloys," by James J. Curran, published in *Chem. & Met.*, Aug. 23, 1922, it is stated that alloys containing from 5 to 10 per cent of silicon "may possess either one of two entirely dissimilar structures."

This opinion is concurred in by the above writer and, as stated, by the writers of three other articles. It is stated that the difference in the two dissimilar structures is due to the presence of sodium in one of them. The photomicrographs and experimental evidence given appear to bear out the above contention. However, no data were given as to the difference in physical properties produced by the addition of sodium, a deficiency supplied later by Dr. Edwards (*Chem. & Met.*, Sept. 27, 1922, p. 654).

While examining an aluminum-silicon casting the writer obtained the accompanying photomicrograph. The composition of the casting was as follows: aluminum 87.09 per cent, copper 0.18 per cent, silicon 10.68 per cent, iron 1.79 per cent, manganese 0.26 per cent. My alloy had a structure like the one described by Jeffries (April 19, 1922), containing 10 per cent silicon and 1 per cent iron, made by direct electrolytic reduction. There is seen the needle-like structure supposed to be obtained in the absence of sodium as well as the structure obtained by the introduction of sodium.

It is possible that the structure shown is a transition stage between the two "dissimilar structures." However, it is probable that the presence of sodium is not sufficient to account for the differences in structure. Small amounts of iron give a needle-like structure (Hoyt, "Metallography," Vol. II, p. 77), which might possibly account for the needles shown. However, with a structure, supposed to be due to the presence of sodium, such needles should not appear, according to Curran's article, since the sample used in his experiment contained 0.70 per cent of iron.



AL-SI ALLOY, HAVING INDICATIONS OF BOTH "NORMAL" AND MODIFIED STRUCTURE. ETCHED WITH NaOH SOLUTION. X 150

The specimen used was repolished and re-etched with NaOH solution. Each time the resulting structure was as shown.

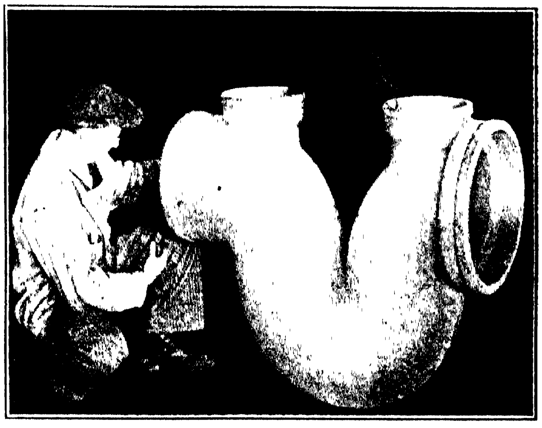
Mammoth Acid Drain Pipe In Yale's Sterling Laboratory

To the Editor of Chemical & Metallurgical Engineering

SIR:—I have read with considerable interest the very excellent article that appeared in your issue of Feb. 28 on the Sterling Laboratory of Yale University, and while it may seem meticulous to point out any detail so far removed from the casual inspection of this great laboratory as the main acid drain, my attention was attracted by the statement in the article that "a drainage system has been installed entirely of chemical stoneware."



DURIRON 14-IN. RUNNING TRAP FOR STERLING LABORATORY, YALE UNIVERSITY

The fact that the Duriron Co. furnished the main drain pipe and fittings for the Sterling Laboratory is particularly recalled by me, inasmuch as these lines were of 10- and 14-in. size, the largest drain pipe that had been produced in Duriron at that time.

This one detail of the construction problems serves to emphasize the immensity of this building, inasmuch as the main drain pipe from an educational laboratory rarely exceeds 6 in.

The accompanying photograph of one of the Duriron 14-in. fittings will aid in visualizing the scale on which the Sterling Laboratory is built.

THE DURIRON CO., INC.
P. D. SCHENCK, President.

Some Research of General Interest in Progress at the Mellon Institute

Outline of Present Status of Investigations Being Conducted in Fellowships Covering Bread, Carbon Dioxide, Coke, Corrosion, Fiber Containers, Gelatine, Insecticides, Insulation, Laundering, Magnesia Products, Mundacizing, Nickel and Monel, Refractories, Vitrified Tile, and Wood Chemicals

BY ALAN G. WIKOFF

TEN years ago the Industrial Fellowship system, formulated by Dr. Robert Kennedy Duncan in 1906, placed in experimental operation at the University of Kansas in January, 1907, and inaugurated at the University of Pittsburgh on March 1, 1911, was established on a permanent basis as the Mellon Institute of Industrial Research. During this first decade, the steady growth of the system has been attended with results of such economic importance to a variety of industries that the fame of the Institute and its work has spread throughout the technical world.

In this connection it is interesting to note that out of 350 Fellowships, 300 have been entirely successful. Of the remainder, 26 were of doubtful success, 11 unsuccessful and 13 were not completed. While in many cases the Fellowships are maintained by a company for its exclusive information, the volume of data which has been made available through publication is really surprising. Indeed, a mere enumeration of the books, bulletins, journal contributions and patents by members of the Institute during the period 1911-1922 forms a pamphlet of 37 pages.[1]

At the present time, 80 Industrial Fellows are conducting research on 50 Fellowships, covering the following subjects:

Asbestos, bread, byproduct recovery, carbon dioxide, chrysotile, cleaning, coke, corrosion, dental alloy, emulsion, flavoring, enameling, esters, fertilizer, fiber, food container, gelatine, glue, heavy chemicals, inks, insecticides, insulation, laundry, magnesia products, medicinals, metallic oxides, metal ware, natural gas, nickel, oil, organic synthesis, perfumes, pharmaceuticals, protected metals, refractories, roofing, salt, silicate, slag, smoke, steel, stove, synthetic acids, synthetic resins, textile finishing, varieties, varnish, vitrified tile and wood chemicals.

The complete list of Fellowships and personnel is given in Table I.

While it is obviously impossible to attempt to present a complete picture of current activities at the Institute, the writer feels that a résumé of some of the research in progress may serve to give a clearer conception of the workings of this great organization. At the same time he doubts whether it is possible to convey by means of the written word even a small measure of the spirit of enthusiasm and co-operation which is at once evident to the visitor at the Institute and which permeates its every undertaking.

Through the courtesy and co-operation of the executive staff and the Fellows themselves, general information regarding recent research on sixteen topics is presented in the following pages. In some cases the earlier status of the work has been outlined in a previous article by Savage.[2]

It will be noted that a number of Fellowships are maintained by associations of manufacturers. This is a phase which is becoming increasingly important, as the Institute thereby renders service to a whole group instead of to an individual, and it is possible to conduct the investigations on a more elaborate scale, because the expense is distributed. Most of the results in association research are of such a nature that they may be published without reservation. In the extension of uses for materials, a type of pioneering which is being carried out on a number of Fellowships, the concerted action which is possible through associations is very helpful.

Contact with the Institute and the Fellow is maintained as a rule by a research advisory committee appointed by the association and consisting of three or four officers of company members who are recognized specialists in the field under study. Through their co-operation, the work is planned and the Fellow supplied with necessary materials and all technological information. As in the case of all Fellowships, progress reports are made weekly to the administration. These are summarized into monthly reports for the information of the donors, followed by annual reports if the Fellowship is extended for more than one year. At the termination of the research a monograph is prepared.

[1]Copies of this list, which is Bibliographic Series, Bulletin 1, may be obtained from the Director, Mellon Institute of Industrial Research, Pittsburgh, Pa.

Table I—List of the Industrial Fellowships in Operation at Mellon Institute on March 1, 1923

No.	Names of Industrial Fellowships	Industrial Fellows Names and Degrees	Date of Expiration
181	Synthetic resins	C. B. Carter (Ph.D., University of North Carolina), senior fellow, A. E. Coxe (B.S., University of Chicago)	April 1, 1923
309	Glue	A. M. Howald (Ph.D., University of Pittsburgh)	April 1, 1923
324	Textile	E. R. Clark (B.A., Yale University)	May 1, 1923
326	Enameling	R. D. Cooke (M.S., University of Wisconsin)	April 1, 1923
327	Varnish	Marc Darrin (M.S., University of Washington)	May 1, 1923
328	Steel	B. B. Wescott (Ph.D., University of Pittsburgh)	June 15, 1923
329	Stove	J. F. Hansen (B.S., University of Illinois)	June 22, 1923
330	Bread	H. A. Kohman (Ph.D., University of Kansas), senior fellow, Roy Irvin (M.S., University of Kansas), E. S. Stateler (M.S., University of Pittsburgh)	June 1, 1923
331	Protected metals	J. H. Young (Ph.D., Ohio State University), senior fellow, P. D. Gephart (B.Ch.E., Ohio State University)	June 1, 1923
332	Food container	W. F. Henderson (Ph.D., University of Pittsburgh), senior fellow, H. E. Dietrich (A.B., University of Kansas)	July 12, 1923
333	Corrosion	C. R. Texter (B.S., Pennsylvania State College)	July 1, 1923
334	Gelatine	T. B. Downey (Ph.D., University of Pittsburgh)	Sept. 1, 1923
335	Ester	J. J. Fitzpatrick (B.Chem., University of Pittsburgh)	Aug. 5, 1923
336	Oil	W. F. Faragher (Ph.D., University of Kansas), senior fellow, W. A. Gruse (Ph.D., University of Wisconsin), R. W. Henry (B.S., University of Oklahoma), S. P. Marley (B.S., University of Pittsburgh)	Sept. 1, 1923
337	Metallic oxides	G. F. Seil (Ph.D., University of Pittsburgh)	Sept. 1, 1923
338	Slag	Tracy Bartholomew (E.M., Colorado School of Mines), senior fellow, H. C. Goover (A.B., Ursinus College)	Sept. 21, 1923
339	Gas	J. B. Garner (Ph.D., University of Chicago), senior fellow, Gertrude E. Price (A.B., Goucher College), assistant	Sept. 15, 1923
340	Wood chemicals	R. F. Remler (B.Chem., University of Pittsburgh)	Nov. 1, 1923
341	Perfumes	L. E. Gilson (Phar.B., University of Southern California), E. H. Balz (Ph.D., University of Pittsburgh)	Oct. 1, 1923
343	Pratt	L. H. Cretcher (Ph.D., Yale University), senior fellow, F. W. Hightower (B.A., University of Texas)	Dec. 15, 1923
344	Inks	F. F. Rupert (Ph.D., Massachusetts Institute of Technology)	Nov. 1, 1923
345	Chrysotile	Henry Joseph (Ch.E., Columbia University)	Jan. 1, 1924
346	Laundry	A. F. Shupp (Ph.D., University of Pittsburgh), senior fellow, Alice L. Wakefield, (B.S., Carnegie Institute of Technology), Mary M. Danley (B.S., Carnegie Institute of Technology)	Nov. 1, 1923
347	Emulsion flavors	Melvin DeGroote (B.Ch.E., Ohio State University)	Nov. 15, 1923
348	Heavy chemicals	E. E. Marbaker (Ph.D., University of Pennsylvania)	Dec. 1, 1923
349	Fiber	M. C. Walsh (Chem.Eng., Columbia University)	Nov. 15, 1923
350	Salt	T. E. Williams (B.S., University of Michigan)	Nov. 1, 1923
351	Nickel	O. B. J. Fraser (B.S., Queen's University), senior fellow, H. E. Searle (B.S., Queen's University)	Dec. 1, 1923
352	Silicate	J. I. Crawford (B.S., University of Illinois)	Dec. 1, 1923
353	Medicinal	C. C. Vogt (Ph.D., Ohio State University)	Jan. 1, 1924
354	Varieties	J. R. Harding (M.A., Leland Stanford University), senior fellow, F. J. Murphy (B.S., University of Pittsburgh)	Jan. 1, 1924
355	Fertilizer	H. H. Meyers (B.S., University of Pennsylvania), senior fellow, W. T. Nichols (B.Chem., University of Pittsburgh)	Jan. 5, 1924
356	Insulation	R. H. Heilman (E.E., University of Pittsburgh)	Jan. 1, 1924
357	Coke	F. W. Sperr, Jr. (B.A., Ohio State University), advisory fellow, W. J. Huff (Ph.D., Yale University), H. W. Rose (B.A., Yankton University), J. A. Shaw (B.S., Pennsylvania State College), G. G. Dosy (B.S., Worcester Polytechnic Institute)	Jan. 1, 1924
358	Byproducts	Walther Riddle (Ph.D., University of Heidelberg), H. F. Gill (Ph.D., University of Pittsburgh), assistant	Jan. 1, 1924
359	Insecticides	O. F. Hedenburg (Ph.D., University of Chicago)	Feb. 1, 1924
360	Asbestos	G. H. Katz (B.S., Ohio State University)	Feb. 1, 1924
361	Metal ware	W. G. Imhoff (M.S., University of Pittsburgh)	Feb. 16, 1924
362	Organic syntheses	J. G. Davidson (Ph.D., Columbia University), senior fellow, C. J. Herrly (B.S., Pennsylvania State College), A. R. Cade (M.S., University of Minnesota), J. T. Baldus (B.Chem., University of Pittsburgh), assistant	Jan. 1, 1924
363	Synthetic acids	R. B. Trusler (B.S., Syracuse University)	Feb. 1, 1924
364	Dental alloy	J. W. Harsch (B.S., University of Illinois)	March 1, 1924
365	Roofing	I. S. Ross (M.S., New Hampshire College)	Feb. 1, 1924
366	Refractories	M. C. Booze (B.S., University of Illinois), senior fellow, S. M. Phelps (University of Toronto), R. F. Ferguson (B.S., University of Pittsburgh), Jules Labarthe (B.S., University of California), W. R. Kerr (University of Pittsburgh), assistant	March 1, 1924
367	Magnesia products	H. W. Greider (M.S., University of Kansas)	March 1, 1924
368	Pharmaceuticals	A. W. Harvey (Ph.D., University of Pittsburgh)	March 1, 1924
369	Smoke	A. R. Powell (Ph.D., University of Illinois)	March 1, 1924
370	Vitrified tile	H. G. Schurecht (B.S., University of Illinois), senior fellow, G. R. Pole (B.S., University of Washington)	March 1, 1924
371	Vitrified tile	H. G. Schurecht (B.S., University of Illinois), senior fellow, G. R. Pole (B.S., University of Washington)	March 1, 1924
372	Cleaning	L. F. Jackson (B.S., University of Kansas), senior fellow, Helen E. Wassell (B.S., Carnegie Institute of Technology)	March 1, 1924

At present, the following Industrial Fellowships are maintained by associations of manufacturers:

Name	*Company-Members in Association*
Carbon dioxide	7
Edible gelatine	7
Fiber	25
Insecticides	5
Laundry	2066
Magnesia products	2
Metal ware	15
Mundacizing	10
Refractories	90
Stove	15
Vitrified tile	44
Wood chemicals	68

Vitaminous Bread

Henry A. Kohman, Roy Irvin and E. S. Stateler, on the Bread Fellowship, have been aiding the Ward Baking Co. laboratories in developing a bread, now on the market, which is a complete food.

By feeding tests on laboratory animals using the best white breads obtainable by the usual methods of manufacture, it was ascertained that, as exclusive articles of diet, these breads could not provide either growth or increase in body weight and that the animals under observation could not exist on bread alone. Whole wheat bread was also found deficient. With the addition of vitamines and mineral salts from wheat germ and bran, the animals under test showed improved condition and better development, although they still did not reveal normal growth. It then developed that the proteins in the bread were not properly balanced and that milk proteins were needed. Making the bread with milk instead of water and adding extra milk solids solved this particular problem. Addition of the new wheat germ extract was also necessary in order to balance the mineral salts. Indeed, the addition of many substances was tried and by eliminating all nonessentials and retaining the necessary and vital substances, the growth of the experimental animals was improved step by step.

Finally there resulted a bread on which the animals under observation grew to maturity and remained in a healthy condition. More important still, these animals were able to reproduce and rear their young, which had not been possible with previous breads. As many as six generations of animals have been raised on this new bread as the sole source of food, only city water being supplied in addition to the bread in all the concluding animal tests.

In making this new bread, which is already on the market in a number of cities, the vitamines and mineral salts recovered from the byproducts from milling wheat are restored to the white flour, and, with the additional vitamines and proteins provided by the use of rich whole milk, without any water whatever, a loaf of bread is produced which is a balanced food, complete in itself.

This work presents an almost ideal answer to the oft-repeated question, "Does research pay?" since one of the factors essential to successful research—benefit to the public as a whole—is more clearly evident than in the average instance.

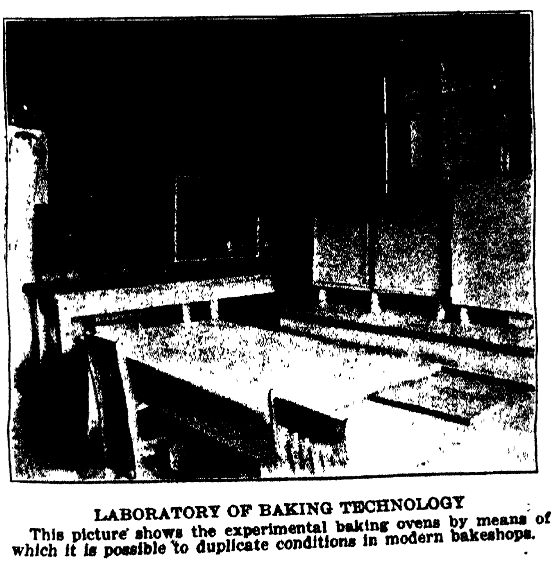
Uses for Carbon Dioxide

For the purpose of classifying, investigating and extending the uses of carbon dioxide, particularly liquid carbon dioxide, the Liquid Carbon Dioxide Division of the Compressed Gas Manufacturers' Association has established an individual Fellowship, C. L. Jones being the present incumbent. Data of unusual interest have been accumulated, some of which will be treated in more detail in an article on the uses of liquid carbon dioxide to be published in a subsequent issue. Mr. Jones is now according research attention to the use of liquid carbon dioxide in extinguishing mine and electrical fires.

Coke Fellowship

Although only five names appear under the multiple Industrial Fellowship on coke, the Koppers Co., which maintains the Fellowship, has a chemical research force which averaged about twenty members for the year 1922. F. W. Sperr, Jr., chief chemist of the Koppers Co., is senior advisory Fellow.

Owing to the wide interests of this organization, the Fellowship activities may be divided into two classes: Research problems; and necessary testing work required for the construction of byproduct coke and gas-oven plants with complete byproduct recovery, and tar-distilling and liquid purification plants. This testing work also includes the examination of coals for yield and nature of coke and byproducts, to be used as basis of plant guarantees; the examination of tars, etc.



LABORATORY OF BAKING TECHNOLOGY
This picture shows the experimental baking ovens by means of which it is possible to duplicate conditions in modern bakeshops.

In regard to the research problems, the most noticeable recent accomplishment has been the commercial development of the liquid purification process for removal of hydrogen sulphide and also hydrogen cyanide from the gas. Over twenty liquid purification plants are in operation or under construction, and the process is also being exploited in foreign countries. A plant is being started at the present time in England.

Purification of ammonia-still waste is rapidly becoming necessary for many plants and methods for carrying out this purification have been developed through research.

Another important line of investigation has been the study of coke from the standpoint of physical characteristics, with special reference to its performance in the blast furnace. Of most immediate interest is the combustibility of coke.

These three phases—gas purification, ammonia-still waste purification, and study of coke—are the most important lines of investigation in progress at the present time and work will be continued thereon during the coming year.

The investigation of new uses for byproducts from coke plants is always under consideration. This is especially true of coke-oven tar and light-oil products.

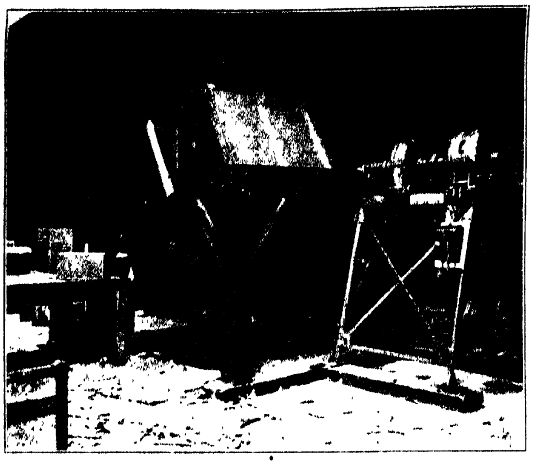
The various members of the organization have over eighty United States and foreign patents issued or favorably acted upon, covering various phases of the work. Among the research accomplishments of the past (mostly during the period of the war) are the recovery of benzene and toluene from carburetted water gas, the manufacture of coumarone and other resins, and motor fuels.

Corrosion

One of the well-known manufacturers of steel pipe is the donor of a Fellowship on corrosion, the work of which is being carried on by C. R. Texter. This Fellowship is devoted to a study of the effect of different kinds of water upon the internal corrosion of pipe lines, and of practical means for the prevention thereof. It has been found that, in natural waters, one of the most important factors influencing the corrosion of steel and iron pipes in hot water supply systems, boiler economizer tubes, etc., is the amount of oxygen carried in solution by the water. Another large factor is the chemical composition of the water itself, upon which depends the tendency of the water to form or not to form a self-healing protective film upon the surface of metal containing the water. This question is being investigated in a practical way upon as many different waters as possible.

Increasing the Service Rendered by Fiber Containers

Within recent years the partial replacement of wooden boxes and crates by fiber containers has become increasingly important. In addition to such advantages as lower first cost and reduced shipping weight, the use of the fiber products aids in conserving a natural resource which is being depleted at an alarming rate. Much of the progress toward the present highly satisfactory container is the result of investigational work



DRUM TESTER

Used in the tests made by the industrial Fellowship maintained by the Container Club, an association of manufacturers of solid and corrugated fiber boxes

conducted under the Fellowship maintained by the Container Club, an association of corrugated and solid fiber box manufacturers. Standardization and improvement of raw materials, manufacturing processes and finished products have been the aims of this work, which is at present carried out by Maurice C. Walsh.

Some of this work was summarized in the previous report.[5] For the purpose of determining resistance to handling and rough usage, there has since been installed a revolving 7-ft. hexagonal drum with various baffles, in which the containers receive in a brief period more severe treatment than would result from a transcontinental shipment. This drum has been of immense utility in determining the values of different box designs and the worth of proposed improvements and changes.

Recently a series of 500 fiber cases, consisting of 5-case lots of each product which a prominent food manufacturer packs in glass, was run in the drum tester to the point of breakage of the first bottle. Physical tests of the bottles were also made in four different ways and it was shown in a hearing before the Interstate Commerce Commission that there is no relation between the fragility of glass bottles and breakage in shipment when packed in fiber containers.

Stacking qualities of the boxes are determined by hydraulic-press tests, and it is interesting to note that fiber boxes have now been developed which will stand, when empty, a pressure of over one ton without collapsing.

Service facilities of the laboratory are available without charge to the general public for the benefit of the industry and a great deal of the work is done for shippers and manufacturers not members of the Container Club. A report on work done is made every 2 months at the meetings of the Container Club, and frequent visits are made to plants of box manufacturers and shippers, so that their problems may be studied at first hand.

Determining the Food Value of Edible Gelatine

Thorough investigation of the food value of edible gelatine is being conducted by T. B. Downey, in a Fellowship established by the Edible Gelatine Manufacturers of America, Inc. Through feeding experiments on albino rats, an effort is being made to get definite information on the real food value of gelatine as well as its supplementary action when used in conjunction with other food products. Its uses in confectionery and in ice cream present specific problems to be studied. In the case of milk it has been found that gelatine acts as a protective colloid, preventing the development of hard curds, and thus making the milk easier to digest. Gelatine functions in a similar way to make ice cream easier to digest, in addition to acting as a stabilizer. Dr. Downey has completed arrangements with medical specialists for thorough study of gelatine in infant feeding.

Enthusiastic personal interest in the progress of the work is taken by the donor of the Fellowship. It has been determined to establish and to make public the true facts as to just what gelatine does in all of its present uses and just what is its real food value.

Research and the Power Laundry

In 1914 a small group of Pittsburgh laundry owners, realizing that they were beset by technical problems beyond the comprehension of laymen and that the then recently organized Mellon Institute was equipped to solve them, established an Industrial Fellowship for the investigation of problems in laundering. About 18 months later the financial obligations were assumed by the Laundryowners National Association, making the services of the laboratory available for about 2,000 laundry members throughout the country. In the present multiple Fellowship, Dr. A. F. Shupp is assisted by Alice L. Wakefield and Mary M. Danley.

Standardization of supplies constituted the first work of the Fellowship, for many of the preparations used in the laundries were sold under trade names and it was necessary to ascertain the merit of each product. Attention was then directed to standardization of procedure, work on these two phases culminating in the publication of a "Manual of Standard Practice for the Power Laundry Washroom." In this treatise standard formulas for washing all types of fabrics are given, together with discussions of water, soap, soda and other supplies. Before making these recommendations, the possibility of disease being spread through laundries was carefully considered. Bacteriological tests showed that a treatment at least 20 minutes at a temperature between 140 and 160 deg. F. destroys all pathogenic non-spore-bearing organisms, while the dry rooms, tumblers and ironing process complete the sterilization.

During the past year the question of low-titer versus high-titer soaps has been under consideration. It has been shown that solutions of high-titer soaps exhibit lowest surface tension at about 140 deg. F., while the

VIEW IN MAIN RESEARCH LABORATORY OF THE LAUNDRYOWNERS NATIONAL ASSOCIATION

[5]See footnote 2.

corresponding temperature for low-titer soaps is around 90 deg. F. Since maximum emulsifying power obtains at the point of minimum surface tension, this would indicate that low-titer soaps should be more efficient for washing in cold or lukewarm water.

Although standard procedures have been worked out, it must be remembered that it is not possible for the laundry to standardize the goods which are sent to it. Adjustment of claims for damage is an important item in laundry management and studies of this phase soon developed the interesting fact that in many cases the fabric itself and not the laundry was at fault. While only four fibers are in general use—cotton, linen, wool and silk—improper manipulation during spinning, weaving, bleaching, dyeing, etc., often introduces defects which may not be evident until the finished goods are wet or washed, when they disintegrate or distort in a manner which would seem to indicate very rough treatment by the laundry. For instance, cloth may be finished and dried with some of the threads under greater tension than others. As long as the goods remain dry, they appear satisfactory; but when wet, the threads assume a normal tension and the piece shrinks unevenly or gets completely out of shape. Other examples were given in the previous article.

This aspect of the work has become so important that the entire time of one of the incumbents is devoted to it. It is realized that the solution of these problems lies in educating the buyers of textiles to discriminate between the well-made product of a reputable manufacturer and the clever but inferior imitation which often brings a higher price. This is an undertaking of considerable magnitude, but an excellent start has been made through the publication of a treatise on "The Conservation of Textiles," in which, for the first time, the faults of textiles are discussed in detail. It also includes a plea for a pure fabric law. The interest and co-operation of many of the larger textile mills have been secured and it is planned by the Laundry-owners National Association to carry on the campaign through distribution to the public of a series of educational leaflets covering the selection and care of textile products.

Insecticides

As noted in the previous article,[4] important research on the manufacture of lead arsenate and calcium arsenate has been conducted by Dr. Oscar F. Hedenburg, Industrial Fellow for the Rex Spray Companies, an association of manufacturers of insecticides of all types. More recently there has been developed through this research work a new and valuable household insecticide which is very effective against flies, mosquitoes, moths and other insect pests. This new material, "Fly-Tox," is a clear, amber-colored liquid of a pleasing odor and is applied by spraying.

[4]See footnote 2

Heat Insulation

Until the present Industrial Fellowship year the work on heat insulation was supported by the Magnesia Association of America. By special arrangement the association gave permission to the present donor—an individual manufacturer of heat-insulating materials—to subsidize the investigations.

At the present time, R. H. Heilman is conducting a series of tests for the purpose of determining the merits of insulations for superheated steam and of developing new coverings to keep pace with the growing demand for higher pressures and superheat.

The electrical method of testing is employed in the laboratory and pipes of various sizes are used in order to derive formulas whereby the losses from pipes of any size and operating under any condition of steam pressure can be readily and accurately calculated.

EXECUTIVE STAFF

Edward R. Weidlein — William A. Hamor — E. Ward Tillotson — Harry S. Coleman

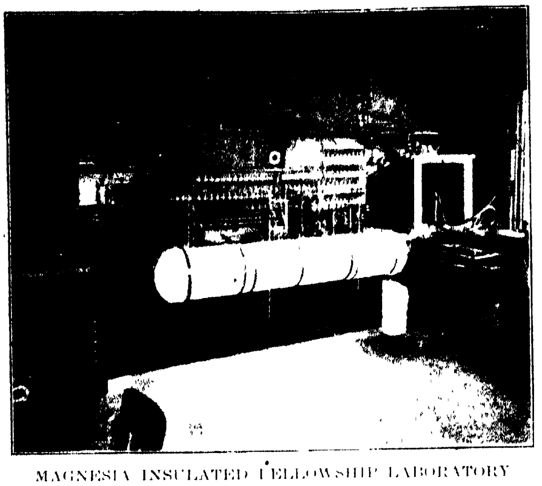
Many tests are being conducted in the laboratory to determine the thermal conductivity of various insulations and the laboratory tests are frequently checked by field tests, so as to obtain not only the thermal efficiency of the coverings but also their practicability as heat insulators under actual operating conditions.

For a paper entitled "Heat Losses From Bare and Covered Wrought Iron Pipe at Temperatures up to 800 Deg. F.,"[5] presented before the American Society of Mechanical Engineers in 1922, Mr. Heilman was awarded one of the society's junior prizes.

New Uses for Light Magnesium Carbonate

Light magnesium carbonate, the chemically precipitated basic hydrated carbonate of magnesium, possesses properties which would indicate the possibility of extending some of the present applications and of developing new ones, while modification of certain physical properties would make it better adapted for

[5]Abstracted in *Chem. & Met.*, vol. 27, p. 63, July 12, 1922. *Mechanical Engineering*, vol. 44, p. 435, July, 1922.



MAGNESIA INSULATED FELLOWSHIP LABORATORY

many uses. This, in brief, is the purpose of the magnesia products Fellowship, maintained by two prominent manufacturers of this material.

Convinced by a preliminary survey that the rubber industry afforded one of the most promising fields, H. W. Greider made a study of some physical properties of rubber compounded with light magnesium carbonate and with other pigments. The magnesium carbonate was found to act as a typical reinforcing pigment, increasing the tensile strength, hardness, stiffness and resilient-energy capacity of the compounded rubber. Only gas black exceeds it in reinforcing power. However, owing to the crystalline character of the present product, it tends to give a high permanent set, which is not generally desired. Work in progress includes a study of particle size with the object of increasing the uniformity while decreasing the size of the particles and also of increasing the ease of dispersion in rubber and other materials in which it is used as a filler.

Abrasion resistance is another property of vulcanized rubber which has received careful attention. In this connection it is interesting to note that the eminent English authority Dr. Philip Schidrowitz, commenting in the *India Rubber Journal** on Mr. Greider's report entitled "The Resilient Energy and Abrasion Resistance of Vulcanized Rubber," says that as a whole it "is a notable contribution to the literature of the subject."

Reducing Losses in Galvanizing

Many problems of economic importance to the galvanizing industry are being studied by Wallace G. Imhoff on the Fellowship maintained by a group of sheet metal ware manufacturers. The work is planned to aid the industry in producing goods of higher quality and also in developing economies in practice.

The principal loss of zinc in galvanizing results from the formation of dross, zinc ashes or sal ammoniac flux skimmings. Any reduction which can be made in this loss will have a direct effect upon the cost of production. When, for example, it is considered that every 5 lb. of iron that enters the bath will render unavailable 95 lb. of zinc, the importance of the possible savings will be readily appreciated.

Spent pickle is another byproduct that is receiving attention, with a view to possible recovery or utilization. The whole subject of pickling has been studied systematically in order to determine the pickling time and the method of handling which will give the maximum efficiency for different classes of ware.

Similar studies on the galvanizing operation itself have been conducted to develop the best coating for the purpose intended; in other words, to get the right coating in the right place.

Engineering recommendations covering such topics as most economical design for galvanizing plants, comparative values of different fuels, and kettle design also form an important part of the service which is being rendered by this Fellowship.

Mundacizing

For several years a multiple Industrial Fellowship on dry cleaning has been maintained by the International Technical Society of Cleaners and Dyers, an organization of nine of the largest and most progressive firms in the business. Recently it was desired to adopt a name which would better express the action of cleaning both dry and wet, and at the suggestion of W. A. Hamor, the Latin *mundo*, to rehabilitate, was chosen as the root for a series of new terms. Thus, the society becomes the Mundatechnical Society of America, the technical men in the industry are mundatechnologists, the master cleaners are mundicians, the operation of cleaning will be known as mundacizing, etc. Cleaning is thus differentiated from laundering.

Lloyd E. Jackson and Helen E. Wassell have obtained some very interesting results in studying the problems confronting the cleaning or mundacizing industry. As in the case of the laundry work, it was first necessary to establish specifications for dry-cleaners' soap, cleaners' naphtha and benzol. Motor gasoline is not satisfactory, as the light portions result in high evaporation loss, high-boiling fractions remain in the goods, and unsaturates give odors difficult to remove.

In a plant of any size the investment in gasoline or benzol is a considerable item, and the recovery of the solvents in a condition for re-use is consequently a problem of importance. It can be accomplished by distillation, of course, but work in progress on this Fellowship indicates the possibility of economically removing dirt and color by suitable chemical treatment.

Rendering garments mothproof at the same time that they are mundated is another phase of the investigations which offers attractive possibilities. It has already been determined that mundacizing is very efficient in destroying bacteria and larvæ.

Since gasoline or benzol is the only solvent used, there are frequently found on mundacized garments stains which require for their removal treatment with other solvents or agents. Many special problems arise and the laboratory is frequently consulted regarding the best procedures for removing particularly obstinate spots and for renovating unusual goods.

Nickel and Monel Metal

Certain mysterious failures of Monel metal tie-rods, pins, etc., in pickling tanks led to the establishment of a multiple Fellowship for the purpose of investigating the cause. Corrosion was found to be the result of a concentration-cell effect set up between points at which the pickle had penetrated the wood and was in contact with the metal as a stagnant solution and other points where the metal was exposed to a free wash of solution, as at cracks. The subject of atmospheric corrosion was next taken up, and this is being continued

*Vol 64, page 845, Nov 18, 1922.

by the present incumbents, O. B. J. Fraser and H. E. Searle. Projected uses for both Monel and nickel are also being studied. Pickling equipment, valves in superheated steam lines, dyeing, laundry and dairy machinery, hospital equipment, equipment for cafeterias and restaurants, meat slicers, drying screens for glue and gelatine, filter cloth and a variety of chemical engineering apparatus may be mentioned as some of the typical uses for Monel. Plugs for Burton-process stills are being made from cast Monel.

Refractories

The matter of tests for refractory materials and products has been the basis of a considerable portion of the work carried on at the Mellon Institute of Industrial Research by the multiple Fellowship established by the Refractories Manufacturers Association.

The test for spalling or disintegration under abrupt temperature changes has required the accumulation of a large amount of data, in order that the test, as finally used, may be applicable in a practical way.

A new test for determining the action of various slags or fluxes upon refractories has been evolved. This in conjunction with tests previously in use makes possible the obtaining of definite results.

A furnace has been developed for the hot crushing of highly refractory specimens, in which very high temperatures may be maintained while the specimens are under extreme loads. Four tests may be run at one time. It has proved to be valuable in the development of bonds for chromium and magnesite refractories and in research on silica brick.

All other standard tests are made upon refractories in addition to those named, many of them being made in such large number that excellent practice has been established.

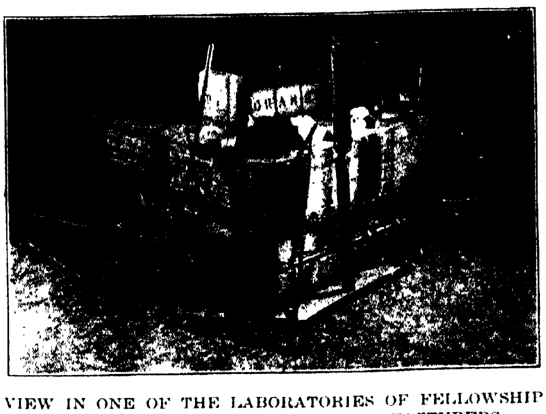
Special tests have been applied from time to time for comparative purposes. These have been particularly valuable in the accumulation of data on the unstudied physical and chemical properties of refractories.

The application of these tests has resulted in a decided improvement in the quality of refractory products. The manufacturers have recognized the value of work carried on in a well-organized laboratory and have employed it very fully in control of the quality of their products as well as in the development of new products and in the bettering of their manufacturing methods.

The true value of such work to the manufacturers and consumers of refractories can be appreciated only when it is realized that the product is ordinarily made from naturally occurring materials which are heterogeneous mixtures and often vary to the extreme. Without control tests, a deficiency in the product is not recognized until failure occurs in a furnace wall.

A number of failures of refractories have been investigated and the data gathered have led to better practice in furnace construction. A notable example is the investigation of various refractory cements on the market. This has resulted in an educational campaign against the use of cements of poor quality and has produced gratifying results.

With the development of tests covering the various properties of refractories has come the tendency to specialize. It is no longer common for a manufacturer to supply one or two classes of product for a great variety of uses. On the contrary, the particular requirements of a consumer are now met by a product designed to meet his needs. The economies of such practice are readily apparent.



VIEW IN ONE OF THE LABORATORIES OF FELLOWSHIP SUPPORTED BY METAL WARE MANUFACTURERS

This picture shows an experimental gas-fired galvanizing kettle in which all the operations of galvanizing are duplicated on a small scale. This is a typical illustration of hot galvanizing, or pot galvanizing.

Problems in the Manufacture of Vitrified Tile

Two associations of manufacturers of vitrified tile, the Clay Products Association and the Eastern Clay Products Association, jointly maintain a multiple Fellowship for the purpose of improving their product. Problems at present under investigation by H. G. Schurecht and G. R. Pole fall into three groups: Removal of iron-bearing minerals from the clays; glazing, and heat distribution in kilns.

Iron produces small dark lumps on the surface of the tile, so that a rough surface is presented by the interior of the pipe instead of the desired smooth finish. Elimination of iron will also reduce manufacturing losses and improve the appearance and glaze of the ware.

Relation between composition of clays and their ability to take salt glaze has been established by making a series of clay test-bars with variable amounts of the constituent under study. These were then fired and salt-glazed along with regular ware in a commercial kiln. A highly siliceous lime-free body seems to give the best results. The work is being extended to determine the influence of magnesium, potassium and sodium.

Since more uniform strength of ware as well as economy in fuel would result from more even distribution of heat in the kilns, a study of this factor is being undertaken for the various types of kiln and designs of flues in common use.

That such a commonplace commodity as drain tile should present problems for research quite as attractive as any in more highly developed fields may come as a surprise to many, but it is a fact that it has been found to be rich in opportunities of economic importance.

Extending the Uses for Wood Chemicals

About sixty-eight companies, manufacturers of methanol, calcium acetate and charcoal, comprising the National Wood Chemical Association, maintain a Fellowship, on which R. F. Remler has been studying the commercial applications of acetone and methanol.

During the past year Mr. Remler completed an investigation of the solvent properties of acetone. Solubility data were obtained for the following classes of materials: Oils, fats and greases, mineral lubricating oils; asphalts and bitumens; essential oils; rosin, copal

resins, coumarone resins; water gums; shellacs; waxes; cellulose acetate and cellulose nitrate. These results show its efficiency as an industrial solvent. Owing to the low boiling point, when used for extraction purposes the fuel cost is low and there is less danger of decomposing the final product than when higher boiling-point solvents are employed. Frequently, where used as a lacquer or varnish solvent, the vapors of acetone can be recovered by absorption, followed by fractional distillation. Acetone is less flammable than benzene, toluene ethyl ether, petroleum ether, gasoline or pentane. It is completely miscible with water and with many other solvents. A homogeneous liquid can be produced in some instances by the addition of a small amount of acetone to two immiscible solvents.

Work has also been done on acetone as a motor fuel. Some of the results may be summarized as follows:

Acetone alone is an excellent fuel, easy to start, does not freeze at the coldest winter temperature, and will not detonate under 180-lb pressure. It is not only miscible in all proportions with the various fuels used in motor cars, but produces a uniform mixture where added in various amounts to a number of immiscible liquids. Where added in small amounts to high-hydrocarbon fuels, it minimizes the deposition of carbon and prevents "fuel knocks." Acetone is the most economical solvent for acetylene, and, if saturated with this gas and added to composite motor fuels, produces a smoother running mixture, facilitates starting, and permits operating on a leaner mixture.

A study of the action of acetone and methanol on various metals is now in progress.

Mr. Render is prepared to serve as a clearing house of general information concerning products of wood distillation and to furnish advice regarding industrial applications of acetone, methanol, and acetic acid. He has collected all facts reported in the literature and this information is available to anyone interested in the subject.

Hazards in Gas Compression

Temperature Control Through Proper Lubrication and Cooling Is Essential—Different Gases Require Special Precautions

APPLICATION of the principles of safety engineering to problems of gas compression is discussed by A. D. Risteen in the April, 1923, number of *Mechanical Engineering*.

The outstanding factor in safe compression is temperature. This must be carefully controlled in the case of every gas through proper lubrication of the cylinder of the compressor and by cooling this cylinder by proper circulation of cold water in the jacket. Intercoolers in cases where several stages are employed are likewise essential.

For explosive gases such as hydrogen, valves on the compressor should be locked to prevent leakage. The precaution of removing every possible source of ignition is general. Wiring should be inclosed, switches and fuses placed at a distance; all bulbs should be inclosed in vapor-proof globes; no motors should be running in proximity to any place where gas may escape. Ample ventilation of rooms where gas is handled is of the utmost importance. Ease of exit must also be provided. In the cases of various common gases certain specific precautions become necessary.

In compressing air, water rather than oil should be used as a lubricant wherever high pressures are to be obtained. If oil is used on lower stages, the quantity and quality must be very carefully regulated. Removal of excess oil accumulated in receiver, piping or discharge valves must be provided for.

Oxygen must be absolutely free from combustible impurities at the time of compression and must be stored in strictly clean containers. Presence of grease, oil, organic dirt or red lead involves an extreme hazard. Water must be used in lubricating compressor.

Explosion through leakage is the chief danger in handling hydrogen. Admixture of oxygen makes the gas very unstable. Small amounts of oxygen may be removed by palladium pumice.

Nitrogen, argon, carbon dioxide and similar inert gases require comparatively few precautions. The toxic effect of CO_2 must be guarded against. Usually N is required free from hydrocarbons. This requires water lubrication.

Common Gases Cause Trouble

Chlorine is easy to see and its odor is readily recognized. Cooling caused by expansion of the gas in case of an explosion causes so much chilling that gas is dispersed only slowly. To prevent corrosion of containers, this gas must be absolutely dry. This drying may be effected in towers packed with pumice wet with concentrated sulphuric acid. The chief difficulty in compression is maintenance of gas-tight apparatus. Special packings of alternate hard and soft rings may be used. Compressed chlorine should be stored in clean cylinders to avoid hazard of chemical combination with foreign substances which might be present.

Since heat is absorbed when acetylene is formed, this gas is unstable under many conditions. The piston should move at low speed to avoid heating, and several stages should be employed. Apparently acetylene becomes unstable on standing, especially at high pressures. This gas should not be stored in an otherwise empty cylinder at a pressure over 30 lb. per sq.in. absolute. To store acetylene safely the compressed gas is dissolved in acetone. Cylinders used for this gas must never be used for any other purpose.

Ammonia Forms Explosive Mixtures

Contrary to the usual assumption that ammonia gas is not explosive, it has been found that an air mixture containing 16 to 27 per cent ammonia can be exploded. For this reason arc lights or other means of ignition should be guarded against wherever the concentration of ammonia gas may build up. Because of its solubility in water, a sprinkler system is recommended as a means of reducing its effect in case of an emergency. The compression of ammonia involves another source of danger. If the gas is allowed to become unduly hot during the process, a readily combustible gas is formed. Decomposed oil presumably forms part of this gas. The ammonia itself dissociates somewhat into its components. To avoid the danger of explosion during compression it is necessary to use a special lubricant and to keep the gas cool during the process.

A safety valve on compressing apparatus is recommended as a means of relief in case of trouble. To avoid danger of release of gas into surrounding atmosphere it is recommended that the safety valve discharge be into the low-pressure main or outside the building.

Distribution of Sulphur in Petroleum Products*

Particularly With Reference to the Primary Products Resulting From Cracking Distillation of a Hydrocarbon Oil—Found to Be Closely Analogous to Distribution of Nitrogen in Destructive Distillation of Shale Oil

BY GUSTAV EGLOFF AND JACQUE C. MORRELL
Research Laboratories, Universal Oil Products Co., Chicago, Ill.

CRUDE petroleum and the commercial cuts distilled from this substance as a general rule contain some sulphur. The forms into which this sulphur occurs may be briefly summed up as follows:

(a) Free sulphur.

(b) Hydrogen sulphide.

(c) Organic sulphur compounds.

Separation and identity of the last-named class of compounds is a very difficult problem. However, the following classes of compounds have been found in crude petroleum or its distillates:

Thiophenes[1], hydrothiophenes[2], sulphonic acids, alkyl sulphates[3], alkyl sulphides or thioethers[4], and mercaptans, or alkyl hydrosulphides[5]. The last two classes of compounds can be looked upon structurally as hydrogen sulphide or hydrosulphuric acid, in which either both hydrogens or one hydrogen has been replaced by alkyl groups.

SOME OF ITS DELETERIOUS EFFECTS

The presence of sulphur in the various commercial cuts of petroleum has a marked bearing upon the use to which these products may be put. In gasoline or motor fuel the presence of sulphur, either in the elementary form or as certain of its compounds, affects the metallic parts of the internal combustion engine in such a way as to cause serious damage, especially where the percentage is very high. In burning oils, such as kerosene, the presence of sulphur compounds beyond a certain limit is objectionable because of the bad odors produced by the use of these oils. Lubricating oils containing a high percentage of sulphur are also apt to have their usefulness impaired by the presence of sulphur or its compounds which might cause corrosive action.

In the cracking of various types of oil for the production of gasoline, the problem of the distribution of sulphur in the primary products of cracking is a very important one. The use of a charging stock with a high content of sulphur is apt to give a motor fuel which may defy treatment for the removal of sulphur compounds or the reduction of the amount present.

No work as yet has been published upon the distribution of sulphur in such cracked products, and it is with this end in view that this investigation is undertaken.

Beilby[7] has carried out some very interesting experiments with regard to the distribution of nitrogen in the various products resulting from the destructive distillation of nitrogenous organic material. He finds that albumin, gelatine and corresponding vegetable matter yield on thermal distillation: (1) ammonia, (2) oil rich in alkaloidal bodies, (3) carbonaceous residue containing a large proportion of the original nitrogen.

When more or less altered deposits of peat, coal, shale, etc., are distilled, a similar redistribution of the nitrogen takes place. A distribution of the nitrogen in shale is shown after distillation as follows:

	Per Cent of Nitrogen
Ammonia and water distillate	17.0
Oils as alkaloidal tar	20.4
Coke residue	62.6

Beilby showed that the nitrogen in the shale upon retorting distributes itself with a higher percentage in the higher boiling point fractions, reaching a maximum in the residue. Further redistillation of the tar into ten fractions also indicates a distribution of nitrogen as shown above—that is, higher percentages in the higher boiling point fractions, reaching a maximum in the residue. The formation of ammonia is a function of the conditions of temperature, time, retort and other factors. Slow distillation results in a decomposition of the alkaloids, producing more ammonia. For example, the total nitrogen in the shale was 0.7 per cent and redistribution took place in the following manner, calculating on a basis of total nitrogen as 100:

	Per Cent of Nitrogen
Ammonia (in water distillate)	32.8
Alkaloids (in oil)	20.0
Coke (N_2)	45.7
Loss	1.5

The work of Bielby indicates, therefore, that the nitrogen present in the original bituminous material increases in the latter fractions during retorting, reaching a maximum in the residue, and furthermore that during distillation of the shale only the more volatile alkaloids come off, and that the residue still contains the less volatile or pitchy nitrogenous bodies. It is probable that there is a series of unbroken continuity from the volatile alkaloids up to pitchy or cokelike nitrogenous bodies.

Perkins[8] has shown that, in working with an American and a Canadian crude oil, when distilled under atmospheric pressure, the percentage of sulphur increases as a function of increasing boiling point fractions. Some of his results are summarized in Table I.

It may be mentioned here that the finding of the present investigation regarding the distribution of sulphur in the primary products from the cracking of oils is closely analogous to the work of Beilby, with regard

to the distribution of nitrogen in the destructive distillation of organic bodies containing nitrogen.

The starting materials in this work were the primary products resulting from the cracking of a Mexican gas oil by the continuous liquid-gas phase process covered by the Dubbs patents. The quantity of oil operated upon and that of the primary products is shown in Table II and the principal characteristics of these materials will be found in Table III.

The oil was cracked under a pressure of 120 lb. with a liquid transfer temperature of 800 deg. F.

Methods of Determining Sulphur

A great variety of analytical methods exist for the determination of sulphur in petroleum products. Each of these methods has its particular virtues and drawbacks. Although in general by most of the methods reasonable checks may be obtained, the variation in results using different methods is very great.

With the exception of the determination of sulphur in the uncondensible gas the four methods used in the present investigation were as follows:

(1) The lamp method for the determination of sulphur in pressure distillate.

(2) Nitric acid oxidation method, usually known as the Rothe method.

(3) Sodium peroxide bomb method

(4) The oxygen bomb calorimeter method.

In the determination of the sulphur in the uncondensible gases the usual procedure of determining hydrogen sulphide and carbon dioxide was carried out. A modification of the Burrell apparatus for gas analysis was used, the amount of gas absorbed in sodium hydroxide being taken as the sum of the percentage volumes of carbon dioxide and hydrogen sulphide. The sum of these substances averaged 8 0 per cent. The average carbon-dioxide percentages in a large number of analyses of the uncondensible gas from various types of charging stocks containing no hydrogen sulphide was less than 1 per cent. This would give by difference a volume of hydrogen sulphide equal to 7.0 per cent.

The percentage of hydrogen sulphide given above is only an estimate, although the probable error is very small. However, in order to obtain the true percentage a method was devised whereby the gases were drawn through an absorption bulb containing a solution of approximately normal cadmium chloride. The hydrogen sulphide was absorbed by this solution, with the resulting precipitation of cadmium sulphide. The increase in weight of the bulb is assumed to be the weight of the

hydrogen sulphide in the gas. The change of volume is also noted. In actual practice two Wetzel bulbs in series were used as absorption vessels in order to insure complete absorption. The volume of hydrogen sulphide in the gas as calculated from the determination by this method is 6.8 per cent, which checks very closely the above approximated amount. Under the circumstances it seems that very little if any absorption of the carbon dioxide takes place.

It is to be noted here that for very small amounts of hydrogen sulphide in gases the method making use of absorption in a solution of iodine and back titration with sodium thiosulphate is in all probability the most accurate.

Discussion of Methods

There is no doubt that the results as obtained by the oxygen bomb and the sodium peroxide bomb method give consistent results, as well as results which are of the same order of magnitude. The oxygen bomb method is preferable from the viewpoint of accuracy, since a cleaner precipitate is obtained.

The results obtained by oxidation with nitric acid are not favorable to the use of that method. Comparison of the sum total of sulphur in the primary products with that of the raw oil would seem to indicate losses in the latter, probably by volatilization during digestion of the oil with the acid.

In a critical examination of the data it must be recalled that the operations of measuring large quantities of liquids, gases and solids by meter, gage or scales are a function of the final comparisons as well as the analytical methods. There is also to be considered the possibility of some sulphur reacting with the metal parts of the system.

Conclusions

From the results set forth in Tables IV and V it should be pointed out that on a basis of the actual percentages of sulphur in the primary products of cracking hydrocarbon oils, the content of sulphur increases with the density of the liquid and solid products, but is higher in the gas than in any of the products. This is very closely analogous to the distribution of nitrogen in the destructive distillation of oil shale.

On a percentage basis with regard to the total amount of sulphur present the analogy does not hold for the coke, owing principally to the relatively low percentage of this product, although there is an increase in the percentage of sulphur with increasing density for the liquid and gaseous products when calculated on this basis.

Increase in Output of Aluminum for 1922

The value of the new aluminum produced in the United States during 1922 is reported as $13,622,000, an increase of about 25 per cent over the value in 1921. During the first half of the year domestic aluminum was quoted at 20 cents a pound for 99 per cent grade. In August the price rose slightly and on the passage of the tariff act rose to 23 cents a pound, where it remained during the rest of the year.

Exports of aluminum from the United States during 1922 included 1,538,079 lb. of ingot and scrap aluminum and alloys containing aluminum, 2,808,946 lb. of plates, sheets, bars, strips and rods and 4,548,939 lb. of manufactured articles, which represents a very large increase over the amount exported during the previous year. Imports, on the other hand, also increased to 31,482,983 lb. during the early part of 1922, as compared to 26,177,852 lb. for the corresponding period in 1921. This includes aluminum in crude form, scrap and alloys of any kind in which aluminum is the material of chief value.

Electrically Sintered Magnesite

Electrically sintered magnesite, a material having the highest melting point of any commercial refractory, is now being produced in quantity by the Carborundum Co. It is made from carefully selected California magnesite and is thoroughly fused in an electric furnace. It contains about 95 per cent MgO and less than 1 per cent of iron oxide and has a melting point of about 2,600 deg. C.

The material is especially resistant at high temperatures to iron or iron oxide. This makes it most valuable for lining metallurgical furnaces, either in the form of bricks or in granular form, tamped in. A further unusual feature of electrically sintered magnesite is that it does not contract when subjected to conditions encountered in industrial installations.

Some Notes on Quicksilver

The production of quicksilver in the United States in 1922, from the reports of the United States Geological Survey, amounted to 6,497 flasks of 75 lb. net, as compared with 6,339 flasks in 1921, which was the smallest annual output in 72 years of recorded production of domestic quicksilver. Of the total amount produced in 1922, California produced 3,494 flasks, Texas 2,725 and Nevada and Oregon 278. The average price of quicksilver in 1922 per flask of 75 lb. is reported as $58.95 in New York and $57.78 in San Francisco. However, the tariff act of 1922 placed a duty on imported quicksilver of 25 cents a pound, equivalent to $18.75 a flask. At the end of the year, the directors of the great Almaden mine in Spain reduced the price at the mine to about $45 per flask. No important additions to the known resources of domestic quicksilver were made during 1922, but the effect of the new import duty will probably result in a moderate increase in production for 1923.

Silicate of Soda In the Ceramic Industries*

Its Properties Depend Upon Ratio of Na_2O to SiO_2—What Grades Are Most Suitable for Various Purposes

BY JAMES G. VAIL
Philadelphia Quartz Co., Philadelphia, Pa.

CONSIDERATION of silicate of soda in the ceramic industries or, for that matter, in any industry must be predicated on an understanding of what is meant by the term silicate of soda. In a commercial sense silicate of soda is not more definite a term than clay. Its connotation is generic rather than specific. Attention must be called to this fact, because in spite of a voluminous literature there are still many technical men who think of a definite sodium silicate when they see the sirupy liquid of commerce.

Sodium metasilicate has been studied by several workers, notably Erdenbrecher, who has prepared three crystalline hydrates of Na_2SiO_3 with four, six and nine molecules of water, respectively. These may all be prepared at ordinary atmospheric temperatures. They all melt in their water of crystallization to liquids of low viscosity relative to the commercial preparations on the American market.

The ratio of Na_2O to SiO_2 is the usual index of the type of a commercial silicate solution. As the percentage and molecular ratios are so nearly alike, custom has chosen the more convenient percentage ratio. This may vary between the 1 : 1 of the metasilicate up to 1 : 4 or even higher. The properties of the products at the two ends of the scale are very different, and any intermediate composition can be produced in general without sharp breaks in the curves which represent the changing characteristics. Although it is likely that a compound of the ratio 1 : 2 does exist, its presence in the familiar solutions of this composition has not been completely proved. It is important then when you hear or read about silicate of soda to think, Which silicate of soda?

USE IN MENDING SAGGERS

Perhaps the use of silicate of soda for mending saggers is more widely applicable in the ceramic industries than any other. Where the break is a simple one, the process of repair is so simple as to be a marked economy. For this purpose a silicate which dries in the air to form a firm joint and retains its bonding quality as the temperature rises should be selected. All air-dried silicate solutions, even when they develop a bond strength above 1,000 lb. per sq.in., are hydrous. They can be completely dehydrated only at kiln temperature. During the removal of the last few per cent of water the bond strength of most silicate solutions is much reduced. At temperatures near 2,000 deg. F. sintering begins and the silicate again is sticky and has holding power. The ratio which we have found most suitable for this sort of work is about $Na_2O:SiO_2 :: 1:2.4$. If a grade containing more silica is used, its strength will decline earlier with advancing temperature. If a more alkaline type be selected, the cement will have a lower melting point and will set too slowly at atmospheric temperature. Silicate of soda should be mixed with a refractory clay to make the sagger mending cement. A mixture of calcined and raw clays is best, though not essential. A wide variety of clays can be used. The silicate of ratio 1:2.4 is usually sold as a solution of about 47 per cent solids testing 52 deg. Bé. About two parts by weight of this and one part of powdered clay should be used. A little water may be added to permit mixing the cement to a smooth, thick, creamy consistency. It is best to paint both broken surfaces of the sagger with the cement, taking care to apply enough to prevent a premature set due to absorption of water from the wet cement by the porous body of the sagger. This would occur only when the cement is spread very thin. Enough should be used to allow the cement to remain sticky for 5 minutes if exposed to the air. The broken parts should be pressed together so that a little is squeezed out and allowed to stand undisturbed over night. A joint formed in this way is usually stronger than the body of the sagger.

Cements made with clay and silicate of soda are also useful in making gas-tight brickwork in kilns, boiler furnaces, coke ovens and the like.

DEFLOCCULATING CLAY SUSPENSIONS

The influence of electrolytes on the suspension of clay in water as applied to refining and casting has received a great deal of attention and is the subject of a fairly voluminous literature. Beginning with a discussion of Acheson's paper on Egyptianized clay before this society in 1904, when W. D. Gates called attention to a similar effect of silicate of soda on clay, members of the American Ceramic Society have made numerous contributions to our knowledge. Bleininger and Schurecht should be especially mentioned in this connection. It is worthy of note that much that has been written is either not clear or entirely silent as to the kind of silicate employed. All solutions of silicate of soda will indeed assist in the suspension of clays and up to an optimum concentration make the separation of other minerals easier. In each case amounts beyond the optimum concentration produce a lesser effect or cause the flocculation of the suspended clay.

The work of Schurecht has shown that the effect of silicate is not merely the effect of a given amount of sodium oxide which may be added in any convenient form. A unit of Na_2O as sodium silicate has a larger effect in reducing the viscosity of a clay slip than the same amount of Na_2O added either as hydroxide or carbonate. The silica must enter into the reaction, and it appears that a study of the various types of silicate with different ratios of $Na_2O:SiO_2$ would be a valuable contribution to our knowledge of the art. The hydrogen-ion concentration is certainly an important factor in the effect of electrolytes on clay suspensions; the different types of silicate provide a convenient means for securing the concentration suited to the manipulation of each particular clay and the buffer effect of the silica should make it more easy to control the characteristics of the slip or the suspension in the refining process.

EFFECT ON DENSITY SHRINKAGE

The varieties of silicate of soda should also be studied with reference to their effect on the density shrinkage and strength of the ware. If one form of sodium silicate added to a clay in amounts of less than 2 per cent based on a 40 per cent solution can cause differences of more than 100 per cent in the dry strength or the

*Presented before the Terra Cotta Division, American Ceramic Society, at the Pittsburgh meeting, Feb. 12-16, 1923.

fired strength of clays, it is a matter of concern to know whether the form arbitrarily chosen for the study was in fact the most suitable. We have abundant evidence that the various forms do not behave alike.

Bonding Abrasive Wheels

One of the oldest uses of silicate of soda is to form a bond for abrasive materials in the manufacture of grinding wheels and abrasive stones. The process is widely used and has numerous advantages, important among which is the possibility of forming a wheel on one day and putting it into service the next. The silicate bond easily produces masses having a tensile strength of 2,000 lb. per sq.in. and the loss in process is very small. The silicate ordinarily employed for wheel manufacture has a ratio of 1 : 2 and is concentrated to a very sticky solution containing about 54 per cent solids. This solution is mixed with approximately an equal weight of a finely pulverized mineral such as clay or silica. The chemical characteristics of this powder can be varied considerably and good results secured, but its fineness and the thoroughness with which it is mixed with the silicate solution and the abrasive grains are important. The tamping of the mixture into molds calls for experience and skill to produce a uniform body. The wheels are first air dried at temperatures below the boiling point of water for a length of time dependent on the size of the wheel and then baked at about 450 deg. F. for several hours. The chemistry underlying this process is not fully understood, although a large amount of practical experience has developed a technique which gives good results. It is not, for instance, known that there is any reaction between the mineral filler and the silicate solution, and yet wheels are made sufficiently resistant to water to be run wet.

The water resistance of some mixtures is, however, improved by the addition to the inert mineral of small quantities of oxides capable of reacting with the silicate at the temperatures used in the process. One of these is zinc oxide. Fundamental research on the reactions of the silicate abrasive wheel process is needed to understand what has been empirically found to be good practice and to point the way to improvements. We already know that a silicate of very different character from those used for adhesive purposes is required.

Whether it be the making of silicate cements for mending saggers and setting brick with gas-tight joints, or the regulation of the flowing and suspension characteristics of mixtures of clay and water with small additions of silicate solutions, or the manufacture of quick process silicate abrasive wheels, the fact is worth remembering that the various forms of silicate have different properties. The grade best suited for one process may be quite unfit for another and many a process can be perfected by choosing a silicate solution adapted to the peculiarities of the clay with which it comes in contact and the conditions of its use.

Increase in Automobile Production

The Department of Commerce in Washington reports that automobile production increased in January and was the highest on record with the exception of last June. The output of passenger cars increased from 223,706 cars in January to 254,415 in February. Truck production amounted to 21,354 cars in February, as against 19,376 cars in January. Reports came from approximately 90 passenger car and 80 truck manufacturers.

Increasing Profits Without Increasing Sales

Dr. E. B. Lathrop has made a very good point in an article under the above title which appeared recently in the Philadelphia Chamber of Commerce *News Bulletin.* He points out first that the normal reaction of the executive is to urge an increase in sales in order to increase profits. On the other hand, in industries where the market saturation point is nearly reached or in which production will vary considerably from year to year due to an uncertain demand, it is much easier to save on the cost of purchases and better technical control. Suppose, for example, a firm makes $1,000 saving per month by better buying and better technical work, and suppose too that the firm is making a 10 per cent net sales profit. This monthly saving of $1,000 would be equivalent to a total yearly increase in sales of $120,000. Viewed from this standpoint, what might be termed "intensive cultivation" is very highly profitable.

Importance of Technical Purchasing of Raw Material

Take, for example, the purchasing of a common raw material such as ordinary salt. If we study different industries in which this material is used, the importance of technical purchasing can at once be made evident. For example, sodium chloride is used in ice cream manufacture. It is well known that different grades of salt give different results in the speed of making the ice melt. This of course is due to the calcium and magnesium chloride impurities in the salt, and yet the ice cream manufacturers have taken no advantage of this very common observation. They have not attempted to balance the relative corrosion which their salt may give against the more rapid freezing which is obtained.

In producing soap, salt is used to separate boiled soap from the excess of free alkali. The sodium soaps are all soluble, but calcium, magnesium and barium soaps are insoluble and have no value as cleansing agents. Obviously, then, the impurities in common salt will become invidious impurities in the soap itself.

Purchasing Department Should Wage an Aggressive War With Technical Implements

Again, in the manufacture of hydrochloric acid, which is prepared from common salt with either sulphuric acid or niter cake, the sodium sulphate thus manufactured is used in glass and paper making. Naturally the impurities which appear in the salt will become impurities in the salt cake. Examples in which the impurities in the raw material vitally affect the subsequent technology could be multiplied almost indefinitely. Here is a problem in which technical knowledge can play as important a rôle as it does in technical selling. The sales engineer has come to stay. His function in industry and his utility have been demonstrated. How about the purchase engineer? Is it not just as logical to make use of technical knowledge in purchasing as it is in sales? Instead of waging what might be termed a defensive war, why should the purchasing department not wage an aggressive war, using the modern implements of technical knowledge to carry it out? The purchase engineer and the sales engineer go hand in hand. They are twin positions, and in fact in many companies the same department, and the same engineers would adequately fill both functions. A least here is room for constructive thought and constructive action.

Heat Salvage in Small Furnaces

Thirty Per Cent Fuel Saved on Even a Small Tool-Room Furnace by a Simple Recuperator—Heat-Resisting Pipe Offers Ideal Medium With Which to Build Heat Interchanger

By W. C. Buell, Jr.
Buell-Schaub-Mueller, Inc., Consulting Engineers, Pittsburgh, Pa.

Increasing interest in fuel conservation in recent years, coupled with the higher cost of fuel for industrial operation, has forced the recognition that waste heat, heretofore not considered an item of value, can be utilized, and by simple methods made to do useful work, even on small heating furnaces. In units of larger size, the value of waste heat has long been known and reclaimed to a considerable degree in blast, open-hearth, large billet heating and reverberatory furnaces, glass tanks, pot furnaces and others.

Reclamation of waste heat in these larger units was due not to a desire to save fuel, but to the necessity for increasing the flame temperature. High furnace temperatures for heating operations where the metal or compound must be raised to 2,700 deg. F. or more is accomplished by adding, to the fuel itself, appreciable quantities of sensible heat in the air required for combustion. Thus, Pittsburgh natural gas, containing 1,130 B.t.u., has a maximum flame temperature, when burned in the correct amount of cold air, of approximately 3,760 deg. F. At this temperature all the heat liberated during combustion is carried away by the products of combustion. If the air is preheated by any method to, say, 1,200 deg. F., that air will bring in 250 B.t.u. of sensible heat, which, if added to the original value of the gas, will give a total calorific value of the mixture of 1,130 + 250, or 1,380 B.t.u. per cu.ft.

This gas, with a calorific value of 1,380 B.t.u. per cu.ft., will have a theoretical flame temperature of approximately 4,280 deg. F. The increase comes entirely from the preheated air, and naturally, with higher flame temperature, a heating operation will be carried out

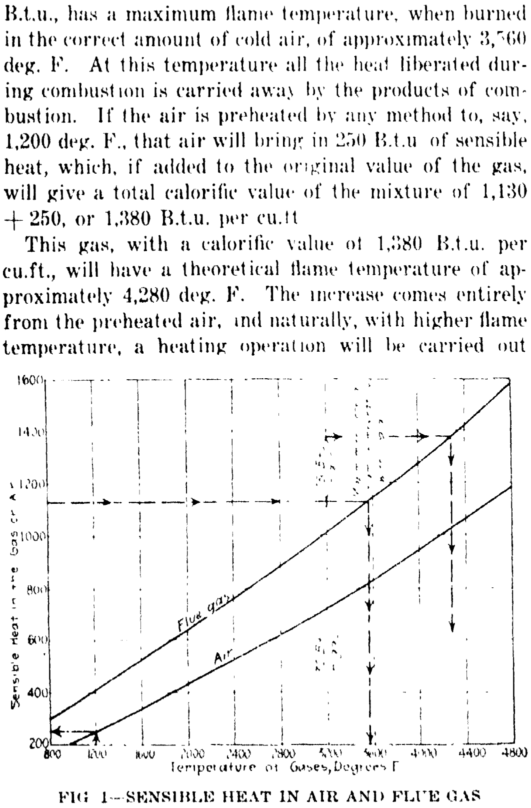

FIG. 1—SENSIBLE HEAT IN AIR AND FLUE GAS
Assumptions: Pittsburgh natural gas burned in theoretical amount of air.

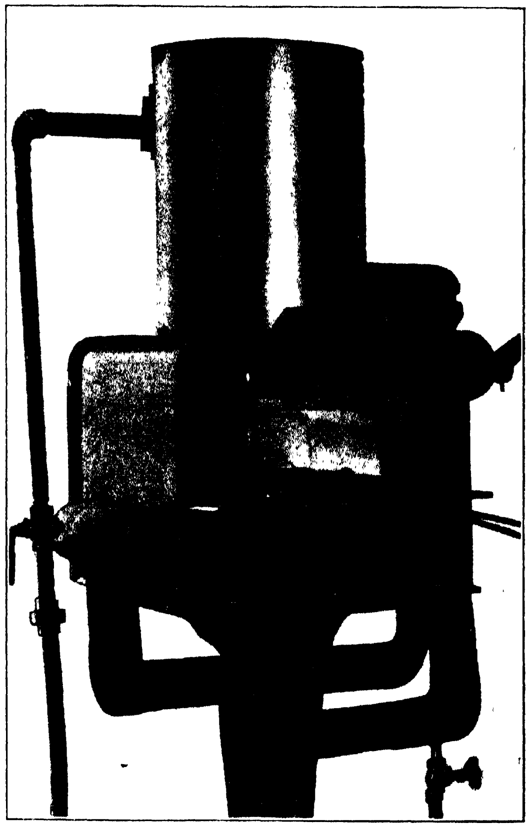

FIG. 2—AUTHOR'S FIRST RECUPERATOR, MOUNTED ON TOOL-ROOM FURNACE

with considerably greater rapidity than with lower flame temperature. Other similar problems in maximum flame temperatures on Pittsburgh natural gas may be solved graphically as shown in Fig. 1.

Waste heat may be salvaged in three general ways:

1. By placing a steam boiler in the waste gas flue between furnace and stack to generate steam.

2. By use of the regenerative furnace. This has two sets of reversing chambers in the waste gas flue between furnace and stack. The flue gas passing out gives up its heat to the brick checkerwork of one chamber and on reversing incoming air picks up this heat.

3. By recuperators. These are tubes placed in the waste flue, between furnaces and stacks, and through

which air for combustion is passed, thereby absorbing heat.

For obvious reasons heat-salvaging apparatus of the first classification is out of the question for small furnaces.

Regenerators of the second classification are relatively great in first cost, upkeep and labor cost, and require careful operation to accomplish good results.

Recuperators appear to offer the best solution of waste heat recovery in smaller furnaces. Once installed, they require no operating attention and if properly designed, upkeep cost is a relatively small item. Within certain limits, recuperative elements may be of tile or metal and inclosed in brick-lined containers. Tile recuperators are subject to the very severe criticism that, being of firebrick mixture, they resist the flow or transfer of heat to a very much greater degree than does silicon carbide or metallic elements. Accordingly, to secure an equivalent heat transfer from hot flue gas to colder air, it is necessary that the transfer area of tile recuperators vary directly as its thermal conductivity. To obtain equivalent results, then, the specified transfer area of tile recuperators must be at least five times as great as with silicon carbide elements; and from five to twenty-five times as great as when metallic elements are used as the medium of transfer. In addition to the foregoing basic objection to the use of tile recuperator elements, tile is fragile and hard to lay up with joints that remain tight enough to prevent escape of air into the flue gas compartments.

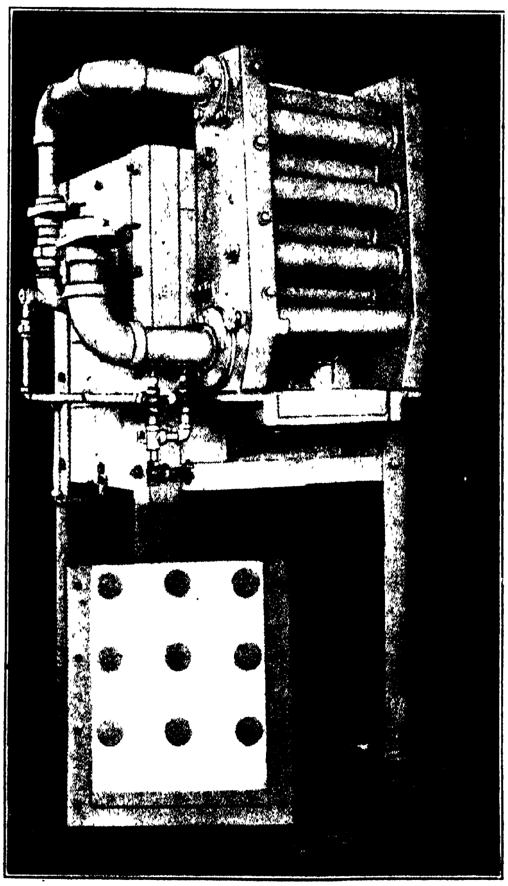

FIG. 3—W. S. ROCKWELL CO.'S "ECONOMIZER FORGE" (FRONT REMOVED)

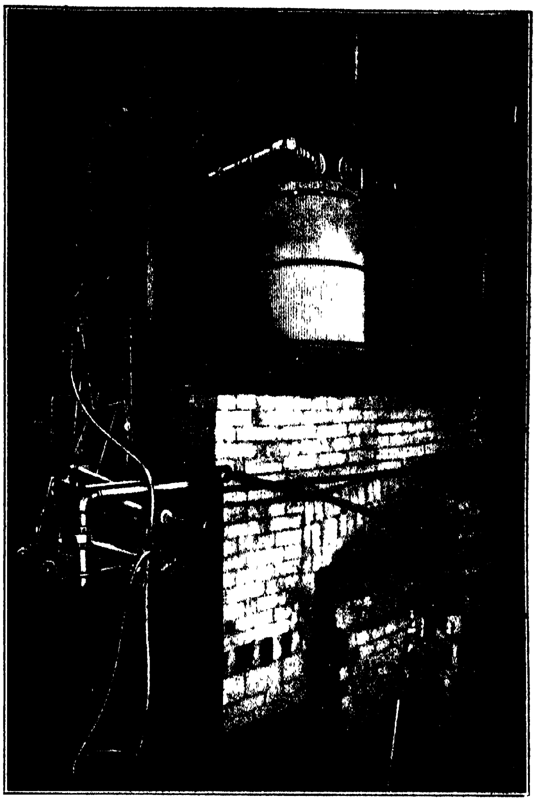

FIG. 1—EXPERIMENTAL RECUPERATOR ON FORGE FURNACE

As the scope of this article includes relatively small furnaces, metallic recuperators only are considered, for in such practice, limitations of the tile recuperator prevent its successful use. Tile recuperators have a fairly well defined field of application in larger furnaces.

While silicon carbide is a much better medium for recuperator elements than fireclay tile, on account of its greater conductivity, it is open to the objections of high first cost, fragile nature and the same difficulty of making tight joints. With their high thermal conduction and relatively low cost, metallic elements without doubt are the best elements to use in recuperators. But if satisfactory results are to be secured, a thorough understanding must be had of their properties, reaction under the working heats, and a knowledge of the engineering principles of recuperator design.

A consideration of the metals available for recuperators of this kind may be interesting. Certain of the nickel-chromium alloys on account of their high melting points and resistance to gases under high temperatures would make ideal recuperator elements. The high first cost of these alloys and difficulty of securing sound castings with thin walls are severe drawbacks to their general use, but even so, these alloys are the only metals available which will stand temperatures of the metal walls reaching 2,000 deg. F. or more.

Cast iron has long been used in heat exchangers—recall the original blast-furnace stoves made with cast-iron pipe elements. Cast iron was fairly satisfactory for that service as long as the temperatures encountered were relatively low. Cast iron is reasonably satisfactory for recuperator elements where the final temperature of the air does not exceed a few hundred degrees,

but it has the disadvantages of requiring a heavy wall section and relatively great weight.

It is desirable to bring air and flue gas into as close and continuous contact as possible throughout the entire length of the heat exchanger. Based on present experience, it appears that relatively small pipes, say 4 or 6 in. diameter, manifolded so as to secure proper area, offer the best available conduit. In the writer's practice, it is customary to force air to be heated through cylindrical containers which are surrounded by the hot flue gas. The air passes counter-current to the gas, both going at relatively high velocity. For low-temperature work (where the flue temperatures do not exceed 1,000 deg. F. and final temperature of the air 300 or 400 deg. F.) wrought-iron pipe gives excellent results. But when the flue gases are from 1,000 to 2,200 deg. F. and final air temperatures 300 to 1,200 deg. F., untreated wrought-iron or steel pipe does not last long.

TABLE I HEAT BALANCE
Figured in B.t.u. per hour

	Non-Recuperative	Recuperative
Total in fuel	119,645	82,350
Returned in preheated air	0	8,668
Total to furnace	119 645	91,018
Radiation loss		
Combustion chamber	25,331	30,911
Heating chamber	36,542	23,028
To recuperator	0	37,079
Vent loss	57 772	0
Total	119,645	91,018
To recuperator		37,079
Returned to heated air		8,668
Radiation loss in recuperator		15,208
Final vent loss		13,202
Total		37,079
Fuel saving		31 3%

If steel pipe is impregnated with aluminum (Calorized after the method of the Calorizing Co of Pittsburgh), pipe recuperator elements will give an economical performance in waste heat recovery within the temperature limits just mentioned. The life of calorized pipe is from five to ten or more times the life of untreated pipe. The cost of the special treatment is quite low. A calorized pipe has the added advantage of maintaining the same high rate of thermal conductivity at all times, for it does not scale.

The design of thermal recuperators should not be attempted by those not thoroughly versed in the art, for many factors must be co-ordinated to produce economical results; otherwise an installation that is neither economical nor satisfactory will result

A considerable number of furnaces employing the recuperative principle of salvaging waste heat by use of metallic recuperators are in general use. The writer believes that he developed in 1913 and arranged to have placed on the market one of the first commercial recuperators for small furnaces. This consisted merely of mounting on top of a small tool room furnace a brick-lined chamber containing a coil through which the air was forced (Fig. 2). That the use of even this small device was worth while is indicated from the heat balance (Table I) of one furnace operating without a recuperator and one furnace with recuperator, both furnaces being of exactly the same size and operated under identical temperatures in the heating chamber (2,450 deg. F.).

It is interesting to note that less than 10 per cent of the total B.t.u. required in an average hour was represented in the heat returned in the air. The recuperator effected a total saving of 31 per cent; less than 10 per cent was represented in actual heat returned, while over 20 per cent was had through increased flame temperature, less weight of furnace gases and other contingent economies that generally enhance the value of recuperative devices.

The idea exemplified by Fig. 2 may be applied, of course, in many ways. Fig. 3 shows an especially neat and compact recuperator built alongside a small forge furnace (designed by the W. S. Rockwell Co.). It has the front removed in order to show the calorized preheater pipes.

Beginning early in 1915, and extending over a period of more than 2 years, in collaboration with John W. Griswold, the writer made a series of tests on recuperative forge furnaces. The first experimental furnace, as constructed in the laboratory of Tate-Jones & Co., Inc., is shown in Fig. 4. This recuperator was designed along the lines of a Junker calorimeter: Flue gases were drawn through the recuperator by an exhauster mounted above, while air for combustion was forced through by a positive pressure blower (not shown in the figure). Much trouble was at first encountered with the heat exchanger elements. While only about 30 in. in diameter with 45 in. effective height, they had an interior transfer surface of over 100 sq.ft. and at times reduced the gases of combustion from 2,000 to 400 deg. F., and raised air temperatures from atmospheric to 1,700 deg. F.

The results secured were so very favorable that a second experimental furnace and recuperator was built for drop forge work in a large manufacturing plant at Toledo, Ohio. In this furnace forty to fifty steel bars 3 in. diameter, 40 in. long were heated per hour to about 2,000 deg. F. to be forged into six-throw automobile crank shafts. In one 24-hour period of ordinary shop operation it used 3,300 cu.ft. of coke-oven gas per ton of forgings. This is equivalent to less than 15 gal. fuel oil per ton—a very remarkable performance.

FIG. 5—CAR TYPE FURNACE WITH SIX RECUPERATORS

Fig. 5 shows a Car Type Annealing Furnace utilizing the same principle, but where the waste gas flues are brought outward into individual small stacks, instead of following the usual practice of passing upward through the furnace walls. Surrounding each of these stacks is a metal jacket through which air for combustion is forced and part of the heat of the waste gas is thus transferred to the air and reclaimed.

Recuperative forging furnaces of large size have been designed, patented and constructed by the Heppenstall Forge & Knife Co., one of that company's installations being shown in schematic outline in Fig. 6. Recuperators in this furnace are calorized U tubes, suspended in a chamber beyond the heating furnace proper, and into which the waste gases are directed. Air is forced through these tubes, where it is heated and thereupon

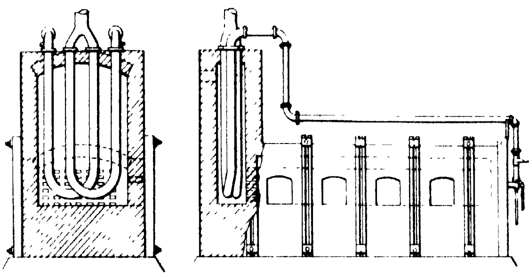

FIG 6—RECUPERATOR TUBES ON OIL FIRED FORGING FURNACE

led to the oil burners at the front end. Remarkable operating economies are shown by this installation. Temperatures from the recuperative effect are relatively low (600 to 700 deg. F.) and only about one-half of the total air required for combustion is preheated.

Interesting experiments are now being conducted on calorized pipe blast-furnace stove elements, with a view toward determining to what extent calorized air pipes can replace the regenerative brick chambers. Complete data on these experiments are not now available for publication, but extremely satisfactory results are shown from the preliminary figures. A consideration of blast-furnace stoves is beyond the scope of this article; but it is mentioned to show that the subject is of sufficient interest to cover all phases of industry wherever the use of heat is of importance.

Economies From Recuperation

Naturally the question will be asked, "How much can we save by the use of recuperative devices?"

There are at least twenty variable factors which will have a bearing on the ultimate over-all saving. Saving will be less where the existing non-recuperative furnace practice is very good. Poor or indifferent furnace practice is vastly improved by the use of recuperation; when provision is made for the installation of recuperative elements and the furnace placed in the hands of competent engineers, they will frequently so change the existing design of the furnace itself as to produce a still greater economy.

It is possible to design the recuperator to salvage almost any amount of waste heat that may be arbitrarily named. The higher the temperature of the waste furnace gases the greater the percentage that can be economically recovered. In forging practice it is economical to premise a design on a 50 per cent recuperative efficiency; for low-temperature heat-treating practice in small furnaces it is seldom economical to carry recuperation beyond a maximum of 30 or 40 per cent. On the other hand, recuperators operating on relatively low recuperator efficiencies will be found to produce material over-all savings. A chart is shown in Fig. 7 giving: (a) the fuel saving possible with waste gases at any temperature, (b) combustion conditions within the ordinary range of furnace practice, and (c) the saving with recuperators of varying effectiveness. This chart shows, for example, that gases which leave a furnace at 1,400 deg. F. and have entrained 10 per cent excess air carry out a total heat equal to that produced by 38 per cent of the fuel fired. If a recuperative device having a 40 per cent thermal efficiency is connected to the furnace, then over 15 per cent of the total heat fired will be returned to the furnace as sensible heat in the air for combustion.

The theoretical fuel saving itself is of considerable interest, but in every case the actual saving will be found much greater than the theoretical; for, as explained before, the addition of sensible heat to the fuel gives the equivalent result of increasing the calorific value of the fuel and thus increasing flame temperature. How this works out in theory and practice may be seen by re-examination of the chart Fig. 1, which shows the heat in the products of burning 1 cu.ft. of Pittsburgh natural gas, containing 1,130 B.t.u. per cu.ft. If we read down from this curve on the vertical ordinate, we shall find the theoretical flame temperature a trifle less than 3,600 deg. F. If the air is preheated by recuperation to 1,200 deg. F., that air will contain 250 B.t.u., which, added to the 1,130 originally in the gas, will give a total calorific value of the fuel of 1,380 B.t.u. Reading through as before, Pittsburgh natural gas with 1,380 B.t.u. will have a theoretical flame temperature of 4,280 deg. F. Thus, by increasing the calorific power of the fuel 18 per cent, we increase flame temperature over 20 per cent.

It seems wise to point out the advisability of entrusting the design of recuperative devices only to com-

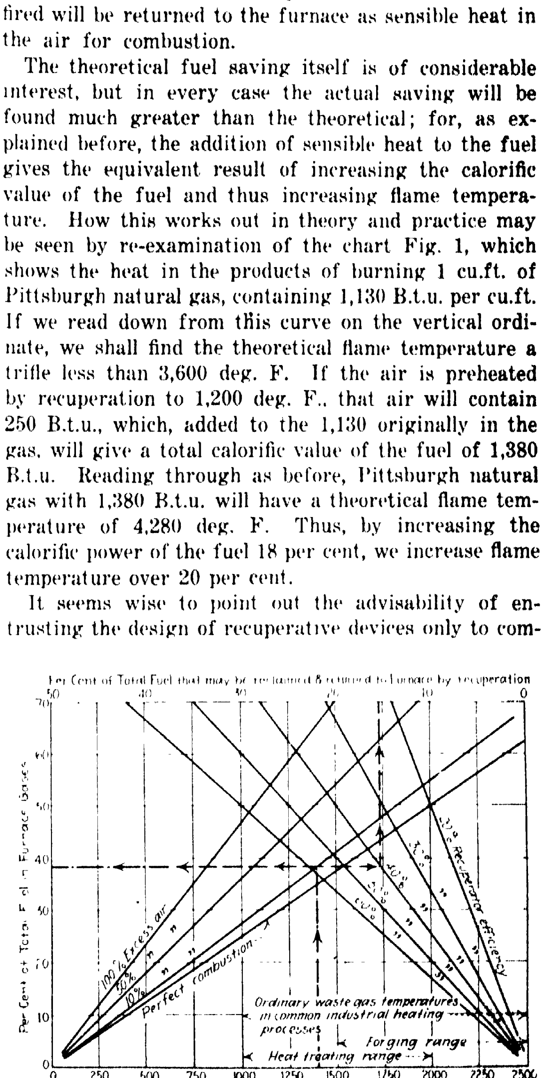

FIG 7—FUEL LOSSES AND POSSIBLE SAVINGS

petent engineers. The mass of variables affecting actual results can be only roughly evaluated from such data as are at present available. This points to the likelihood of obtaining only mediocre results by those who do not have available the necessary experimental data as yet unpublished.

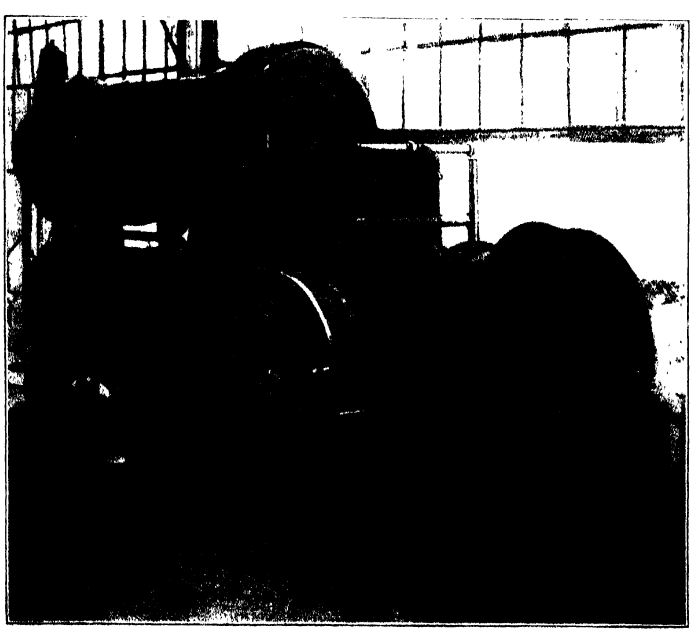
Although this article presents data which cannot be classified as conclusive, yet they are sufficiently indicative to call attention to the possible savings of our natural resources. Fuel savings and other economies are now possible by making comparatively inexpensive alterations in furnace installations. The era we are now facing promises to be one of the most severely competitive that manufacturers have as yet experienced. Many plants operating on narrow margins should find such basic savings of vital significance.

Automatic Furnace and Quencher

The W. S. Rockwell Co., of New York, manufacturer of industrial furnaces, has had on the market for some time an automatic rotary heating furnace and an automatic rotary quenching tank. It has recently effected a combination of these two units so that they may be operated as one; and heating and quenching can be carried on as a continuous, automatic unit process. The accompanying photograph shows the set-up of the combined units.

The operation of these units separately is well known to those interested. When operated together the procedure is as follows: After the material has been slowly brought up to temperature and discharged from the furnace, it slides into the submerged end of the quenching tank, where it is automatically picked up in small batches by the internal thread of the rotating tank and conveyed through the quenching fluid as it is raised to the final discharge.

This combination provides, then, a continuous unit giving individual and uniform treatment in both heating and quenching. By its use, as against that of the elements separately, chances for trouble with the product are largely eliminated. A real advantage is also gained through the reduction of labor required to operate and the elimination of dependence on the human element.



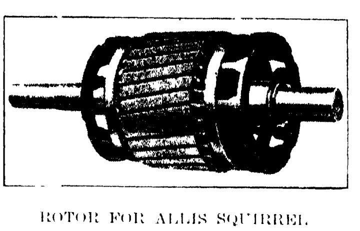
AUTOMATIC ROTARY FURNACE AND QUENCHING TANK

Heavy Duty Motor

Of recent years there have been few innovations of great novelty in the field of electrical motors, which adds particular interest to the new line of heavy duty, polyphase squirrel-cage motors recently placed on the market by the Louis Allis Co., of Milwaukee, Wis.

In the usual design of this type of motor, the rotor winding is formed with the bars individually joined to the end rings. This makes a multiplicity of joints and is a source of delays for repair when loose bars occur.

In the L-A Type H. D. motor, the new Allis type, the entire winding of the rotor consists of an integral sheet of copper, punched and formed by a special mechanical process. This one-piece winding is machine wrapped around the rotor core, the copper bars being expanded into the core slots by swaging, as indicated in the accompanying illustration. The single joint that extends through the two end rings is silver welded, after which the metal at both connections is processed by means of a contracting operation that rehardens the copper at the point where the heat, applied during the welding, softened it. This treatment results in a lapped,



ROTOR FOR ALLIS SQUIRREL CAGE MOTOR

silver-welded joint of maximum strength. The rotor winding, except for the joint in the two end rings, is electrically and mechanically as substantial and indestructible as a piece of pure copper pipe.

On account of being fabricated of comparatively thin copper stock, a material that has a high thermal conductivity, this rotor winding readily conducts the heat generated in it toward the ends of the rotor bars, where the heat is dissipated through the action of malleable iron fans. The rotor bars themselves also constitute a very efficient blower, thus materially increasing the ventilation.

The rotor core is a self-contained unit, and may be pressed on and off the shaft readily, as it has a straight keyway. Otherwise it is largely conventional except that it employs open slots without the usual overhanging tooth tips. Experience has shown that so long as a suitable relation is maintained between the air gap and slot width the performance does not suffer as regards power factor and efficiency and that a rotor core of this construction, with a suitable winding, results in exceptionally high starting and running torques. These

abnormally heavy starting and running torques have led the manufacturers to increase the shaft size above the usual practice for a given rating, which, in combination with the liberal bearings, fabricated from a phosphor bronze, insures exceptionally long life in service.

While great stress has been laid on the mechanical ruggedness of this new line of motors, the electrical characteristics have received equally careful attention. In addition to the exceptional starting and running torques, all motors are guaranteed to carry their full rated load continuously with a temperature rise not exceeding 40 deg. C., and after their ultimate temperature has been reached, to carry 25 per cent overload for 2 hours with a temperature rise not exceeding 55 deg. C. These motors are made in standard industrial sizes, voltages and frequencies

Thermal Conductivity

Interesting researches have been carried out by the Feather-Stone Inulation Co., of Los Angeles, on the thermal conductivity of what is known as the Feather-Stone insulating brick, manufactured by the company from material obtained from its deposit at Covina, near Los Angeles. The weight per brick is little more than 2½ lb., or 37 lb. per cu.ft. Compressive strength has been calculated at 36 tons per sq.ft. Thermal conductivity amounts to about 1 B.t.u. per sq.ft. per hour per deg. F., which is about one-tenth that of ordinary firebrick. Charts showing the comparative thermal conductivities of Feather-Stone

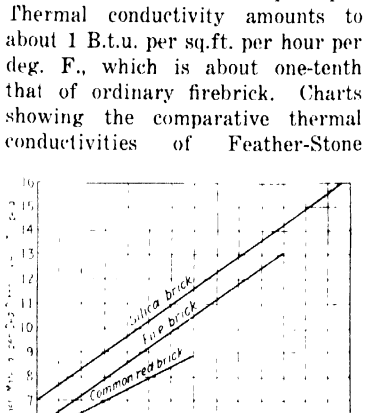


FIG. 1—GRAPH SHOWING THERMAL CONDUCTIVITIES OF VARIOUS TYPES OF BRICK

brick, common red and refractory brick are shown in Fig. 1. Fig. 2 illustrates graphically the relative heat losses through the insulated and uninsulated walls of a furnace.

Thermolith Cement

A new fire cement has been developed by the Harbison-Walker Refractories Co. The trade name given it is Thermolith. It is claimed for this cement that it sets hard and bonds fireclay brick firmly without heat. Fireclay and many other fire cements are incapable of bonding firebrick at ordinary temperatures. Thermolith remains a bond at all working temperatures—extreme heat

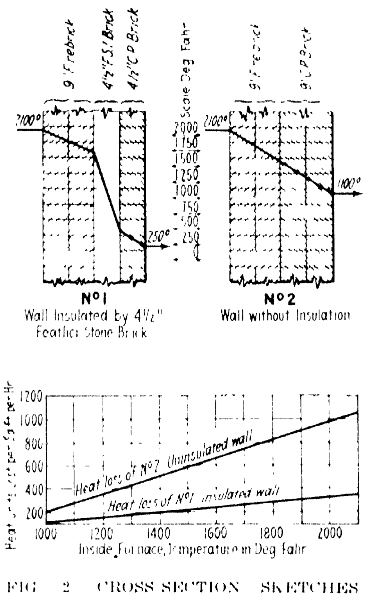

FIG 2 CROSS SECTION SKETCHES AND GRAPH SHOWING HEAT LOSS THROUGH INSULATED AND UNINSULATED WALLS

conditions neither fuse it nor crumble it. It is a high-temperature cement and a low-temperature cement. It is also claimed for this cement that it does not flux the brick at any working temperature, because it is chemically neutral. This same quality also enables it to resist the action of slags and clinkers, no matter whether acid or basic. It is mechanically strong. It withstands abrasion, either of furnace charge or mechanical equipment.

Thermal tests which have been conducted show this cement unfused at even the highest working temperatures, and in abrasive tests it has been impervious to sand blasts of sufficient force to wear down fireclay brick. It comes in dry powdered form. It is applied with a trowel after simple mixture with water. It does not require covering with water to prevent deterioration when not in use after the package is opened. It is packed in 200-lb. air-tight metal drums.

The cement is recommended by its manufacturers for use in laying up fireclay brick in blast-furnace and blast-furnace stove linings; boiler settings and firebox arches, heating, forge and welding furnaces; copper, lead and zinc furnaces; cement, lime and pottery kilns; gas regenerator linings; glass pot furnaces and glass leers; brass furnaces, and other miscellaneous uses. It is also of great value in patching and repairing fireclay brick construction, such as in boiler and gas-generating practice, where rapid and effective repairs are a requisite for uninterrupted service. This cement is also effectively used as a coating on refractory surfaces for protection against abrasive, corrosive and chemical attack.

Catalogs Received

POWER SPECIALTY CO., New York, N. Y.—Catalog EC 100 Descriptive catalog of the Foster Economizer for use in connection with steam boilers

COOPER HEWITT ELECTRIC CO., Hoboken, N. J.—Various leaflets as follows: Quartz glass apparatus for photophysics and photochemistry, the Lab-Arc, a high tension quartz mercury arc for polarimetry, interferometry, photomicrography, spectrometry, etc The Uviarc lamp in the laboratory, the ultra-violet lamp, the Uviarc test for dyes, inks, textiles, leather, prints and paper and Bulletin 105 on Uviarc and Ultra-violet lamps

NEW JERSEY FOUNDRY & MACHINE CO., 90 West St., New York, N. Y. Catalog 103, describing a new portable elevator.

GRINNELL CO., Providence, R. I.—Booklet on the Grinnell type tray drier

SAWYER SPECIALTY SCALES CO., Jacksonville, Fla Booklet on an accurate system of filling barrels with exact quantity.

QUIGLEY FURNACE SPECIALTIES CO., 26 Cortlandt St., New York, N. Y.—Bulletin 53—Uses of Hytempite Bulletin 70, the application of Mono-line, a cement for repairing and lining work in foundry practice.

HARDINGE CO., New York.—Bulletin 13. The Hardinge mill for grinding and pulverizing This bulletin describes new developments in pulverizing and grinding practice and a new type of conical mill put out by this company.

BLAW-KNOX CO., Pittsburgh, Pa.—Catalog on the Batcherplant A catalog on this company's so-called Batcherplant which is an overhead bin for the storing, measuring, and delivering of materials which are to be used in measured batches

TRUSCON LABORATORIES, Detroit, Mich.—Leaflet. A quotation from Samuel T. Very's article in a recent issue of *Architecture* on integral waterproofing descriptive of the application of Truscon products

DE LAVAL STEAM TURBINE CO., Trenton, N. J.—Leaflet Description of the installation of centrifugal pumps in the Baltimore plant of the American Sugar Refining Company

Catalogs Wanted

James H. Apps, consulting engineer, 205 Scripps Bldg., San Diego, Calif., desires to receive catalogs covering filters, drying and dehydrating apparatus, cooking kettles—steam jacketed and otherwise—oil-burning apparatus and pressure and exhaust fans.

Cama, Norton & Co., 11 Elphinstone Circle, Bombay, India, invite the receipt of correspondence and catalogs on engineering subjects for which they may have openings in Bombay and India in general.

Synopsis of Recent Literature

World Paper Production

From a recent article in *Paper* we learn that the total production of the existing 2,825 paper mills all over the world in 1913 amounted to approximately 9,750,000 tons and in 1920 the total output of paper and boards was about 14,500,000 tons. The average production of paper per meter-width of paper machines by countries has been estimated as follows: Germany, 540 tons; France, 660 tons; Sweden, 895 tons; England, 910 tons; Norway, 1,000 tons; Finland, 1,240 tons; Japan, 1,630 tons; United States, 1,845 tons; and Canada, 2,200 tons per year. The tons are to be understood as metric tons.

In 1921 the daily capacity of the United States mills was 7,825 tons mechanical, 5,700 tons sulphite, 904 tons sulphate and 1,846 tons soda pulp. During 1921 there was also converted into paper 3,550,000 tons of wood pulp and an unknown quantity of rags. However, the production of 1921 was much less than that of 1920, judging not only from the reported decrease of 846,000 tons of wood pulp but also from the fact that imports were lessened by 206,000 tons as against 1920. This decrease was not confined to the United States alone, as all over the world the same lessened production for 1921 occurred as compared with 1920 and even 1922 did not reach the production of 1920.

Zinc Dust and Its Uses

A. Billaz, in *L'Industrie Chimique*, Aug. 18, 1922, p. 193, notes that those chemical properties of zinc to which it owes its extended use in the powdered state are: (*a*) Reducing properties, which are utilized particularly in dye manufacturing—for example, in the reduction of nitro compounds to organic amines, and in the preparation of sodium hydrosulphite for the reduction of the vat colors; (*b*) the property of precipitating metals, such as copper, cadmium, lead, silver and gold from their solutions. It is used in the purification of zinc sulphate solutions destined for electrolysis or for the manufacture of lithopone, and precipitating gold and silver from their cyanide solutions; (*c*) the property of combining with dry oxygen only at a high temperature, and of giving with moist air a basic carbonate or with sea water an oxychloride which protects the bulk of metal from further alteration. These properties have led to the following applications: Painting iron objects; galvanization by cementation (sherardizing, which consists essentially in immersing iron objects in zinc dust at a temperature of 300 deg. C.); cold or electrolytic galvanizing of cast-iron objects; and metallization, or deposition by projection of a layer of zinc on the surface of the metal to be protected. The industries which use powdered zinc obtain the material from different sources, in accordance with the chemical rôle it has to play. One of these sources is from zinc smelters in which the zinc dust is but a byproduct. It is also made by blowing a stream of gas against a trickle of liquid zinc, and by a little-known pulverization (grinding) process. Zinc dusts are far from being pure zinc; they contain varying amounts of foreign materials, more or less undesirable to the user.

Up to recent years the presence of carbon in zinc dusts was explained solely by mechanical entrainment of the element volatilized from the charge or from the electrodes. Lemarchands (*Revue de la Métallurgie*, December, 1920) drew attention to the relation between the carbon in the dust and the carbon monoxide in the distilling gases, and proposed a chemical origin, depending upon the reduction of the carbon monoxide by the zinc, to the carbon. The main reaction is $Zn + CO = ZnO + C$, but this is modified by two other reactions, $ZnO + CO = Zn + CO_2$ and $CO_2 + C = 2CO$.

The oxidation of the zinc vapors by air is the most general and widely appreciated cause of the formation of zinc oxide contained to the extent of from 6 to 50 per cent. Air exists in the retorts and condensers, from the very commencement of the distillation, and cannot be avoided either in the ordinary furnaces or in the electric furnace. Zinc nitride, Zn_3N_2, the proportion of which in a zinc dust may vary from 0.16 to 0.42 per cent, is also formed from reaction with atmospheric gases.

Microscopic examination shows that grains of zinc dust are metallic globules coated with ZnO crystals; a circumstance which prevents the metallic droplets from wetting each other and uniting with the main body of liquid condensate.

Heated in air, zinc dust, owing to the concentration of oxygen on the surface of the metallic particles, ignites before melting.

Important Articles In Current Literature

More than fifty industrial technical or scientific periodicals and trade papers are reviewed regularly by the staff of *Chem & Met* The articles listed below have been selected from these publications because they represent the most conspicuous themes in contemporary literature, and consequently should be of considerable interest to our readers Those that are of unusual interest will be published later in abstract in this department but since it is frequently impossible to prepare a satisfactory abstract of an article this list will enable our readers to keep abreast of current literature and direct their reading to advantage The magazines reviewed have all been received within a fortnight of our publication date

Temperature Control in Steel Making

Charles Clausel de Coussergues presented a paper on "The Influence of Temperature in Steel Production" before the Liége Congress, June, 1922 (*Revue de Métallurgie*, 1922, pp. 639-644), in which he notes that for a long time one of the desiderata of steel-melting practice was to get the highest possible temperature. However, one now begins to question this statement and to wonder whether a maximum temperature is always to be considered as the best condition for the molten bath.

Consider the basic open-hearth process; it is well-known that an increase in temperature will accelerate the formation of basic slag with a relatively high melting point and will also tend to maintain the slag in a fluid state. Therefore it may be considered advisable to reach a high temperature as rapidly as possible—say above 1,600 deg. C. Such a high temperature will also aid the oxidation of various impurities in the steel, as this is done largely by iron oxide and as the solubility curve of the oxide of iron in iron rises sharply with the temperature, being practically nil at 1,400, about 1 per cent at 1,700 and 3 per cent at 1,800 deg. C.

Such high temperature will, however, hinder dephosphorization. It has been demonstrated some time ago that phosphorus might act as a deoxidizer in presence of carbon if the temperature is not very high. Such, for instance, was the practice of the Décazeville

plant in France in 1902 and 1903 and of the Tsaritzyne works in Russia. The same fact was also pointed out by Howe in his work on steel when referring to the Creusot practice with basic bessemers. It has been said sometimes that on theoretical grounds such a process will prove impossible above the inversion point of the reaction

$$P_2O_5 + 5C = 2P + 5CO,$$

i.e., above 1,100 deg. C. That is, however, in contradiction with practice, and the error seems to lie in the fact that phosphorus does not occur in the bath as phosphoric oxide, but as phosphate.

As it is often advantageous to dephosphorize the bath in the presence of carbon, the process should be conducted at that stage which makes dephosphorization possible—i.e., at a relatively low temperature. Incidentally the lower temperatures will assist in getting rid of iron oxide, as its solubility at lower temperatures is very small.

It follows from these two series of considerations that the molten bath should be superheated first and then somewhat cooled down. Final deoxidation will be effected then at a relatively lower temperature, a smaller amount of oxides will have to be reduced, less deoxidizers will have to be used and a saving in costs obtained.

A New Material for Permanent Magnets

The performance of a permanent magnet depends upon both the remanence and the coercive force. The product of the remanence (R') as determined in a yoke by the coercive force K, as measured by a magnetometer, is considered to be a measure of the quality of the magnetic material. It has been shown[1] that, by the addition of manganese to iron, the coercive force was increased to double that of the ordinary chromium or tungsten magnet steel, but that this was accompanied by the reduction of the remanence to a point where the alloy was useless as a permanent magnet. In the present investigation[2] the addition of cobalt, with its known beneficial effect upon the saturation value of iron, was studied by Gumlich. First, three series of alloys with carbon ranges of 0.7 to 0.8 per cent, 1.0 to 1.1 per cent and 1.2 to 1.4 per cent containing from 3 to 11 per cent Mn, and with Co about 35 per cent, were made up. It was soon found that there was no advantage in going over 4 per cent in Mn. The best alloys of these series were found to be (H max. 500):

	%C	%Mn	%Co	R'	K	$R' \times K \times 10^{-3}$
(1)	0 83	4 8	35	9530	158	1505
(2)	1 12	4 7	35	9580	156 3	1497
(3)	1 24	4 0	35	9720	132 3	1285

The best heat-treatment was found to be quenching in ice-cooled oil from 850 deg. C.

The addition of cobalt in any lower proportion than 33 per cent caused rapid falling off in both R' and K.

In another series chromium was added to determine in what degree this element could be used as a substitute for the expensive cobalt. It was found that 5 per cent Cr could be substituted for 10 per cent of cobalt without appreciably altering the magnetic properties, provided the carbon was kept around 1.1 per cent. If, however, the Co was kept at 35 per cent and 5 per cent Cr added, very much better results were obtained, as, for comparison (H max. 500):

	%C	%Mn	%Co	%Cr	R'	K	$R' \times K \times 10^{-3}$
(2)	1 12	4 7	35		9580	156 3	1497
(4)	1 11	5	20	5 1	9430	155 0	1460
(5)	1 11	3 5	36	4 8	9130	203 8	1863

In these higher coercive force alloys it is necessary to use higher magnetizing forces than in ordinary magnet steels. Fields up to 1110 H max. were tried and gave increasingly good results. R' and K were boosted to 9310 and 227 respectively, as compared with 9130 and 203 at H max. = 500.

With high Cr, Co and C (alloy 5), it was necessary to increase the hardening temperature to 875 deg. C. Under aging, hammering and heating tests these alloys showed little change, the maximum being 3½ per cent due to heating to 100 deg. C. The temperature coefficient (20 to 100 deg. C.) was found to be 204×10^{-6}, which is about the same as our present Cr and W steels.

[1]*Electrotech. Zeitschrift*, vol. 40, p. 26 (1919).

Corrosion of Metals by Refrigeration Brine

Results of a study to determine causes and methods of overcoming corrosion in refrigeration brine systems by Emerson P. Poste and Max Donauer, of the Research Laboratories, Elyria Enameled Products Co., are summarized in *The Mills Dealer* for February.

Three types of brine were found in commercial use: Natural calcium chloride, soda byproduct calcium chloride, sodium chloride. The latter is not used to any extent, as it is of a severely corrosive nature, probably due to an induced oxidation. Analyses of the two types of calcium chloride are as follows:

	Natural Per Cent	Soda Byproduct, Per Cent
Calcium chloride	73 59	74 07
Sodium chloride	1 45	0 51
Magnesium chloride	0 00	0 00
Total solids	75 11	74 66
Water	24 89	25 34

To determine the effect of acidity and alkalinity on rate of corrosion, tests were made with a brine of commercially pure calcium chloride treated with lime and acid to produce a range of from the equivalent of 0.5 per cent free calcium hydroxide to 0.3 per cent free HCl. The curve indicates that to keep corrosion at a minimum the alkalinity must be greater than 0.1 per cent. Brines originally alkaline will turn acid gradually, and a curve showing the rate in days plotted against original alkalinity was also determined. As in the first curve, the break in the curve comes at a free lime content of 0.1 per cent. Rate of corrosion was also found to decrease with the density of the brine.

These and other findings may be summarized as follows: Essentially pure calcium chloride brine is alkaline when first made, but it soon turns acid on exposure to air, due to absorption of carbon dioxide. With this acidity comes a marked increase in corrosive action. The activity is materially increased in the presence of magnesium chloride as a result of the earlier development of acidity and the formation of corrosive ammonium chloride in the case of ammonia leakage. Contact of unlike metals or the presence of stray electrical currents increases the rate of corrosion of a pure brine and the presence of the above impurities accelerates these electrical tendencies. The corrosive action of brine decreases with increasing brine density. Chlorides are on the market which are contaminated with magnesium chlorides, though first-class materials are available, both soda byproduct and natural chlorides. Corrosive brines free from magnesium chlorides may be corrected by treatment with lime if the alkalinity produced is maintained above 0.1 per cent. This is readily done by keeping a supply of lime in a bag hung in the brine tank.

Wear on Rails

According to M. J. Gouttier, in *Revue Universelle des Mines*, vol. 11, p. 524, the Sandberg sorbitic process of improving rails--used to a certain extent in England--has been lately applied by a traction line in Paris. Owing to the increase of the volume of the traffic and of the weight of the cars, the rails were being subjected to a more severe strain and are wearing down more rapidly than ever before. Investigations were set on foot to find a remedy. First it was thought best to alter the section of the rail. Another line of research was the question of using nickel steels, but their price proved prohibitive. The manganese and high-carbon steels were also studied.

Steel rails containing 0.5 per cent C, 0.3 per cent Si and 1.1 per cent Mn, treated by the Sandberg process, gave very good resistance to wear and were not expensive.

The Sandberg sorbitic process is applicable to the treatment of all similar articles where hardness and toughness are required. There are obvious objections to hardening rails by quenching. It is only necessary that the rails should be tough and hard. Therefore the rails, when still at a temperature above the critical range, are cooled by a blast of air or atomized fluid so as to cool them with a moderate speed through the critical range and obtain finally a sorbitic structure. By this treatment an increase of 10 to 15 per cent of tensile strength and of 20 to 25 per cent of elastic limit is easily had. Elongation is, of course, a little reduced and the Brinell hardness increased by 20 to 25 per cent. Resistance to abrasion is also raised very considerably.

The process has been developed to the treatment of rails *in situ*, by drawing a high temperature flame along the surface of the rail and then flooding the hot surface by a water jet.

Review of Recent Patents

Gas-Flow Meter—Charles W. Hinman has been granted a patent for a gas-flow meter which uses the heat interchange system for indicating the rate of gas flow. The method and apparatus are patented. The method consists of abstracting from the gas the quantity of heat resulting from the fixed diminution of temperature of the gas between inlet and outlet, producing in the abstracting fluid (water) a fixed temperature difference between inlet and outlet. The water flow is thus indicative of the rate of gas flow, due account being taken of the specific heats and temperature differences involved. (1,446,461. Feb. 27, 1923.)

Process for Treating Paper Mill Waste—J. E. Plumstead has assigned to the Jessup & Moore Paper Co., of Philadelphia, a process for recovering the soluble salts and the combined carbon in pulp mill waste liquor. This is done by passing first through an incinerating evaporator that takes off all the water, some of the chemicals and gases formed and reduces the combined carbon to a char. The resulting mixture of carbon and chemicals is treated with water in a dissolving tank, ground up finely and filtered. The carbon sludge which is thus obtained is dried and ground again and finally used as pulverized fuel. The hot gases are treated in a scrubbing system to remove any valuable products before allowing them to escape. (1,442,494. Jan. 16, 1923.)

Electrical Precipitation of Flocculent Material—This invention is concerned with the electrical precipitation of suspended materials from gases, when the suspended materials are of a light, flocculent nature such as soot or carbon smoke. In order to overcome the difficulty of precipitation of such materials, a solid, pulverulent material of a coarser, heavier nature than the material which it is desired to precipitate is distributed into the gas. This heavier material serves to form with the light, flocculent material a compact and granular mass easy of precipitation.

In operation, a suitable weighting and granulating medium, such as finely divided clay, fullers earth, soapstone, sand, cement, kiln flue dust or finely divided rock or earth of any kind which is heavier and more compact than the deposit which would be formed by precipitation of the material suspended in the gases is injected into the stream of gases passing to the electrical precipitator so as to become thoroughly distributed throughout the body of gases. This may be effected by injecting such finely divided solid material into the gas stream by blowing it in with a current of air, or steam, or other gas, or a mechanical distributing apparatus.

As the gas is then passed through the electrical precipitator and is subjected to the action of an electrical field produced between discharge and collecting electrodes, the material suspended in the gases, including the weighting and granulating agent aforesaid, is deposited on the collecting electrodes, and is removed from such electrodes from time to time by jarring, brushing or otherwise. By reason of the weighting and granulating effect of the material added to the gases and deposited along with the material originally suspended in the gases, the material so precipitated will remain on the electrodes instead of being carried along by the gases.

This is of especial importance in the case of gases where the precipitated material includes more or less soot. It has been found that in the precipitation of such material there is a tendency for the light, flocculent soot particles to be carried along by the

American Patents Issued March 20 and 27, 1923

The following numbers have been selected from the latest available issue of the *Official Gazette* of the United States Patent Office because they appear to have pertinent interest for *Chem & Met* readers. They will be studied later by *Chem & Met's* staff and those which, in our judgment, are most worthy will be published in abstract. It is recognized that we cannot always anticipate our readers' interests and accordingly this advance list is published for the benefit of those who may not care to await our judgment and synopsis.

1,449,388—Paint and Varnish Removing Composition. Ida A. Ferrell, Staunton, Ind.

1,449,423—Production of Naphthylamines. Alexander Lowy and Arthur Mark Howald, Pittsburgh, Pa.

1,449,493—Process of Treating Rubber and Product Obtained Thereby. Sidney M. Cadwell, Leonia, N. J., assignor to the Naugatuck Chemical Co., Naugatuck, Conn.

1,449,603—Method of Separating Granular Solid Material. Martin Hokanson, Duluth, Minn.

1,449,613—Wool Cleaning. Hiram Young McBride, Denver, Colo.

1,449,681—Sulphur Dye. Erwin Kramer, Dentz, near Cologne, and Ludwig Zeh, Wiesdorf, near Cologne, Germany, assignors to Farbenfabriken vorm Friedr. Bayer & Co., Leverkusen.

1,449,718—Art of Rendering Paper Material Greaseproof. Wilbur L. Wright, Fulton, N. Y.

1,449,793—Glass and Process of Making Same. William Chittenden Taylor, Corning, N. Y., assignor to Corning Glass Works.

1,449,875—Apparatus for Hydrogenating Carbonaceous Material. Titus Ulke, Washington, D. C.

1,449,892—Sizing Composition and Process of Preparing the Same. Phillip W. Codwise, Dalton, Mass.

1,449,930—Machine for Treating Rubber and Other Heavy Plastic Material. Fernley H. Banbury, Ansonia, Conn., assignor to Birmingham Iron Foundry, Derby, Conn.

1,449,976—Oil Product and Process of Making Same. Henry V. Dunham, Mount Vernon, N. Y.

1,449,981—Method of Indigo Dyeing. Edward T. Garsed, Charlotte, N. C., assignor to Alexander & Garsed, Inc., Charlotte, Inc.

1,450,026—Process for the Manufacture of Lubricants From Low-Temperature Tar. Egon Eichwald and Hans Edgar Richard Vogel, Hamburg, Germany.

1,450,078—Valve for Corrosive Liquids. Charles F. Haunz, Buffalo, N. Y., assignor of one-half to Theodore Krug, Buffalo.

Complete specifications of any United States patent may be obtained by remitting 10c. to the Commissioner of Patents, Washington, D. C.

gas stream because they do not form a compact adherent deposit on the electrodes, but either fail to adhere, or adhere only loosely to the electrodes, and are easily swept along by the gas stream. The dust, clay or other solid finely divided material, when precipitated along with the soot, forms a heavy more or less compact and granular deposit which adheres to the electrodes sufficiently to prevent being swept along with the gases, but can be readily dislodged by jarring or brushing, and when so dislodged will fall by gravity into the collecting means in the bottom of the precipitator. (1,446,-778. Gustav A. Witte, assignor to International Precipitation Co., of Los Angeles, Calif. Feb. 27, 1923.)

Process for Making Sulphates—Harry Pauling, of Berlin, Germany, has developed a process for making sulphates. It consists essentially in treating the metal with nitric acid, about 50 per cent strength. The acid is slightly warmed in order to start the reaction and a rapid evolution of nitric acid takes place. These gases are absorbed in suitable absorption towers, which may be operated in such a manner that the nitric acid is regenerated to the same strength at which the operation started. At the end of the reaction a solution of the nitrate of the metal is treated in another vessel with sulphuric acid. The nitric acid set free in this reaction is also recovered in the absorption chamber. Air is forced through the solution in order to free it from nitric acid. The resulting solution of copper sulphate may be crystallized by cooling.

The distinct advantages of this process lie in the fact that a very rapid reaction is effected with no loss of the intermediate agent—nitric acid. Formerly, sulphuric acid was run down through towers over copper or zinc, or nickel, or whichever metal was to be used, and the solution collected at the bottom This particular method is much more rapid and gives the material a high purity. (1,446,578. Feb. 27, 1923.)

Calcium Carbide Production—In U. S. patent 1,327,736 a claim was made for a process of producing calcium carbide from coking coal and lime mixed in proportions to form a cokelike mass and then subjected to the action of heat to convert it into carbide. It was stated in the specification that calcium oxide or calcium carbonate may be used with the bituminous coal when calcium carbide is the ultimate product desired. In a later patent (1,396,058) a cemented mixture of oxide and carbon made by the intimate mixture of lime and bituminous coal, heated to form a homogeneous mixture, was used as the raw material. It is stated in the present patent that a satisfactory product is obtained by intimately mixing equal parts by weight of calcium carbonate ground to about 40 mesh fineness with bituminous coal ground to about 8 mesh fineness. This mixture is subjected to heat sufficient to distill the coal. The heating may be performed in an ordinary gas retort or furnace. At about 600 deg. F. the tarry products are liberated and as the heating proceeds further, these bubble through the mass of material, thereby coating and impregnating each lime particle with hydrocarbon, which, under the influence of heat, is converted into coke or carbon. The action of the tarry products and the presence of an excess of carbon prevents the conversion of the calcium carbonate into the oxide (assuming the lime ingredient used is the carbonate). At the conclusion of the operation, a cemented mass of coke and limestone is obtained, which is of uniform composition throughout and which forms an ideal resistor to the passage of electric current in a carbide furnace. This raw material will not deteriorate, even though it is exposed to the action of the water. Hence it can be stored indefinitely and handled with convenience in the shipping. Furthermore, the limestone supplies not only the necessary calcium oxide, but has a fluxing effect which enables the reaction to be realized in a particularly efficient manner. (1,445,644. James H. Reid, assignor to International Nitrogen Co., Cleveland. Feb. 20, 1923.)

Organic Arsenic Compound—A new arsenic compound having the formula $As(OH)_2OCH_2COOH$ can be obtained by the interaction of chloracetic acid with arsenic oxide, As_2O_3, or its derivatives, provided the reaction takes place in the presence of an alkali. An example of how the material is produced is as follows: 198 parts of arsenic oxide (As_2O_3) are dissolved in 330 parts of sodium hydroxide and 700 parts of water. Subsequently 273.5 parts of chloracetic acid ($ClCH_2COOH$) are dissolved in a cold solution of 130 parts of caustic soda in 130 parts of water. The latter solution is then added while stirring to the solution of arsenic. After the reaction is complete the mixture is neutralized with acetic acid and rendered alkaline with a surplus of ammonia. By the addition of calcium chloride the calcium salt of the acetic arsenic acid is precipitated, filtered off and dried. The resulting compound is said to have therapeutic value. Johann Huismann and Jurgen Callsen, assignors to Farben-Fabriken vorm. Friedr. Bayer & Co., of Leverkusen, Germany (1,445,685. Feb. 20, 1923.)

Production of Cellulose Ethers—The present process in the manufacture of cellulose ethers is considerably accelerated by a method patented by Leon Lilienfeld, of Podhajce, Poland. Instead of washing out the alkali from the alkali cellulose, which is formed as an intermediate product in the ordinary process of manufacture, by this method the agent for conversion of the alkali cellulose to the ether is added before getting rid of the caustic. This does away with the pressing, centrifuging or like operations which have previously been necessary. The alkylating, aralkylating or arylating agent is added immediately after the caustic solution has acted upon the cellulose. (1,441,989. Jan. 9, 1923.)

British Patents

For complete specifications of any British patent apply to the Superintendent British Patent Office, Southampton Buildings Chancery Lane, London, England.

Pickling—In order to avoid brittleness in pickled iron or iron alloys, organic bases containing nitrogen rings, especially the quinoline nucleus, are added to any usual pickling bath, which may comprise sulphuric acid of 5 per cent strength for hot pickling, or hydrochloric acid of 10 to 20 per cent strength for cold pickling, and 1 to 2 per cent of the nitrogen compound. Extracts from the distillation products of coal tar or fractions of coal-tar distillates which contain the bases, or synthetic products may be used. Specification 158,768 is referred to. (Br. Pat. 188,713. British and Foreign Chemical Producers, Ltd., London. Jan. 10, 1923.)

Refining Lead—Oxidizable impurities such as arsenic, antimony, tin and zinc, are removed from lead by bringing the molten lead into contact with an oxidizing agent such as alkali nitrate, nitrite, chlorate or hypochlorite, or a peroxide, in suspension or solution in molten caustic alkali, or caustic alkali and a fusible chloride. The molten metal is preferably passed through the reagent by means of the apparatus described in specification 142,398 or 184,-639. The temperature and the proportion of oxidizing agent may be so adjusted that different impurities are removed in succession. (Br. Pat. 189,-013. H. Harris, London. Jan. 10, 1923.)

Artificial Silk—For purifying viscose and similar cellulose solutions to be used in the manufacture of artificial silk, the solution is emulsified with an organic liquid such as paraffine, which does not dissolve in the solution; on standing, the emulsion separates into layers, and the organic liquid carries with it the suspended particles and a portion of the resinous and coloring impurities of the viscose solution. Separation may be accelerated by passing the emulsion through a centrifugal separator. Subsequent filtration is unnecessary. (Br. Pat. 189,114; not yet accepted. J. R. N. van Kregten, assignor to Naamlooze Vennootschap Nederlandsche Kunstzijdefabriek, Arnhem, Holland. Jan. 17, 1923.)

Activated Carbon—Decolorizing carbon is produced from carbonaceous material of vegetable, animal or mineral origin, by dry distillation in presence of activating gases or other substances with or without a preliminary distillation together with inert or slightly active gases. The gases, which may be chlorine, volatile chlorides, air, steam, carbon dioxide or monoxide, flue or generator gases, or mixtures of these gases, are passed through the charge in a direction opposite to that of the charge itself. The other activating substances specified are calcium or magnesium carbonates and chlorides, slaked or unslaked lime or "liquids or gases." The raw materials such as wood waste, peat, waste cellulose, lignite, briquetted coal, etc., is charged into a retort, preferably

vertical or inclined, and the active gas, preferably at 100 to 600 deg. C., is introduced at the other end. The temperature of the retort is controlled by means of the gases so that it rises to a maximum and then decreases. Various temperatures are specified for the activation by the different gases. The retort gases produced are preferably removed at a short distance from one end of the retort, to obviate the choking of the conduit by the cooled products, and may be utilized to heat the retort. The product may be ground and purified by treatment with hydrochloric acid or "other chemicals." (Br. Pat 189,148; not yet accepted. General Norit Co., Ltd., Amsterdam. Jan. 17, 1923.)

Ammonia Recovery—Ammonia is recovered from producer gas, distillation gases and other gases containing a small amount of ammonia. The gas is passed through carbonaceous material containing organic acids such as soft lignite or peat, and the invention may be carried out in conjunction with the manufacture of producer gas from peat, lignite or similar material. The ammonia is liberated by means of alkali and the absorption material is regenerated by treating with an acid such as hydrochloric and removing the excess acid. (Br. Pat. 191,741. Industrial Research, Ltd., London. March 7, 1923.)

Insulating Varnish—Fatty acids are heated with either the gelatinized product formed by heating a vegetable oil with or without resin, or a mixture of glycerine and resin with or without vegetable oil. The heating is continued until the ingredients are thoroughly mixed and are on the point of gelatinizing. The compositions, with or without dilution with solvents such as kerosene, are used as varnishes and are further heated after application to cause them to solidify. Suitable fatty acids are those obtained from drying and semi-drying oils such as linseed, Chinese wood, corn, cottonseed, soya bean, peanut, sesame, rapeseed, castor oil and tung oils. Suitable resins are shellac and Congo copal. The products are particularly applicable for japanning or enamelling electric conductors and other metallic surfaces for insulating and protective purposes. (Br. Pat. 191,422; Western Electric Co., Ltd., Norfolk House, Victoria Embankment, Westminster March 7, 1923.)

Men in the Profession

Dr. FRANK APP has resigned from the staff of the Agricultural College and Experiment Station of Rutgers College to become vice-president of the Minch Brothers Co., at Bridgeton, N. J.

HENRY H. BUCKMAN, formerly head of Buckman & Pritchard, Inc., New York, producer of zircon, etc., will operate as a chemical engineer in raw materials and manufactures, with headquarters at Jacksonville, Fla.

WILLIAM I. BURT, formerly sales engineer of the Bristol Co., is now chief chemist of the Dolomite Products Co., Maple Grove, Ohio.

Dr. ARTHUR HOLLY COMPTON, head of the department of physics in Washington University, has been appointed professor of physics at the University of Chicago.

Dr. CECIL H. DESCH, professor and dean of the faculty of metallurgy in the University of Sheffield, delivered recently the "Second Sorby Lecture" on "The Services of Henry Clifton Sorby to Metallurgy." The Sorby lectureship has been instituted by Sheffield engineering associations to commemorate the work of Dr Sorby, who rendered signal service to metallurgy and to microscopy.

W. A. DUNKLEY has resigned his position as gas engineer at the Urbana Station of the Bureau of Mines to become superintendent of the gas department of the Memphis (Tenn.) Power & Light Co.

EDWARD CURTIS FRANKLIN, president of the American Chemical Society and professor of organic chemistry in Leland Stanford University, addressed the Pittsburgh Section of the society in the auditorium of the U. S Bureau of Mines on March 26. His subject was the "Ammonia System of Compounds," although it might be termed as a discussion of the analogy of ammonia to water. A number of interesting experiments were made.

CHARLES W. FRANCIS is now superintendent of the Lennox Chemical Co., Euclid, Ohio.

JOHN HAYS HAMMOND has endowed a scholarship in engineering at Yale University for a Mexican student. The scholarship is for a 4-year course and covers expenses of tuition, dormitory, meals, books, etc., and also transportation from and to Mexican border.

Dr. A. P. HOLLEMAN of the University of Amsterdam, Holland, will lecture, April 13, at 4 p.m. in the Doremus Lecture Theater, Chemistry Building, College of the City of New York.

Dr. IRA N. HOLLIS, for 10 years president of Worcester Polytechnic Institute and previously professor of engineering at Harvard University, has offered his resignation to the board of trustees.

A. C. HOUGHTON, who for the past 18 years has been associated with the Semet Solvay Co., has entered the employ of the Bakelite Co., of New York City. Mr. Houghton will erect and operate a phenol plant for that company near Cleveland, Ohio.

FRANK HOYER, formerly with the General Chemical Co., Buffalo, N. Y., has become an instructor in chemistry at the Hutchinson High School, Buffalo. Mr. Hoyer will spend part of his vacation with the General Chemical Co.

Dr. J. C. KARCHER of the sound laboratory, Bureau of Standards, has resigned to accept a position as technical adviser to the production manager of the Western Electric Co., Chicago, Ill.

CHESTER H. PENNING accepted an appointment as special expert with the chemical staff of the U. S. Tariff Commission, and assumed his duties in Washington about the middle of March.

HARRY STEBBINS, of Powers-Weightman-Rosengarten Co., has accepted the chairmanship of the fine chemicals division in the forthcoming Home Service Appeal of the Salvation Army for a fund to maintain and extend its activities in Greater New York.

E. T. STOTESBURY has been elected president of the Temple Iron Co., Reading, Pa.

Obituary

SIR JAMES DEWAR, the famous British chemist, who was the co-inventor with Sir Frederick Abel of cordite, the smokeless powder adopted by the government, died on March 27, in his eighty-first year. He also brought forward the Dewar flask, popularly known as the thermos flask. Sir James Dewar was born in Kincardine-on-Forth, prepared for college at the Dollar Academy and went to Edinburgh University, where he specialized in chemistry. On his graduation he became the assistant to Lord Mayfair, then occupying the chair of chemistry at Edinburgh University. Devoting himself to research the greater part of his long life, Sir James Dewar's investigations in the field of chemistry covered a wide range. Especially well known were the following among his investigations: Physiological action of light; problems of spectroscopy; liquefaction of gases; the scientific use of liquid oxygen, air, fluorine and hydrogen. For a time he was director of the Davy-Faraday Research Laboratory, and he held professorships at St. Peter's College, Cambridge, and was also Jacksonian professor of experimental philosophy at Cambridge. He was knighted in 1904.

GUSTAVUS DETLEF HINRICHS, formerly professor of physical science at the State University of Iowa and of chemistry at the St. Louis College of Pharmacy, is dead, at the age of 77.

CHARLES M. MACNEILL, president of the Utah Copper Co. and the Chino Copper Co. and vice-president of the Replogle Steel Co., died of pneumonia on March 17, at his home in New York, at the age of 52. He was ill less than 2 days. When 33 years of age he was elected president of the Utah Mining Co. and had been prominent in the copper industry since that time.

The Week in Industry and Trade

Current News and Market Developments

News Section

April 9, 1923
CHEMICAL & METALLURGICAL ENGINEERING
Tenth Avenue at 36th Street, New York
H. C. PARMELEE, *Editor*

Market Section

The Summary of the Week

The advance in phenol, together with prospects for a higher contract market, has stimulated the trade to such an extent that new production is under consideration in several quarters.

The Salesmen's Association of the American Chemical Industry has appointed a committee to draw up a uniform contract to govern transactions in chemicals.

Soap makers absorbed more than 1,000,000 lb. of extra tallow at 9c. per pound.

Heavy arrivals of arsenic from Japan reached the market during the week, but were readily absorbed.

Muriate of potash is very firm due to difficulty in securing stocks from Germany, and other potash salts are firm as a result.

Higher average price for tin caused advances in tin products at the beginning of the month, but tin oxide eased off in price during the week

Reports from Germany say that American buyers of chemicals are no longer active in German markets owing to the unsatisfactory result of previous business.

The Interstate Commerce Commission has refused to allow Western transcontinental railroads to reduce freight rates on oils from the Pacific coast to Chicago.

Permanganate of potash attracted considerable interest, but actual business was not heavy, as stocks are limited.

Bleaching powder has been finding a good outlet in consuming trades, and some producers are sold up.

Completing the Circle

THIS is the first issue of *Chem. & Met.* which contains this new department, "Industry and Trade." It is a new effort and will be a permanent addition to our service.

This department is built for every man in the chemical engineering industries. Whether his work be executive, operating, purchasing or selling, this department is his. He will naturally use it with different emphasis depending on his needs, but he will use it. Behind this constructive effort is a desire to serve all phases of the chemical engineering industries—production, management and marketing. The prestige that *Chem. & Met.* has earned as the leading technical paper in the field is a promise that its effort in marketing will be constructive and distinguished.

It has been more than a year since Herbert Hoover, acting as a spokesman and a critic of industry, said that the greatest effort of business in the next decade would be to diminish the slack and waste in distribution. That is the job of every business man. How is he to undertake it? What manner of effort must be made? Will it be accomplished by the single act of a genius? Probably not. It is a task for every one of us.

Distribution efficiency or marketing efficiency must be based first on a knowledge of markets. This includes current prices, and these *Chem. & Met.* will give you weekly. Accurate prices they are, compiled by men with long experience and a wide acquaintance, men who know accurate prices and who know where to get them.

Knowledge of markets must also include an understanding of the price changes that are likely to occur. Whether these changes are cyclical and dependent on seasonal demand or whether they are due to some unusual factors, they must be anticipated and interpreted by experts in that work. This *Chem. & Met.* will do through "Industry and Trade."

Again, knowledge of markets must include acquaintance with the trends of business. The post-war deflation taught us that lesson. The economics of business, the general movements toward depression or boom are not apparent from the day's work and can be sensed only by those who can get a perspective on conditions. In *Chem. & Met.* it is possible for us to focus the statistics from hundreds of sources into a balanced point of view on business conditions.

Imports and foreign prices are indications of the severity of foreign competition, and these will both be covered. Notes on corporations and industrials, reports of decreased or increased production, personal items indicating a greater or smaller emphasis on various phases of a company's business—all of these things paint a composite picture of business during the week.

This department will be *Chem. & Met.'s* contribution to better efficiency in marketing.

There is yet another side of this work that is important. In this department will be a record of important events in industry and trade. Not only is this department a market service to the industry but it is the newspaper of the industry. Able editors in New York, Chicago, Washington and San Francisco, constant editorial contact with industrial centers through trips and scores of correspondents in larger centers of activity make possible a news service that is unique.

H. C. Parmelee

Technical Societies and Trade Associations

News of the Week

Current Events Legislative Progress

Chemistry by radio is one of the latest wrinkles in popular education. Certain A.C.S. sections have already broadcast entertaining programs of chemistry with success. The New York Section is now planning a series of five or six lectures of popular interest which are to be wirelessed from the New York station WEAF. Subjects and speakers will be announced in the near future.

Gold and silver data are ready to be laid before the special Senate committee investigating the status of these industries. Various agencies have been active in assembling these data; the committee representing the mining congress expresses hope that the outcome of the investigation may greatly benefit the entire nation.

Prohibition of naval stores exportation from France is urged by various of her manufacturing syndicates which claim that the low stocks now in hand are fast being depleted by foreign purchasers. Rosin and turpentine are the commodities most affected.

New York's garbage problem is becoming serious. A study is being urged to find an improved method of disposing of the 3,700,000 tons of waste which has to be removed annually. Present methods involve both waste and a menace to health.

Education in leather is the aim of a campaign just launched, which is to be financed by the American Sole & Belting Leather Tanners, Inc. Various organizations are co-operating in this campaign to show the public what factors enter into leather manufacture and so influence costs to consumer.

The Austrian glass industry is tottering. Its wares cannot be placed on home or foreign markets. German and Czechoslovakian competitors are underselling Austrian firms by 40 to 50 per cent.

Soap going into Cuba from other countries than America is liable to new duties if a movement now on foot is carried through. Cuba makes most of her laundry and floating soap using much imported raw material, but has in the past imported toilet and perfumed soaps from Europe. The new measure would effectively stop this importing.

French metal industry is slowing down. An order has just been received here for 1,000,000 tons of American coal. The present supply of coke is very low. Almost none comes from the Ruhr. Several concerns are facing the suspension of all operations.

A unique service to paint men is being rendered by Spencer Kellogg & Sons, Inc., of Buffalo, N. Y. This firm, manufacturer of vegetable oils and oil products, is offering the services of an expert on linseed oil to speak before any master painters' association in the United States.

Calendar

The following important technical meetings are scheduled for the immediate future:

AMERICAN ASSN OF ENGINEERS Norfolk, May 7-9

AMERICAN ELECTROCHEMICAL SOCIETY New York City, May 3-5

AMER SOCIETY MECHANICAL ENGRS. Montreal, May 28-31

AMERICAN FOUNDRYMEN'S ASSOCIATION Cleveland, O., April 28-May 4

AMERICAN OIL CHEMISTS' SOCIETY Hot Springs, Ark., April 30-May 1

AMERICAN WELDING SOCIETY New York, April 24-27

AMERICAN ZINC INSTITUTE St. Louis, May 7-8

CANADIAN INSTITUTE OF CHEMISTRY Toronto, May 29-31

INTERSTATE COTTON SEED CRUSHERS ASSN Hot Springs, Ark., May 2-5

SOCIETY OF CHEMICAL INDUSTRY Canadian Section Toronto, May 29-31

SOCIETY OF INDUSTRIAL ENGINEERS Cincinnati, O, April 18-20

SOCIETY OF CHEMICAL INDUSTRY New York, joint meeting with other societies, April 13

Six million cords of pulpwood was consumed by United States pulp mills in the banner year, 1920. A recent report of O. M. Porter of the American Pulp and Paper Association states that last year fires destroyed enough wood to keep our mills running for 18 months at this rate. Budworms are destroying an average of 10,000,000 cords a year in Quebec alone.

The sisal inquiry of the government has been placed in charge of P. L. Van Buren Bell, who has been appointed by Secretary Hoover. Mr. Bell is to look into the situation on the ground with especial reference to the control of the Yucatan crop.

Colombia and Brazil urge American investigation of their rubber resources The Ministers of these countries have issued statements in which co-operation in a study of the situation is promised. Willingness on the part of these countries to have the United States develop its own rubber industry within their bounds seems manifest.

Acetylene and oxygen, purified and mixed, roughly 40 per cent of the former to 60 per cent of the latter, constitute a new anæsthetic. Its discoverer, Prof. K. Gaus, has named the mixture narcylene. The objectionable odor of the acetylene is overcome by the addition of pine oil.

Federal Phosphorus Co. Not to Produce Arsenate

The Federal Phosphorus Co. is not to engage in the manufacture of calcium arsenate. Theodore Swann, president of the company, has notified *Chem. & Met.* that the statement appearing in last week's issue to the opposite effect is in error.

Tariff Investigation Organized

Schedules asking information regarding costs of production and other data have been mailed by the Tariff Commission to domestic producers of the seven chemicals regarding which the commission has undertaken investigations looking toward changes in duties under the flexible tariff section of the new act.

The commission has approved plans by which F. W. McSparren, of the chemical section, and an accountant not yet selected will sail for Argentina April 14 to investigate costs of production and other competitive conditions of casein in the South American republic, which is the largest exporter to the United States, and by which C. R. DeLong, chief of the section, and M. G. Donk, an assistant, and an accountant will sail for Europe about May 1 to investigate costs of production there of oxalic acid, diethyl barbituric acid, barium dioxide, potassium chlorate and sodium nitrite. Dexter North, another chemist, will join the European party later. Investigation into foreign costs of production of logwood extract will be made, in the Caribbean islands principally, at a somewhat later date.

Casein Investigation Under Way

Chief DeLong and Mr. Donk spent several days in New York and vicinity recently conferring with producers of casein regarding the tentative cost schedule. As a result several changes were made in this schedule before it was sent out. There are about seventy producers of casein in the United States. Schedules for the other chemicals, each of which involves a smaller number of domestic producers, were sent out without consultation. While in New York the representatives of the Tariff Commission also arranged with importers for letters of introduction to their foreign connections.

The schedules, in most cases, will be compiled in the office of the Tariff Commission before experts and accountants visit the domestic plants to check the returns and observe conditions, and in others will be filled by the manufacturers and held until the commission's representatives call.

Franklin Discusses Ammonia

Thirty A.C.S. sections throughout the country are to hear Dr. E. C. Franklin, president of the society, lecture on "The Ammonia System of Compounds." His first delivery of the talk was before the Southern California Section on March 16 at Los Angeles.

Dr. Franklin illustrated his remarks by a large number of experiments with liquid ammonia. He stressed the similarity that existed in many of the physical and chemical properties of ammonia and water. Although water was accepted as the universal solvent, ammonia was equally effective. A parallelism existed between the water of crystallization of some compounds and the ammonia of crystallization of others. Pure water is a non-conductor of electricity; liquid ammonia is equally resistive. An experiment was made of attaching to electrodes in the liquid a circuit containing a source of power and an ordinary electric bulb. Insufficient current passed to cause the filament to glow. After the addition of a minute amount of silver nitrate, however, the liquid ammonia became a conductor, and incandescence resulted.

Pure liquid ammonia is neither acid nor base; acids and bases react with it as they do with water. High degrees of concentration are practicable with many salts when dissolved in liquid ammonia; crystallization usually occurs with much greater facility from an ammonia solution than from a water solution. A distinct analogy is traceable between hydrolysis and, to coin a term, ammoniolysis.

Motor Fuel Development Encouraged by France

French importers of gasoline must purchase motor alcohol from the government. Recent legislation in France makes it compulsory for those who import motor gasoline to purchase from the government each month a quantity of motor alcohol equal to one-tenth of the volume of gasoline imported during the previous month. A cablegram to the Department of Commerce from Commercial Attaché C. L. Jones explains that this measure will become effective in July, 1923. The Department of Commerce states that apparently this measure is aimed to utilize the large stocks of alcohol held by the French Government and likewise to assist in the development of a "national motor fuel," using alcohol as a base.

Naval Stores Data Sought

The Bureau of Chemistry is making the necessary preparations to collect annual statistics on turpentine and rosin in the hands of the consuming industries and also statistics showing the stocks of rosin and turpentine at the primary ports and chief marketing centers. Figures will be made public jointly by the Bureau of Chemistry and the Bureau of the Census and will be available some time in May.

Paper Exposition Program Announced in Detail

Large Attendance Expected — Many Exhibitors Have Taken Space— Technical Meetings Planned

Many features both in exhibits and programs mark the opening of the Paper Industries Exposition at Grand Central Palace, New York, on April 9. Ticket demand has been very heavy for the exposition. Only four spaces remain unoccupied; the total number of exhibitors is twice that of the first Chemical Exposition. Every phase of the industry is represented.

The program for the week follows:

Monday, April 9—Opening Day. Formal opening, 2 p.m. Afternoon and evening, motion pictures.

Tuesday, April 10—Clean Food Packaging Day. Afternoon, program of notable addresses; official visit by Salesmen's Association of the Paper Industry; evening, motion pictures.

Wednesday, April 11—Executive Day. Executives of paper-manufacturing plants to be shown through the exposition. Afternoon and evening, motion pictures.

Thursday, April 12—Technical Paper Manufacturing Day. Afternoon, special technical program; official visit by American Paper and Pulp Association and the National Paper Trade Association; evening, motion pictures.

Friday, April 13—Printers, Publishers and Advertisers Day. Afternoon, program of notable addresses; evening, motion pictures.

Saturday, April 14—Consumers Day. Afternoon, special features of interest to paper consumers; afternoon and evening, motion pictures.

CO_2 Consumption Grows

Carbonated beverages now are being consumed in this country at a rate in excess of four billion bottles per year, J. W. Sale, chief of the Water and Beverage Laboratory of the Bureau of Chemistry, estimates. An indication of the growth of the carbonated beverage industry is had in the fact that the membership of the bottlers' organization, the American Bottlers of Carbonated Beverages, although formed only 3 years ago, now has a membership of more than 1,800. The 1923 convention of the organization is to be held in Providence, R. I. The exact date has not yet been set.

To Make Alloy Steel in Canada

The formation of the Dominion Alloy Steel Corporation, Ltd., by a number of iron- and steel-producing experts of wide experience is one of the latest and most interesting developments in the Canadian iron and steel industry. Today all the steel used in the manufacture of motor cars is being purchased from the United States. Canada now ranks as the second largest maker and user of automobiles among the nations of the world. Approximately $600,000,000 is invested in this industry.

Feiker Heads Material Survey

At the request of Secretary Hoover, of the U. S. Department of Commerce, F. M. Feiker, assistant to the president of the McGraw-Hill Co., Inc., has undertaken the organization and general direction of the world surveys of raw material supplies, rubber, sisal hemp and nitrates, for which Congress recently made an emergency appropriation of $500,000.

California Uses Own Resources in Pottery Making

With the exception of English china and ball clays, and English cliftstone whiting, the new plant of the Homer Knowles Pottery Co., Santa Clara, Calif., will utilize almost exclusively Pacific coast raw materials in the production of chinaware. The flint and feldspar will be taken from California properties; the borax and boracic acid will come from Death Valley, Calif.; the oxide of cobalt from California and Nevada; and the oxide of zinc and white lead from other points in this district. Operations at the pottery have been commenced and it is expected to develop the plant to the greatest extent. Homer Knowles is president and L. S. Reading vice-president.

Canada Provides Paper School

Plans are being made by the government of the Province of Quebec, Canada, for the establishment of a pulp and paper-making school and a bureau of scientific research in connection with the forest industries of the province. In this regard the Minister of Lands and Forests is working in conjunction with the Canadian Pulp and Paper Association.

Of importance also to the forest industries is the forthcoming conference between the provinces in the matter of forest protection. This is to extend to all the provinces and it is being hoped also that it will be possible to interest the United States, principally in regard to the Maine forests. The idea that the Minister of Lands and Forests, Honore Mercier, has in mind is that there should be a certain uniformity of laws for the prevention of forest fires.

To Discuss Cement Constitution

The Portland Cement Association, at its forthcoming meeting, is to hear P. H. Bates of the Bureau of Standards discuss the problems of the cement industry. Particular emphasis is to be laid upon the constitution of cement. It is expected that Mr. Bates' talk and the discussion of it will bring out the more important points that will be investigated by the association in the research which has been recently authorized, and which, it is hoped, will be carried out by the association in close co-operation with the National Bureau of Standards.

Commercial and Business News

German Chemical Companies Unable to Fulfill American Contracts

French Occupation Prevents Securing Raw Materials From the Ruhr —Tariff Difficulties Encountered by American Buyers— Poor Containers and Adulterated Products Factors in Demoralizing Trade

THE German chemical market, particularly at Hamburg, has a gloomy outlook which can be attributed to various reasons, among which is the difficulty of obtaining materials from the Ruhr owing to the French occupation.

There are many instances where chemical concerns at Hamburg are unable to fulfill their contracts with American houses owing to the impossibility of getting materials from manu facturers in the Ruhr area. In a number of instances, American firms have found it impossible to obtain delivery on products ready for shipment which are in the hands of manufacturers in the Ruhr and are in a quandary as to what to do in cases of revolving contracts for materials which they have contracted to deliver to American buyers.

Certain American buyers are frantic in their efforts to fill contracts falling due in the United States, and except in cases where the Germans have a speciality chemical which can be obtained from no other country, are rushing to buy the materials in the American market in order not to lose customers and are therefore forced to take losses on some deliveries.

Steady Decrease of American Buyers

American buyers have ceased buying promiscuously in the German market. American buyers in the German market have had unfortunate experiences with the operation of the new American tariff in the payment of duties on some commodities, especially those which were not clearly specified in the new law, the duties on which in certain instances are said to have run so high as to make the value of the commodity three times the wholesale market price in the United States.

Tariff Causes Mixup

In one case a firm which purchased a salt not specifically provided for in the new tariff and which sold for 25c. a pound in the New York wholesale market was requested to pay a duty of 75c. per pound in accordance with the category under which it fell, and finding this impossible, endeavored to cancel contracts for delivery of the commodity with German manufacturers. He was finally forced by court action to take another consignment ready for shipment, resulting in a terrific loss which had its effect in both the German and the American market. A number of other instances of like character might be cited.

High Prices for Containers

Prices for good containers for chemicals have soared to such height that it is almost impossible to obtain a good barrel or jute bag in which to ship materials. Barrels, in some cases, cost more than the materials, and often cheap barrels or used barrels are provided which break before they arrive at their destination or are so dirty inside as to spoil the materials for practical use.

Certain American importers of chemicals state that often when a consignment of salts has reached New York from Germany, after unloading a cargo, there is more salt in the ship's hold and on the dock than in the bags.

Inferior Quality of Chemicals

So many complaints are made as to the quality of German chemicals and so many cases are pending in the German courts between concerns on account of chemicals not coming up to specifications that it has driven the American buyer to other markets. The impurities in epsom salts and glauber salts shipped from Germany are such that they do not come near the U.S.P. specifications, although the German analyst assures the buyer that the product will meet the U.S.P. specifications. This is more noticeable in the dealings with new concerns which have originated since the war than with old established firms, the latter still being careful in all dealings in order to uphold the reputation of their houses. Recently the percentage of sand and iron and other impurities found in certain chemical salts has been very noticeable. One American firm dumped 50 tons of epsom salts into the river after their arrival in this country due to the fact that they contained such a large percentage of such impurities.

High Prices

Prices have in most cases now exceeded gold values and German firms are now importing commodities which they were recently exporting to the United States. Caustic soda, sodium sulphide and sal ammoniac are among the materials which are being purchased from the New York market.

Imports of Chemicals for December Fall Sharply

Chemical Imports for the Calendar Year, However, Show Good Gain Over Those of Previous Years

A decided decrease in the imports of chemicals and allied products is shown by the December figures which just have been compiled by the Department of Commerce. In December the value of chemicals and allied products brought into the country free of duty were valued at $4,738,819. The value of the imports on the dutiable list was $2,809,166. This compares with $10,731,795, the total imports of free and dutiable chemicals and allied products in November. There was a notable falling off also in the imports of coal-tar chemicals. In December the value of all coal-tar chemicals brought into the country was $687,972. In November those imports were valued at $1,055,523.

The imports of paints, pigments and varnishes were valued at $275,514, an increase of $75,000 over the imports in November. It also is noteworthy that the imports of paints, pigments and varnishes in December of 1922 exceeded the value of the imports in December of 1921.

Imports of Fertilizers Decline

Imports of fertilizers in December were only slightly more than half as great as those brought into the country in November. The total value of fertilizers imported during December was $3,851,619. These imports, however, are greater than those of December, 1921, when the value of all fertilizers imported was $569,512. Most of the increase is accounted for by larger imports of nitrate of soda. The increase applied, however, to all the nitrogenous phosphates and to potash fertilizers.

Imports for the Calendar Year 1922

With a compilation of the December figures a review of the imports of the entire calendar year now is possible. Throughout 1922 chemicals and allied products valued at $63,126,239 were imported, about $10,000,000 more than the value of imports during the calendar year of 1921. Imports of coal-tar chemicals throughout 1922 were valued at $11,012,769, slightly less than the value of imports of 1921.

Colors Again Coming In

The year 1922, however, saw the upbuilding of a considerable import of colors, dyes, stains, coal acids and coal bases. The value of these products imported in 1922 was $1,006,924. There were no imports of these commodities during 1921. Paints, pigments and varnishes to the value of $3,673,139 were imported during the 12 months of 1922. This is an increase of a million

and quarter dollars over imports in the calendar year of 1921.

Fertilizers to the value of $45,183,574 were imported during 1922. This is an increase of nearly $15,000,000 over the value of the 1921 imports. The largest single item entering into that total is $26,152,723. The value of Chilean nitrates imported during 1922 was about $9,000,000 more than were imported during 1921.

Comparative figures showing the imports of certain chemicals during December, 1922, with revised chemical figures for December, 1921, are as follows:

	1921	1922
Carbolic acid (lb.)	.....	24 510
Other intermediates (lb.)	99,114	111,052
Synthetic indigo (lb.)	336,979	. .
Alkalis and alkaloids (lb.)	1,049,861	
White arsenic (lb.)	.....	699,697
Oxalic acid (lb.)	......	488,950
Sulphuric (lb.)	......	432,000
Tartaric (lb.)	.....	98,387
Muriate of ammonia (lb.)	151,969	....
Perchlorate (lb.)	..	259,938
Bleaching powder (lb.)	1,998,069	76,800
Crude iodine (lb.)		10,734
Cyanide of potash (lb.)	.. ..	236,363
Sodium nitrate (lb.)	.	333,919
Calcium cyanamid (tons)	1,582	6,751
Sulphate of ammonia (tons)	295	..
Muriate of potash (tons)	14,229	8,318
Kainite (tons)	10,777	10,520

Coal-Tar Survey Being Made by Tariff Commission

A thorough survey of production, importation and world conditions of coal-tar dyes and chemicals is being prepared by W. N. Watson, color expert of the chemical section of the Tariff Commission. The work probably will not be completed for several months.

The survey probably will not be published, being intended for the information of Congress, but the data will be made available to the trade on request. This is the first comprehensive survey of coal-tar finished products undertaken by the Tariff Commission, the work heretofore having been confined to an annual census of production and importations, with notes on occasional items for the benefit of committees of Congress. The survey will include chapters on dyes, pharmaceutical ingredients, synthetic tanning materials, flavors and perfumes, phenolic resins and synthetic indigo. It will embrace world production and distribution, domestic conditions and competitive conditions generally.

Washington News

Reduce Rate on Sesame Seed

The Interstate Commerce Commission has upheld the contention of the Globe Cotton Oil Mills that a rate of 55 cents on sesame seed from San Francisco to Los Angeles is unreasonable. The commission finds that the rate was unreasonable to the extent that it exceeded 25 cents per 100 lb. In its opinion the commission held that sesame seed is comparable with flaxseed and rapeseed.

Research Work to Aid in Increasing Arsenic Production

The recent agitation regarding white arsenic and the insecticide of which it is the principal ingredient, calcium arsenate, has served to stimulate research and prospecting for arsenious ores. Beyond these factors, however, there has been no definite result reported, byproduct smelter plants apparently awaiting a more definite demand before going into heavy production of arsenic.

The Geological Survey is engaged in an informal check of estimates of 1923 production of white arsenic, and while there is no report in shape for official announcement, it is said that indications point to a production of 21,000 to 22,000 tons, instead of the approximately 18,000 tons which was estimated in a report given Congress several months ago. Minimum domestic requirements for purposes other than insecticide manufacture are estimated at 9,000 tons.

Research work along the lines of improved methods of recovery of arsenic from smelters and a redistribution of refining plants if demand justifies and also along the lines of less costly and more efficient means of direct recovery of arsenic from ore is progressing actively, being the outstanding result of the recent agitation.

Increased Movement of Nitrate of Soda to This Country

While import figures covering February business are not available, the traffic through the Panama Canal during February indicates a very material increase in the movement of nitrate of soda from Chile to the United States. During February 183,344 tons of that commodity passed through the Canal. While it is known that all of this tonnage did not come to the United States, it does indicate the very much larger volume in which nitrate is moving. It can be said that imports into the United States are greater in proportion than the increases in the shipments to other countries.

Bright Outlook for American Chemical Products

Trade prospects are particularly bright for practically every chemical product that the United States is in a position to export, chemical specialists in Washington point out. The fact that German exports to this country are continuing in larger volume than had been expected should not lead to the conclusion that Germany is exporting in the same volume to other countries or that shipments to America will continue at the present rate. Germany is particularly anxious to secure business where payment is made in dollars. The uncertainty of the situation at home and the way in which the mark is being manipulated at this time are causing Germany, it is believed, to rob her own consumers to fill American orders. To the economic reasons for such procedure must be added the powerful influence to that end which is being exerted by American importers. Some are of the opinion that Germany must almost have given up dyeing at home in her effort to build up dollar credit and hold on to her American market. All reports being received from Germany, however, are to the effect that the volume of new production is low and continues to diminish.

Imports of Coal-Tar Dyes in 1922

Imports of coal-tar dyes in 1922 totaled 3,880,811 lb., valued at $5,600,163, according to premilinary figures from the records of the Commerce Department. Of the total, 1,738,753 lb. valued at $2 533,581, came from Germany; 1,476,715 lb., valued at $2,326,391, from Switzerland; 177,293 lb., valued at $229,608, from England; 145,989 lb., valued at $175,436, from Italy; 168,201 lb., valued at $197,383, from the Netherlands; 57,541 lb., valued at $56,848, from France, and the remainder from Belgium, Canada, Japan and Czechoslovakia.

The total compares with imports of 3,914,036 lb., valued at $5,156,779, in 1921. In 1914, before the domestic dye industry gained a foothold, imports totaled 46,000,000 lb., and only 6,000,000 lb. was produced in the United States, practically all of this from intermediates imported from Germany.

Competition From Moroccan Phosphate Rock

No actual measure is possible as yet of the character of competiton which may be expected from Moroccan phosphate when the railroad is completed between Casa Blanca and Oued-el-Zem. It is known, however, that the Moroccan product is of high grade and will displace Florida phosphate in certain markets. Due to the isolated location of the deposits and the care with which those interested in the development are guarding information as to the probable extent of their output, no accurate data are available. It can be said, however, that the potentialities of this competition are causing concern on the part of those interested in American phosphate properties.

Chemical Company Expands

The Hanovia Chemical & Manufacturing Co., of Newark, N. J., has purchased a large plot of ground adjoining its factory. This purchase was made in order to provide for future expansion of the company.

Heavy Demand Forces Linseed Oil Prices Upward

Record Shipments of Argentine Seed Readily Absorbed—Foreign Oil Bought by Crushers

IN the latter part of last year estimates on the Argentine linseed crop indicated an exportable surplus of 62,000,000 bu. Later these estimates were revised and trade opinion now places the exportable at 40,000,000 bu up to 52,000,000 bu. with many well-informed seed men inclining toward the higher figure. Granting that the lower estimates are correct, there was good reason to believe that the world's supply of linseed was large enough to insure a relatively low price level for linseed oil in all markets. Crop prospects in India were generally favorable and a minimum exportable of 12,000,000 bu. is expected from that country. Moreover, the Continent was regarded to be in a position where its consuming requirements for seed would be less than normal.

Seed Movement Satisfactory

The movement of seed from producing sections has been all that could have been expected. From Oct. 1 to March 31 receipts at Western terminals in this country were about 7,600,000 bu. Imports during the same period swelled the total to such an extent that crushers have had a supply of approximately 17,000,000 bu. This is at the ratio of 34,000,000 bu. for the year—a total which, with the exception of last year, never had been consumed in any year in the history of the domestic industry. Shipments from the Argentine during the first 3 months of this year reached the record volume of 20,744,000 bu. Of this amount 12,926,000 bu. went to the United Kingdom and the Continent, thus showing that the supply in all consuming markets was unusually large.

Reasons for the High Prices

Prices for seed and oil, however, have gone steadily upward and at present these commodities are selling at levels higher than have been in effect since 1920. Various reasons may be assigned for the strong position of the markets. In the first place, it is evident that former standards of consuming needs in this country must be discarded in favor of standards more in accord with the progressive growth of the paint, varnish and other industries whose manufactures include linseed oil as a necessary raw material. In a recent address before the Paint, Oil and Varnish Club of New York one of the most experienced linseed men in the trade stated that this country was consuming seed at the rate of 40,000,000 bu. per year.

Furthermore, Europe has upset all calculations by the extent of its seed purchases and especially by its prominence as a competitor in Argentine markets. As an incidental cause for high prices, it may be recalled that the early promise of a record yield in the Argentine inspired heavy speculative trading on the short side of the market, and the covering of these short sales helped to start the trend of values upward. Briefly summarized, current values for seed and oil may be explained by the natural workings of the law of supply and demand. There appears to be nothing fictitious or inflated about present values, and lower prices can hardly be looked for until the balance swings more in favor of supply.

Interest in Foreign-Made Oil Revived

One of the important developments growing out of the sharp rise in prices is found in the revival of interest in foreign-made oil on the part of American importers. When the new tariff law went into effect last September, it provided for an import duty on linseed oil, of 3.3c. per pound, equal to 24¾c. per gallon. This was generally regarded as an effective barrier and it was freely predicted that foreign oil would not be able to compete in our markets as long as this tariff remained in operation. Yet last month more than 1,500,000 gal. of oil were reported to have been bought in European markets by American interests, with domestic crushers credited as being the largest purchasers.

Western Railroads Can't Lower Rates on Vegetable Oils

The Interstate Commerce Commission has refused permission to Western transcontinental railroads to reduce freight rates on vegetable oils from Pacific coast points to Chicago and adjacent territory. Transcontinental railroads by schedules filed to become effective Dec. 5, 1922, proposed the 10c. cut. Protest was immediately made by the importers, dealers and manufacturers and the Eastern trunk lines, and the commission suspended the schedules pending an investigation.

Russian Far East Restricts Imports of Chemicals

Advices just received from the Russian Far East state that a law has been passed prohibiting the importation of various commodities. Among the items specified on the prohibited list are many chemicals and allied products, including: glauber salts, phosphates, alcohol, carbonate and bicarbonate of soda, caustic soda, chlorine, lime, resin, tar, asbestos, magnesium, talc, manganese ore, potato flour, fertilizers, varnish, paints, candles, sheet glass, textile raw materials except cotton, inks, except copying and fountain pen ink.

Mills Oppose Move to Lower Vegetable Oil Duties

J. A. Arnold, vice-president of the Southern Tariff Association, has filed a petition signed by 160 cotton oil mills. This petition is in the form of a protest against any move to lower duties on vegetable oils. Edward Woodall, chairman of the Vegetable Oil Division of the Southern Tariff Association, in a memorandum accompanying the petition gives notice that, if the vegetable oil schedule is reopened, he will apply for an increase of 50 per cent in the duties on vegetable oils, based on cost of production in this country compared with similar cost in the Far East.

Trade Notes

Charles J. Roh, vice-president and sales manager of the Murphy Varnish Co., of Newark, N. J., returned last week from an extensive business trip throughout the West, including the Pacific coast.

At the last meeting of the Paint, Oil and Varnish Club of New York, three new members were admitted. They were: H. F. Kleinfeldt, of the Abbe Engineering Co.; R. G. Jackson, of the Kentucky Color & Chemical Co., and W. Buxbaum, of the Winchester Arms Co.

J. C. Smith, for several years secretary of the Oil Seeds Co., of New York City, has formed a new company under the name of the Smith-Weihman Oil Co., with offices at 19 Moore St. Mr. Smith is secretary of the Oil Trades Association of New York.

Charles W. Mixter, of Brookline, Mass., has accepted an appointment as tariff economist on the Tariff Commission.

E. W. Jayne, of Jayne & Sidebottom, left New York last week on a business trip to the Middle West.

The world's production of tin in 1921 was only 109,704 metric tons, the lowest annual output since about 1908 and a decrease of about 16,000 tons from that of 1920.

Dr. J. W. Jenks, of the Alexander Hamilton Institute; W. F. Gephart, of the First National Bank of St. Louis, and A. C. Kains, president of the Federal International Banking Co., New Orleans, will be speakers at the Foreign Trade Convention to be held at New Orleans, May 2, 3 and 4.

Exports of quebracho extract from the Argentine from March 1 to March 23 were 31,000 tons, which compares with 20,000 tons exported in the corresponding period of 1922.

The steamship Stuart Dollar arrived at San Francisco on April 2 from the Far East with 192 packages of arsenic and 352 barrels of china wood oil.

R. B. French, manager of the New York office of the Harshaw, Fuller & Goodwin Co., is on a buisness trip to Buffalo and surrounding territory.

Facts and Figures That Influence Trade in Chemical Products

Market Conditions

Current Prices Imports and Exports The Trend of Business

Steady Contract Deliveries Feature Market for Heavy Chemicals

Antimony Products Advance in Price—Cream of Tartar and Tartaric Acid Firmer—Arsenic Stronger for Spot and Nearby—Tin Oxide Lower—Permanganate of Potash in Light Supply

GOOD call is reported for contract deliveries of most heavy chemicals and in some cases producers are using their entire output to take care of existing orders. New business during the week showed a falling off as compared with the preceding week. German chemicals have attracted attention following reports that difficulty was found in securing supplies. In many cases stocks already contracted for are not coming to hand and importers who had resold their German contracts have been trying to protect their buyers by securing the goods from sources outside the original sellers. The freight situation is still unfavorable for moving materials from some sections of this country and this is causing some delays in deliveries.

Permanganate of potash was actively sought during the period but offerings are small as domestic goods are sold ahead and imported material is not coming in freely enough to relieve the spot stringency. Large amounts of arsenic reached the local market during the week but most of this went direct to consumers and the balance was sold while afloat so the spot situation was not bettered. Cream of tartar and tartaric acid are feeling an increased seasonable demand and brought higher prices in the local market. Antimony oxide and other antimony products likewise were firmer. Tin oxide lost the advance reported at the beginning of the month and showed a decline of 3c. per pound. Hydroquinone was offered at $1 per pound, which represents a decline of 5c. per pound. Hyposulphite of soda also was offered at prices more in buyers' favor. Formaldehyde was unchanged in price as far as producers were concerned, but second hands were shading.

Fertilizer Chemicals Active

The fertilizer trade has had a very active season and a correspondingly active call for many chemicals has come from that source. While the season is now well advanced, there still is heard a good inquiry for many fertilizer chemicals. It is significant to note that imports of fertilizer materials for the last calendar year reached a valuation of $45,183,574, which represents a gain of nearly $15,000,000 over the total for 1921. Of this increase about $9,000,000 was credited to nitrate of soda. Imports of all chemicals for the year ending December 31 were valued at $63,126,239, or about $10,000,000 more than in the preceding year.

"Chem. & Met." Weighted Index of Chemical Prices

Base = 100 for 1913-14

This week	**181.61**
Last week	181.44
April, 1918 (high)	286.00
April, 1919	231.00
April, 1920	261.00
April, 1921 (low)	140.00
April, 1922	158.00

The moderate advance in the index number was caused chiefly by the uplift in linseed oil. Chemicals showed but little average change.

Acids

Acetic acid—Consumption of acetic acid continues in a satisfactory way and there appears to be no likelihood of an easing off in prices for some time to come. The corroders have been absorbing large quantities. The 28 per cent held at $3.17½ per 100 lb., while the 56 per cent was nominally unchanged at $6.35@$6.37 per 100-lb. Glacial closed at $12.05@$12.85 per 100-lb.

Citric acid—There was a seasonable increase in the volume of business and with foreign markets tending higher prices here were quite firm at the close. The imported was raised to 51c. per pound in more than one direction and talk of even higher prices than this was heard in the local trade. Domestic material held at 49@50c. per pound. Several shipments came through from abroad in the past week.

Formic acid—The 85 per cent was available at prices ranging from 14½@17c. per pound, according to quantity, delivery, etc. The market was a little unsettled in some directions.

Boric acid—The market was steady on the basis of 11c.@11½c. per pound. Some traders were not disposed to shade 11½c. per pound, immediate delivery.

Muriatic acid—Production is well taken care of and a firm undertone features the market. Nominal quotations range from $1.00@$1.10 per 100 lb., on the 20 degree in tanks.

Oxalic acid—There was a firm undertone to the market for oxalic acid and makers recently advanced prices to the basis of 12¾c. per pound, f.o.b. works. Spot material settled at 13¼c.@13½c. per pound. The fact that competition with foreign goods, temporarily, has been eliminated, brought out a much better feeling here. Imported costs from 13¼c.@13½c. to import, according to advices received here late in the week.

Sulphuric acid — Consumption has been good for some time past and with stocks reduced in nearly all directions a strong undertone features the market. The 66 degree variety closed at $15@$16 per ton, in tanks, f.o.b. works. On the 60 degree the nominal quotations range from $9.50@$10.50 per ton, f.o.b. works. Oleum was raised to $18.50@$19.50 per ton.

Tartaric acid—Producing costs have advanced and this combined with good consuming demand has strengthened the market. Sellers now hold imported at 34c. per lb. and domestic makes are held at an inside price of 35c. per lb.

Potashes

Bichromate of potash—Some reports credited sales of moderate sized lots at 10¾c. per lb. but the general asking price showed 11c. per lb. as the inside price. Stocks have been moving freely and the market appears to be in a strong position with much depending on future developments in the market for muriate.

Carbonate of potash—Buyers have shown considerable interest in hydrated but offerings are so meager that trading has been held down to small volume. Prices are little better than nominal at 7½c. to 7¾c. per lb. Shipments are quoted at the same level as spot but guaranteed deliveries are hard to locate. Calcined 80-85 per cent likewise were practically taken off the market and in most quarters prices meant nothing in the absence of offerings. Calcined 96-98 per cent sold in a small way with asking prices at 8c. per lb. and upwards according to seller.

Caustic potash—Inquiry for spot and prompt shipment was not heavy but offerings are light and prospects are more favorable for an advance rather than a decline in price. Sales of 88-92 per cent on spot were reported at 8¼c. per lb. and as high as 8½c. per lb. was asked by some holders. Shipments are firm at 8¼c. per lb.

Permanganate of potash — Domestic producers are busy taking care of orders

in hand and have little if any surplus for new business for April delivery. Imported goods have sold freely and it is difficult to locate round lots for prompt delivery. Spot prices are given at 25½c. per lb. and upwards, according to seller. Goods afloat are said to have sold at 25c. per lb. April shipments were offered at 22c. to 22½c. per lb.

Sodas

Bichromate of soda—Small lot transactions have predominated throughout the week, although round lots have passed against contracts. Producers are maintaining values at 7½c. per lb. at the works and spot trading is going through at prices ranging from 7¾c. to 8c. per lb. depending on quantity and seller. Chrome ore is quoted at $20.50 per ton for Indian, c.i.f. Atlantic ports. Rhodesian and New Caledonian are held at $21 to $24 per ton.

Caustic soda—Reports on export business vary but it seems certain that considerable business has been transacted for shipment abroad at prices ranging from 3.45c. to 3.50c. per lb. f.a.s. Domestic buyers have been taking on stocks in a large way and a firm tone is evident in the market. Producers offer at $2.50 per 100 lb. at the works, basis 60 per cent, with the usual premiums for less carlot quantities. Second hands offer solid 76 per cent at $3.45 to $3.65 per 100 lb. in the spot market, the range varying according to quantity and make.

Chlorate of soda—Some offerings of inferior grades have been on the local market and have been quoted under the open market price. Domestic producers report a good call for their product both in the way of new business and in ordering material out on old contracts. Prices are firm and unchanged at 6½c. to 7c. per lb. at the works. Imported grades are not pressing on the market and are held at 6½c to 7c. per lb.

Hyposulphite of soda—There was a general reduction in the market, establishing the price at $2.50@$2.75 per 100 lb. Demand has been rather inactive and with offerings of foreign material very much in evidence the situation has favored buyers for some weeks past.

Nitrate of soda—Activity in the fertilizer trade has been noted for some time and large amounts of nitrate of soda have been delivered at Southern ports. Buying orders are still prominent and it is evident that many consumers are not covered up to their full requirements. It is probable that demand will not continue active much longer, as the fertilizer season is too far advanced to permit of trading in the volume recently noted. Revisions in the prices of producers in Chile have been expected but so far no announcement has reached the domestic trade. Importers say the amount held in this country is small and this has a sustaining effect on values. Nitrate is quoted at $2.65 per 100 pounds ex vessel, Atlantic ports.

Nitrate of soda—The market has picked up a little in activity but the improvement has not been sufficient to describe trading as active. Some consuming trades are in the market constantly while others are hardly taking their normal requirements. Sellers are offering freely but are not cutting prices in order to stimulate buying. Foreign grades are offered in numerous directions and prices vary from 8¾c. to 9c. per lb. according to quantity and seller. Domestic grades also are in good supply with prices holding on an unchanged basis of 10c. to 10½c. per lb.

Silicate of soda—Different consuming trades have been in the market and sellers report a very satisfactory volume of business. Considerable quantities of silicate are said to be used in the sealing of paper cartons. Producers quote the 40 degree at 75c. to 85c. per 100 pounds at the works. The 60 degree is held at $1.60 to $1.70 per 100 pounds works.

Soda ash—New business continues to hold up well but the bulk of the business passing is against old contracts. Consumers are calling for deliveries promptly and more than normal amounts are being taken off the market. With the large production well taken care of and producing costs holding at relatively high levels the market is working into a very strong position although no price changes seem in immediate contemplation. Some producers are not eager to enter into new contracts calling for extended deliveries. Contract prices for light ash, basis 48 per cent, are quoted at $1.20 in bags and $1.40 in barrels. Dense ash is quoted at $1.25 in bags and $1.45 in barrels. Dealers were offering carlots of light ash at $1.75 in bags and $1.95 in barrels.

Miscellaneous

Antimony oxide—White oxide guaranteed 99 per cent has been firm with higher prices in effect due to higher cables from China and limited offerings on spot. Demand has been quiet, but this had no influence as a market factor. Quotations are now held at an inside figure of 9c. per lb. Standard powdered needle antimony is held at 8c. per lb., with lump nominal at 7¾c. per lb.

Arsenic—Fairly large amounts of white arsenic reached the market in the past week coming from Japan. Nearly all arrivals, however, were sold ahead and there still is a scarcity of spot material. Quotations in the spot market vary from 15½c. to 16c. per lb., according to seller. Sales of March-April from Japan were reported at 14½c. per lb. June shipment from Japan was quoted at 12½c. per lb. and some reports were heard to the effect that contracts covering shipments over the last half of the year could be placed at 11c. per lb. Sales of material afloat were put through at 15¼c. per lb.

Bleaching powder—Steady withdrawals are being made against contracts with active interest in spot and nearby goods. Some producers are sold up to capacity and there are no heavy surplus stocks in any quarter. A firm undertone features prices and large drums are held at $2.40@$2.55 per 100 lb. at the works. Spot cars at the works are quoted at $2.20 per 100 lb. The contract price remains at $1.90@$2.00 per 100 lb.

Borax—The market has maintained a steady position with a seasonable movement to consumers. Granulated and refined, crystals or powdered are offered at 5¼c. per lb. in bags, carlots. The price for goods in barrels was 5½c. per lb. Boric acid was quiet but steady at 11c. per lb.

Copper sulphate—Demand has been fairly active and a firmer feeling was in evidence. Cables again reported a higher market abroad and it was doubtful whether $5.70 could have been shaded on May-June shipment from the other side. Domestic makers quote the market at $6.25@$6.50 per 100-lb. on the large crystals, the inside figure obtaining on round lots only.

Cream of tartar—Consumers have been in in the market in an active way and with producing costs increasing the tendency of prices has been upward. The inside price is now given as 25½c. per lb. and asking prices range up to 26½c. per lb.

Formaldehyde—An easy tone has featured trading in this chemical. In the first place buyers are reserved and are interested only when price concessions are granted. First hands are keeping their quotations nominally unchanged at 16c. per lb. but resale offerings have changed hands as low as 14½c. per lb.

Lead acetate—With no important change in pig lead and the demand for the chemical fairly active prices ruled firm so far as the leading producers were concerned. White crystals, in casks, held at 13½c. per pound. White powdered was offered at 14¼c. per pound, in casks, and 15¼c. per pound, in kegs. The brown, broken, in barrels, settled at 12½c. per pound.

Lead arsenate—With the demand holding up well on the approach of the season of large consumption prices ruled steady, but closed the week unchanged at 12@12½c. per pound for the paste and 21½@22c. per pound for the powdered.

Nickel sulphate—Leading sellers were asking 11½c. per lb. as the inside price. Nickel ammonium sulphate was firm at 10½c. per lb. and upwards, according to quantity.

Sal ammoniac—Several shipments from abroad were landed here last week, but this failed to shake the market. The undertone was firm in all directions, reflecting higher replacement cost. Imported white on spot settled at 7@7½c. per pound. Imported gray was raised to 8½@9c. per pound. Domestic white granular held at 7¾@8c. per pound, carlots, f.o.b. works. Lump was firm at 14½@15½c. per pound, immediate delivery.

Salt Cake—Resale lots are very difficult to locate and only occasional sales of small lots are reported. First hands also have very little to offer, as they are using their output to fill contracts. Consumers are interested in taking on fresh commitments but under the circumstances trading is naturally restricted. Quotations hold at $25 to $27 per ton for bulk lots.

Sulphate of Aluminum—Quiet conditions have prevailed, as most consumers are covered ahead. Contract withdrawals are of good volume and prevent any accumulations in the hands of producers or sellers. Prices have held steady and unchanged at $2.50 to $2.75 per 100 pounds for iron free and $1.50 to $1.60 for the commercial.

Tin oxide—There was a reduction of 3c. per pound in tin oxide, following closely upon the easier situation in the metal. Leading makers now offer tin oxide at 52c. per pound, in barrels, immediate delivery. Trading was moderate throughout the week.

Coal-Tar Products

Active Demand for Phenol—Production Inadequate—Benzol Offerings Increase—Crude Naphthalene Higher Abroad—Solvents Scarce

INTEREST centered in the strong situation which has arisen in the market for phenol. The inquiry was fairly active, but business in spot and nearby material was restricted for want of offerings. Talk in the trade of new sources of domestic production did not change the attitude of sellers. Large handlers of phenol have no faith in the prospects for increasing the output so far as the immediate future is concerned and when old contracts expire there is a strong possibility that new prices will show a higher range. Demand for benzol has not yet opened up and this accounts for the slightly easier undertone for this commodity. Solvent naphtha was scarce, owing to the sold-up position of the market. Crude naphthalene was higher abroad and this stiffened prices here. Several parcels of cresylic acid arrived from the other side, despite the high duty, but there is much dissatisfaction over the tariff and traders believe that something will have to be done so that consumers not protected with contracts for the domestic material may continue manufacturing without resorting to a change in formulas. Owing to the inability of German makers to make shipments without encountering all sorts of difficulties because of the Ruhr situation, American manufacturers have been in a position to compete for foreign business. Reports of some large orders in dyes for shipment to China were current in trade circles. The Department of Commerce has announced March imports of coal-tar dyes as 312,809 lb., valued at $301,436, of which 66 per cent came from Germany, 18 per cent from Switzerland and 12 per cent from Italy, the latter representing reparation dyes which were re-exported. March imports compare with 191,709 lb., valued at $199,640, for February, and approximately the same amount for January.

Coal-Tar Crudes, Etc.

Benzene—Offerings were freer and the market presented an unsettled appearance. Traders expect that business will soon open up, as a spell of good weather would bring about increased consumption in the motor fuel field. The 90 per cent was nominally unchanged at 27c. per gallon, in drums, carload lots, contract basis.

Cresylic Acid—Domestic producers have nothing to offer, production being sold up on the basis of 70c. per gallon. In the outside market scattered lots of imported, on spot, sold at $1.40 for the 97 per cent, in drums, and $1.30 for the 95 per cent, in drums. Owing to the tariff situation importers were disposed to offer this material for shipment "in bond" and late in the week the general quotation on nearby material was 85c.

Phenol—Demand was fairly active, but spot business was restricted because of the sold-up condition of the market. Second-hands reported sales in U.S.P. phenol, immediate delivery, in lots of 1 to 3 tons at prices ranging from 52c. to 53c. per pound. Foreign material for shipment was available around 50c. A report was current in the trade that a new factor would soon be in a position to offer phenol. The high prices, in the opinion of traders, will stimulate production. The surplus stocks purchased from the government are disappearing at a surprising rate.

Naphthalene—Importations of crude were reported, but this made no impression upon the market. Cables reported a firmer situation in crude and this resulted in steadying prices in the New York trade. Crude, a little off in quality, brought 2⅝c. per pound. On standard material asking prices now range from 3½c. to 3¾c., as to quantity and seller. Demand for balls was good and the prices were raised to 10¾@11c. per pound. Flake held at 9½c., immediate delivery, and 9c. for June-July. On distant futures prices were considered too vague to quote.

Solvent Naphtha—Production appears to be well sold up and rumors of some re-selling were without foundation. The water-white, in drums, was merely nominal at 37@40c. per gallon. Demand was fairly active.

Toluene—Trading was slow and the market was a featureless affair. Production is limited because of the quiet state of the market. Nominal quotations range from 30@35c. per gallon, contract basis.

H Acid—Offerings were scanty on spot and prices of 80@85c. were considered wholly nominal. Producers say that they have enough orders on hand to take care of their output for some little time to come.

Alpha-naphthylamine—Small parcels sold at 38c. per pound, immediate delivery. The supplies available were moderate only and it was doubtful whether 35c. could have been shaded on a round lot for nearby delivery.

Aniline Oil—The market was inactive, but offerings were not pressing for sale and leading handlers continued to quote from 16c. to 16½c. per pound, as to quantity.

Beta-naphthol—There were offerings at 22c. per pound, round-lot basis, with smaller quantities changing hands at 25c. per pound. The market was barely steady in some directions.

Dimethylaniline—A firmer feeling was reported in this intermediate reflecting improvement in the demand. At the close traders were asking 42@43c. per pound.

Para-cresol—A cable from England quoted para-cresol for immediate shipment at 35d. per pound, c.i.f. New York terms.

Para-toluidine—With offerings scanty the market ruled firm at the recent advance, prices holding at 95@97c. per pound. The inquiry was fair.

Pyridine—The market was entirely nominal, traders experiencing difficulty in obtaining supplies. Recent business in small lots went through at $2.40 per gallon.

N. & W. Acid—Inquiry was moderate only; but with no accumulation in supplies prices for Neville and Winthers acid held at $1.25 per pound.

Xylene—The commercial variety was offered in a moderate way at 30@32c. per gallon. The pure was nominal at 45@50c. in drums.

Propose Uniform Contract for Chemical Trade

The Salesmen's Association of the American Chemical Industry has taken up the question of formulating a uniform contract to be used by the trade in transactions involving heavy chemicals.

The following committee has been appointed to draw up the contract:

Chairman—John A. Kienle, vice-president, in charge of sales, Mathieson Alkali Works, Inc.; P. S. Tilden, sales manager acid and heavy chemical division, E. I. du Pont de Nemours & Co.; E. J. Barber, manager chemical department, White Tar Co., Inc.; Ralph F. Durland, manager, N. Y. sales office, Dow Chemical Co.; William Haynes.

Vegetable Oils and Fats

Linseed at New High for Season—Cottonseed Steadies in South—Coconut Quiet—Good Call for Soya

Linseed oil—The feature in the vegetable oil trade last week was the sharp uplift in prices for linseed oil. Crushers had warned the consumers repeatedly of the impending crisis in the matter of spring deliveries, but it is safe to say that few gaged the market correctly and the fact that several producers would consider less than carlot business only, covering April-May deliveries, proved conclusively that their tanks must be very nearly dry. Spot oil closed at $1.14 per gallon, car lot basis, which compares with $1.10 a week ago. One lot of 1,000 barrels of June oil sold early in the week at $1.06, but the price for this position at the close was $1.10 asked. July oil settled at $1.09, with August forward at $1.07@$1.08 per gallon, carlots, cooperage included. The flaxseed markets established new highs for the season on light offerings of nearby material. There was no important change in the world's flaxseed situation. Crushers in New York territory apparently have enough seed on hand, but are handicapped by insufficient press capacity. Production could not be augmented in time to help the market. Foreign oil was active and well-informed members of the trade say that more than 1,500,000 gallons have been purchased for shipment to this country in the past month or so. At the close bids of $1.14 per gallon, duty paid, were turned down for oil afloat. April shipment from the other side settled at $1.10, with May-June at $1.07@$1.08, c.i.f. terms. Linseed cake was offered at $35 per ton, in bags, summer positions. Demand for cake for export was dull. A parcel of 3,000 tons of Argentine flaxseed afloat sold at $2.31, c.i.f. New York.

Cottonseed oil—The recovery in lard in the West, together with favorable news on the distribution of cottonseed oil and products, brought out a recovery in prices for the options. Estimates on March consumption were optimistic and trade leaders expect that the disappearance will exceed 200,000 barrels. April business has opened up well and should the rate of consumption be maintained the supply situation may become tight before new oil is available. Crude settled nominally at 10½c., f.o.b. mills.

Coconut oil—Business fell away and prices at the close were barely steady, both here and on the coast. Ceylon type oil was offered freely at 9c. coast, sellers' tanks, with intimation that this figure could be shaded on a firm bid. The market here settled at 9½@9⅝c. per pound, tank car basis. Copra ruled firm around 5½c. per pound, c.i.f. Pacific coast ports.

China wood oil—The offerings were meager, despite the fact that several parcels reached United States ports. Spot oil held at 35c. a pound in the "outside" market. On futures, traders were reluctant to quote pending a freer movement of oil from the interior of China. A nominal price for July-August shipment oil was 24½c.

Palm oil—Nearby oil was firm on moderate offerings, but some traders regarded the more forward positions as a little unsettled. Not much new business was placed last week. Lagas for shipment held at 8.55c. per pound, with Niger at 8.20@8.25c. per pound, c.i.f. New York.

Sesame oil—Refined imported oil sold at 12¼c., c.i.f. New York, nearby positions. May shipment was traded in at 12c., c.i.f. terms.

Soya bean oil—Bids at 10¼c. per pound for seller's tanks, April shipment from the coast were turned down. The asking price at the close on nearby material was 10½c., duty paid, f.o.b. coast. Demand was fairly active.

Menhaden oil—Trading in new oil on the "if made" basis has set in and it is estimated that more than 10,000 barrels of crude sold at 50c. per gallon, f.o.b. point of production.

Tallow—Sales during the week reached the total of 1,000,000 pounds, the bulk of the business passing being in extra special on the basis of 9c. per pound, loose, ex-plant.

Greases—Offerings were limited and prices ruled firm. Low acid yellow held at 8½@8¾c. per pound.

Miscellaneous Materials

Barytes—Demand for the white floated was fairly active and with no change in the position of crude prices ruled firm on the carlot basis of $28 per ton, containers included, f.o.b. St. Louis. Crude held at $8@$10 per ton, f.o.b. point of production. Off color, wet ground, was offered at $15@$16 per ton, f.o.b. works.

China clay—There was a steady call for this material and prices were firmly maintained. Crude was nominally unchanged at $7@$9; powdered, $13@$20, f.o.b. Virginia points. Imported lump $15@$20 f.o.b. American ports; powdered, $45@$50.

Pyrites—Imported lump, 1 in. diameter and up, 12c. per unit; fine, 12c. per unit, ex ship, Atlantic ports. Market steady.

Lithopone—Several shipments arrived at New York from Antwerp. Domestic makers reported a good volume of new business on the basis of 7c. per pound, in bags, carlots, April-May-June delivery. The market was firm.

White lead—The market for the metal was a shade easier, but this did not influence corroders and prices for the pigments were unchanged. The official quotation for pig lead held at 8.25c., New York. Trading in the pigments was fairly active. With stocks of unsold material subnormal and as there appears to be little likelihood for a sudden change in the metal situation, producers hold out no encouragement in the way of lower prices. Standard dry white lead, basic carbonate, closed the week at 9¾c. per pound, in casks, carlots. Red lead, dry, was offered at 11.40c. per pound, in casks.

Zinc oxide—A firm undertone featured the market. Producers report steady gains in the volume of business, and, with the metal showing no important change, they regard the market as favoring sellers so far as the future is concerned. American process, lead free, held at 8c. per pound, carlot basis, with the leaded grades commanding from 7@7¼c. per pound. French process, red seal, was available at 9¾c. per pound.

Glycerine—Several refiners announced a reduction of ½c. per pound in the chemically pure grade, establishing the market at 18c. per pound, in drums. The reason for the decline could be traced to the unsettled market for crude. Business was inactive during the past week and competition was more of a factor. Dynamite sold at 16½c. per pound, carlot basis. The arrival of several shipments of foreign crude was noted. Soap lye crude, basis 80 per cent, loose, carlots, closed nominally at 11@11¼c. per pound. Recent business in the Middle West went through at 10¾c. Saponification was offered sparingly and quotations of 12¾@13c. were considered nominal.

Naval stores—The shrinkage in spot holdings brought out a general advance in prices. Turpentine sold as high as $1.53 per gallon in the Savannah market. In the New York trade the nominal quotation toward the close was $1.61 per gallon. In rosins prices ruled firm on the basis of $6.20 per barrel for the "B" grade. Demand for rosins was good. Pine tar pitch held nominally at $6.00 per barrel.

Shellac—Cables from Calcutta reported a steady market toward the close, with the result that operators here were no longer anxious to discount futures. The importations were not large enough to bring out any real change for the better in the market for spot goods. The inquiry was satisfactory. T. N. on spot settled at 76c. per pound. Bleached, bone dry, held at 90c. on spot, with futures available around 86c. Superfine was traded in at 80@81c. per pound. Calcutta offered T. N., April shipment, at 72c. c.i.f. New York.

Alcohol—A fair trade was reported in denatured alcohol and prices ruled steady. The No. 1, 188 proof, was offered at 39c. a gallon, with the No. 5 at 38c. a gallon. Methanol, 95 per cent, was maintained at $1.19@$1.21 a gallon; 97 per cent close at $1.21@$1.23 a gallon. The situation in ethyl was unchanged, quotations holding on the basis of $4.75@$4.85 for the 190 proof.

Imports at the Port of New York

ACIDS—200 kegs tartaric, Bremen, Order, 100 cs. tannic, Shanghai, East Asiatic Co., 100 csk. citric, Rotterdam, Order, 456 bbl. citric, Palermo, Order; 4 bbl. tartaric, Palermo, Order; 157 bbl stearic, Rotterdam, M. W. Parsons; 41 drums phosphorus, Hamburg, Hummel & Robinson, 78 dr. cresylic, Hamburg, Caldwell & Co., 60 pkg. phosphoric, Bremen, Order; 10 csk. oxalic, Antwerp, Brown Bros. & Co.

ALBUMEN—54 pkg, Hamburg, Cooper & Cooper.

ALCOHOL—25 bbl den't'd, San Juan, M Fiegel Bros.; 115 bbl. do., San Juan, C Esteva.

ALIZARINE—6 csk., Hamburg, Kuttroff, Pickhardt & Co.; 4 csk., H. A Metz & Co

AMMONIUM—60 csk. muriate, Glasgow, Nat'l. City Bank, 100 cs. bromide, Hamburg, Nat'l Am. Bank, 549 csk nitrate, Hamburg, Kuthroff, Pickhardt & Co., 70 csk. muriate, Bristol, C de P. Field & Co, 40 pkg. carbonate, Liverpool, Brown Bros., 112 csk. phosphate, Antwerp, Globe Shipping Co.

ANTIMONY SALT—20 bbl., Hamburg, J D. Lewis.

ANTIMONY OXIDE—335 bags, Hankow, Java Handelsvereeniging

ARSENIC—100 bbl. red, Hamburg, Brown Bros. & Co.; 200 csk, Hamburg, Pfaltz & Bauer; 338 bbl., Antwerp, Order, 109 csk., Rotterdam, Lunhan & Moore; 496 cs, Kobe, China Am. Tobacco Trading Co, 150 cs, Kobe, N. Y. Trust Co.; 579 cs., Kobe, Takata & Co.; 360 cs, Kobe, Nat'l Shawmut Bank of Boston; 200 cs., Frazar & Co; 100 cs, Kobe, Order; 120 cs, Yokohama, Am. Trading Co.

BARYTES—500 bags, Bremen, Order.

BARIUM NITRATE—29 csk, Hamburg, Industrial Trust Co.

BARIUM CARBONATE — 130 bags, Bremen, Hummel & Robinson.

BLANC FIXE—48 bbl., Hamburg, A. Murphy Co.

BARIUM BINOXIDE—64 cyl., Havre, Mallinckrodt Chem. Works.

BARIUM CHLORIDE—71 csk, Hamburg, A. Klipstein & Co.; 52 csk., Antwerp, Order.

CALCIUM CHLORIDE—166 dr., Hamburg, Order.

CASEIN—85 sk., Rotterdam, T M. Duche & Sons; 128 bags, Hamburg, A. Klipstein & Co.; 751 bags, Buenos Aires, Bank of America; 998 bags, Buenos Aires, Brown Bros & Co; 2,083 bags, Buenos Aires, Order.

CHEMICALS—3 cs., London, Order; 42 c., Antwerp, J. E. Dockendorff & Co.; 31 bbl., Hamburg, Arco Trading Corp.; 45 csk., Jungmann & Co.; 35 dr., Hamburg, F. Boehm, Ltd; 135 dr., Hamburg, Hummel & Robinson; 400 pg, Bremen, A. Klipstein & Co.; 92 pkg., Hamburg, Superfos Co; 10 cs., Hamburg, Order; 200 csk., Antwerp, Guaranty Trust Co.; 400 bags, Antwerp, C. B. Richard & Co.; 500 csk., Antwerp, Order; 422 pkg., Liverpool, Monsanto Chem. Works; 50 cs., Bremen, Merck & Co

CHALK—75 csk. precipitated, Bristol, H. J. Baker & Bro.; 1,000 bags ground, Antwerp, Cooper & Cooper; 400 bags, Antwerp, Irving Nat'l Bank; 2,215 bags, Antwerp, Order; 200 bags, Antwerp, Order; 500,000 kilos, Dunkirk, J. W. Higman & Co.; 990,000 kilos, Dunkirk, Taintor Trading Co.; 1,000 bags, Antwerp, Bankers Trust Co.

COPPER SULPHATE—77 csk., Liverpool, E. M. Sergeant & Co.; 200 csk., Liverpool, Order; 98 csk., Swansea, Order; 201 csk., Antwerp, Order; 400 csk., Liverpool, Order.

COLORS—5 bbl. aniline, Hamburg, Carbic Color & Chem. Co.; 2 csk. aniline, Hamburg, Kuttroff, Pickhardt & Co.; 13 csk. aniline, Genoa, Irving Nat'l Bank; 6 csk aniline, Genoa, Ladenburg Thalmann & Co.; 8 csk. aniline, Genoa, Am. Exchange Nat'l Bank; 29 bbl. black, Kobe, American Trading Co.; 20 cs. dry, London, Downing & Co.; 9 kegs aniline, Liverpool, Textile Alliance.

COPRA—13,514 sk., Cebu, Order; 119 bags, Morant Bay, Franklin Baker Co.

DEXTRINE — 500 bags, Rotterdam, Stein, Hall & Co.; 500 bags, Rotterdam, J. Morningstar Co.

DIVI-DIVI — 1,481 bags, Maracaibo, Huth Gillespie & Co.; 334 bags, Puerto Plata, Cordilleras Comm. Co.

EPSOM SALT—750 cs., Hamburg, Brown Bros. & Co.; 6,000 bags, Hamburg, Superfos Co.; 160 csk., Hamburg, Order.

FLORIUM NITRATE — 3 cs., Hamburg, Order.

FULLERS EARTH—250 bags, London, C B. Crystal Co., 350 bags, Bristol, L. A. Salmon & Bro.

FLUORSPAR—300 bags, Rotterdam, L. A Salmon & Bro

GUMS—125 bags Persian, Bombay, Guaranty Trust Co., 469 bags karaya, Bombay, Brown Bros. & Co., 266 bags do., Bombay, Chatham & Phenix Nat'l Bank; 90 bags do., Bombay, Irving Nat'l Bank, 1426 bags do., Bombay, Order; 106 pkg. tragacanth, Bombay, Order, 375 cs. gum, Calcutta, Balfour, Williamson & Co., 150 cs tragacanth, London, Thurston & Braidich, 205 pkg damar, Singapore, Order, 525 pkg arabic, Port Sudan, Thurston & Braidich, 2,758 pkg. arabic, Port Sudan, Order, 260 bags arabic, Port Sudan, Nat'l Bank of Egypt, 420 bags arabic, Port Sudan, Thurston & Braidich, 350 bags arabic, Port Sudan, Caracando Bros; 2,030 pkg. arabic, Port Sudan, Order, 400 bags copal, Antwerp, Brown Bros & Co; 25 bags, copal, Antwerp, Order, 294 pkg copal, Antwerp, Order, 15 bbl sandrac, Marseilles, G Lincks, 24 bags copal, London, S Winterbourne & Co, 50 pkg. damar, Batavia, Balfour, Williamson & Co., 200 cs. damar, Padang, Smith & Schipper; 100 cs. damar, Padang, Order, 8 cs. damar, Tandjong Priok, Order, 2,293 pkg. copal, Macassar, Order; 75 cs. damar, Port Said, Order.

GALLNUTS—250 cs, Hankow, Arnhold Bros

GLAUBERS SALT—500 bbl., Hamburg, E. M Sergeant & Co., 35 bbl., Hamburg, Schutz & Rulckgarber; 122 bbl, Hamburg, Order

GLYCERINE—40 dr, Antwerp, N Y. Trust Co.; 54 dr., Melbourne, Marx & Rowolle

HEXAMETHYLENETETRAMINE 38 cs., Hamburg, Industrial Trust Co.

HYDROGEN PEROXIDE—61 pkg. Antwerp, Order.

IRON SULPHATE 57 csk., Antwerp, E M Sergeant & Co., 311 bbl., Antwerp, Order.

LOGWOOD EXTRACT—131 bbl., Cape Haitien, Logwood Mfg Corp, 15 bbl. crystals, Cape Haitien, Logwood Mfg. Corp.

LITHOPONE—120 csk, Bremen, Pfaltz & Bauer; 1,500 csk., Antwerp, Benj. Moore & Co; 200 csk, Antwerp, A Klipstein & Co.

MYROBOLANS — 4,312 bags, Bombay, Order; 4,410 bags, Calcutta, Nat'l City Bank, 6,880 pkts., Calcutta, Order.

MANGANESE—22 csk., Bristol, Lamson A. & C Co. Magnesia, chloride, 70 dr., Brown Bros. & Co., 138 dr, Hamburg, Brown Bros & Co.; Magnesite, calcined, 295 bbl., Rotterdam, Innis Speiden & Co.

NAPHTHALENE — 886 bags, London, Irving Nat'l Bank; 1,740 bags, Hamburg, Holder of B. L.; 150 bags, Hamburg, L. Martin Co; 500 bags, Hamburg, Order; 270 bags, London, Irving Nat'l Bank.

NICKEL SULPHATE—47 csk., Swansea, Order.

OILS—Cod—225 csk., St. Johns, R. Badcock & Co.; 60 bbl., St Johns, Bowring & Co, 200 csk, St. Johns, Job Bros. & Co.; 160 bbl., London, Order. **Coconut**—710 tons, Manila, Order, 816 tons, Manila, Order. **China wood**—306 csk., Hankow, Cook & Swan; 1,000 bbl., Hankow, Order. **Fusel**—29 dr, Rotterdam, Credito Italo; 33 dr., Hamburg, Order; 31 bbl., Hamburg, Order; 24 dr, Antwerp, Guaranty Trust Co.; 50 dr, Rotterdam, Caldwell & Co.; 6 dr., Rotterdam, Order; 12 bbl., Dunkirk, Guaranty Trust Co. **Olive, sulphur**—350 bbl., Milazzo, Banca Comm. Italiana; 300 bbl., Milazzo, Order; 200 bbl., Palermo, Brown Bros. & Co.; 200 bbl., Palermo, Order. **Palm**—64 csk., Liverpool, African & Eastern Trading Co.; 8 csk., Liverpool Order; 250 csk., Hamburg, African & Eastern Trading Co; 174 csk., Hamburg, Order; 32 csk, Liverpool, Order; 80 csk., Liverpool, D Bacon; 61 csk., Liverpool, Order. **Peanut**—400 bbl., London, E. F. Drew & Co. **Perilla**—500 dr., Kobe, Am. Express Co.; 525 bbl., Dairen, Int'l Banking Corp.; 400 bbl., Dairen, Bank of N. Y. **Rapeseed**—125 bbl., London, Order. **Sardine**—2,000 cs., Kobe, Bank of America; 200 cs, Kobe, Lee, Higginson & Co.; 2,000 cs, Yokohama, Order. **Linseed**—286 bbl., Rotterdam, J. C. Francesconi & Co. **Sesame**—569 bbl., Rotterdam, Nat'l City Bank.

PHOSPHATE, BONE—304 bags, Rotterdam, H. J. Baker & Bros.

PLUMBAGO—308 bbl., Colombo, Goldman, Sachs & Co, 100 bbl, Colombo, H. W. Peabody & Co, 564 bbl., Colombo, H. P. Winter & Co, 308 bbl., Colombo, First Fed. Banking Corp.

POTASSIUM SALTS 29 csk, nitrate, Hamburg, Order 50 cs. caustic, Gothenburg, Mallinckrodt Chemical Works; 5,317 pkg. muriate, Bremen, A. Vogel, 15 cs. carbonate, Bremen, P H. Petry & Co.; 32 dr bicarbonate, Rotterdam, Meteor Prod. Co., 100 cs. bromide 206 csk caustic, 107 pkg. actz. Hamburg, Roessler & Hasslacher Chem Co., 440 cs bromide, Hamburg, Superfos Co, 56 csk. product, Hamburg, A Klipstein & Co, 101 dr. caustic, Hamburg, A Klipstein & Co., 40 dr. caustic, Hamburg, A Klipstein & Co.; 44 csk. salts, Hamburg, Roessler & Hasslacher Chem. Co, 270 cs cyanide, Hamburg, Roessler & Hasslacher Chem Co., 100 cs. alum, Hamburg, A. Klipstein & Co; 322 csk. alum, Hamburg, Order, 16 csk bisulphide, Hamburg, Order, 310 bbl. chlorate, Hamburg, Order, 28 csk carbonate, Hamburg, Order; 3,164 bags muriate, Bremen, A. Vogel, 22 bbl perchloride, Swansea, Order; 5,500 bags muriate, 1,500 bags sulphate, Antwerp, Société Comm. des Potasses D'Alsace, 125 bbl. chlorate, 20 bbl. perchlorate, Marseilles, Nat'l City Bank; 250 bbl chlorate, Marseilles, Order, 4 csk. prussiate, Antwerp, Order; 46 csk. carbonate, Antwerp, Order

QUEBRACHO—20,997 logs, Santa Fe, Tannin Corp

SAL AMMONIAC 73 csk., Meteor Prod-phate, Antwerp, Société Comm des Potasses ucts Co, 36 bbl, Hamburg, J. A. Van Brunt & Co., 94 csk, Hamburg, Order; 76 bbl., Hamburg, Order

SEEDS—Castor—1,426 bags, Bombay, Folkart Bros, 10,245 bags, Cocanada, Order, 16,296 bags, Cocanada, Ralli Bros; 12,977 bags, Cocanada, Order. **Linseed**—22,430 bags, Rosario, Spencer Kellogg & Sons, 105,264 bags, Buenos Aires, Order; 30,294 bags, Buenos Aires, Merchants Nat'l Bank of Boston, 8,524 bags, Rosario, Order.

SHELLAC — 130 bags, Calcutta, Phil. Nat'l Bank; 100 bags, Calcutta, London & Liverpool Bank of Commerce, 100 bags, Calcutta, Arbuthnot, Latham & Co.; 600 pkg., Calcutta, Order, 100 bags, Hamburg, A. Murphy & Co.; 11 bags, Hamburg, Kasebier-Chatfield Shellac Co.; 50 cs., Bremen, Order, 100 bags, London, Order; 2,182 bags, Southampton, Order; 75 bags, Calcutta, Cont Comm Nat'l Bank; 319 pkg., Calcutta, Irving Nat'l Bank; 290 pkg., Calcutta, Lee, Higginson & Co.; 52 bags, Calcutta, First Nat'l Bank of Boston; 100 pkg., Calcutta, Brown Bros. & Co.; 100 pkg., Calcutta, London & Liverpool Bank of Commerce; 1,050 pkg., Calcutta, Order; 1,625 pkg refuse lac, Calcutta, Order; 141 pkg, Karachi, Order; 156 bags sticklac, Marseilles, Order

SODIUM SALTS—5,667 bags nitrate, Antofagasta, W R. Grace & Co.; 11,286 bags nitrate, Iquique, W. R. Grace & Co.; 500 csk. nitrate, Hamburg, Kuttroff, Pickhardt & Co; 20 dr. perborate, Hamburg, Bank of America; 122 csk sulph., Hamburg, Roessler & Hasslacher Chem. Co.; 43 dr. sulphide, Hamburg, Order; 81 dr. sulphide, Hamburg, Order; 180 cs. cyanide, Marseilles, Asia Banking Corp.; 99 bbl. hyposulphide, Antwerp, Cooper & Cooper; 128 dr. sulphide, Antwerp, J. D. Leis; 17 csk. prussiate, Liverpool, Guaranty Trust Co.; 35 csk. prussiate, Baker Bros.

STARCH, POTATO—1,250 bags, Rotterdam, Stein, Hall & Co.

STRONTIUM NITRATE—44 csk., Hamburg, Roessler & Hasslacher.

SUMAC—700 bags, Palermo, Equitable Trust Co; 300 bales, Palermo, Order.

TARTAR, CRUDE—16 pkg., Valparaiso, National City Bank; 668 bags, Marseilles, Tartar Chem. Works; 105 bags, Marseilles, C Pfizer & Co.

TALC—1,000 bags, Bordeaux, L. A. Solomon & Bro.; 500 bags, Bordeaux, Hammil & Gillespie; 800 bags, Bordeaux, Order; 62 cs., Bordeaux, Binney & Smith.

TALLOW, VEGETABLE — 500 pkg., Hankow, Arnhold Bros.; 500 pkg., Hankow, Am. Linseed Co.

TALLOW, ANIMAL—558 csk., 16 pipes, Melbourne, D. Bruce & Co.

WHITING — 500 bags, Bristol, L. H. Butcher & Co.; 90 bbl., Antwerp, Order.

WOOL GREASE—75 bbl., Manchester, Am. Trust Co.

ZINC OXIDE—10 bbl., Marseilles, Order; 300 bbl., Antwerp, Brown Bros. & Co.

ZINC WHITE — 100 bbl., Marseilles, Reichard, Coulston, Inc.

Current Prices in the New York Market

For Chemicals, Oils and Allied Products

General Chemicals

Acetic anhydride, 85%, drums	lb	$0 38 –	
Acetone, drums	lb	22 –	23
Acid, acetic, 28%, bbl	100 lb	3 17½ –	3 92
Acetic, 56%, bbl	100 lb	6 35 –	6 37
Glacial, 99½%, bbl.	100 lb	12 05 –	12 85
Boric, bbl.	lb	11 –	11
Citric, kegs	lb	49 –	50
Formic, 85%	lb	14½ –	17
Gallic, tech.	lb	45 –	50
Hydrochloric, 18° tanks,	100 lb	90 –	1 00
Hydrofluoric, 52%, carboys	lb.	12 –	12
Lactic, 44%, tech., light, bbl.	lb	11½ –	12
22% tech., light, bbl	lb	05½ –	06
Muriatic, 20°, tanks,	100 lb	1 00 –	1 10
Nitric, 36°, carboys	lb	04½ –	05
Nitric, 42°, carboys	lb	06 –	06½
Oleum, 20%, tanks	ton	18 50 –	19 00
Oxalic, crystals, bbl.	lb	13½ –	14
Phosphoric, 50%, carboys	lb	07½	08
Pyrogallic, resublimed	lb	1 50 –	1 60
Sulphuric, 60°, tanks	ton	9 00	10 00
Sulphuric, 60°, drums	ton	12 00 –	14 00
Sulphuric, 66°, tanks	ton	15 00 –	15 50
Sulphuric, 66° drums	ton	19 00	20 00
Tannic, U.S.P., bbl.	lb	65	70
Tannic, tech., bbl	lb	45 –	50
Tartaric, imp. crys., bbl	lb	34	
Tartaric, imp., powd., bbl.	lb	34 –	
Tartaric, domestic, bbl..	lb	35 –	
Tungstic, per lb	lb	1 00 –	1 20
Alcohol, butyl, drums, f.o.b. works.	lb	.27 –	.29
Alcohol ethyl (Cologne spirit), bbl	gal	4.75 –	4 95
Alcohol, methyl (see Methanol)			
Alcohol, denatured, 188 proof No. 1, bbl	gal	39 –	40
Alum, ammonia, lump, bbl	lb	03½	03¾
Potash, lump, bbl	lb	03 –	03½
Chrome, lump, potash, bbl	lb.	.05½ –	05¾
Aluminum sulphate, com., bags	100 lb	1 50 –	1 65
Iron free bags	lb	02½ –	02¾
Aqua ammonia, 26°, drums	lb	.06¼ –	07¼
Ammonia, anhydrous, cyl	lb.	.30 –	30½
Ammonium carbonate, powd casks, imported	lb	.09½ –	10
Ammonium carbonate, powd domestic, bbl	lb	.13 –	.14
Ammonium nitrate, tech., casks	lb	10 –	11
Amyl acetate tech. drums	gal	3 50 –	3 75
Arsenic, white, powd., bbl	lb	15½ –	16
Arsenic, red, powd., kegs	lb	14½ –	15
Barium carbonate, bbl	ton	78 00 –	80 00
Barium chloride, bbl.	ton	90 00 –	95 00
Barium dioxide, drums	lb	18 –	18½
Barium nitrate, casks		08 –	08½
Barium sulphate, bbl	lb	04 –	04½
Blanc fixe, dry, bbl	lb	.04½ –	04¾
Blanc fixe, pulp, bbl.	ton	45 00 –	55 00
Bleaching powder, f.o.b. wks., drums	100 lb.	2 15 –	
Spot N. Y. drums	100 lb.	2 60 –	2 70
Borax, bbl	lb.	05½ –	05¾
Bromine, cases	lb	28 –	30
Calcium acetate, bags	100 lb	3 50 –	3 60
Calcium carbide, drums	lb	04½ –	04¾
Calcium chloride, fused, drums	ton	22 00 –	23 00
Gran. drums	lb	.01½ –	01¾
Calcium phosphate, mono, bbl	lb	06½ –	07
Camphor, cases	lb	91 –	93
Carbon bisulphide, drums	lb	07 –	07¼
Carbon tetrachloride, drums	lb	10 –	
Chalk, precip.—domestic, light, bbl	lb	.04½ –	04¾
Domestic, heavy, bbl..	lb	03½ –	03¾
Imported, light, bbl.	lb	04½ –	05
Chlorine, liquid, cylinders	lb	06 –	06½
Chloroform, tech., drums	lb	35 –	38
Cobalt oxide, bbl	lb	2 10 –	2 25
Copperas, bulk, f.o.b. wks.	ton	16 50 –	20 00
Copper carbonate, bbl..	lb	19	20
Copper cyanide, drums	lb	47 –	50
Coppersulphate, crys., bbl	100 lb	6 25 –	6 50
Cream of tartar, bbl	lb	25½ –	25¾
Epsom salt, dom., tech., bbl	100 lb	2 00 –	2 25
Epsom salt, imp., tech., bags	100 lb	1.10 –	1 25
Epsom salt, U.S.P., dom., bbl	100 lb	2 50 –	2 75
Ether, U.S.P., drums	lb	.13 –	15
Ethyl acetate, com., 85%, drums	gal	.80 –	85
Ethyl acetate, pure (acetic ether, 98% to 100%)	gal	.95 –	1 00
Formaldehyde, 40%, bbl	lb	.14½ –	.16
Fullers earth, f.o.b. mines	net ton	16.00 –	17 00
Fullers earth—imp., powd.,	net ton	30.00 –	32 00
Fusel oil, ref., drums.	gal.	3.55 –	4 05
Fusel oil, crude, drums.	gal.	2.30 –	2 40
Glaubers salt, wks., bags	100 lb	1.20 –	1 40

THESE prices are for the spot market in New York City, but a special effort has been made to report American manufacturers' quotations whenever available. In many cases these are for material f.o.b. works or on a contract basis and these prices are so designated. Quotations on imported stocks are reported when they are of sufficient importance to have a material effect on the market. Prices quoted in these columns apply to large quantities in original packages.

Glaubers salt, imp., bags	100 lb.	$1 00 –	$1 25
Glycerine, c.p., drums extra	lb	.18 –	.18½
Glycerine, dynamite, drums	lb	.16½ –	
Iodine, resublimed	lb	4 55 –	4 65
Iron oxide, red, casks	lb.	.12 –	.18
Lead			
White, basic carbonate, dry, casks	lb	.09¾ –	.10¼
White, basic sulphate, casks	lb	09½ –	
White, in oil, kegs	lb	.12½ –	14
Red, dry, casks	lb	.11½ –	12
Red, in oil, kegs	lb.	.13½ –	.15
Lead acetate, white crys., bbl.	lb.	13½ –	14
Brown, broken, casks	lb	12½	
Lead arsenate, powd., bbl	lb	23 –	24
Lime-Hydrated, bbl	per ton	16 80 –	17 00
Lime, Lump, bbl	280 lb	3 63 –	3 65
Litharge, comm., casks	lb	10¾ –	11
Lithophone, bags	lb	07 –	07¼
in bbl	lb	07¼	07½
Magnesium carb., tech., bags	lb	08 –	08½
Methanol, 95%, bbl	gal	1 21 –	1 23
Methanol, 97%, bbl	gal	1 23	1 25
Nickel salt, double, bbl	lb	10½ –	.
Nickel salts, single, bbl.	lb.	11½ –	
Phosgene		60 –	75
Phosphorus, red, cases	lb.	35 –	40
Phosphorus, yellow, cases	lb.	.30 –	.35
Potassium bichromate, casks	lb.	.11 –	.11¼
Potassium bromide, gran., bbl	lb.	.16 –	.23
Potassium carbonate, 80-85%, calcined, casks	lb.	.06 –	.06¼
Potassium chlorate, powd	lb.	.07 –	.08
Potassium cyanide, drums	lb.	.45 –	50
Potassium hydroxide (caustic potash) drums	100 lb	8 25 –	8 50
Potassium iodide, cases	lb.	3 65 –	3 75
Potassium nitrate, bbl	lb.	.06½ –	.07½
Potassium permanganate, drums	lb.	.25½ –	.25¾
Potassium prussiate, red, casks	lb.	.80 –	.85
Potassium prussiate, yellow, casks	lb.	.37½ –	.38
Salammoniac, white, gran., casks, imported	lb	.07 –	.07½
Salammoniac, white, gran., bbl., domestic	lb	.07¾ –	.08
Gray, gran., casks	lb	08 –	09
Salsoda, bbl	100 lb	1 20 –	1 40
Salt cake (bulk)	ton	26.00 –	28 00
Soda ash, light, 58% flat, bags, contract	100 lb	1.60 –	1.67
Soda ash, light, basis, 48%, bags, contract, f.o.b. wks.	100 lb.	1.20 –	1 30
Soda ash, light, 58%, flat, bags, resale	100 lb.	1 75 –	1.80
Soda ash, dense, bags, contract, basis 48%	100 lb.	1.17½ –	1.20
Soda ash, dense, in bags, resale	100 lb.	1.85 –	1.90
Soda, caustic, 76%, solid, drums, f.a.s.	100 lb.	3.45 –	3.70
Soda, caustic, 76%, solid, drums, contract	100 lb	3.35	3.40
Soda, caustic, basis 60%, wks., contract.	100 lb.	2.50 –	2.60
Soda, caustic, ground and flake, contracts	100 lb.	3.80 –	3.90
Soda, caustic, ground and flake, resale	100 lb	4 00 –	4.15
Sodium acetate, works, bags	lb	06 –	.06½
Sodium bicarbonate, bbl	100 lb	2 00 –	2.50
Sodium bichromate, casks	lb	.07¾ –	.08
Sodium bisulphate (niter cake)	ton	6.00 –	7.00
Sodium bisulphite, powd., U.S.P., bbl	lb.	.04½ –	.04¾
Sodium chlorate, kegs	lb.	.06½ –	.07
Sodium chloride	long ton	12.00 –	13.00
Sodium cyanide, cases	lb.	.20 –	.23
Sodium fluoride, bbl	lb.	$0.09 –	$0 10
Sodium hyposulphite, bbl	lb.	.02½ –	03
Sodium nitrite, casks	lb.	.08½ –	09
Sodium peroxide, powd., cases	lb.	.28 –	30
Sodium phosphate, dibasic, bbl	lb.	.03½ –	04
Sodium prussiate, yel. drums	lb.	.18½ –	19
Sodium silicate (40°, drums)	100 lb.	.80 –	1 25
Sodium silicate (60°, drums)	100 lb.	2.00 –	2 25
Sodium sulphide, fused, 60-62%, drums	lb.	.04½ –	.04¾
Sodium sulphite, crys., bbl	lb.	.03½ –	03¾
Strontium nitrate, powd., bbl.	lb.	.09½ –	.10
Sulphur chloride, yel drums.	lb.	.04½ –	.05
Sulphur, crude	ton	18.00 –	20 00
At mine, bulk	ton	16 00 –	18 00
Sulphur, flour, bbl	100 lb.	2.35 –	3 15
Sulphur, roll, bbl	100 lb.	2.00 –	2.50
Sulphur dioxide, liquid, cyl	lb.	.08 –	.08½
Talc—imported, bags	ton	30 00 –	40 00
Talc—domestic powd., bags.	ton	18.00 –	25.00
Tin bichloride, bbl	lb.	.13½ –	.14
Tin oxide, bbl	lb.	.52 –	.54
Zinc carbonate, bags	lb.	.14 –	.14½
Zinc chloride, gran, bbl	lb.	.06 –	.07
Zinc cyanide, drums	lb.	.37 –	.38
Zinc oxide, lead free, bbl.	lb.	.08 –	.08½
5% lead sulphate, bags	lb	.07½ –	....
10 to 35% lead sulphate, bags	lb.	.07 –	.
French, red seal, bags	lb	09¾ –	
French, green seal, bags	lb	.10¾ –	
French, white seal, bbl	lb	12 –	
Zinc sulphate, bbl..	100 lb.	2.75 –	3.00

Coal-Tar Products

Alpha-naphthol, crude, bbl	lb.	$0.80 –	$0.85
Alpha-naphthol, ref., bbl	lb	1 05 –	1.10
Alpha-naphthylamine, bbl.	lb	.35 –	36
Aniline oil, drums	lb.	.16 –	.16½
Aniline salts, bbl.	lb.	.24 –	.25
Anthracene, 80%, drums	lb.	.75 –	1.00
Anthracene, 80%, imp., drums, duty paid	lb.	.70 –	.75
Anthraquinone, 25%, paste, drums	lb.	.70 –	.75
Benzaldehyde U.S.P., carboys	lb.	1.40 –	1.45
Benzene, pure, water-white, tanks and drums	gal.	.32 –	.35
Benzene, 90%, tanks & drums	gal.	.27 –	.30
Benzene, 90%, drums, resale	gal.	.30 –	.33
Benzidine base, bbl	lb.	.85 –	90
Benzidine sulphate, bbl	lb.	.75 –	.80
Benzoic acid, U.S.P., kegs	lb.	.72 –	.75
Benzoate of soda, U.S.P., bbl	lb.	.57 –	.65
Benzyl chloride, 95-97%, ref., drums	lb.	.25 –	.27
Benzyl chloride, tech., drums	lb.	.20 –	.23
Beta-naphthol, subl., bbl	lb.	.55 –	.60
Beta-naphthol, tech., bbl	lb	.23½ –	.24
Beta-naphthylamine, tech.	lb.	.80 –	.90
Carbazol, bbl	lb.	.75 –	.90
Cresol, U.S.P., drums	lb	.25 –	.29
Ortho-cresol, drums	lb.	.24 –	.26
Cresylic acid, 97%, resale, drums	gal.	1 40 –	1.50
95-97%, drums, resale	gal.	1.30 –	1.30
Dichlorbenzene, drums	lb.	.07 –	.09
Diethylaniline, drums	lb.	.50 –	.60
Dimethylaniline, drums	lb	.42 –	.43
Dinitrobenzene, bbl	lb.	.19 –	.20
Dinitroclorbenzene, bbl	lb.	.22 –	.23
Dinitronaphthalene, bbl	lb	.30 –	.32
Dinitrophenol, bbl	lb	.35 –	.40
Dinitrotoluene, bbl	lb	.20 –	.22
Dip oil, 25%, drums	gal	.25 –	.30
Diphenylamine, bbl.	lb.	50 –	.52
H-acid, bbl..	lb.	.80 –	.85
Meta-phenylenediamine, bbl.	lb.	.95 –	1 00
Michlers ketone, bbl...	lb.	3.00 –	3.50
Monochlorbenzene, drums	lb.	.08 –	.10
Monoethylaniline, drums	lb.	.95 –	1.10
Naphthalene, crushed, bbl.....	lb.	.08 –	.09
Naphthalene, flake, bbl...	lb.	.09½ –	.10
Naphthalene, balls, bbl...	lb	.10½ –	.11
Naphthionate of soda, bbl	lb	.58 –	.65
Naphthionic acid, crude, bbl.	lb	.60 –	.65
Nitrobenzene, drums	lb.	.10 –	.12
Nitro-naphthalene, bbl...	lb.	.30 –	.35
Nitro-toluene, drums	lb.	.15 –	.17
N-W acid, bbl.	lb	1 25 –	1.30
Ortho-amidophenol, kegs.	lb	2.30 –	2.35
Ortho-dichlorbenzene, drums	lb.	.17 –	.20
Ortho-nitrophenol, bbl.	lb.	.90 –	.92
Ortho-nitrotoluene, drums...	lb.	.10 –	.12
Ortho-toluidine, bbl.	lb.	.13 –	.15
Para-amidophenol, base, kegs	lb.	1.15 –	1.20
Para-amidophenol, HCl, kegs	lb.	1.20 –	1.25
Para-dichlorbenzene, bbl	lb.	.17 –	.20
Paranitraniline, bbl.	lb.	.74 –	.75
Para-nitrotoluene, bbl...	lb.	.55 –	.65
Para-phenylenediamine, bbl.	lb.	1.45 –	1.50
Para-toluidine, bbl...	lb.	.95 –	.98
Phthalic anhydride, bbl......	lb.	.35 –	.38
Phenol, U.S.P., drums.......	lb.	.50 –	.55
Picric acid, bbl..	lb.	.20 –	.22
Pyridine, dom., drums........	gal.	nominal	
Pyridine, imp., drums.......	gal.	2.50 –	2.75

Resorcinol, tech., kegs	lb.	$1.50 - $1.55
Resorcinol, pure, kegs	lb.	2.03 - 2.10
R-salt, bbl	lb.	.55 - .60
Salicylic acid, tech., bbl	lb.	.47 - .48
Salicylic acid, U.S.P., bbl	lb.	.50 - .52
Solvent naphtha, water-white, drums	gal.	.37 - .40
Crude, drums	gal.	.22 - .24
Sulphanilic acid, crude, bbl	lb.	.18 - .2.
Thiocarbanilide, kegs	lb.	.35 - .38
Toluidine, kegs	lb.	1.20 - 1.30
Toluidine, mixed, kegs	lb.	.30 - .35
Toluene, tank cars	gal.	.30 - .35
Toluene, drums	gal.	.35 - .40
Xylidines drums	lb.	.40 - .45
Xylene, pure, drums	gal.	.45 - .50
Xylene, com., drums	gal.	.35 - .37
Xylene, com., tanks	gal.	.30 -

Naval Stores

Rosin B-D, bbl	280 lb.	$6 20 -
Rosin E-I, bbl	280 lb.	6 30 -
Rosin K-N, bbl	280 lb.	6 35 - 6 75
Rosin W G-W.W., bbl	280 lb.	7 00 - 8 00
Wood rosin, bbl	280 lb.	6 25 -
Turpentine, spirits of, bbl	gal.	1 60 - 1 62
Wood, steam dist., bbl	gal.	1 35 -
Wood, dest. dist., bbl	gal.	1.25 -
Pine tar pitch, bbl	200 lb.	- 6 00
Tar, kiln burned, bbl	500 lb.	- 12 00
Retort tar, bbl	500 lb.	- 11 00
Rosin oil, first run, bbl	gal.	.43 -
Rosin oil, second run, bbl	gal.	.47 - ...
Rosin oil, third run, bbl	gal.	.53 -
Pine oil, steam dist.	gal.	... - .90
Pine oil, pure, dest. dist.	gal.	... - .85
Pine tar oil, ref.	gal.	... - .46
Pine tar oil, crude, tanks f.o.b. Jacksonville, Fla.	gal.	... - .35
Pine tar oil, double ref., bbl	gal.	... - .75
Pine tar, ref., thin, bbl	gal.	... - .25
Pinewood creosote, ref., bbl	gal.	... - .52

Animal Oils and Fats

Degras, bbl	lb.	$0 03¾ - $0.04¼
Grease, yellow, bbl	lb.	08½ - 08¾

The following base prices per 100 lb. are for structural shapes 3 in. by ¼ in. and larger, and plates ¼ in. and heavier, from jobbers' warehouses in the cities named:

	New York	Chicago
Structural shapes	$3.29	$3.14
Soft steel bars	3.19	3.04
Soft steel bar shapes	3.19	3.04
Soft steel bands	3.29	3.19
Plates, ¼ to 1 in. thick	3.29	3.14

Industrial

Financial, Construction and Manufacturing News

Construction and Operation

Alabama

HOLT—The Central Iron & Coal Co. has broken ground for the erection of its proposed new 1-story foundry for the production of cast-iron pipe, to be 150x364 ft., estimated to cost $85,000, with machinery.

Arizona

TUCSON—The Tucson Gas, Electric Light & Power Co. will make improvements and extensions in its artificial gas plant to cost about $200,000, including the installation of additional machinery.

Arkansas

FORT SMITH—The Fort Smith Cotton Oil Co., North 1st and G Sts., has plans in progress for the erection of a new fertilizer manufacturing plant, to be 1-story, estimated to cost $25,000, with equipment.

California

LOS ANGELES—The Los Angeles Pressed Brick Co., Frost Bldg., manufacturer of common and semi-vitreous face brick, has plans under consideration for the erection of a new plant with initial output of close to 100,000 bricks per day. A department will be installed for the manufacture of roofing. A tunnel kiln will be constructed. Howard Frost heads the company.

LOS ANGELES (San Pedro)—A 1-story foundry, 150x180 ft., will be constructed by the Walsh Automatic Coupling Co., estimated to cost about $25,000. Farrell & Miller, Western Mutual Life Bldg., Los Angeles, are architects.

LINCOLN—Gladding, McBean & Co. have work under way on extensions at their local clay products plant, to include the installation of additional machinery. A tunnel kiln is being constructed, to be used in connection with roofing tile manufacture.

Connecticut

MIDDLETOWN—The Benevue Co., recently organized, has leased feldspar properties of the Laurel Brick & Sand Co., at Laurel, near Middletown, and plans for the installation of a new plant for commercial feldspar production. Equipment will be provided for initial employment of about 100 operatives. The company also purposes to construct and operate a pottery in this section at a later date.

District of Columbia

WASHINGTON—The Washington Gas Light Co., 411 10th St., N. W., is arranging a construction program for new artificial gas plants, improvements in present plants and system to involve an annual amount of about $1,000,000 for a number of years. Plans for initial work are under consideration.

Illinois

CHICAGO—The National Wood Finishing Co., recently organized to manufacture oils, paints and varnishes, has leased the 2-story and basement building, 50x120 ft., at 2242 Belmont Ave., with option to purchase, for a new plant. An adjoining site, 75x125 ft., has also been secured for later expansion. Machinery will be installed and the plant placed in operation at an early date.

CHICAGO—Brenner, Monley & Morris, Inc., care of Fox & Fox, 38 South Dearborn St., Chicago, architects, has had plans drawn for the construction of a new copper rod and wire mill on Kedzie St., to be 1-story, 105x300 ft., and estimated to cost approximately $250,000, with machinery. Work will be placed under way at an early date.

ROCKFORD—The Sargent-Morse Paper Co., 315 Chestnut St., has tentative plans under consideration for enlargements in its plant, for the manufacture of paper and paper board products. The company was incorporated recently to succeed to an existing business.

CHICAGO—The National Fiber & Vulcanizing Co. has leased the 1-story plant at 2808-14 West Lake St., totaling about 10,000 sq.ft. of space, for a new works. Possession will be taken at once.

Indiana

INDIANAPOLIS—The Ideal Paint Co. has leased a building at 437 East 10th St. for enlargements in its plant. Equipment will be installed at an early date.

SOUTH BEND—A large foundry will be constructed at the plant of the Studebaker Corp., manufacturer of automobiles, estimated to cost close to $200,000. Plans have been drawn and bids called for the general erection.

INDIANAPOLIS—Eberhardt & Co., Greenbrier St., manufacturers of waterproofing compounds and kindred products, have plans nearing completion for the erection of an addition to their plant on Darwin St. and Hillside Ave.

Louisiana

YOUNGSVILLE—The Youngsville Sugar Co. has plans under way for extensions and improvements in its plant including the installation of additional machinery. Enlargements will be made in the power department. R. O. Young is general manager.

BASTROP—H. L. Brown, vice-president of the Yellow Pine Paper Mill Co., Orange, Tex., and associates have organized a new company to be known as the H. L. Brown Paper Co., Inc. Property has been purchased at Morehouse Parish, near Bastrop, and work will soon be commenced on a new paper mill, with an initial capacity of 50 tons of kraft paper and pulp per day. It is estimated to cost in excess of $1,750,000, with machinery. A power house will be built. George F. Hardy, 309 Broadway, New York, is engineer.

Maryland

NORTH EAST—The North East Porcelain Co., recently organized, has taken over the former plant of the Maryland Porcelain Co., on Broad Creek, near the city, and will soon commence the manufacture of porcelain products. The factory will be improved and additional machinery installed. E. Kirk Brown is president; Robert C. Reeder, treasurer; and Gustav Glocker, secretary and general manager. The last noted will be in active charge of the project.

Massachusetts

SPRINGFIELD—The B. & H. Paper Co., 65 Water St., has plans in progress for the erection of a new 2-story building, 50x90 ft., on Fulton St., estimated to cost about $25,000.

EVERETT—The Boston Electrolytic Oxygen Co., South Ferry St. and Revere Beach Parkway, manufacturer of industrial oxygen, etc., will commence the immediate erection of a new 1-story plant addition, 24x86 ft., estimated to cost about $14,000, exclusive of equipment. A general building contract has been awarded to the Hudson Construction Co., Everett.

HOLYOKE—The American Writing Paper Co. is perfecting plans for the electrification of its various mills in this section, to replace waterpower operation during certain periods of the year.

Michigan

MONROE—The Monroe Board & Lining Co., First National Bank Bldg., has tentative plans under consideration for the construction of a new local mill for the manufacture of paper and paper board products. William G. Gutman heads the company.

DETROIT—The National Lead Co., 1607 Howard St., is completing plans for the erection of a new 2-story building, 40x120 ft., at Howard and 10th Sts., for general works expansion. Western & Ellington, 1507 Stroh Bldg., are architects.

Missouri

INDEPENDENCE—The Faultless Pneumatic Tire Co., 414 Shuker Bldg., Kansas City, Mo., Frank Y. Allen, head, has preliminary plans under way for the remodeling and improving of a building at Independence, for the establishment of a new plant. An appropriation of about $50,000, is being made for the work and the installation of equipment.

KNOB NOSTER—Frank C. Nicholson, Kansas City, Mo., head of the Harrisonville Brick & Tile Co., Harrisonville, Kan., has leased a brick manufacturing plant at Knob Noster. Improvements will be made and additional equipment installed for brick production and affiliated manufacture. A new kiln will be installed. It is planned to place the plant in service at an early date.

KANSAS CITY—The Cook Paint & Varnish Co., 1319 Grand Ave., has awarded a general contract to Collins Brothers, 1600 Grand Ave., for the erection of a new 2-story and basement plant on Harrison Ave., between 14th and 15th Sts., North Kansas City. It will be 113x162 ft. Work will be placed in progress at an early date. Hans Von Unwerth, 509 Finance Bldg., is architect and engineer.

KANSAS CITY—The Kansas Portland Cement Co., Federal Reserve Bldg., a subsidiary of the International Portland Cement Co., Kansas City and New York, will operate the former plant of the Bonner Portland Cement Co., Bonner Springs, Kan., recently purchased by the parent organization. Plans are nearing completion for enlargements in the works to develop an annual production of 4,000,000 bbl., and operations will soon be commenced. H. Struckmann is president.

New Jersey

NEWARK—The Hanovia Chemical & Mfg. Co., 233 New Jersey Railroad Ave., manufacturer of liquid gold, luster colors, etc., has commissioned Fred A. Phelps, Union Bldg., architect and engineer, to prepare plans for enlargements in its plant for considerable increase capacity in different departments. The company has purchased property on New Jersey Railroad Ave., from Chestnut to Oliver St., for future extensions.

NEWARK — The Crepe Craft Paper Mfg. Co., 121-23 Jackson St., has leased space in an adjoining building for enlargements in its plant.

TRENTON—The Electric Porcelain Mfg. Co., New York Ave., has awarded a contract to Harry Faske, Trenton, for the erection of a 1-story addition to its plant to cost about $14,000 exclusive of equipment.

NEW BRUNSWICK — The American Clay Products Co. has leased the entire plant of the Atlantic Clay Products in East Brunswick Township at an annual rental of $50,000, and will occupy the factory at once. The works will be used for the manufacture of hollow tile products.

KEYPORT—The Architectural Tile Co. is negotiating with the city council for the purchase of municipal property in the vicinity of its plant, to be used for proposed additions.

New York

DEFERIET—The St. Regis Paper Co., Watertown, will soon take bids for the erection of a 1-story addition to its mill at Deferiet, estimated to cost about $60,000.

Ohio

AKRON—The Chemmitex Rubber Co., has leased the tire manufacturing plant of the Interlocking Cord Tire Co., at Mogadore, near Akron, and will take possession at once. The Interlocking company has plans nearing completion for the erection of a new factory in the immediate vicinity of the former plant, and will soon begin work.

ROSSFORD—The Edward Ford Plate Glass Co. has awarded a contract to A. Bentley & Sons, Toledo, for the erection of additions to its plant to cost about $2,000,000, with machinery. Work will be commenced immediately.

Oklahoma

SAND SPRINGS—Chestnut & Smith, operating the local Phoenix refinery, have plans nearing completion for extensive improvements and additions in the oil refining plant to increase the output to 8,000 bbl. per day. It is purposed to have the plant ready for operation in June.

WETUMKA—The Phillips Petroleum Co. is planning for the construction of a new gasoline refining plant on local site.

NEWKIRK—The local oil refinery of the Pirtle-Pittman Co. has been acquired by R. S. Ayres and associates, and a new company will be organized to operate the plant. Plans are under way for extensions and improvements, to include the installation of additional equipment including "cracking" stills for gasoline production. George Turner will act as assistant general manager.

ARDMORE—The Santa Fe Oil & Refining Co., recently organized, has taken over the local plant of the Chickasaw Refining Co., lately secured at a bankruptcy sale. The new owner will take immediate possession, and plans for extensions and improvements, including the installation of additional equipment. James A. Cotner heads the company.

Oregon

SALEM—The Oregon Pulp & Paper Co. has commenced work on enlargements to its local mill to double, approximately, the present capacity. Machinery to cost about $75,000 will be installed.

Pennsylvania

ALLENTOWN—The Coston Brick Co. has commenced the erection of a new plant on North Quebec St., near the Union Blvd., for the manufacture of concrete brick, tile and kindred products. The machinery installation will be started at an early date.

PHILADELPHIA—A 1-story foundry to cost about $25,000, will be constructed at the plant of the American Engineering Co., Wheatsheaf Lane and Sepviva St.

PHILADELPHIA—The R. E. Tongue & Brothers Co., Allegheny and Amber Sts., manufacturer of chimneys and other glass products, has plans in progress for the erection of a new plant addition to cost approximately $60,000, including equipment. The construction contract has been let to the William Steele & Sons Co., 16th and Arch Sts.

MACUNGIE—Bids are being taken by the East Penn Foundry Co. for the erection of a new 1-story foundry, 140x150 ft., for the manufacture of cast-iron pipe and brass castings. Facilities will be provided for the employment of about 100 men.

South Carolina

GREENWOOD—Fire, March 13, destroyed a portion of the fertilizer mixing plant of the Southern Cotton Oil Co., with loss reported at close to $25,000. It is planned to rebuild.

Tennessee

JOHNSON CITY—The Watauga Cement Products Corp. will construct a number of additions to its plant and install new equipment. It is purposed to double the present capacity. J. W. Warren is president and general manager.

ROCKWOOD—A. E. Venable is organizing a company to construct and operate a local plant for the manufacture of brick, tile and kindred burned clay products. It is expected to develop an initial capacity of 50,000 bricks per day.

Texas

BRECKENRIDGE—The Gulf Production Co. has perfected plans for the construction of six new gasoline plants, casinghead type, in this vicinity, estimated to cost approximately $1,500,000, with machinery. Work on the initial plant will be commenced at once, designed for a daily output of about 8,000 gal. of gasoline.

CORPUS CHRISTI—The city council is arranging for a bond issue of $350,000, for the installation of a municipal gas plant and system.

GAINESVILLE—George Brown and Joseph Curtis, Gainesville, have acquired the plant of the Gainesville Brick Co., near the city limits. A new company with capital of $75,000, will be organized to operate the property, and extensions and improvements made.

FORT WORTH—The Herbert Oil Co., Majestic Bldg., is arranging an appropriation of about $50,000, for extensions in its plant and the purchase of additional equipment.

FORT WORTH—The Helius Casinghead Co., Fort Worth, has plans under way for the construction of a new gasoline plant in the vicinity of Brownwood, Tex., estimated to cost close to $200,000, with machinery. It will be designed for an output of about 10,000 gal. per day.

Vermont

HARTFORD—The Hartford Water Co. has plans under way for the construction of a new water-purification plant in connection with its local waterworks. Weston & Sampson, 14 Beacon St., Boston, Mass., are engineers.

Virginia

ROANOKE—The Roanoke Tire & Rubber Co., Terry Bldg., is arranging a list of equipment for installation at its proposed new plant, and will take bids until about May 1. R. F. Mitchel, Seaboard Bank Bldg., is architect. Alfred Buck heads the company.

SUFFOLK—The Boll Weevil Exterminator Co., recently organized with capital of $500,000, plans for the operation of a local plant for the manufacture of insecticides. Thomas H. Debnam, Suffolk, is treasurer.

Washington

SEATTLE—The Associated Oil Co. has commenced the construction of a new storage and distributing plant on Railroad Ave., comprising a number of buildings, tanks, etc., estimated to cost $75,000.

Canada

FORT ALEXANDER, QUE.—The J. D. McArthur Co., Quebec, is perfecting plans for the construction of a new paper and pulp mill in this vicinity, estimated to cost close to $1,000,000, with machinery. B. W. Thompson is vice-president.

Industrial Developments

LEATHER—The American Hide & Leather Co., New York, will take possession of its new plant at Peabody, Mass., recently purchased, early in April, and will commence operations at once for the manufacture of leather specialties of various kinds. The plant has a rated capacity of 1,500,000 ft. of material per month.

The Castle Kid Co., Camden, N. J., is advancing production at its tannery and is now working on a night and day schedule. Employment is being given to a full force. Both cabrettas and kid in various colors are being produced.

The Texas Hide & Leather Co., Yoakum, Tex., has completed enlargements in its plant, and the new departments have been placed in service. The working force will be increased.

The Standard Kid Mfg. Co., Wilmington, Del., is running under heavy output and giving employment to additional workers.

GLASS—The Owens Bottle Co., Toledo, O., has placed all of its plants on a full 24-hour operating basis, giving employment to maximum working forces. Incoming orders insure the continuance of this schedule for an indefinite period.

Manufacturers of flint glass in all parts of the country have made an agreement with workers for the elimination of the usual "summer suspension" period during the present year, and practically all plants will be continued in operation, allowing employees vacation periods, with restriction that not more than 25 per cent of the shop force shall be absent during any particular period.

Bottle-manufacturing plants in New Jersey, at Millville, Glassboro, Bridgeton and vicinity, are running under heavy production schedules with large working forces. It is expected that this basis will be continued for an indefinite period.

PAPER—The River Raisin Paper Co., Monroe, Mich., is running on a full-time operating schedule, giving employment to a full working force of about 1,000 men. The company has heavy advance orders on hand.

The American Writing Paper Co., Holyoke, Mass., is maintaining production on a capacity schedule with full working forces at its different mills. This basis will be continued indefinitely.

The Eddy Paper Co., Three Rivers, Mich., recently acquired by new interests, has advanced production to about 80 per cent of capacity, and expects to advance this output in the near future.

CERAMIC—The Columbia Clay Products Co., Warrenton, Ore., which has been in financial difficulties for a number of months past, is arranging for the early resumption of operations at its plant.

The Illinois China Co., Lincoln, Ill., has placed its new 10-kiln plant in operation and expects to develop maximum output at an early date. The company specializes in the manufacture of vitreous chinaware, plain white and decorated. The new plant

replaces a works destroyed by fire some time ago.

The Fredonia Brick Co., Fredonia, Kan., manufacturer of face brick, has resumed production at its plant, and expects to maintain operations for an indefinite period. Additions are now in progress and new machinery will be installed in a number of departments.

The Knoxville Brick Co., Knoxville, Tenn., is running full on a basis of about 80,000 bricks per day. Plans are in progress for a number of additions, with new machinery to increase this output at an early date.

The B. Mifflin Hood Brick Co., Atlanta, Ga., is operating at full capacity at its various brick and tile plants, and reports orders far in excess of those at this same time a year ago. The plants will be continued on the present basis indefinitely, giving employment to full working forces.

RUBBER—The manufacture is advancing in the Akron, O., district, and total current production is now approximately 100,000 completed tires daily at all plants. Of this aggregate, the Goodyear Tire & Rubber Co. is running on a schedule of close to 30,000 tires per day, with the Firestone Tire & Rubber Co. maintaining about this same output. The Goodrich Rubber Co. is manufacturing more than 20,000 tires daily, the Miller Rubber Co., 8,500; the General Tire & Rubber Co., 2,200; the Seiberling Tire & Rubber Co., 2,000, the India Rubber Co. more than 700, the Swinehart and Mohawk Tire & Rubber companies, 1,000 each, and the American Rubber Co., 750 tires daily.

The Bourn Rubber Co., Providence, R. I., has closed its plant temporarily, pending the outcome of a strike of operatives, totaling about 500. The company has refused to meet a demand for a wage advance of 10 per cent.

C. H. Booth, receiver for the Republic Rubber Co., Youngstown, O., is arranging plans for a reorganization, with expectation of placing all mills of the company on the active list at an early date.

IRON AND STEEL—The Carnegie Steel Co. is arranging to blow in its blast furnace at Niles, O., following a 7-year idle period. The plant has a rated output of 300 tons of pig iron daily, and will give employment to about 275 men, of which 200 will operate on the day turn, and the remainder on night shift.

The Penn-Seaboard Steel Corp., Philadelphia, Pa., has advanced production at its Chester, Pa., mills to 100 per cent capacity and is said to have orders on hand to insure this schedule for at least 90 days. The plant has been running at from 80 to 90 per cent since last fall.

The Virginia Iron, Coal & Coke Co., Roanoke, Va., is arranging to blow in another blast furnace at its plant.

The Adrian Furnace Co., Du Bois, Pa., is planning to place the torch to its local blast furnace at an early date.

The Titusville Iron Co. and the Titusville Forge Co., Titusville, Pa., affiliated organizations, are running at full capacity, giving employment to about 1,300 operatives. Wages have been advanced at the plants 10 per cent, effective April 2.

The Kittanning Iron & Steel Mfg. Co., Pittsburgh, Pa., a subsidiary of the Carbon Steel Co., has blown in its Rebecca furnace in the Kittanning, Pa., district.

Following the adoption of an increased operating schedule with two extra shifts in the blooming mill, the Eastern Steel Co., Pottsville, Pa., is planning for third shift at an early date, making full 24 hour service. An increased working force will be employed.

The Newton Steel Co., Youngstown, O., is operating at 17 sheet mills under capacity output.

The Low Moor Iron Co., Low Moor, Va., is planning to blow in its local blast furnace at an early date.

Of a total of 117 sheet mills in the Mahoning Valley section, Youngstown, O., only 2 such plants are now inactive; 115 mills are running full with normal working forces.

MISCELLANEOUS—The American Smelting & Refining Co., New York, is operating its copper refinery at Chrome, N. J., at maximum capacity, on a basis of about 20,000,000 lb. of refined copper per month. A full working force is engaged.

The Air Reduction Sales Co., New York, has completed its new plant at Baltimore, Md., and will place the factory in service at once for the production of commercial oxygen.

The Sinclair Refining Co., New York, has resumed production at its Mereaux, La., oil refinery, and purposes to develop maximum output.

New Companies

HENRY LANGE, INC., Kearny, N. J., has been incorporated with a capital of $25,000, to manufacture glass products. The incorporators are C. Martens and Henry Lange, 177 Windsor St., Kearny. The last noted represents the company.

THE FEDERALOID CORP., Brooklyn, N. Y., care of John Bogart, 63 Park Row, New York, representative, has been incorporated with a capital of $40,000, to manufacture celluloid products. Incorporators: D. I. Michaelson, J. Levy and J. Rottiner.

THE VENEKLASEN CLAY PRODUCTS CO., Hamilton, Mich., has been incorporated with a capital of $30,000, to manufacture burned clay wares of various kinds. The incorporators are Benjamin J. and John H. Veneklasen, both of Zeeland, Mich.

THE SCOLLAY PAPER CO., Boston, Mass., has been incorporated with a capital of $100,000, to manufacture paper products. John J. Delany, president, and M. F. Boyle, Mattapan, Mass., treasurer. The last noted represents the company.

THE LAWRENCE MFG. CO., Washington, D. C., care of the Capital Trust Co. of Delaware, Dover, Del., representative, has been incorporated under Delaware laws with capital of $15,000,000, to manufacture chemical specialties, cleansing powders, etc. The incorporators are John H. Lawrence, Washington, John H. Watkins and Frank J. King, New York.

THE KEARNEY-DAILEY GLASS CO., 407 North Elizabeth St., Chicago, Ill., has been incorporated with a capital of $100,000, to manufacture glass products. The incorporators are James M. Dailey, Thomas S. Kearney and James J. McMahon.

THE TRANSLOID PRODUCTS CO., Danbury, Conn., has been incorporated with a capital of $500,000, to manufacture glue, isinglass, gutta percha, rosin and kindred products. The incorporators are Charles Hetzel, William F. Buzaid and T. A. Keating, 118 Liberty St., Danbury.

THE ZEMCO CHEMICAL CO., New York, care of J. J. Hanrahan, 7 East 42d St., representative, has been incorporated with a capital of $100,000, to manufacture chemicals and chemical byproducts. The incorporators are L. Hoffman, J. M. Habstedt and D. Currubi.

THE URADIA CHEMICAL CORP., Houston, Tex., has been incorporated with a nominal capital of $5,000, to manufacture chemical products. The incorporators are J. E. Hall, R. A. Barrett and O. D. Thomas, all of Houston.

THE PHILLIPS PETROLEUM PRODUCTS CO., Boston, Mass., has been incorporated with a capital of $650,000, to manufacture petroleum and refined oil byproducts. Ralph B. Phillips is president; and Thomas F. Thornton, 1207 Columbus Ave., Boston, treasurer. The last noted represents the company.

THE H. H. DIERKES CO., INC., Union Hill, N. J., has been incorporated with a capital of $25,000, to manufacture brick and other burned clay products. The incorporators are Otto H. Harting, O. Venion, Jr., and Henry H. Dierkes, 144 Bergenline Ave., Union Hill. The last noted represents the company.

THE ALCON CHEMICAL ENGINEERING CO., 308 Capitol Theater Bldg., Detroit, Mich., has been incorporated with a capital of $10,000, to manufacture chemicals, chemical byproducts, etc. The incorporators are J. Howard Smith, J. A. Miller and J. F. Williams, 414 Fourth Ave., Royal Oak, Mich. The last noted represents the company.

THE SOUTHERN ALPHA TILE CO., Tampa, Fla., care of the Colonial Charter Co., Ford Bldg., Wilmington, Del., representative, has been incorporated under Delaware laws with capital of $100,000, to manufacture tile and other ceramic products.

THE WANNER MALLEABLE CASTINGS CO., 10 South La Salle St., Chicago, Ill., has been incorporated with a capital of 20,000 shares of stock, no par value, to manufacture iron and other metal castings. The incorporators are Harry C. Wanner, J. Fred Reeve and Bernard W. Vinissky.

THE CONCRETE BRICK & TILE CO., Wildwood, N. J., care of Leap, Sharpless & Way, Wildwood, representatives, has been incorporated with a capital of $100,000, to manufacture concrete products. The incorporators are Charles W. Craythorn, William H. and I. L. Austin, all of Wildwood.

THE F. T. PARSONS PAPER CO., Washington, D. C., care of the Capital Trust Co. of Delaware, Dover, Del., representative, has been incorporated under Delaware laws with capital of $200,000, to manufacture paper products. The incorporators are Frank T. Parsons, Washington; Benjamin F. Bond, Jr., and Bert Reid, Baltimore.

Coming Meetings and Events

AMERICAN ASSOCIATION OF CEREAL CHEMISTS will hold its ninth annual convention at Hotel Sherman, Chicago, June 4 to 9.

AMERICAN ASSOCIATION OF ENGINEERS will hold its annual convention in Norfolk, Va., May 7 to 9.

AMERICAN ELECTROCHEMICAL SOCIETY will hold its spring meeting May 3, 4 and 5, 1923, at the Commodore Hotel, New York.

AMERICAN FOUNDRYMEN'S ASSOCIATION will hold a meeting in Cleveland, O., April 28 to May 4.

AMERICAN GAS ASSOCIATION will hold its annual convention the week of Oct. 15 at Atlantic City.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS will hold its summer meeting June 20-23 at Wilmington, Del.

AMERICAN LEATHER CHEMISTS ASSOCIATION will hold its twentieth annual convention at the Greenbrier, White Sulphur Springs, W. Va., June 7, 8 and 9.

AMERICAN OIL CHEMISTS' SOCIETY will hold its annual meeting at the Eastman Hotel, Hot Springs, Ark., April 30 and May 1.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS will hold its spring meeting May 28 to 31 in Montreal, Canada.

AMERICAN SOCIETY FOR TESTING MATERIALS will hold its twenty-sixth annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, beginning Monday, June 25, 1923, and ending either Friday or Saturday of that week.

AMERICAN WELDING SOCIETY will hold its annual meeting April 25 to 27 at the Engineering Societies Building, New York.

AMERICAN ZINC INSTITUTE, INC., will hold its fifth annual meeting at the Hotel Chase, St. Louis, May 7 and 8.

CANADIAN INSTITUTE OF CHEMISTRY will hold its annual meeting in Toronto, May 29 to 31.

ENGINEERING SECTION of the National Safety Council will hold a mid-year safety conference April 17 in the auditorium of the Western Society of Engineers.

INTERSTATE COTTON SEED CRUSHERS ASSOCIATION will hold its annual convention at Hot Springs, Ark., May 2 to 4.

IRON AND STEEL INSTITUTE (London) will hold its annual meeting May 10 and 11 at the House of the Institution of Civil Engineers, London, S. W. 1.

NATIONAL ASSOCIATION OF MANUFACTURERS OF THE UNITED STATES OF AMERICA will meet in annual conference May 14 to 16, inclusive, at the Waldorf-Astoria, New York City.

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (NINTH) will be held in New York Sept. 17-22.

NATIONAL FOREIGN TRADE COUNCIL has postponed its annual conference from April 25, 26 and 27, to May 2, 3 and 4. It will be held in New Orleans, La.

NATIONAL LIME ASSOCIATION will hold its fifth annual convention at the Hotel Commodore, New York City, June 13 to 15.

NATIONAL SYMPOSIUM ON COLLOID CHEMISTRY will be held at the University of Wisconsin, June 12 to 15.

SOCIETY OF CHEMICAL INDUSTRY, Canadian Section, will meet in Toronto, May 29 to 31.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stetters Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month.

SOCIETY FOR STEEL TREATING — Eastern sectional meeting will be held June 14 and 15, in Bethlehem, Pa.

SOCIETY OF INDUSTRIAL ENGINEERS, with headquarters in Chicago, will hold its spring convention in Cincinnati April 18, 19 and 20, 1923. The major subject will be "Management Problems of the Smaller Plants."

The following meetings are scheduled to be held in Rumford Hall, Chemists' Club, East 41st St., New York City: April 13—Society of Chemical Industry (in charge), American Electrochemical Society, Société de Chimie Industrielle, American Chemical Society, joint meeting. May 4—American Chemical Society, regular meeting. May 11—Société de Chimie Industrielle (in charge), American Chemical Society, American Electrochemical Society, Society of Chemical Industry, joint meeting. May 18—Society of Chemical Industry, regular meeting. June 8—American Chemical Society, regular meeting.

CHEMICAL & METALLURGICAL ENGINEERING

A consolidation of
ELECTROCHEMICAL & METALLURGICAL INDUSTRY *and* IRON & STEEL MAGAZINE

H. C. PARMELEE, Editor

Volume 28 New York, April 16, 1923 *Number* 15

Highlights of The A.C.S. Meeting

ALTHOUGH perhaps a shade more academic than usual, the meeting at New Haven was nevertheless one of the most significant in the history of the American Chemical Society. Circumstances made it so. The presence of a distinguished group of world leaders in science and the university ceremonies attending the dedication of Yale's new chemical laboratory gave an international academic interest to the occasion. And, too, Dr. EDGAR F. SMITH'S historical address had a quality of scholarship and of the art of presentation which left its deep impression on all who heard it.

From the viewpoint of the society, however, the extended sessions of the Council and its studious reception of the important reports of the committee on society procedure marked real milestones of progress in the direction of a more unified and harmonious membership. A few knotty problems are still unsolved, but the Council, as well as the committee, demonstrated that it is awake to the society's shortcomings. Further progress rests largely with the sections. The discussion at the first Council meeting brought out clearly the fact that the committee's report had been carefully studied by certain of the sections and that some of the representatives had been given definite instructions on which they were able to base their actions as the different issues were decided. On the other hand, it was equally evident that a good share of the membership as such had had no opportunity to consider the matter or to instruct their councilors. Although the committee was discharged and graciously voted the thanks it so well deserved, the fact remains that progress in society procedure is not a dead issue. Both the majority and minority reports, together with the Council's discussion and action, are worthy subjects for further study by the sections and the membership at large.

The division programs, even though long, were not uninteresting, and they actively competed for the attention of the members and guests. The symposiums on catalysis and colloids and the important general papers by Prof. T. G. DONNAN and Dr. OSKAR BAUDISCH reflect the intense interest of American chemists in the fundamentals of their science. But that practice also vied with theory was indicated by the close attention given to the special programs on motor fuels, insecticides and fungicides and the materials of equipment construction. In the sessions of the Organic Division, which not so very long ago were rather slimly attended, there was at times standing room only, and not much of that. Industrial chemistry, on the other hand, lured into its conferences many men of pure science. This is as it should be, because industrial research has assumed its proper rank in the great procession of science, it marches with the Very Learned, and except among some of the laggards, it has ceased to be the Recipe Mill uninformed persons think it should be.

Next September the society will meet in Milwaukee and conditions there will likely favor a shading toward industrial rather than academic interests. Thus will come the balance that makes it possible for the society to steer an even course of progress.

Materials for Equipment Construction

A SYMPOSIUM is not unlike a dangerous drug from a journalistic point of view. It is splendid if used occasionally as a stimulant perhaps, but too frequent use brings immunity to stimulation. Then the drug loses its force. So in *Chem. & Met.* we have been careful to use the symposium in moderation and each time for a definite, constructive purpose.

In this issue we publish a series of notes and essays on Materials for Equipment Construction. To chemical engineers there is no question so ubiquitous, so puzzling or so imperative as "What material shall we use in this equipment?" Everyone can recall a process which failed or succeeded because of the clumsy or deft selection of materials. Yet with all its importance there is a surprising tendency in this problem to copy the practice of others without knowing whether this practice has brought success or failure or without being fully acquainted with conditions under which the material was used.

Periodically, therefore, we must wake up and devote an increased amount of intelligent attention to this phase of our work. We should ask questions such as, What is the latest practice in making pressure vessels? What new materials are there which will resist acid corrosion? or weathering? or high temperature? What have they been doing in the alloy field or with industrial glassware?

This symposium does not pretend to be complete. It is a stimulant and not a dictionary. By no means are all the materials of construction mentioned, nor is there any attempt to be exhaustive in the treatment of any of them. In most of the essays the modern practice or the modern tendencies in the use of a material or a group of materials are reflected. Sometimes a producer offers a word of advice to consumers. Sometimes a consumer reports his success or failure. The net result is, first, a picture of the most important activities in the materials of construction field and second, a reminder of a neglected opportunity on your part if you are not utilizing the best knowledge that is available in selecting your materials for equipment fabrication. Finally, it is a promise on our part to keep this problem before you, for we believe it lies at the foundation of production success.

Impressive Circumstances Connected With the Dedication of Yale's New Chemical Laboratory Feature Spring Gathering—Reports of General Sessions and Important Council, Division and Section Meetings

EDITORIAL STAFF REPORT

HISTORY records that on two other occasions the American Chemical Society met at New Haven. But never was a meeting held under such impressive circumstances nor before such a distinguished group as gathered for the sixty-fifth meeting during the week of April 2, 1923. In round numbers 1,500 members and guests were present—including such world leaders in science as Sir J. J. Thomson, Professors F. G. Donnan of London, A. F. Holleman of Amsterdam, Giuseppi Bruni of Milan, G. Urbain of the Sorbonne and Principal Irvine of St. Andrew's. The dedication of the Sterling Memorial Laboratory marked an event in the history not only of Yale University but of chemistry in America

Council Meetings

From the point of view of the society a great deal of interest attaches to the two important Council meetings held in Byers Hall on Monday and Wednesday afternoons. President E. C. Franklin presided at both. About 115 councilors were present at the first meeting and 60 to 75 at the second.

Prof. O. B. Tower of Western Reserve University presented a memorial note on the long and active life of the late Prof. Edward W Morley, concluding with appropriate resolutions of appreciation, which were adopted by a rising vote.

The secretary was instructed to turn over the society's collection of autographed letters from eminent men to Prof. Edgar Fahs Smith, in whose keeping they will be properly cared for and eventually made available to all chemists, along with the rest of his great store of historical papers.

A new section was chartered with headquarters at Erie, Pa., and the secretary was instructed to provide a charter for another section which shall include Rock Island, Davenport, Clinton and Moline, as soon as proper application has been made.

Dr. A. M. Comey, formerly of Wilmington, Del., but now of Cambridge, Mass., was elected to succeed Dr. George D. Rosengarten, whose term as member of the committee on national policy has expired.

Committee Reports Heard

A large number of committees handed in reports, of which the following were a few: The advisory committee to the War Department recommended the proper and authoritative study of color for uniforms, to provide for minimum visibility. The committee on employment recommended the addition of $2,400 to the budget to provide for employment information in the news edition of *Industrial and Engineering Chemistry*. The committee on industrial alcohol recommended an advisory committee, preferably of technical men, to look after the sales of industrial alcohol. It is believed that this will help rather than hinder the enforcement of prohibition, inasmuch as the present non-technical force with its police powers is more easily deceived than would be a group of informed men, whose business is to look after industrial sales. It should also help to diminish the confusion and disorder which now reigns in regard to the industrial uses of alcohol.

The secretary reported that 1,278 members of the society were dropped for delinquency in payment of dues on Jan. 1, 1922.

A little flurry of excitement followed a resolution in regard to the action of the advisory committee in connection with an amended Stanley bill in which the advisory committee, acting for the Council, expressed itself as favoring a provision in the patent law that would require foreign patentees or owners of patents under certain conditions either to produce or to license productions in this country. After a rather heated discussion on the propriety of the committee's action, its decision was supported. It brought out, however, a good story from Henry Howard of how German industrialists working with their government succeeded in making a treaty with the United States which would

not require them to make patented dyes in this country nor establish here the technique of making dyes. The story involved a most remarkable series of false scents and misleading trails, all carefully planned out beforehand.

The difficult work began with the majority and minority reports of the committee on progress in society procedure. At first it appeared that the problems were too big and too far-reaching to be decided by the Council at that late hour, and finally it was resolved to refer the majority and minority reports to the advisory committee with the request that they be digested and recommendations offered to the Council at the September meeting.

The session adjourned about 6 o'clock.

Society Policies

At a subsequent meeting of the advisory committee it was decided that the report had not received sufficient discussion by the Council and accordingly a special session was arranged for on Wednesday afternoon. At that time over 4 hours was devoted to a consideration of this important report on society policies and procedure. The committee, consisting of A. V. H. Morey, chairman; George L. Coyle, L. C. Drefahl, Graham Edgar, H. C. Parmelee, R. E. Swain and J. N. Swan, had given more than a year's study to basic problems connected with the management and policies of the American Chemical Society. A unanimous report, together with majority and minority discussion of society membership, publications and finances, was read by the chairman and considered by the Council while functioning as a committee of the whole. Later, the following significant action was taken on the committee's recommendations:

A general plan of regional representation of directors was approved and a committee authorized to report the necessary changes to be made in the constitution and bylaws.

By unanimous vote, an executive committee to consist of the president and secretary of the society, the editor of the *Journal of the American Chemical Society* and the editor of *Industrial and Engineering Chemistry*, the last past president and three councilors at large was authorized to replace the present advisory committee. Its powers were further extended to include those usually held by an executive committee.

Although it was generally agreed that the Council was too large to be an efficient governing body, none of the schemes proposed for reducing its membership could gain the meeting's approval, and the matter was laid on the table for later action.

Intersectional meetings of the American Chemical Society will probably be approved and extended as soon as a working plan is formulated by a committee to report at the next meeting of the Council.

After a discussion of the election of members and classified membership, the Council adopted the committee's recommendation that a special committee be appointed to study and report its findings in the matter of definite measures for enhancing the value placed on membership in the society.

The very intimately related subjects of the society's publications and its finances come in for a major share of the Council's discussion, especially since on certain matters there was a division of opinion within the committee. The Council appeared to be unanimous in its opinion that the financial condition of the society is fundamentally sound and no material economies are likely to be effected in the society's present management. The majority and minority reports pointed out that the society's advertising business was conducted on a satisfactory and reasonable basis, and in answer to a question from the floor, the editor of the *Industrial Journal* declared that an increase in the advertising rates in that publication was already under contemplation. Certain other technical considerations in connection with the production of the society's publications were also discussed, but without definite action by the Council.

A significant motion passed during the last few minutes of the meeting instructed the secretary to mail the final program to members 10 days in advance of the Council meeting. It also set the final date of acceptance of papers at least one month before the general meeting.

Chemistry and the Public

The purpose of the meeting in New Haven, in the words of Prof. Treat B. Johnson, chairman of the executive and program committee, was to bring together chemistry and the public. The fact that Woolsey Hall was crowded to capacity for the first general session was pleasing evidence of the society's success in this direction. In his introductory remarks Professor Johnson called attention to the fact that this was the third time the American Chemical Society has met in New Haven. The first meeting was in 1899, when the society's membership was 1,570; at the time of the second meeting, in 1909, the membership had increased to 4,136.

The society was then officially welcomed to New Haven by state, city and university, represented respectively by Lieutenant-Governor Hiram Bingham, Mayor David E. FitzGerald and President James R. Angell. Presi-

Impressive Circumstances Connected With the Dedication of Yale's New Chemical Laboratory Feature Spring Gathering—Reports of General Sessions and Important Council, Division and Section Meetings

EDITORIAL STAFF REPORT

HISTORY records that on two other occasions the American Chemical Society met at New Haven. But never was a meeting held under such impressive circumstances nor before such a distinguished group as gathered for the sixty-fifth meeting during the week of April 2, 1923. In round numbers 1,500 members and guests were present—including such world leaders in science as Sir J. J. Thomson, Professors F. G. Donnan of London, A. F. Holleman of Amsterdam, Giuseppi Bruni of Milan, G. Urbain of the Sorbonne and Principal Irvine of St. Andrew's. The dedication of the Sterling Memorial Laboratory marked an event in the history not only of Yale University but of chemistry in America

Council Meetings

From the point of view of the society a great deal of interest attaches to the two important Council meetings held in Byers Hall on Monday and Wednesday afternoons. President E. C. Franklin presided at both. About 115 councilors were present at the first meeting and 60 to 75 at the second.

Prof. O. B. Tower of Western Reserve University presented a memorial note on the long and active life of the late Prof. Edward W Morley, concluding with appropriate resolutions of appreciation, which were adopted by a rising vote.

The secretary was instructed to turn over the society's collection of autographed letters from eminent men to Prof. Edgar Fahs Smith, in whose keeping they will be properly cared for and eventually made available to all chemists, along with the rest of his great store of historical papers.

A new section was chartered with headquarters at Erie, Pa., and the secretary was instructed to provide a charter for another section which shall include Rock Island, Davenport, Clinton and Moline, as soon as proper application has been made.

Dr. A. M. Comey, formerly of Wilmington, Del., but now of Cambridge, Mass., was elected to succeed Dr. George D. Rosengarten, whose term as member of the committee on national policy has expired.

COMMITTEE REPORTS HEARD

A large number of committees handed in reports, of which the following were a few: The advisory committee to the War Department recommended the proper and authoritative study of color for uniforms, to provide for minimum visibility. The committee on employment recommended the addition of $2,400 to the budget to provide for employment information in the news edition of *Industrial and Engineering Chemistry*. The committee on industrial alcohol recommended an advisory committee, preferably of technical men, to look after the sales of industrial alcohol. It is believed that this will help rather than hinder the enforcement of prohibition, inasmuch as the present non-technical force with its police powers is more easily deceived than would be a group of informed men, whose business is to look after industrial sales. It should also help to diminish the confusion and disorder which now reigns in regard to the industrial uses of alcohol.

The secretary reported that 1,278 members of the society were dropped for delinquency in payment of dues on Jan. 1, 1922.

A little flurry of excitement followed a resolution in regard to the action of the advisory committee in connection with an amended Stanley bill in which the advisory committee, acting for the Council, expressed itself as favoring a provision in the patent law that would require foreign patentees or owners of patents under certain conditions either to produce or to license productions in this country. After a rather heated discussion on the propriety of the committee's action, its decision was supported. It brought out, however, a good story from Henry Howard of how German industrialists working with their government succeeded in making a treaty with the United States which would

following year bold spirits erected a glass house in the woods and exported their product to England. They made beads also for trading purposes, and some of the beads they made exist today. By 1619 two or three blast furnaces had been blown in. Later the glass house and these furnaces were destroyed in an Indian massacre.

John Winthrop the younger was among the first members of the Royal Society and he was in frequent correspondence with his scientific friends in London. He made many contributions to the proceedings of the Royal Society. The notion of alchemy, of the transmutation of metals, still prevailed, and Winthrop had a sense of it. Indeed it lasted well into the eighteenth century. There was the Rev. Ezra Stiles, the seventh president of Yale, who was the first to teach chemistry at the college, and he surely would not acknowledge any addiction to this form of witchcraft or wizardry; for the practice of alchemy was considered no less than this. But the Rev. Ezra Stiles, who discussed the secular ways of matter by day, would experiment in secret at night, and who shall say how tempted he was or how far he resisted the temptation to consider the ways of Satan in the transmutation of base metals into gold? Stiles was a correspondent of Priestley, and that also would bespeak his favor with Dr. Smith, for Dr. Smith has a very tender spot in his heart for the memory of that rather cantankerous and obstinate old gentleman.

Then followed a short historical note of the life of Benjamin Silliman the elder, who, after graduating from Yale and studying law, accepted the call of his alma mater to teach chemistry.

Silliman began teaching chemistry at Yale in 1804 and for 15 years he worked 15 or 20 ft. underground in the cellar of the house of the president of the college. In 1805 he made a trip to Europe and met Sir Humphry Davy and others. In 1818 he established the *American Journal of Science*. His correspondence with Hare also shows him to have been an active producer, although his great work was teaching. "Those who smooth the road to science," said Dr. Smith, "are often more useful than the men of original research." Among the men inspired by his teaching were Dana the geologist, Brush, Brewer the geographer, Johnson of the Agricultural College, and J. Willard Gibbs, the first of physical chemists.

It was not alone what Dr. Smith said but also his manner of saying it that gave his address such rare distinction. Its literary beauty was a subject of frequent discussion throughout the meeting among those that heard it. In fact we shall probably have to wait for several generations before we shall have another great chemist with the finish, the wit and the subtle elegance of speech to match the ex-provost of Pennsy.

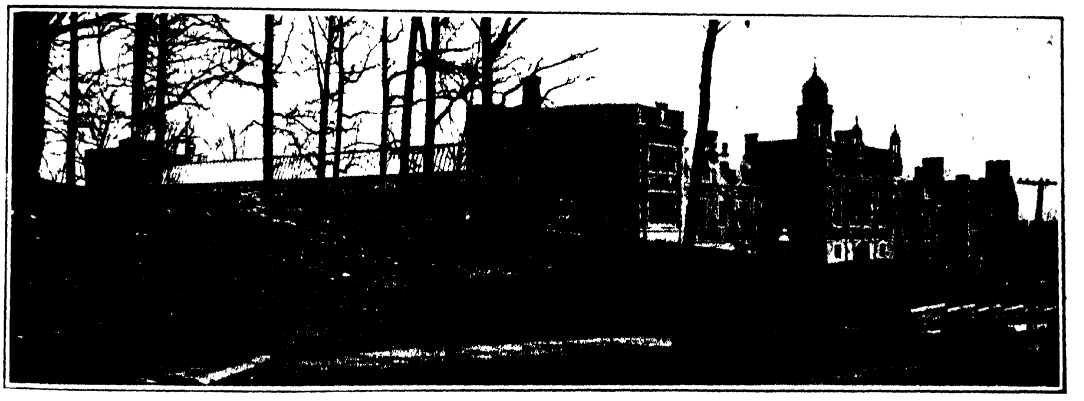
The Chemist in Industry

The sessions of the Industrial Section, which were held in the large lecture room of the Osborn Memorial Laboratory, enjoyed an attendance which varied between 30 and 300; there being, usually, between 50 and 75 members and visitors in attendance throughout the session. It is perhaps unfair to pick out only three outstanding features, for the general standard of articles was excellent and the discussions, for the most part, were intelligent and animated. There were three papers, however, of greater interest than the rest, possibly because of timeliness or some other unusual circumstance.

The first was a paper by L. V. Redman, entitled "Phenol Resins in Chemical and Allied Industries." It was not so much the utility of the phenol resins in chemical engineering industries that was novel or significant. As a matter of fact, the consumption of these is relatively insignificant.

Analyzing the distribution of these products, by industries, it was found that in 1917 the automobile industry took 65 per cent of the total production; that smoking articles took 20 per cent, and miscellaneous industries, mainly telephones, 15 per cent. In 1921, 50 per cent was used by the automobile industry; 15 per cent in the smokers' products; 15 per cent still in the miscellaneous, and 20 per cent in what might be termed mechanical products—buttons, pencil holders, handles, etc. In 1922, due to the remarkable development of radio, 34 per cent of the total business was radio; 30 per cent automobiles; 6 per cent smokers' articles; 10 per cent miscellaneous, and 20 per cent mechanical. The radio business is peculiar in that it utilizes a very large percentage during the months from January to April.

The industry has been on an insecure basis because of raw materials. Phenol has always been a foreign product. During the war a tremendous phenol capacity was created in the United States, but this rapidly dwindled until there is comparatively little produced at present. In order to make the industry more secure, the Bakelite Corporation is building a large phenol plant on the shores of Lake Erie, which will be in operation within a year. This will make the industry



STERLING LABORATORY, SHOWING SAWTOOTH CONSTRUCTION

a nationally contained industry, as is the case with one of the other great plastics, celluloid, which of the four great plastics is the only self-contained American industry; the others, rubber and fiber, are still dependent on foreign resources.

Progress in the Study of Corrosion

The second significant paper had to do with corrosion. It was presented by Professor Whitman, of Massachusetts Institute of Technology. Reviewing the work done in that field, Professor Whitman pointed out that the most important factors in corrosion were, actually, the removal of the hydrogen produced by the action of the hydrogen on iron. This removal can take place in two ways. The first method is by supplying oxygen to form water—and this is a straight diffusion problem. In other words, the rate of removal of hydrogen depends directly on the rate at which oxygen can get to the surface of the metal to remove the hydrogen atoms. Second, it can be removed by the evolution of hydrogen gas, as occurs in acid solutions. The experimental work of this problem consisted in suspending a steel shaft with a smooth surface in acids of varying concentrations, and rotating it at various speeds. The acid concentration was varied from less than $0.05N$ to $5N$ and the shaft was speeded up from zero to 4,000 r.p.m. Corrosion was measured by titrating the iron in the solution at the end of a given time. At rest, it was found that the corrosion in strong acids was much greater than that in weaker acids, but when rotation started it was found that the rate of corrosion diminished for a time and then increased rapidly, all concentrations approaching the same corrosion rate, so that at 4,000 r.p.m. there is practically no difference in the rate of corrosion in weak and strong acids. This shows pretty conclusively that there are two effects: one which depends on the hydrogen-ion concentration and the other which depends on the rate of diffusion of oxygen to the steel surface.

Experiments were then tried with oxygen, nitrogen and air as the atmosphere over the liquid, with increasing rate of revolution. It was found that the corrosion under oxygen was about 3½ times that under air, whereas that under air was considerably greater than that under nitrogen. This seems to show again, conclusively, that the oxygen diffusion is a primary factor at high speed.

The Plauson Mill Cornered at Last

The third high spot in the session was a discussion of the colloid mill, by W. J. Kelly, of the Goodyear Tire & Rubber Co., who has been in Germany and has watched the mill in operation. It was, for most of the audience, the first time that any accurate, first-hand data were presented on the colloid mill, and it was therefore exceedingly interesting. Mr. Kelly described clearly the design of the mill, it being a set of staggered teeth on a rotating drum, the teeth rotating between baffles on the side of the mill and the clearance being about 1 mm. The rotation does actually reach 12,000 r.p.m. and for those high speeds is direct connected with motor or turbine. It also is run with a belt when the speed is as low as 3,000 r.p.m.

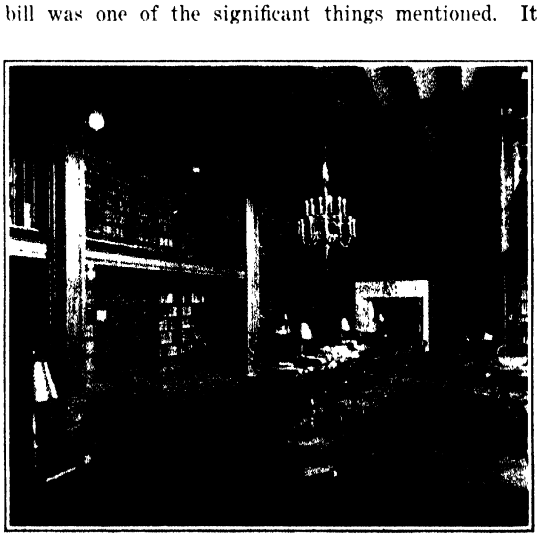
In answering questions with regard to the mill, Mr. Kelly pointed out that it was a batch mill and that the present size handles, roughly, 5 kg. of material, 1 kg. being the material to be ground and 4 kg. being water. It takes about 10 minutes to grind up this batch to a size of material which is almost colloidal. An appreciable percentage of the particles have a vigorous Brownian movement and go down to less than 1μ in diameter. The turbine-driven mill is almost vibrationless; the bearings are thoroughly protected and the packing is a compound of graphite and asbestos. Power consumption is extremely large, being, roughly, 28 hp. As yet it can hardly be called a commercial success—in fact, the commercial application is extremely limited. At the present time it cannot be applied to large-scale work, although there does not seem to be any reason why the difficulties cannot be overcome.

Mr. Kelly said, in answer to some criticisms of the Newport Company for not wanting to sell the mill in the American market, that the company had received its first mill last August and did not want to sell the mill until sure that it was reliable and until the limits of applicability were exactly known.

Considerable animated discussion occurred with regard to the mill, and it was altogether an ideal paper for a meeting. It developed out of a comprehensive survey of the industrial colloid field by Dr. Harry N. Holmes, of Oberlin University. Dr. Holmes discussed the colloid mill and then went on to other fields of colloid activity—silica gel, lignin, syneresis, smoke settling, lubrication, carbon and lamp black, glass and enamel, paper and paint. He urged the establishment of fellowships for the study of colloidal problems and believes that widespread application would follow from fundamental studies.

Some Materials of Construction Papers

At the first session Professor Boltwood, of Yale, described the Sterling Laboratory and some of the problems that had to be solved during its design. Prof. C. R. Hoover, of Wesleyan University, then discussed an elaborate series of experiments on laboratory table tops and reached the conclusion that, without counting the psychology of the situation—which often should be the determining factor—Alberene was the most suitable material for laboratory table tops. C. M. Strickland, of the American Rolling Mills Co., presented a paper on the resistivity of iron and its application to chemical industry. The importance of small amounts of impurities which reflect directly in the industrial corrosion bill was one of the significant things mentioned. It



LIBRARY IN STERLING LABORATORY

HARKNESS MEMORIAL QUADRANGLE

was stated that in 1921 pig-iron production was less than the rust loss to industry, this being probably due to the relatively large amount of impure iron produced during the preceding years of war activity.

The symposium on materials of construction in chemical industries was continued with a paper by Prof. C. S. Robinson of M.I.T. on the use of wood, pointing out the necessity of selecting the material with considerable care, as wood was not a standard material by any means, and further that wood from the same tree varied considerably, depending on the grain and the selection of the piece. In other words, two pieces of maple might vary more appreciably than maple and pine. In general, however, there seems to be an appreciable tendency toward the use of cypress and pine in the East and the redwood in the West. This paper was discussed ably by W. A. Peters, of the du Pont company, who reflected the experience of his company in regard to the action of various kinds of material on wood. W. Evans, of the B. F. Goodrich Co., gave an interesting discussion of the growth of the rubber industry, and, finally, of the use of all kinds of rubber, with the exception of hard rubber, in chemical engineering industries.

Hard Rubber an Increasing Factor

Mr. Buttfield, of the American Hard Rubber Co., then described some of the uses of hard rubber in industrial work, hard rubber being described as material containing between 15 and 50 per cent sulphur and varying considerably, depending upon the time of the cure as well as the mix. There is no limit to what might be called "hard rubber," however. One interesting recent development was the use of hard rubber for coating and lining metal objects, modern practice favoring the use of a soft rubber binder which sticks to the metal surfaces better.

In the beginning of the Friday session Dr. Charles H. Herty gave a talk on the trials and tribulations of the organic chemical industry during the past year, and he sounded a note of optimism for the future. Dr. Turrentine, of the Bureau of Soils, presented a paper on the extraction of nitrates from caliche, pointing out that poor chemical engineering was largely responsible for the inefficiency of the Chilean industry and that, in general, a recovery of 55 per cent was made on the caliche. The export tax, of course, represents about 41 per cent of the total cost, labor 19 per cent and fuel 11 per cent. Efficiencies in plant operation would naturally cut down the total cost per pound and even though the ratios might not be changed appreciably, the cost would be considerably improved. As a matter of fact, the investors are using all the surplus to pay dividends and there is therefore no surplus for developments. Dr. C. L. Reese commented on the report, stating that in some quarters greater efficiency was achieved by chemical control, although absolute chemical control was impossible because of the difficulty of sampling crude caliche.

Division of Organic Chemistry

The first morning was taken up with a symposium on catalysis. As there were twelve papers in all, there was scant time for proper presentation and less for discussion.

The effect of small quantities of iron in aiding the reduction of aldehydes in the presence of platinum black was strikingly presented by Roger Adams.

J. S. Reichert and J. A. Niewland described the catalytic combination of benzene homologs with acetylene to derivatives of diphenyl ethane.

H. S. Taylor brought out the fact in his talk on negative catalysis that one molecule of diphenylamine in 10,000 mols of benzaldehyde absolutely inhibits the oxidation of the aldehyde by oxygen.

There were almost as many varieties of theories as there were papers, and the indications were that the development of theories which will be capable of general acceptance is still far off. This subject of catalysis seems to deserve an individual section so that proper discussion would be possible without further encroaching on the time of the Organic or the Physical section, whose rosters are already overcrowded.

In the general program the papers by the foreign visitors excited considerable interest and were given with the lecture hall filled to capacity.

A. F. Holleman of the University of Amsterdam, Holland, presented a rather general paper reviewing the reactivity of various groups in the benzene derivatives, with particular reference to the effect of a substituent in determining the position taken in the molecule by groups entering later.

Many Interesting Papers

One paper of interest was that by James F. Norris and E. O. Cummings on "The Electrolytic Reduction of Various Organic Acids." The remarkable feature was brought out that fumaric acid in the form of its sodium salt could be almost quantitatively reduced to succinic acid without the use of a diaphragm, whereas with maleic acid a diaphragm was absolutely necessary to obtain suitable yields.

Thomas Midgley, Jr., together with C. A. Hochwalt and G. Calingaert, described the preparation of diplumbic hexaethide, a byproduct of their researches on anti-knock materials. This compound has not been previously prepared.

The chemical compounds present in coal tar were discussed by J. M. Weiss and C. R. Downs, who presented the picture of the compounds really present in appreciable amounts in American coke-oven tar, together with the proportionate amounts found. Phenanthrene was shown to be next to naphthalene the most abundant material present and, contrary to popular conception, only about thirty compounds are present in sufficient amount to be of even potential commercial importance.

A novel field of research was that of Elmer E. Brown

and Treat B. Johnson, who have collected large quantities of tubercle bacilli and subjected them to chemical analysis. The results presented were preliminary and the work is to be continued further.

Another paper, by J. J. Donleavy and T. B. Johnson, proposed the crystalline compounds formed by organic acids with pseudo thio-ureas as a means of identification. Various of these salts were exhibited and showed a fine crystalline appearance.

A rather novel feature for the organic section was the use of moving pictures to demonstrate various types of laboratory apparatus by H. T. Clarke of the Eastman Kodak laboratories.

Apart from the papers already mentioned, there was a very large number of other worthy contributions, the unfortunate part being that the number of papers on the program was so great that adequate time could not be given to either presentation or discussion.

Motor Fuel Symposium

The members of the Division of Petroleum Chemistry joined with the Section of Gas and Fuel Chemistry on Friday morning for a Motor Fuel Symposium under the chairmanship of Dr. Van H. Manning, director of research of the American Petroleum Institute. The purpose of this symposium was to bring out the important fundamentals of present-day knowledge of motor fuel supplies and requirements from a chemical point of view. The program consisted of five papers taking up five distinct phases of the subject.

Availability, usability and power-producing ability were three phases of fuel requirements discussed by S. W. Sparrow of the Bureau of Standards, who presented the first paper. In determining usability the explosive range, distillation range, latent heat of evaporation, flash point, freezing point, separation point, viscosity, detonation characteristics, spontaneous ignition temperature and corrosiveness were discussed. Great emphasis was laid upon the necessity of having a uniform viscosity of the fuel.

Available Petroleum Supplies

F. W. Lane and A. D. Bauer were the authors of a paper, "Economic Aspects of Motor Fuel Supply From Petroleum." They pointed out the steadily increasing percentage of the petroleum produced in the form of gasoline because of increasing temperature of cut and increasing cracking of lighter fractions into gasoline constituents. They believe that increases in production will be accomplished to a considerable extent by further recovery from abandoned wells, by improved working methods in old fields and by greater care in conserving the lighter fraction of oils after removal from the well. The greatest benefit for our future years will, however, come from more efficient utilization in the engine itself. It is to this possibility which these authors point with the greatest optimism.

Refinery Problems in Motor Fuel Supply

Frank A. Howard and N. E. Loomis of the Standard Oil Co. of New Jersey presented a discussion of important refinery problems bearing upon adequacy of motor fuel supply. Proper plant equipment, including countercurrent cooling methods, ample condensing equipment, comprehensive gas-tight vapor-recovery system and other modern plant facilities, were urged as the most important plant requirements. It was pointed out that loss of a gallon of light gasoline made the manufacture of several gallons of commercial gasoline less because the quantity of the commercial product is limited essentially by the amount of light constituents available for blending into a commercial mixture.

In view of this necessity for maintaining proper proportion among light, medium and heavy constituents the recovery of volatile liquid hydrocarbons from the refinery gases was suggested by the authors as second only to the importance of proper processing equipment. Of course, such recovery system requires particularly great care in having gas-tight vapor lines throughout the plant. And to supplement the equipment and the vapor recovery the authors pointed out that it is absolutely essential to protect storage tanks against evaporation losses. This phase of the subject was discussed with special reference to the use of Sealite, the compound recently described before the American Petroleum Institute. This patented compound is a mixture of glucose, cornstarch, glue, calcium chloride and other constituents in a liquid form that can be beaten up into a froth which is spread on the surface of the oil tanks. A layer approximately 1 in. thick is recommended by these speakers, as this quantity is found to be effective over a period of at least a year. With it the evaporation losses are only one-fifth that occurring in ordinary tank storage.

New Motor Fuels

Henry A. Gardner of the Institute of Industrial Research, Washington, reported briefly on work which he has been doing for the Bureau of Aëronautics of the U. S. Navy Department. The use of anhydrous alcohol, which is now available commercially, is particularly advantageous with aviation fuels. It is free from gum-forming constituents or corrosive agents and seems to have "anti-knock" characteristics, especially when used in mixtures of 30 per cent alcohol with 70 per cent gasoline. With such mixture extended tests by the navy are under way from which it is hoped that very complete information will be available as to performance under conditions of flight. Such fuel has one disadvantage in that it takes up moisture from the air when exposed to damp atmospheres, causing separation of the constituents under some circumstances. But with properly closed containers this difficulty can, in the opinion of the author, be avoided.

Wilbert J. Huff of the Koppers Co. discussed coal tar as a source of fuel for internal combustion engines, giving particular attention to the possibility of using naphthalene or oils which require different methods of burning in an engine than are used with gasoline. The author reviewed the history of the use of naphthalene in such engines and pointed out some of the limitations and some of the possible advantages which might be realized from this as a motor fuel.

Gas and Fuel Chemistry

In order to encourage coke-oven operators connected with steel plants to release the tar for refining instead of burning it, effort has been made by the Koppers Co. to develop methods for burning the soft pitches formed by partial distillation of coke-oven tars. One of the important problems involved is the design of equipment for pumping and burning these heavy tars or soft pitches which remain after the light oil constituents have been removed. Wilbert J. Huff discussed the fundamental data which he has obtained for the design of tar-handling equipment, particularly the relation of tem-

perature to viscosity of tars and soft pitches derived from them.

E. R. Weaver and P. G. Ledig of the Bureau of Standards described a simple device for determining the approximate concentration of water vapor in a gas. The operation of the device depends upon the change of conductivity of a thin film of hygroscopic material with changing moisture content of the atmosphere. The results reported indicate that a few parts per million of water vapor is sufficent to produce a definite indication on the device and that up to a partial pressure of 20 or 30 mm. the indications are significant and reliable.

The Burrell gas indicator for combustible gases in air was discussed by L. H. Milligan, who reported on changes in this device and tests he has made with it in the course of his work at the Bureau of Mines

HEAT BALANCES AND HEAT OF CARBONIZATION OF COAL

A brief report was made by D. W. Wilson and L. Evans of the Buffalo Station of the Massachusetts Institute of Technology regarding the fundamental principles which should be observed in striking a heat balance on industrial equipment. The authors bring out clearly the error frequently made in this sort of engineering calculation through failure to realize the necessary precautions for consistency of computation. Particular emphasis is laid upon difference in apparent efficiency or apparent loss that may result from different bases of calculation as to temperature of reference. Changing the reference temperature often changes by many per cent the apparent heating loss or the apparent efficiency of a system.

The thermal behavior of coal during carbonization has been studied experimentally in the laboratory at the U. S. Bureau of Mines, Pittsburgh station. J. D. Davis reported on this work. It is shown by this author that the heat of reaction depends very much upon the maximum temperature to which the carbonization of the coal is carried. Over the lower range of carbonization temperatures coals usually show endothermic reactions; but between 400 and 700 deg. C. the net heat of reaction is exothermic; whereas at still higher temperatures the overall effect is given as endothermic. In every case, however, the results show only a small heat of reaction for coals, usually less than 20 calories per gram on the curves presented.

Division of Petroleum Chemistry

A varied program including several papers of unusual importance attracted a record number of petroleum chemists to the sessions of this division. In the absence of Dr. T. G. Delbridge, who had been forced to resign from the chairmanship because of new responsibilities in the Atlantic Refining Co., and of Vice-Chairman R. R. Mathews, Dr. W. F. Farragher, of Mellon Institute, presided. Eleven papers were read and discussed at the first session of the division, which then joined with the Section of Gas and Fuel Chemistry for the joint symposium on motor fuel.

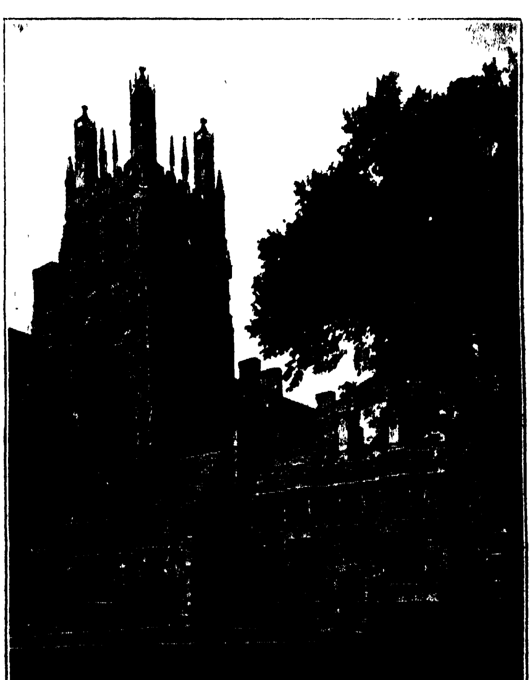
HIGHER ALCOHOLS FROM PETROLEUM OLEFINES

The production by the Standard Oil Co. of New Jersey of higher alcohols from petroleum olefines was described by W. W. Clough and Carl O. Johns, of the research division, development department, of that company. Dr. Johns, who presented the paper, pointed out that although the olefines were absent from crude petroleum, they were produced in considerable quantities during pressure still cracking. By reaction with concentrated sulphuric acid, alkyl esters are formed which are hydrolyzed with water to yield the alcohols. This is the basis of the present process which has been placed on a successful commercial basis, largely through the efforts of M. D. Mann, Jr., who is in charge of the company's alcohol plant.

It is significant that in all of these alcohols the hydroxyl group is on the second carbon atom of the straight chain molecule. No branch chains or OH groups in other than secondary positions have been observed. Of the various alcohols, isopropyl (2 - propanol) is perhaps the best known. It is a clear, colorless liquid, not definitely toxic but capable of producing peculiar physiological effects entirely different from those produced by ethyl alcohol. Its chloride is an excellent fat solvent. The secondary butyl alcohol (2 - butanol) was formerly only a laboratory curiosity, prepared by an expensive organic synthesis. However, it is now prepared in lots of thousands of gallons by distillation from the crude mixtures of higher alcohols. It forms at 87.5 deg. C., a constant boiling solution containing 72.7 per cent of alcohol by weight. The acetate is prepared by refluxing with acetic anhydride. The secondary amyl (2 - pentanol) forms a constant boiling solution at 119.1 deg.

The chlorides of all three alcohols are interesting organic compounds, and the fact that their use is not as dangerous as ether or benzol implies that they may become useful solvents for fat extraction.

The paper by Prof. C. W. Botkin of New Mexico A. & M. College was presented in abstract by C. L. Jones of Mellon Institute. The preliminary experiments described indicate that by pressure decomposition the yield of crude gasoline from shale oils may be increased to 45 per cent and that this treatment greatly improves refining qualities. The yield and quality of the crude motor fuel fraction, however, is not so high as obtained from the usual petroleum oils under the same conditions.



A CORNER OF THE HARKNESS MEMORIAL

The continued interest in viscosimetry and its importance to the petroleum industry was evidenced in three significant papers on this subject. Dr. W. H. Herschel of the Bureau of Standards discussed tests in which the actual temperature in the outlet tube of a viscosimeter of the Saybolt type was determined with a thermocouple in order to procure evidence in regard to proper bath temperatures. Prof. E. C. Bingham and G. R. Hood of Lafayette College and W. H. Fulweiler of the United Gas Improvement Co. reported on changes in the viscosity of mineral oils on standing. The question had been raised whether mineral oils maintain a constant fluidity suitable for use in calibrating viscosimeters. A sample of pale mineral oil measured by W. L. Hyden in 1921 and showing a validity of 0.9243 was redetermined recently with the same instrument under exactly the same conditions and an increase in fluidity of 1.36 per cent was obtained.

Dr. Fulweiler reported in his paper that a white medicinal oil examined by him had at first decreased in viscosity and then after a year started increasing. In the case of another oil that was being used in interlaboratory standardization of the Saybolt instrument an increase in viscosity of 0.9 per cent was noted within a few months. Another mineral oil showed a fair constancy for over a year. Lard oil, on the other hand, started decreasing and then suddenly increased to 17 per cent—obviously showing it to be unsatisfactory as a standard.

Contact Catalysts for Cracking

Contact catalysis in the vapor phase cracking of petroleum hydrocarbons was the subject of two papers presented by Thomas Midgley, Jr., of the General Motors Research Corporation and Prof. James R. Withrow of Ohio State University. In the first it was pointed out that selenium, the basis of powerful anti-knock materials, is also a contact catalyst for cracking oils when it is used in the form of ferrous selenide. As shown by the following results a very striking increase in the nitratable material and a corresponding decrease in the critical temperature of dissolution with aniline were obtained. A slight increase in gasoline yield is to be noted:

	Original Kerosene	With Pumice	With Fe_2O_3	With FeSe
H_2SO_4 Absorption (per cent)	4	20	22	28
Crit. temp. of dissol. with aniline (deg. C.)	60.5	53	55	46
Nitratable content (per cent)	23	17	18	43
Gasoline content (per cent)	0	25	30	40

The work reported by Professor Withrow was to extend Midgley's investigations to include other metallic oxides in order to see if there was any periodicity in the cracking effect. So far none has been noted. Elementary selenium proved the most effective catalyst. None of the other compounds was higher than metallic iron, whereas nickel and the sulphides of the iron group tend to decrease cracking.

Coloring Matter of Cracked Gasoline

Dr. B. T. Brooks and H. O. Parker of the Mathieson Alkali Works in a joint discussion of the coloring matter of cracked gasoline pointed out that the bright yellow color that sometimes comes from high-temperature cracking is probably due to conjugated di-olefine bodies. The authors proved that sulphur compounds were not the cause of this color by cracking a water-white pharmaceutical oil and obtaining a bright yellow-colored oil. This color was effectively removed by fullers earth. Midgley later pointed out that silica gel would accomplish the same purpose.

The last paper to be presented was that of the division's secretary, Dr. W. A. Gruse, and was of significance in that it suggested a direct means for the evaluation of motor fuels. The distillation test is not as reliable an index of the value of a fuel for the internal combustion motor as is the point of initial condensation (dew point). Accordingly an apparatus has been developed for the direct determination of this significant physical constant. The dew points determined in this apparatus were uniformly higher than those calculated by the method based on the 85 per cent point in the distillation tests.

Cellulose Division

The outstanding feature of the sessions of the Cellulose Division was the joint meeting with the Sugar Division at which J. C. Irvine, principal of St. Andrew's University (Scotland), spoke on "The Chemistry of the Polysaccharides." Professor Irvine's talk was a marvel for the way in which it made such a complex subject as the chemistry of the polysaccharides appear so very simple. Were it not for the glimpses of the extraordinarily painstaking technique required, one would have obtained the impression that this was one of the simplest fields of experimental chemistry. Professor Irvine expressed the opinion that the constitution of cellulose may be expressed in terms of molecular structure, but he pointed out that this did not tell us the mode of polymerization nor could it explain how these molecules are marshaled to give the cellulose fiber or the starch grain. In other words, while it would give us the constitution of the cellulose molecule, it would not in any way settle the chemistry of cellulose, which is almost entirely in the realm of the colloidal state.

Next in interest was the symposium on "Oxycellulose, Cellulose Hydrate and Hydrocellulose," which was the special order of business for Thursday afternoon. The symposium was opened by Professors L. E. Wise and Harold Hibbert and was participated in by a considerable number of those present. It was agreed that the term "hydrocellulose" was particularly unfortunate and that it would be advantageous if some means could be taken for abolishing it.

Dr. Alfred Tingle, of the E. B. Eddy Co., called attention to some products derived from sulphite waste liquor which have physical properties which render them easy to work with. He suggested their possible importance as starting materials for a new series of derivatives.

As a result of their further study of the chemistry of wood cellulose, Sherrard and Froehlke and also Sherrard and Gauger expressed the opinion that the cellulose of the woods which they have examined is not the same fundamentally as the cellulose from cotton.

According to Dr. L. F. Hawley of the Forest Products Laboratory it is not possible to obtain the methoxyl in wood charcoal in the form of methanol by distillation. Various catalysts were tried and also distillation with various gases. The same author, with L. C. Fleck, reported that there was in all woods examined a relation between the toxic effect of the water extract of the wood, when allowed to act on wood-destroying fungus, and the durability of the wood.

Hill and Hibbert have found that the stability of certain cyclic acetals related to the cellulose nucleus varies markedly from chains composed entirely of car-

bon atoms. Experiments are in progress involving the synthesis of members containing from 10 to 18 atoms in the chain. A number of interesting suggestions were offered by Professor Hibbert as to the ease with which the formation of unsaturated groupings such as aldehydes, esters and methoxyl groups may take place in plant growths.

The committee on standard cellulose presented a double report. The first part contained methods and specifications for preparing a standard sample of pure cellulose, while the second covered the analytical methods involved in the examination of cellulose.

Dye History in America

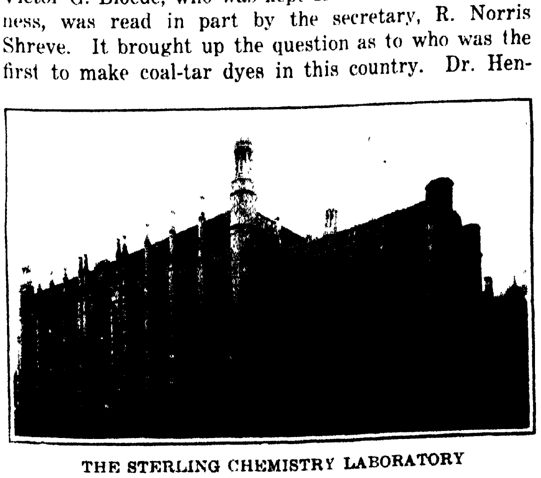
The symposium on the coal-tar dye industry in the United States prior to 1914 began with a paper by Dr. Ellwood Hendrick, giving a history of the Albany Aniline & Chemical Works, which was organized in 1868 by Arthur Bott at the suggestion of A. W. Hofmann. He gave his own experiences, and told of the various chemists engaged in the effort up to 1884, when the bond holders foreclosed. He concluded with a history of the Hudson River Aniline & Color Co., organized in 1882, and of the American Aniline & Color Co., the absorption of the two companies by the Bayer Company and record of their products up to 1914 and later.

George A. Prochazka told of his beginning in the industry in 1882, of the incorporation of the Central Dyestuff Co. in 1898, and of the manufacture of various dyes and intermediaries under the supervision of himself and his brother John up to 1914. He gave dates and tonnages in regard to the various products, which included the remarkable statement that the company with which he was associated made and sold 100,000 lb of eosine in 1897. This was before para-red succeeded it in paint.

Prof. Irving W. Fay, of the Brooklyn Polytechnic Institute, led the discussion on the teaching of dye chemistry along with the organic course, and suggested that it be taught by the case system, to make students think for themselves.

The paper by Dr. Charles E. Munroe and Miss Aida M Doyle was read in abstracted form by Miss Doyle. It presented the efforts made by the government at Washington at various times to foster the industry.

Other contributions by Eugene Merz, W. J. Stainton, Herman A. Metz and J. F. Schoelkopf, Jr., were read by title, but will be published with the others. That of Victor G. Bloede, who was kept from attendance by illness, was read in part by the secretary, R. Norris Shreve. It brought up the question as to who was the first to make coal-tar dyes in this country. Dr. Hendrick thought it was the Albany works in 1868 under Arthur Bott. In the paper of Dr. Munroe and Miss Doyle the date was given as 1866, but the name of the maker was not added. And Mr. Bloede remembered a German in Brooklyn who had a little plant on the Edwardes Canal, as far back, if we recall the date right, as 1864



THE STERLING CHEMISTRY LABORATORY

Section of Chemical Education

In the Section of Chemical Education George S. Counts made a plea for the needed research on the teaching of chemistry in secondary schools. W. H. Chapin reported on research problems which are fitting for teachers with limited time and equipment. Earl R. Glenn and Louis E. Welton presented a scientific study of the achievement of high school students in chemistry. Prof. R. A. Baker of Syracuse University gave a plan for grading large classes in chemistry.

Prof. E. G. Mahin of Purdue University proposed quantitative analysis as a study that replies to the instinctive questing within the minds of students as to what makes things go. Properly administered, it develops thinking and reasoning powers. Petty cheating, such as the manipulation of data and reports, are far tory than by rigid disciplinary measures. Prof. W. H. Chapin presented his method of teaching quantitative analysis, and Prof. H. R. Kraybill discussed the subject in relation to students of agriculture. Prof. Charles W. Cuno spoke of the need for more chemistry for engineers so that they may meet their problems in road building, electric furnace practice, metallography, etc. He wondered whether these subjects were not basically chemical. If they are, then how shall they be taught?

Prof. A. P. Sy of Buffalo University made a plea for a pedagogical scrap-heap in chemistry. Our concepts of chemistry are changing rapidly, and we should adjust our teaching methods to conform to modern ideas, especially to beginners.

The Chemical Education Section is becoming at once active and useful. The report presented by the committee on the correlation of high school and college chemistry did not meet with unanimous approval, which is natural, because the problem has not been solved as yet. But the discussion has got far beyond the old blame-shifting talk. That which is most earnestly sought is a better method of presenting chemistry to beginners, whether they are in high schools or colleges. It is generally recognized that the comparatively few high school pupils who go to college should not affect unfavorably the teaching of the large majority who do not go to college. It was clearly brought out, especially by Professor Sy, that we destroy the attractiveness of the study if we present features of the science to beginners that are not at all interesting to them then, while these same features become of intense interest later when the students come to learn their significance. It is not designed to make chemistry easy, or to use kindergarten methods. The purpose is rather to improve the order of teaching so that the sequence of things taught shall make the course in chemistry a living vital study, one that leads both to deductive and constructive habits of thought, and to the appreciation by the student of his greater understanding of the processes of nature.

Brief reviews of important papers presented before certain other divisions will appear in a subsequent issue.

Materials for Equipment Construction

A Symposium Reviewing the Field From the Standpoint of Present Practice in the Light of the Experience of Producer and Consumer

IT HAS seemed to us a good principle that the fundamentals upon which industries are built should be reviewed from time to time so that the milestones may be observed. Perspective changes The things that once seemed important are not deemed important now. So there must be a healthy checking up that we may all know at least the direction in which we are moving.

In this symposium we have tried to assemble and focus the changes that have come to pass in the use of materials of construction for chemical equipment. It would have given an erroneous perspective to record the changes out of relation to the general background and so these reviews will reflect modern practice.

In general, the topics have been reviewed by an engineer with an impartial predilection for technical facts. In some cases we have enlisted a maker and a user of such a material to bring the contrasting views into the picture. It should be of service to the whole industry to have assembled here authoritative articles on the most important materials of construction, together with the limits in the use of each and its outstanding characteristics.

Important Considerations in the Construction of Wood Tanks

Proper Selection of Stock, Careful Design and Skilled Workmanship Essential—Need for Frank Co-operation of Users

BY CONRAD PENNUCCI
Engineer, New England Tank & Tower Co., Everett, Mass.

WOOD, being more resistant to the action of many acids than are other materials of equal or greater cost, is used extensively in the construction of tanks for the chemical and allied industries. The large number of wood tanks required annually has resulted in the establishment of factories devoted exclusively to their manufacture. Space limitations preclude the presentation here of the details of the technique of tank building and of the uses and adaptation of wood tanks in the chemical industry, but the writer will endeavor to cover in a general way the points that are considered of greatest importance.

The life of a wood tank in industrial use is governed mainly by three factors—the selection of wood, the skill and care used in the construction and the design of the tank.

The importance of selecting stock to be used in making a tank cannot be overemphasized. Not only must the natural resistance of the wood itself be taken into account but also the question of the available supply of the proper uniform grades that are "right" in respect to their quality and condition of dryness must be carefully considered. Only stock that is dry and thoroughly seasoned should be used. In general the greater the number of years intervening between the stump and the tank the better the tank. Such stock undoubtedly costs more, but in comparison is worth more than it costs.

FIG. 1 WOOD TANKS AT PLANT OF CROWN WILLAMETTE PAPER CO.

The very definite constructional limitations of wood demand a close study of the design of the tank, and the importance of it cannot be disregarded.

Workmanship is the vital factor determining the life of the tank. A well-made tank of poor material will usually outlast a badly made tank of good material. While the equipment required in a tank shop is not generally extensive, it is of the greatest importance that the workmen be experienced in construction of this nature. Certain skill is required of tank builders that is peculiar to their trade and it has been found from experience that the most skilled wood worker in other lines cannot compete with the mechanic whose experience has been confined to the peculiarities of tank making.

NEED OF USER-MAKER CO-OPERATION

From the standpoint of both the user and the manufacturer, it is important to have information as to the purpose for which the tank is built.

There has been lacking between the users and the builders of wood tanks the frank co-operation absolutely essential to the development of the best possible equipment. This is a problem that cannot be finally worked out in the laboratory; such findings, while helpful, are often misleading and indicate doubtful preferences. Final decisions must rest on experience based on the service rendered by installations under actual operating conditions.

Very substantial savings would result to the chemical users of wood tanks by pooling their experiences with the manufacturers and frankly studying the problem together. Tank manufacturers have by years of experience acquired considerable knowledge of the varieties of wood and of the construction best suited to meet the different conditions of service.

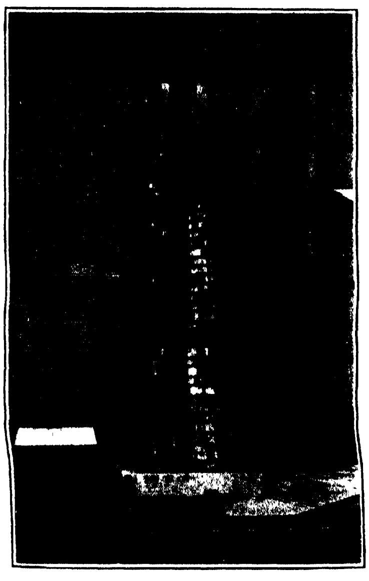
With such co-operation, ill-advised installations would be eliminated, material savings would be apparent at once, and in a few years the aggregate saving would be enormous.

Wood Pipe in Plant Construction

Its Wide Range of Utility in Chemical Engineering Industries Offers a Convenient Solution to Many Piping Problems

BY EUGENE H. SMITH
The Michigan Pipe Co., Bay City, Mich.

ALTHOUGH comparatively little wood pipe is used today in the strictly chemical industries, it is gradually finding a broadening field of application in the industries dependent upon chemical processes, particularly those involving the handling of acidic or other highly corrosive liquids. Thus in the sulphite paper mills wood pipe is used for conveying the sulphite liquor, which because of its sulphurous acid content is extremely corrosive to most metals. In some mills wood pipe is used to transfer the dilute solutions of sulphite pulp from one part of the plant to another. Oil refineries find wood pipe a practical means of handling sulphuric acid wash waters. In steel plants maintaining galvanizing and tin plate departments, corrosive acid solutions are encountered, and in many instances it has been found necessary to use wood pipe in handling them.



WOOD PIPE TOWERS FOR HYDROFLUORIC ACID

A rather novel application of wood piping is found in white lead factories, where it is used for conveying CO_2 required in the manufacturing process.

USE IN FERTILIZER PLANTS

Wood pipe construction is becoming rather general in the fertilizer industry in connection with the towers for the collection of hydrofluoric acid from acid phosphate manufacture. The accompanying illustration shows such a system of towers. The layout is composed of three vertical towers of 48 in. inside diameter, the acid gas main being 30 in. inside diameter and the special wood elbows and tees are also constructed of 30-in. pipe. The pipe may be made in any lengths desired up to 16 ft., being constructed of 3-in. thick Canadian white pine staves, double-tongued and grooved on the lateral edges and molded on the inner and outer faces to conform with the inside and outside diameter of the pipe.

Each section of pipe is mortised and tenoned so that it may easily be set in place. The towers are tightened by the ¾-in. rod placed 10 in. apart, excepting at the joints, where the spacing is 4 in. to provide extra strengthening.

Wood Tanks for the Paper-Making Industry

Details in Design and Construction of Special Equipment Developed to Meet the Needs of This Industry

BY L. E. LONG
Engineer, National Tank & Pipe Co., Portland, Ore

Proper selection of the variety and grade of lumber used, careful design and skilled workmanship and expert supervision are the essentials vitally important in the making of the best possible tanks for use in the chemical industry, and the users would profit by considering the tank from these four important viewpoints.

THE manufacture of wood tanks for the paper-making industry is not a new enterprise. During the past 7 years, however, a special effort has been made to develop equipment particularly adapted to this industry's greatest need—viz., a tank to hold the acid sulphite liquor used in the digestion of wood pulp. It is believed that a description of the design and construction of such a tank may bring out a number of features of interest to chemical engineers in other industries.

These tanks are manufactured from the best quality clear Douglas fir. Heads and bottoms are finished 7½ in. thick and staves 5¼ in. thick are hooped with ¾-in. round, soft-steel hoops, made in sections. Each section is fitted with a button head on one end, and 6-in. cold-rolled thread and hexagon nut on the other end. A specially designed malleable iron draw lug is attached to each hoop section to connect the various sections together and to tighten the hoops on the tank.

Figure 1 (page 676) shows sulphurous acid tanks at the plant of the Crown Willamette Paper Co., located at Floriston, Calif.

The blow-pit tanks, used for the discharge of the digesters, are manufactured from the same class of material, and have the same finished thickness of bottoms, heads and staves as tanks used for the storage of sulphurous acid. The blow-pit tanks, however, are supplied with a perforated false bottom. (See Fig. 2.) The holes in this false bottom are tapered ⅜ in. in diameter on the under side, and ⅛ in. in diameter on the upper side. The false bottom, made of 3-in. clear Douglas fir lumber and finished 2⅝ in. thick, is placed in the tank in the same manner as the bottom and head. The tank is also hooped with ¾-in. round, soft-steel hoops, having the same specifications as the sulphurous acid tanks.

Acid-Resisting Irons

The Composition, Properties and Uses of These Important Materials Reviewed in the Light of Modern Practice

BY PIERCE D. SCHENCK
President, The Duriron Co.

ACID-RESISTING IRONS, frequently referred to as ferro silicon or high-silicon irons, have become an important part of chemical plant construction. The composition of such irons is usually from 13 to 15 per cent silicon, with carbon, manganese, sulphur and phosphorous present in comparatively small amounts and the remainder iron. A better descriptive name for these irons would be iron silicides, as they probably consist of alloys of iron silicide and iron. Any elements outside of iron and silicon have a marked effect in diminishing the resistance to corrosion. The term "high-silicon iron" is indefinite and apt to be misleading. Comprehensive curves have been published proving conclusively that irons with silicon content of less than 12 per cent have little or no advantage over ordinary cast iron so far as resistance to corrosion is concerned.

Fig. 1 illustrates this point, although the curve is drawn to cover only the useful range of iron silicides. The resistance to corrosion increases with the silicon content,

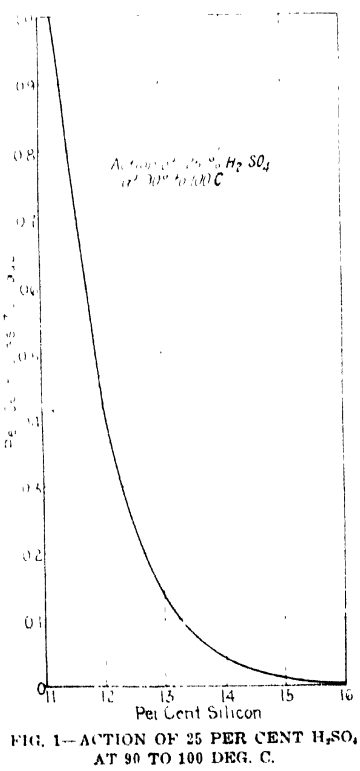

FIG. 1—ACTION OF 25 PER CENT H_2SO_4 AT 90 TO 100 DEG. C.

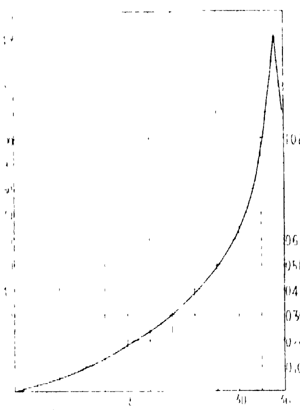

FIG. 2—EFFECT OF HYDROCHLORIC ACID AT DIFFERENT CONCENTRATIONS

but above 15 per cent the increased resistance of the alloy does not justify the higher cost of manufacture. Iron silicides, to give satisfactory results, must be manufactured under the most careful metallurgical control, as slight variations in composition, pouring temperature or cooling rate will have a marked effect on the acid-resisting qualities.

Where severe corrosive conditions are to be encountered a minimum silicon content of 14 per cent and a maximum carbon content of 0.80 per cent should be insisted upon. A higher graphitic carbon content has been found quite objectionable, as it not only lowers the resistance of the metal to corrosion but is apt to segregate and form pockets of pure graphite.

A lower silicon content, particularly if accompanied by an increase in carbon, will result in a rate of corrosion several hundred times as great as would be the case if the specifications mentioned were met.

Perhaps a more satisfactory method of determining the suitability of one of these alloys would be a depreciation test on a representative sample, made by keeping the sample in a 25 per cent sulphuric acid solution for 24 hours at a temperature of 90 to 100 deg. C. Great care should, of course, be used to maintain a uniform concentration of the solution. The loss in milligrams per square centimeter, under such a test, should not be over 0.08, an average of three such tests being advisable on very important work. Iron silicides that pass these specifications should be entirely satisfactory for use with nitric, sulphuric, acetic and, in fact, practically all commercial acids at any strength or temperature, with the exception of hydrochloric and, of course, hydrofluoric acids. Fig. 2 shows the effect of hydrochloric at different concentrations.

There are certain corrosives in the handling of which silicides should never be used, such as bromine, fused alkalis, hydrofluosilicic acid when concentrated, and the chlorides of sulphur. Others, such as caustic solutions, sulphurous acid solutions and certain sulphites, require careful consideration and possibly tests under specific conditions.

An important feature of these silicides is their almost universal resistance to chemicals under various conditions permitting standardization of apparatus. This advantage, together with the fact that apparatus of complicated form and considerable size suitable for high pressures and temperatures can be produced, has provided a construction material making possible on a commercial scale the use of processes which have been heretofore impracticable.

Several manufacturers, both abroad and in the United States, manufac-

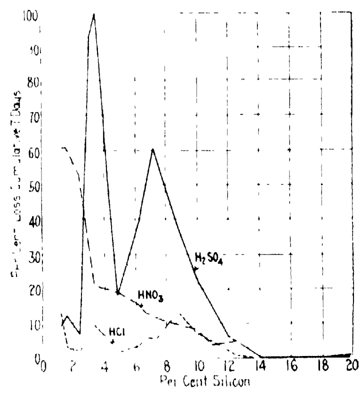

FIG. 3—VARIATION OF CORROSION WITH CHANGES IN PER CENT SILICON

ture standard apparatus such as valves, pumps, pipe, exhaust fans, etc., which are available in various sizes to meet general conditions. Unless the engineer is very familiar with the design and characteristics of silicides, the manufacturers' recommendations as to these points should be considered, as there are certain well-defined limitations of design which are peculiar to the material in question.

Large Containers

Stills and Tanks of Boiler Plate Are Usually Riveted—Welded Seams Have Certain Advantages, and May Now Be Made by Skillful Manufacturers With Dependable Joints Nearly as Strong as the Original Plate

By E. E. Thum

Associate Editor of *Chemical & Metallurgical Engineering*

LARGE containers, to operate at elevated temperature and pressure, are often needed by chemical engineers. At the present time, steel plate is the only structural material available in the necessary sizes, possessing the required strength and obtainable at a price. Naturally, a prerequisite to the use of large stills is that the contents will not react with commercial plate. The word "commercial" might be stressed, because the chemical engineer will find it impossible to obtain stills made of metal having special analysis or of alloy sheets, unless his order amounts to many hundreds of tons or he is justified in paying a very fancy price. Open-hearth firebox steel will ordinarily be found quite suitable. Some manufacturers of large tanks have pronounced ideas on the effect of small percentages of sulphur, phosphorus, copper or silicon, but the purchaser should bear in mind that the specific effect of these usual constituents of steel is far less than many unspecified factors which go to make up "best practice."

By their very nature, large containers must be fabricated of more than one piece. Riveting is the conventional method of jointing. Riveted joints have given satisfactory service in all classes of engineering structures for many years; their strength is easy to compute and has been proved by many tests; the shop practice is well standardized. Therefore a conservative engineer will often specify riveted joints, knowing that any reputable boilermaker can turn out a tight, workmanlike, dependable job. He will see to it, however, that the number of joints is kept to the minimum—each end should be "dished" of one piece; the entire bottom, inclosed in the firebrick setting, should be seamless. To meet such requirements, plate mills have been enlarged until it is now possible to obtain plates 15½ ft. wide and 40 ft. long—sheets which tax the railroad clearances for shipment.

However, riveted joints that easily resist water will develop leaks when handling light distillate. Even the tightest joint is hard put to remain tight when subjected to considerable temperature variations. Therefore much time may easily be lost with riveted connections through shut-downs to calk seams and redrive loose rivets.

If it is desirable to restrict the riveted seams to a minimum, why not dispense with them entirely? Such reasoning has led to the manufacture of "seamless" or "all-welded" containers. The American Society of Mechanical Engineers boiler code, however, does not permit the use of welded seams except for minor details, and then only allows the designer to figure a strength 55 to 65 per cent of that of the original plate. This specification tends to prevent many engineers from using perfectly safe welded joints having the highest efficiencies of any known method of joining metals.

Weld or Rivet?

The truth of the matter is that few engineers are able to give an intelligent answer to the question. Habit, precedent and even less reliable criteria are the bases of decision. Here the problem is discussed and a few axioms are laid down. It is a live, vital question and one that is constantly changing perspective as technological practice develops.

It would not be safe practice to give an ordinary repair man the job of welding up a pressure still. However, gas-, electric- and hammer-welding methods and practices have been highly perfected in quite recent times. A recent series of tests made by the Bureau of Standards on fifty large containers welded by gas flame or electric arc shows that if the seams are beveled both ways before welding (i.e., the welding is done from both sides and the added metal fills a "double V"), the welds may be conservatively figured at 80 per cent of the strength of the original plate. Low-carbon grades of boiler plate are recommended for such work, and the finished job should be tested at 50 per cent overload, hammering the weld during test.

Joint efficiencies as high as those in lap-welded pipe—90 per cent—can be expected in "hammer-welded" seams. This method merely adapts the methods of the blacksmith to very large pieces. Control is entirely automatic; heating is done by gas burners, and the hot seam is hammered together and worked down flat a short length at each operation. A strong joint is doubtless due in no small measure to the hammering which the heated metal receives.

However made, the completed still should be placed in a large furnace and carefully annealed—this to relieve any internal stresses due to the bending of plates or local heating. Not only does this practice allow the engineer to be assured that the metal is not laboring under high initial stresses before it is put to any useful work, but removes the liability for "season cracking"—a peculiar and dangerous brittleness rapidly induced by nitrate and other chemical solutions.

Six Kinds of Riveted Seams

E. E. Rohrer of the Coatesville Boiler Works suggested this listing to us:

In general there are six types of riveted joints: First, the lapped and single riveted seam is almost entirely used for storage tank work. The efficiency of this type of seam is approximately 50 per cent. Second, the lapped and staggered double riveted seam, used where medium pressure may be required. The rivets in this type of seam are usually about 1 in. greater pitch than for the single riveted seam. This type of joint has an efficiency of about 70 per cent. Third, the lapped and triple riveted seam is comparatively seldom used. Fourth, the butt strap double riveted seam (the butt strap seams here mentioned inside and outside butt straps) has an efficiency of about 82 per cent. Fifth, butt strapped triple riveted seam, having an efficiency of about 87 per cent. Sixth, the butt strapped quadruple riveted, having an efficiency of about 93 per cent; these latter two are used on larger diameters and for higher pressures.

Metals for High Temperature

No One Alloy Can Be Used as Standard—Each Has Its Limitations and These Must Be Appreciated in Order to Ward Off Failure

BY F. A. FAHRENWALD
Consulting Engineer, Cleveland, Ohio

MANY chemical processes require the use of metallic containers or mechanical units at high temperature. In such circumstances the degree of commercial success is measured by the degree of stability of these units under manufacturing conditions.

A score or more "heat-resisting" alloys have been offered to meet these requirements. The term "heat-resisting alloy" has come to be blindly used by the purchaser and so misused by the vender without regard to the kind of heat to be encountered or the nature of resistance required. As a consequence, the general effect is so unsatisfactory that the user or designer of high-temperature equipment has come to underrate the possibilities of heat-resisting alloys. The term "heat-resisting," like good or bad or high or low, is merely relative. Any material is heat resisting only to some particular set of requirements.

Therefore, it is no more feasible to make one heat-resisting alloy for all high-temperature uses than it is to make one single, all-purpose grade of steel for watch springs, cutting tools, bridge construction and gas pipe.

THE DIFFERENCE BETWEEN 25 AND 1,000°

It seems difficult to visualize conditions as they would obtain if our normal temperatures were around 1,000 deg. C. instead of 25 deg. C. (as it happens to be for perhaps only this one body in the universe), but this mental adjustment is necessary if the design and materials of equipment for use at the upper temperature are to be satisfactory. As a matter of fact, most failures in high-temperature equipment are not due to a lack of quality in the materials themselves so much as to an improper application due to this inability on the part of either the manufacturer or designer to think from any plane other than that established by the normal temperature and pressure of early courses in physics.

Many structures and devices designed for operation at 1,000 deg. C. are based on data and engineering conditions for ordinary temperatures. When put in operation they suffer the same fate as would the ether-plane of an aviator who from some cold planet attempted to make the trip to earth in a flying structure made up of materials which gave best service under his normal conditions. He would not, of course, use iron or steel, because these show a tendency to brittleness at his low temperatures and he would no doubt employ struts and braces of copper, aluminum or zinc, with perhaps castings of mercury for certain parts of his mechanism, and if he had made no greater allowances for thermal expansion or the weakening of his materials with increasing temperatures than do many of our mundane designers the wreck of his arrival would be no greater than those which happen here.

A timely caution from a very wise metallurgist! When users of metals at high temperatures are able to forget conditions at 25 deg. C. and the ordinary tests and think in terms of 1,000 deg., then there will be less failure. Perhaps then we shall not use an alloy in an oxidizing atmosphere which is of use only under carbon monoxide. Here at least is a prophet whom we should heed.

Corroded surfaces, warped, sagged and cracked structural members, and other types of failure at high temperature have been blamed on the alloy itself when the true cause is that the material and design was not fitted to the particular requirements, or the impossible attempted.

Any metal or alloy is heat resisting with reference only to some clearly defined set of requirements. Thus, tungsten is a very superior heat-resisting material in an atmosphere of nitrogen, argon, or in a vacuum, but tantulum, while nearly as refractory, cannot be used in nitrogen, and neither of these is as heat resisting as ordinary cast iron in open air. Platinum is very heat resisting in open air, but in an atmosphere of CO gas or metallic vapors or in contact with certain salts it is unstable at quite low temperatures. Lead is more heat resisting than nickel or iron when in contact with sulphuric acid, and iron is a better material than platinum for lead pots.

These perfectly obvious examples, which could be multiplied many times, are given merely to illustrate the fact that in so far as resistance to corrosion is concerned any given metal or alloy is "best" with reference to some one set of conditions only. Resistance to corrosion (scaling and oxidation), however, is not the only criterion to be used in selecting equipment for high-temperature operation. If this property alone were required, it would be a relatively simple matter to meet very rigid requirements. The real difficulty lies in combining chemical resistivity with the necessary physical or mechanical stability. As a matter of fact most failures observed in heat-resisting alloy units are due to cracking or warping and not to surface deterioration.

MECHANICAL PROPERTIES AT HIGH TEMPERATURES

It must be remembered here that the mechanical properties of iron, nickel or heat-resisting alloys at 1,000 deg. C. are not those revealed by ordinary physical tests and that these materials at high temperatures are very much like copper, lead or zinc at ordinary temperatures. A hearth plate of steel or heat-resisting alloy will, for example, flow or bend slowly at a temperature of 2,000 deg. F. just as a lead shingle will "creep" down the side of a roof in the hot (high-temperature really, for lead) sunshine. A tensile or bending test carried out at a temperature of 1,000 deg. C. on a typical heat-resisting alloy will show an apparent strength of 25,000 lb. per square inch under a quick pull, when as a matter of fact its effective strength under continuous dead load is only about 5,000. A structural unit may therefore vary five to one in cross-section, depending upon whether designed for intermittent service or to resist permanent stresses.

High-temperature stiffness, hardness or strength may be obtained by proper alloying, but usually at a sacrifice of some other property, just as in the parallel low-temperature example of hard lead for type metal. Again, it would be relatively easy to provide for the combination of a certain kind of chemical resistivity with some specific set of physical or mechanical properties for some definite narrow temperature range; but often one must provide for rapid fluctuations of 1,000 deg. temperature, with the accompanying tremendous forces of thermal expansion. One high-

temperature process, for instance, may require resistance to a certain type of corrosion and in addition, one other property to a maximum degree —such as high tensile strength, or stiffness, or resistance to cracking or abrasion while hot, or a high degree of machinability or ductility while cold to facilitate fabrication. Another process may require the combination of three or more special properties, and it is not difficult to think of only two which can hardly be combined in the same alloy. It is easy, for example, to combine resistance to scaling in open air or ordinary gases of combustion with a high degree of ductility, strength and machinability while cold, but it happens that if these surrounding gases contain a small percentage of sulphur, maximum resistance to corrosion has been found only in alloys which are quite brittle and non-ductile cold and not particularly resistant to warping and cracking at high temperatures. An alloy which has been found to be very resistant to molten lead is quite fragile cold, but machineable — a property not required for this purpose—while another alloy well suited to withstand abrasion in continuous furnaces of a certain type is too hard and so cannot be fabricated into the required forms. These examples are given to show that it is often necessary to accept certain seemingly objectionable features in an alloy which contains to a maximum degree the one particular type of high-temperature stability required and that alloys for use at high temperatures must not be judged by "standards" developed for ordinary conditions.

Practically all of the "heat-resisting" alloys at present on the market are composed of chromium together with one or more of the iron group metals, with minor additions of other elements to impart certain desired characteristics. Maximum operating temperatures — limited by the character of these constituents— are thus necessarily low, but it is not at all unlikely that super-refractory alloys will be available in the near future. It is unfortunate that one cannot go to a handbook for exact and detailed information concerning the behavior of such metals at high temperatures.

So without attempting to advise on specific cases, I would urge a proper consideration of those factors which make for success or failure in high-temperature equipment.

Corrosion-Resisting Irons and Steels

Interesting Discussion of the Corrosion Resistance of Pure Iron. Chromium Steels and Silicon Cast Irons

BY JAMES A. AUPPERLE
Chief Chemist, American Rolling Mill Co. Middletown, Ohio

AT THE outset, one must admit that only a service test will determine whether a metal will resist chemical reagents. This has been found true so often that at times the chemical engineer hesitates to guarantee the performance of any particular metal if he suspects that the operating conditions are slightly different from those with which he has been formerly dealing.

Consequently it is unnecessary to warn the experienced man not to rely too much upon laboratory tests. As ordinarily conducted, they give no more than a rough general indication of the service to be expected. So little is known about the mechanism and true nature of corrosion, and so much depends upon the kind of reaction product—whether loose or adherent, pervious or tight, inhibitive, accelerator or catalyzer—that it is hard to predict what will happen during the fiftieth day, for instance, based upon the results observed during the first day. A consideration of great importance in this connection is whether the salt solution in contact or formed by corrosion will hydrolyze easily with the concomitant formation of acid concentration at those particular regions. Aluminum sulphate is an instance. Impurities in the liquids to be handled sometimes give startling troubles; the amount of oxygen held in the solutions is also a very important factor. A recent test on coal mine waters of the Pittsburgh district containing a wide variety of sulphates gave very puzzling and inconsistent results for these very reasons.

Broadly speaking, in order to obtain a ferrous metal which approaches non-corrodibility it is necessary to render the iron, by suitable alloying, insoluble in the reagent in question, or to make the iron as pure and homogeneous as possible in order to avoid electrolytic or galvanic effects among the different micro-constituents.

Chromium is the element usually added to steel, and silicon is the element usually added to cast iron (in considerable percentages in both classes (to make the alloy insoluble in reagents. Thus we have many kinds of "stainless" steels and high-silicon irons on the market. Great purity in the iron has also been found to be very efficacious in resisting corrosion under many diverse service conditions, which include ground waters and very dilute solutions generally. This is the idea upon which "commercially pure ingot iron" is produced. Possibly the same reason underlies the remarkable preservation of many wrought-iron objects— the iron crystals in this material are quite pure, the so-called "impurities" in this material being concentrated in the slag inclusions.

It should be remembered that chromium steels and more complex steels will often give disappointing results when subjected to the action of acids. Table I illustrates this point by corrosion tests which were made at room temperature.

From these results it will be noted that there is a remarkable difference between the various grades of stainless steel, especially in the acid solutions. In the 5 per cent hydrochloric acid solution, one grade of stainless steel showed forty times as much corrosion as commercially pure iron. A great difference is also noted in the results obtained using 5 per cent acetic acid solution. One type of stainless steel lost practically nothing, while other types of stainless steel lost more than the commercially pure iron.

Commercially pure iron has been successfully employed to resist the action of 20 per cent aluminum sulphate solution and also to resist the action of boiling ammonia (sp.gr. 0.90).

Great strides have been made during recent years in the vitreous enameling industries, by which proc-

TABLE I LOSSES IN OUNCES PER SQ. FT

Material	5 Per Cent Hydrochloric A 100 Hr	5 Per Cent Acetic Acid 100 Hr	Distilled Water 100 Hr	3½ Per Cent Sea Salt 100 Hr	Moist Salt 300 Hr.
Commercially pure iron	0 211	0 034	0 019	0 021	0 075
Stainless steel "A"	8 118	001	002	002	005
Stainless steel "B"	188	046	001	001	004
Stainless steel "C"	2 534	055	006	008	.007

ess a glass-like coating having wonderful acid and alkaline resisting properties is fused onto the metal. Light gage sheet metal can be employed in the chemical industry when an enameled coating is used. The enameled coating is very light and approximately three times as thick as the average metallic coating on sheets. It has been found that utmost homogeneity in the base is necessary if the coating—either of metal or of enamel—is to be absolutely continuous. Included impurities in the base metal almost invariably mark the location of defects in the coatings.

It is obvious that a linseed oil paint should not be used on structural or other material where alkalis predominate, as alkalis would have a tendency to saponify the linseed oil in the paint and thus destroy its usefulness as a protective coating.

A very efficient protective coating which has been used successfully by sulphuric acid plants is coal tar of the consistency of molasses, thinned with the use of benzol if necessary and containing about 10 per cent by weight of dry portland cement. A coal-tar paint of this character can be made up cheaper than any other type of paint, and has been found very satisfactory. The cement will combine with the acids and water sometimes present in coal-gas tar and water-gas tar. The paint should be applied with the use of a sprayer, and the paint should be kept agitated while being sprayed.

Use of Copper and Its Alloys in Chemical Engineering

Easy Fabrication and Resistance to Corrosion Make Them Some of the Most Useful of Construction Materials Used by the Chemical Engineer

BY WILLIAM G. SCHNEIDER
Copper and Brass Research Association, New York City

COPPER has been in use so long that it is usually taken for granted that everybody knows all about copper. Perhaps that habit of thought explains why, in many instances, the broad, general utility of copper has been somewhat lost sight of behind an impressive series of laboratory tests, featuring "successors to copper." The final test of a metal's service value is actual use, and it is a matter of record that in many instances expensive apparatus built of, or using, materials whose reputations were made through special or laboratory tests failed because, in actual operation, conditions were present which could not have been comprehended in the laboratory. Accelerated corrosion tests have repeatedly demonstrated other metals as equally non-corrosive as bronze. Yet the engineer has made the bronze pump practically standard for the handling of acid mine waters, not only because bronze stands up well but also because the bronze pump is readily repaired on the job. To be sure, some of the newer alloys constantly coming to the fore are more resistant to certain forms of corrosion. In many cases, however, these are so difficult to machine, weld, forge or otherwise work that if a break occurs the entire plant or unit is thrown out of operation.

Since the major responsibility of the chemical engineer is quantity production at a profit, and his tools are pumps, coils, tanks, digester, condensers, evaporators, kettles and similar apparatus, his most valuable metal is that which possesses to the greatest extent a combination of the essential qualities of easy fabrication, heat conductivity, non-corrodibility and strength.

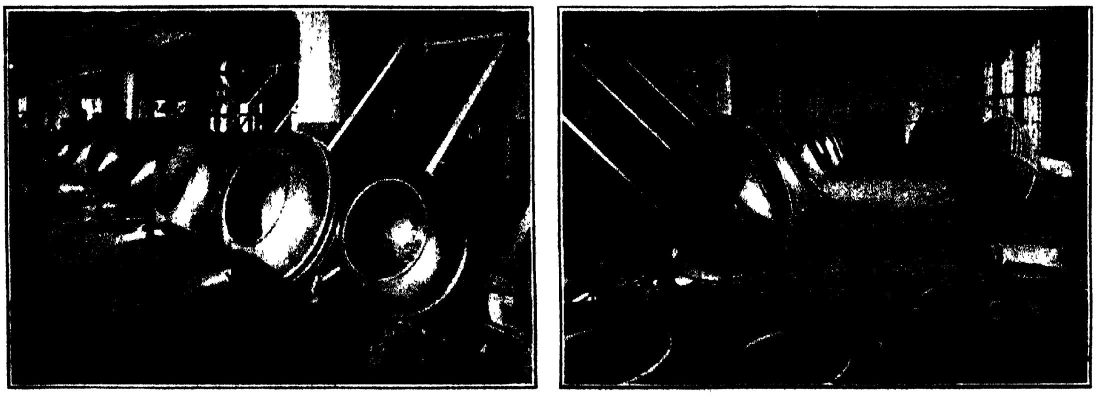
Easy fabrication and its non-corrosiveness are the reasons why copper has been selected for so many types of apparatus used in the chemical and allied industries. But the very ease with which copper is made into even intricate shapes has sometimes earned for it unjust condemnation and criticism.

The naturally close, homogeneous structure of copper has occasionally been weakened by careless manufacture, with the result that instead of developing the inherent valuable properties of copper, they have been destroyed at the expense of its serviceability.

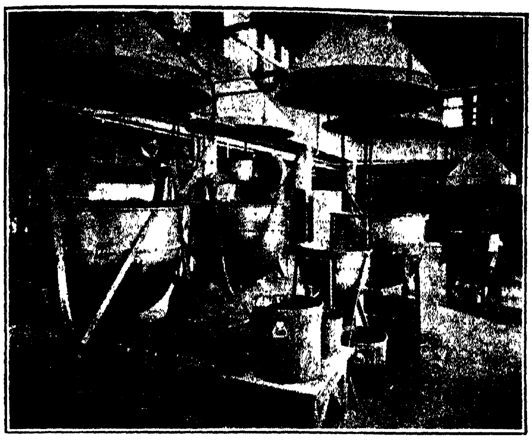
Copper varnish kettle bottoms, condensing equipment, candy kettles, milk evaporators, soup kettles, kettles in which sweet fillings for crackers are prepared, and other chemical equipment, carefully fabricated, are still in active service after 30, 40 and 50 years of continuous use.

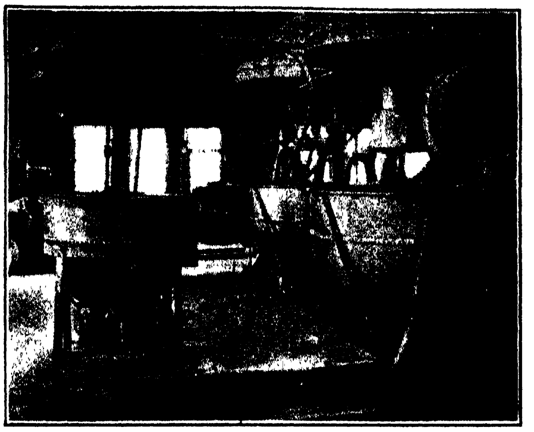
A very desirable feature of copper, aside from its ability to withstand the abrasive and corrosive actions of the various materials used in the plant, is its factor of safety. Subjected to high pressures, if it fails copper does not "let go" at once but rather gives warning and time to get out of harm's way. Other metals of brittleness and rigidity which have their elastic limit too near or equal to the ultimate strength fail all too suddenly.

As extensive as the use of copper



REVOLVING PANS, FABRICATED OF COPPER, USED FOR SUGAR COATING CANDIES





COPPER JACKETED STEAM KETTLES, USED FOR COOKING "GUM" CANDIES, OPERATING UNDER 85-LB STEAM PRESSURE

already is, there are other uses, aside from apparatus, where it would seem logical and economical to use it. Copper, brass, bronze and other copper alloys have made good in condenser equipment for the handling of excessively corrosive fumes and liquids. Sheet copper ducts in ventilating systems, particularly in chemical plants, indicate an advantageous use for copper. The commonly used materials are, to be sure, cheaper, but the success with copper in outdoor service of a similar character is a strong argument in its favor.

In conclusion there is one consideration that cannot be overemphasized. Once the chemical engineer has selected copper or one of its alloys because of its resistance to corrosion or abrasion in connection with his particular problem, he would do well to consult with the experienced fabricator regarding the actual construction of his equipment.

Copper, brass, bronze or other copper alloys are not "cure-all" metals, but when they are properly used and installed they offer advantages in the chemical industry that cannot be surpassed by commercially practical metals

When Copper Should Be Used in Chemical Equipment

A Résumé of Some of Its Desirable Properties as Well as Definite Limitations as a Structural Material

BY JOHN A. STEFFENS
Consulting Chemical Engineer, Brooklyn, N. Y.

THE use of copper and its alloys in the chemical industry is dependent on the property of resistance to corrosion combined with good structural characteristics. Copper may be readily worked into requisite forms, although the methods of the coppersmith differ from those of the iron worker. Supplies of the metal are relatively abundant and cheap and when resistance to corrosion is necessary, the use of copper is usually most economical.

But copper does not universally resist corrosion. Substances containing ammonia and its derivatives in the presence of water, attack it quite vigorously, likewise nitric acid and some of its derivatives. Some sulphur compounds will cause the formation of copper sulphide, and if the surface be subject to fluid flow sufficient to erode the layer of the sulphide, progressive corrosion occurs. The usual practice of tinning the copper surface is no deterrent to this action.

Oxy-acids, such as lactic, tartaric and malic, have a variable action, apparently dependent on the concentration of water, temperature and presence of air. Maleic and fumaric acids attack copper and its alloys. A curious phenomenon is the solution of copper and tin in the anhydrous formic esters, stable crystalline compounds being formed. Further instances of specific corrosive action might be mentioned, but suffice it to say that each substance and process requires testing under working conditions.

USE IN ALCOHOL INDUSTRIES

Despite the instances of corrosion which have been given, the general usefulness of copper in the chemical arts is great and its use is increasing. In the alcohol industry, copper stills are standard equipment. Properly built, a life of at least 10 years may be expected. The small quantities of impurities in alcohol rapidly corrode steel and wrought iron. Cast iron is fairly resistant, but is more costly and cumbersome and, in addition, usually of smaller capacity than similar copper equipment.

In working the products of wood distillation, copper equipment finds extensive use. Methanol, acetone, methyl acetate, dimethyl acetal, aldehyde and other substances have less action on copper than they have on iron.

For the manufacture of esters, copper columns are most commonly used, and where kettles are used, they are usually of copper. Some of the rarer esters require enameled kettles. For the manufacture of ethyl acetate, copper is exclusively used. The acetic acid, except in the presence of air, has little action, and the dilute sulphuric acid practically none.

The use of copper in heating surfaces is extensive. Burnished copper kettles are a common sight in the food industries. Copper tubing in evaporators is common.

To sum up, copper is used to replace steel and wrought iron wherever it satisfactorily withstands the corrosive action of the materials to be processed. Further consideration of this general basis of choice of material leads us outside the field of chemical equipment.

Jacketed Cast-Iron Kettles

Certain Fundamentals Which Are Desirable Features When Cast-Iron Kettles Are to Be Used

BY R. C. BOGGESS
Manager, Dopp Sales, Sowers Manufacturing Co

THE extensive use of jacketed kettles in chemical industries is so well known that it hardly needs comment. The jackets are used for steam, for hot oil, for heating batches and cooling them quickly with cold water, for a thousand and one kinds of chemical reactions in liquid phase. Therefore a brief consideration of a few of the desirable features of jacketed kettle construction will be distinctly worth while. Quite naturally the problems which are considered in this paper are in general problems that we have encountered in the manufacture of the Dopp kettle, and it is perhaps pardonable therefore to mention the successful solution of some of them.

For example, there are many distinct advantages in casting the kettle, the jacket and the reinforcing connection between the outer and inner shell all in one piece. There are no rivets, bolts, seams or joints that work loose with the repeated contraction and expansion inevitably experienced in this type of apparatus. No leaks are possible such as occur frequently in two-piece kettle construction.

Again, the composition of the iron which goes into the kettles must come in for very serious consideration. In the first place, the tensile strength should be high, for in the larger type sizes of kettle the demands are rather severe on the metal itself, and second, the corrosion factors must be considered. As a matter of practice it has been found desirable in our works to use a special iron high in silicon and low in manganese and phosphorus, which has a tensile strength of from 35,000 to 40,000 lb. per sq.in. The silicon content must be balanced, of course, to avoid on the one hand brittleness, and on the other hand rapid corrosion.

RAPID HEAT TRANSFER DESIRABLE

It is worth while recording an interesting test that was made on one of the Dopp kettles and that illustrates a principle worth remembering. The inside of the kettle was coated with a thick grease and steam was turned into the jacket. In a short time the grease melted in around opposite of each of the stay bolts, showing conclusively that these bolts actually conduct the heat into the kettle at a more rapid rate than the surrounding iron. Thus it comes about that the stay-bolted construction and single casting which is standard practice in our fabrication has facilitated the heat transfer.

It is quite essential that kettles of this kind be tested to a high hydrostatic pressure before shipment, and it is safe practice to use twice the working pressure of the steam. This applies not only to the jackets but to the kettle itself if it is to be used for pressure or vacuum work. The use of high temperatures in jacketed kettles is, of course, possible now with heated oil, and temperatures of 575 deg. F. can be reached and maintained inside the kettle. With this kind of a process it is essential to have a leak-proof jacket. In such cases a welded steel jacket has no counterpart in cast-iron work except a one-piece cast construction. There the oil simply can't get out. There are other points which unfortunately have to be regarded as trade secrets and are, therefore, of less interest to the technical man in a symposium than to his other self when he acts as purchasing agent. For example, by specially controlling the casting process and keeping the metal away from the molding sand a smooth surface can be obtained on the iron and no machining or grinding is necessary. This process leaves a protective skin on the surface of the iron which acts as a protective coating.

Aterite

Its Interest to Manufacturers and Users of Chemicals Lies in a Combination of Resistance to Corrosion and to High-Pressure, High-Temperature Work

BY FOSTER MILLIKEN, JR
President of Aterite Co., Inc

RESULTS are usually achieved by effort, but on rare occasions by accident. When Aterite was first conceived, the idea in view was to produce an alloy of certain definite characteristics, and toward this end entire success was met. By a strange coincidence it was found that in addition the resultant alloy had properties more valuable than any originally contemplated, which automatically brought it into a field where previously far from satisfactory results had been obtained by the use of other metals.

Since its introduction in the early part of 1916, Aterite has been used with remarkable success for two primary services—in connection with chemicals and for high-temperature, high-pressure work.

CHEMICAL

To be of value in handling chemicals, a metal must possess certain primary attributes. First, of course, it must be resistant to corrosive action, and second, of almost equal importance, it must be resistant to erosive action. In addition it must be readily machinable, so that without the necessity of special equipment the average mechanic can make the necessary repairs. The metal must have a certain amount of strength and ductility in order to withstand the hard usage it is oftentimes called upon to bear at the hands of unskilled workmen. It must have all these characteristics as well as more minor ones and still be within a price which is not prohibitive.

While Aterite will not resist the corrosive action of all chemicals, still it is proof against those most commonly used, and in addition possesses all other attributes mentioned above.

A concrete example comes to mind. Probably one of the most severe cases is on an acid agitator used in oil-refining work, where during the course of operations the sulphuric acid is changed from strong to very dilute. In such a service a certain refinery had got a maximum service of only 42 days, whereas an Aterite valve has now functioned without interruption for over 6 years. This is only one of many cases and likewise applies to many other acids, such as acetic, hydro-

fluosilicic and chemicals such as aluminum sulphates, etc., to say nothing of kindred lines like vulcanizing.

TEMPERATURE

For high-temperature, high-pressure work a most careful study must be made of a metal's characteristics, as failure is apt to be of a most disastrous nature, both to property and life. To be of value the metal must have many well-defined attributes.

Too many engineers are prone to consider tensile strength as a deciding factor, when instead the yield point should be of main consideration. A metal for temperature work must not only have a high yield point but at the same time a good reduction in area and elongation. It must of necessity be dense, but at the same time exceedingly ductile, so as to give adequate warning before letting go. It should have a low coefficient of expansion and contraction, or if used with other metals, one which compares favorably. In addition the metal must have a high melting point and above all retain its properties at high temperatures.

Aterite possesses each of these requirements to a marked degree, making it an admirable metal for high-temperature, high-pressure work. For valve work in such a service it is particularly suited, being the only known metal of which an entire valve can be constructed, thus completely eliminating any difference in expansion or contraction of parts. Heretofore forged steel has been widely used, but after reaching temperatures of from 800 to 900 deg. F., it rapidly deterioriates. Aterite has been used in various forms, such as valves and fittings on superheated steam lines, even as high as 1,250 deg. F., 250 lb. pressure, without any deterioration.

And so, through a coincidence, the alloy Aterite has been found and proved successful for the handling of chemicals and also for high-temperature, high-pressure work.

Notes on Brasses and Bronzes

They Resist Mild Corrosion—More Severe Conditions Met by Alloying With Manganese or Nickel—Tin Forms Very Sensitive Compounds With Nitrates

BY HAROLD F. WHITTAKER

THE simple brasses and bronzes are not very widely used as corrosion-resisting metals in the chemical industry except under those conditions where relatively mild corrosive conditions exist. Each of these alloys resists normal atmospheric corrosion fairly well. Various bronzes have been used to a large extent in contact with sea water, where they are used in ship propellers and sheathing. In spite of the fact that serious corrosion difficulties were encountered by the United States and British navies during the war, brass is still considered to be far superior to steel for condenser tubes. Corrosion of brass condenser tubes has been divided into five classes. Various methods have been used to overcome the various kinds of attack, but the best method so far found has been a frequent, thorough cleaning of the tubes to remove all deposits or scale.

There are some places where brass and bronze give satisfactory service in the chemical industry. Either will withstand boiling 10 per cent sodium chloride satisfactorily, and bronze resists corrosion fairly well when in contact with warm sulphurous acid solutions. There is one place in the chemical industry where bronze is apparently superior to all other commercial metals as a structural material— manganese bronze resists 85 per cent formic acid exceedingly well; in fact, it lasts almost twice as long as pure copper under similar conditions. This alloy is also known satisfactorily to resist warm dilute sulphuric acid solutions ranging in concentration between 1 and 2 per cent and under such conditions will outlast brass about two and a half times.

There are several places in the chemical industry where brass or bronze must not be used. One of these is in connection with the handling or storage of ammonium nitrate. Although these alloys are not known to form explosive corrosion products, these products have a harmful effect upon the ignition point of certain explosives in which ammonium nitrate is used. Tin is thought to form sensitive compounds with ammonium nitrate, therefore tinned containers or bronze parts should not be exposed in any of the operations in connection with ammonium nitrate.

A rather unusual but interesting type of corrosion takes place between copper, brass or bronze and organic amino compounds such as aniline, toluidine, etc. The copper of these metals readily replaces one of the hydrogen atoms of the amino group, the corrosive compound forming a thick crust on the metal surface. This crust is neither adherent nor protective. The above reaction is usually considered to be a high-temperature reaction, although instances are known where 3 per cent solutions of aniline in hydrocarbons have readily attacked copper at ordinary temperatures.

It might be well to call attention to types of the complex bronzes which have been designed particularly to overcome corrosive conditions. Examples of these complex bronzes are Aterite, which is a nickel brass; Meco metal, a copper nickel zinc alloy, and Ampco, one of the aluminum bronzes containing principally copper, aluminum and iron. There are several similar alloys on the market, but in most instances their compositions are concealed by alloy numbers or trade names. Some of the above alloys have variable composition, hence a suitable composition may be selected for specific corrosive conditions. Most of the above alloys are usually subjected to some working or rolling process previous to their fabrication, since their resistance to corrosion is increased and they possess greater structural strength. The manufacturers recommend these alloys for use with superheated steam, hydrofluoric acid and the organic acids as well as some concentrations of sulphuric acid and sulphurous acids. They are not usually recommended for use with chromic, hydrochloric, nitric, picric or mixed acids nor for ammonium hydroxide. Pure copper is usually considered to be superior to any alloy for handling hot dilute acetic acid. Much better life is obtained from these alloys when arrangements are made to keep oxygen or oxidizing materials away from them when they are exposed to corrosive conditions. It may be of interest to note that one of the above alloys was designed for the purpose of eliminating the necessity of casting under pressure. As far as the writer has heard the alloy gives excellent results in the foundry without the use of a riser.

In any case, where brasses or bronzes are being considered, it is advisable to carry out corrosion tests as nearly as possible under operating conditions.

Aluminum for Chemical Construction

Properties That Favor Its Use for Equipment Fabrication and a List of Uses in Chemical Industries

By E. Blough
Aluminum Company of America

CHEMICAL ENGINEERS are always seeking for materials to improve their plant equipment. Each industry has its own problems in this respect, so a recital of some of the experience gained in the use of aluminum in chemical equipment may prove of use to those engaged in this profession.

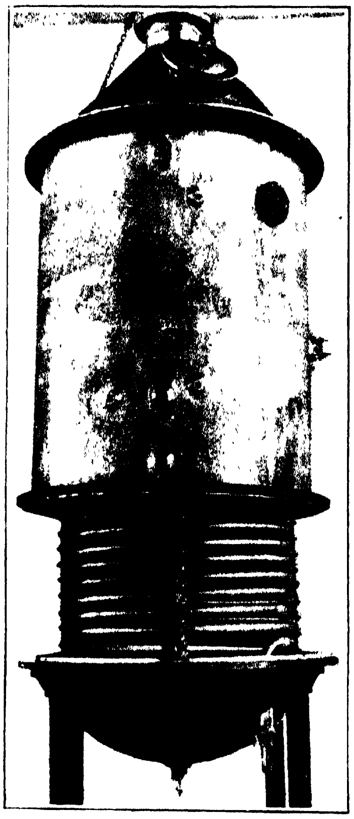


FIG. 1—STILL 11 FT. HIGH DESIGNED FOR INDIA REFINING CO.

Since the utility of the material is based, first, upon its chemical behavior and, second, upon its mechanical properties, it has been found by experience that pure aluminum is more generally applicable to chemical apparatus than its alloys (with an exception noted below). It is always desired that the chemical or product will react as little as possible with the container, and whenever the container is acted upon, the products of the reaction should be colorless.

Pure aluminum tanks, vats, tubing and coils fulfill this requirement. Since the metal is generally used in the soft or annealed condition, the tensile strength may be considered 12,500 lb. per square inch for purposes of design. This figure may also be used as the tubing strength.

It has been found more satisfactory to make pipe fittings of an alloy containing a small amount of manganese, as this alloy gives a casting which may be subjected to a high internal pressure without "sweating."

The shapes in which apparatus can be built are almost limitless. This is due to the fact that aluminum can be formed by drawing, spinning, beating, bending or by any other commercial method. The parts thus formed can be welded together autogenously so that a seamless (without rivets) vessel may be constructed of any size or shape to suit the particular needs of the chemical manufacturer.

A description of some of the uses to which aluminum has been put in the chemical industry may prove of interest and use to those engaged in the manufacture of chemicals.

With a few exceptions, as might be expected, the greatest success has been attained in the organic field. One exception is the use of aluminum tubing in sulphur wells in place of iron tubing. Another use in inorganic chemical manufacturing is for crystallizing pans for ammonium sulphate.

Aluminum is used for vinegar containers and also for piping. There are also several large installations where it is used as storage tanks for acetic acid.

In the forest product field it is used for turpentine stills, wood distillation stills and in this same general field for varnish kettles.

Formaldehyde shipping containers of aluminum have proved very satisfactory.

Gasoline fuel tanks of aluminum are widely used, particularly in aircraft. Similarly, aluminum parts in gasoline pumps for service stations have been approved by the Underwriters' Laboratories.

Aluminum wax cooling pans have an almost limitless life in the preparation of paraffine wax and do not in the least discolor the wax to the detriment of candles.

Condensers and deodorizers are made of the pure metal in the vegetable oil industry, as for example in connection with coconut oil.

Gelatine and glue manufacturers use aluminum for cooling pans.

Tartaric and citric acid manufacturers use aluminum crystallizing pans.

Rubber curing pans are made from aluminum.

The list might be extended and new uses are found each year. A typical apparatus that has been developed is illustrated in Fig. 1 and shows the adaptability of aluminum to chemical manufacturing.

Nickel and Monel Metal

A Brief Note on the Properties Which Give These Metals a Unique Value in Corrosion-Resisting Work

By R. J. McKay
International Nickel Co.

CERTAIN qualifications are desirable in a metal for corrosion-resisting machinery aside from actual resistance to corrosion. It should possess high strength, particularly in such utility tests as resistance to fatigue and to impact. It should be easy to machine, forge, cast, weld, solder, etc. An alloy should be of such a standard character that the composition does not change and the supply be constant and dependable. Knowledge regarding all its properties should be available and acquaintance with such common characteristics as methods of working, resistance to corrosion, etc., should be widespread.

The increasingly extensive use of pure nickel and Monel metal seems to indicate that they possess a healthy percentage of these properties. For example the tensile strength for hot-rolled Monel metal is 90,000 lb., for nickel 75,000, and the yield points 50,000 and 25,000 respectively. These properties and the hardness and ductility can be controlled within limits by proper working. The metals can be machined, forged hot or cold, cast, cold-drawn, brazed, soldered and welded. Spinning requires considerable power and frequent annealing; high temper cannot be produced.

The Izod impact resistance of Monel metal is 114, as compared with mild steel 77 and forged copper 46. It resists acid corrosion by virtue of

its relatively low position in the electromotive series and oxidation by the pacifying effect of its 67 per cent of nickel. Combinations of as strong oxidizing agent as an acid solution will corrode it. Its corrosion resistance does not depend on protective coatings, and therefore it is relatively resistant to effects of high velocity and abrasion in conjunction with corrosion. Further work is being carried out on these metals in order further to justify the present confidence.

Enamel-Lined Apparatus

Vitreous Enamels Constitute a Type of Surface for Chemical Equipment Which Is Useful With Both Corrosive Materials and Those Which Must Not Be Contaminated

BY EDWARD G. MINER
President and General Manager, The Pfaudler Co., Rochester, N. Y.

AS IS well known, enamel-lined equipment represents a type of construction which is practically indispensable for many processes in the chemical and allied industries, where non-corrosive and acid-resisting properties are essential. For use in these industries the Pfaudler Co. has developed two different kinds of enamel. One, a brown enamel, is highly acid-resistant and is applied wherever concentrated acids or other very corrosive materials are to be handled. The handling of caustics of any nature is not advocated, although this has been done successfully on occasion. The other enamel, blue-black, applied on most equipment designed to handle weak acids, neutral solutions, etc., meets that general requirement which dictates that the container used in the process shall in no way impart any of its surface material to the product handled.

PRESSURE RESISTANCE OF ENAMELED WELDED TANKS

Recent tests have indicated that enameled steel tanks, aside from their non-corrosive and acid-resisting qualities, have the ability to withstand very high pressures. Thus a Pfaudler tank in a recent pressure-resisting test conducted by the Pressure Vessel Committee at Washington withstood the hammer blow on its jacket up to 1,600 lb. This demonstrates the strength of the welded construction used in this equipment. For details of manufacture, the reader is referred to previous articles.[1]

Another advantage offered by this equipment is that processes requiring very high temperatures may be conducted with minimum amount of danger to the equipment itself. By circulating hot oil in the jacket it is possible to maintain temperatures of 400 to 500 deg. F. without even slightly endangering the enamel lining. For the handling of products with a high degree of viscosity, high boiling point, etc., this feature is extremely valuable. It may be noted that the Columbia Graphophone Co. employs this method for melting beeswax in making records.

There are also many products which are practically non-corrosive but which must be carefully protected against the slightest possibility for contamination. Food products, drugs, fine chemicals and other materials of similar nature fall in this class. The problem of finding suitable containers for processing, handling and storing such delicate products is solved in a most satisfactory manner by the use of enameled equipment. As a typical example, the manufacture of cold cream as conducted by the Palmolive Co. may be cited. The various ingredients are agitated in a Pfaudler mixing tank located on the fourth floor of the plant. When the consistency is fairly uniform, the batch is dropped to a conical enamel-lined tank suspended from the ceiling of the third floor directly below the mixing tank. Here the product is agitated again to complete the emulsification and is then drawn off at the bottom into jars for distribution.

CERTAIN UNITS HAVE BEEN STANDARDIZED

Co-ordinated efforts toward standardization have resulted in the development of certain units of general applicability in the chemical industries.[2] These include: A standard jacketed still with reducing ell, which is used for the distillation of essential oils and acids, the reduction of fats, etc.; a standard jacketed closed mixing tank with enameled steel agitator; an open evaporating or crystallizing pan which may be single shell or jacketed as required; a standard utility pot which may be used for a variety of chemical operations. In addition special equipment covering a wide range of designs and applications is manufactured.

Lead Pigments: Protective Materials for the Chemical Engineering Industries

Chemical Engineers Should Become Better Acquainted With Advantages and Limitations of Paint and Pigments

BY J. H. CALBECK
Director of Research, Eagle-Picher Lead Co., Joplin, Mo.

THE chemical engineer, unless engaged in the actual manufacture of some of the many products in which lead is used, has little to do with lead pigments, except in the case of paints and cements, and it is along these lines that this paper will deal. Included among the lead pigments are the following compounds: basic carbonate white lead or corroded white lead, basic sulphate white lead or sublimed white lead, sublimed blue lead, red lead and litharge. Lead chromate and other colors containing lead will not be discussed.

The painting done around an industrial plant falls into approximately six distinct classes, which will be discussed in turn.

1. *General Exterior Work*—The materials used consist usually of corroded white lead, sublimed white lead and sublimed blue lead purchased either in the paste form or in ready mixed paints. When purchased in the paste form, these pigments need to be mixed with proper amounts of linseed oil, drier and turpentine. When purchased as ready mixed paints they are ready to use. Ready mixed paint contains, in addition to the lead pigments, various percent-

ages of zinc oxide and inerts such as china clay and whiting. The advantages of lead pigments for these purposes are generally known and there are very few instances where they are not entirely satisfactory.

2. *Interior Painting and Decorating*—The necessity of well-painted and well-decorated interior in chemical and other industrial buildings has of late been given much attention both from the standpoint of safety and sanitation and from the standpoint of efficiency and economy. In some instances white lead is employed using special flatting vehicles for thinning instead of linseed oil. Yet the most widely favored pigments for this purpose are lithopone and zinc oxide, which are generally employed in mill whites and other interior paints.

3. *Priming New Work*—Both steel and wooden structures should be primed as quickly as possible and should be primed with lead in oil or a good mixed paint if the subsequent coats are to give satisfaction. There is no economy in cheap primers. Sublimed blue lead is exceptionally good for both wood and steel and may be used for the finishing coat if a dark color is desired. Red lead has been used for years as a primer for iron and steel work and is preferred by many engineers.

4. *Protective Coatings for Iron and Steel*—As mentioned above, sublimed blue lead or red lead should be employed for priming iron and steel work subjected to all except the most extreme conditions. These pigments sometimes fail in the neighborhood of acid plants where very high concentration of corrosive fumes are given off. In such cases the engineer should use bituminous, graphite, cement or other especially prepared paints. If the conditions are especially bad, the finishing coats should be of sublimed blue lead or red lead, but usually the finishing coats are of lighter hues. Contractors find it a good plan to make each coat a slightly different shade, enabling an inspector to distinguish the different coats easily.

5. *Special Purposes*—In addition to this there are certain special purpose paints, a large quantity of which are used around industrial plants for painting smokestacks, vats, tanks, roofs and equipment where acids or chemicals are used. Painting of concrete work such as floors, stacks and tanks call for special paints. The lead pigments are not used extensively in these plants. Bituminous, graphite and cement paints are usually employed.

6. *Special Color Work*—There is in addition to the above a large amount of special color work to be done about a modern industrial establishment. The advantages of painting fire plugs, switch boxes and pipes supplying water, gas or oil, different colors warrants the special attention necessary to give each one a characteristic color. Lead is used here in the red and yellow pigments, but these colors are usually obtained as ready prepared paints and this certainly is the most satisfactory way to obtain them.

There is a tendency among some engineers to make these special-purpose paints all-purpose paints rather than go to the additional trouble and expense of buying a paint best suited for the job at hand. This is often a costly mistake. There is no all-purpose paint. Yet many superintendents insist in using a stack or roof paint for every purpose about the plant, such as priming iron and steel work or repainting it, and then wonder why it is necessary to repaint so frequently.

It appears, therefore, that the chemical engineer should become better acquainted with advantages and limitations of each pigment and should teach his men how to use them properly.

Building Receptacles of Vulcanized Fiber

A Material of Widening Industrial Application Not Only for Containers but for Gears, Washers, and Other Mechanical Shapes

BY C. C. BELL

Vice-President, American Vulcanized Fibre Co., Wilmington, Del.

ALTHOUGH vulcanized fiber is not exactly a new material to the chemical engineer, it may nevertheless be worth while at the beginning to describe briefly what it is and how it is made. It is a cellulose product, manufactured from pure cotton rag paper treated with zinc chloride. Following a washing process the product goes to the dry house. The chemical action is extremely constrictive, causing the sheets to buckle, and considerable pressure is necessary therefore to flatten them for practical use. This is done in power hydraulic presses, which also function to press the material into the shape in which it is finally sold.

At the time the product was first developed, its only apparent market was in the electrical trade, where the principal insulating material used was vulcanized hard rubber. As a competitive material the new cellulose product gradually became known under the trade name of vulcanized hard rubber, although no vulcanizing process enters into its manufacture.

ITS FIELD OF USEFULNESS

The use of vulcanized fiber for electrical insulation was enormously developed. The high tensile strength of the material and its resistance to wear favorably impressed machine builders, boot and shoe manufacturers and many other industries. With the increasing popularity of the automobile, a new market opened which has since been continually expanding.

Except for the use of fiber gears, washers, bushings and other mechanical shapes, the chemical engineer is perhaps most interested in the adaptability of vulcanized fiber for the manufacture of receptacles and containers. In many industries in which chemical technology forms a vital part, fiber cans, boxes and trucks are used successfully in the place of metal or wood, even though the initial cost is materially higher.

The use in the rubber industry is an example of specialized application. Here vulcanized fiber has been introduced in the form of compound pans and barrels, although factory cars are also made of it occasionally. The hard usage to which compound pans are subjected makes imperative the use of a material presenting an enormous resistance to wear. The light weight of vulcanized fiber is in its favor, but one of the most important of its advantages is the fact that vulcanized fiber will not splinter, consequently there can be no chips or small material to fall into the contents of the pan. It is fair to assume that this same property will result in a more general use of these receptacles in other of the chemical and allied industries.

Chemical Stoneware and Its Applications

Being Hand-Molded, Special Shapes Are as Available as Stock Designs for Use Wherever Corrosive Action Is Encountered

BY MAURICE A. KNIGHT
Maurice A. Knight, East Akron, Ohio

WHILE chemical stoneware is a ceramic material made from clay, its composition is very different from that of ordinary stoneware, pottery, tile or brick, since it will withstand the action of acids, alkalis and corrosive chemicals. In addition it must have mechanical and thermal properties that will enable it to withstand considerable shock and reasonable changes in temperature. For the acid-resisting quality the ware as manufactured in the writer's plant does not rely on any glaze, enamel or veneer, but the entire body has this property. A salt glaze is applied for looks and finish, but plays no part in the acid-proof qualities.

When chemical stoneware was first brought on the market the sizes and designs were very limited, but as experience taught the manufacturers more and more about the compounding and nature of the clays used, the drying and firing, more varied and larger sizes and designs were evolved, until today nearly anything mechanically possible can be made in chemical stoneware.

Although the properties involved in the manufacture of chemical stoneware have been covered in detail in a previous article,[1] a brief review may not be out of place here. The raw clays which come from various parts of the United States and from foreign countries are first prepared through the use of special machinery so that they are of the right consistency and fineness for use. They are then washed, screened and filterpressed, after which they go to the blending room, where they are mixed in the proper proportions to form the different bodies. Seven different bodies are used for chemical stoneware, each designed for a particular service with due regard to the type of corrosion which will be encountered by the finished apparatus. After thorough aging, the prepared clay is ready to be molded by hand into the desired shapes. Then the ware must be carefully and evenly dried in a mechanical drier in a hot room or by natural drying in an open room, depending on the size, design and application of the piece. This drying is a very critical operation and one that must be thoroughly understood if the ware is to come through the fire in first-class shape. When thoroughly dry the ware is fired in periodic down-draft kilns, the firing and cooling operation requiring 2 weeks. The apparatus is then drawn from the kiln, inspected, checked for measurements, tested, packed and shipped. On the average, making a piece of chemical stoneware requires from 4 to 8 weeks from the start to the packing room, depending on size, thickness, design, etc., and this time cannot be shortened without danger of losing the piece.

HAND WORK FACILITATES PRODUCTION OF SPECIAL DESIGNS

Experience has shown that the only practical way to make good reliable chemical stoneware involves hand work by skilled workmen, who must be able to read and interpret the most intricate blueprints. This phase of the industry should be of greatest interest to the manufacturer of chemical products, as on this account he is not limited to standard designs for his process, but can have the apparatus made up to suit the requirements of each reaction. Furthermore, making apparatus to the customer's blueprints or designs is not, as many suppose, a costly procedure, but is in fact comparatively no more expensive than were they stock designs, for even stock designs in chemical stoneware are not made by machinery but by hand, as has already been indicated.

As chemical stoneware is made in the form of various designs of pipe and fittings in a wide range of diameters, in kettle designs, tanks, jars, tourills, receivers, storage jars, tower sections, distributors, tower packing, ejectors, blow cases, monkey pumps, faucets, manifolds, carboy stoppers, acid steam jets, brick, tile linings for tanks and towers, perforated filter tile and filters, generators, subliming pans, decanting jars, evaporating dishes, laboratory sinks, coils of many sizes and designs, "S" pipe, return bends, vapor pipe dampers, dipping baskets, pitcher and jugs, funnels, etc., there is hardly an industry that employs acids, alkalis or corrosive chemicals in its processes that has not some use for chemical stoneware, so it can be briefly stated that chemical stoneware is used and can be used in every industry where there is corrosive action of any kind.

[1]Chester H. Jones, "Chemical Stoneware Manufacture," *Chem. & Met.*, vol. 25, p. 289, Aug. 17, 1921.

Glass in Chemical Industry

A Material Which Is Having an Increasingly Wide Use in Chemical Industry—Its Interesting Development

BY J. F. GREENE
The Kimble Glass Co

GLASS as a material for industrial construction has been known and used for some time. Recently, however, it has seen new application in the use of low-expansion glass for the fabrication of pieces much larger and heavier than any previously attempted. The properties of glass which make it a desirable element in industrial chemical engineering practice are: (1) its transparency, (2) its possible perfection of finish, making a "glassy finish" a byword for supreme smoothness, (3) resistance to chemical attack, (4) the facility with which it can be blown, drawn, pressed or cast. All these properties are not inherent to the highest degree in all glasses, and usually a glass which rates high in one desirable quality will be less suitable in another respect.

The disadvantages of glass are likewise more apparent in some types than in others. They are: (1) brittleness and (2) low tensile strength in the piece, due to the enormous influence of scratches and cracks. Two other properties that come in question are resistance to heat shock and ease of annealing. Glasses vary widely in the possession of these qualifications.

Having in mind the necessary properties of the material which is to compose any industrial piece, the chemical engineer will arrive at a reasonable decision by considering how well any commercial glass meets

his specification and how its total cost (first cost and maintenance) will compare with that of any other material from which the piece might be fabricated. It will sometimes be found that a very expensive material will be cheapest in the end, due to low maintenance costs and fewer interruptions to production. In other cases the cheapest possible material will be the only one really economical.

In application where transparency is the determining factor, glass is almost without a rival. Such applications are sight feed glasses, high pressure gage glasses, glass plates for peep holes, etc. Sight feed glasses, gage glasses, etc., are usually connected to a metal fitting. In selecting a glass for this service, accuracy of sizing should be considered, since a good fit is essential. The glass should be selected to meet the temperature, pressure and heat shock requirements of the particular use. The more trying these are the more expensive glass must be used.

For resistance to chemical attack, glass is excelled in some instances by tin and platinum. It is superior to them in its resistance to phosphides, sulphides and the halogens. Earthenware has the disadvantage of porosity, and chemical stoneware improves in resistance as it approaches a glass in composition. No glass offers complete resistance to strong alkalis. However, much glass is used as small parts of electrolytic caustic plant, because the attack that takes place does not harmfully contaminate the caustic and the pieces can easily be replaced. Thus are used brine wells, a molded tube 3x19 in. with a ½-in. hole drilled in the bottom and caustic tubes, eccentrically shaped tubes about 12 mm. in diameter. The manufacture of these small parts in any other material than glass would be more expensive and not so satisfactory in use.

The Newer Uses of Glass

At a recent application of glass as a resistant material was described by F. C. Zeisberg in a late number of *Chem. & Met.* Small glass rings were used as a tower packing. It is possible to make glass rings very much smaller than earthenware or stoneware rings and as a result obtain a packing material with an enormously increased surface in a given volume. The use of glass pipes, known as "powder tubes," for pipe lines in the powder industry is an application of long standing. The well-known Hart condenser, with tubes 3 in. in diameter and 6 ft long, is still another application.

Its ease of fabrication makes glass a desirable material for many applications where transparency and resistance are not especially necessary. Jets and nozzles of various types and sizes are readily made of glass. The fire-polished finish gives a nozzle which offers the minimum resistance to flow, and allows a perfectly untroubled stream to issue. Such jets are usually made from glass tubing by reworking at the lamps, although larger sizes could be blown in a mold.

There are numerous small parts and fittings in use in the chemical industries which could be made of molded or pressed glass, doing away with expensive alloy metals and machine work. The glass piece would besides be of good resistance to chemical attack and could be fabricated from a glass having the necessary strength and resistance to heat shock.

Before settling on the final design of parts which could be made of glass, it is well to inform the manufacturer of the service under which the material is expected to stand up. He may be able to suggest minor changes in design which will greatly increase ease of manufacture. A serious consideration of industrial glass shapes and products will well repay the designing engineer.

Industrial Pyrex

The Material Is Discussed From the Standpoint of Desirable Basic Characteristics and the Methods of Fabrication

By A. E. Marshall
Consulting Engineer, Baltimore, Md

THE interest displayed by chemical engineers and manufacturers in the adaptation of Pyrex glass to plant uses has resulted in a continuous progression of development work and has also provided an indication of the demands of the chemical industry for materials with acid- and heat resisting properties.

In a previous article published in *Chem. & Met.* an outline was given of the initial stages of applying a material, familiar in laboratory shapes and sizes, to actual plant-scale operations. The present article is a summary of more recent developments and the reasons which lend interest to the future possibilities of Pyrex in the industrial field.

A general consideration of the essential requirements for plant construction materials indicates the following as desirable qualities:

Basic Requirements

1. Resistance to chemical corrosion over a wide range of temperatures.
2. Resistance to heat and to changes of temperature.
3. A reasonable degree of mechanical strength.
4. Possibility of production in a variety of shapes.
5. A cost which makes the complete plant unit a commercial possibility.

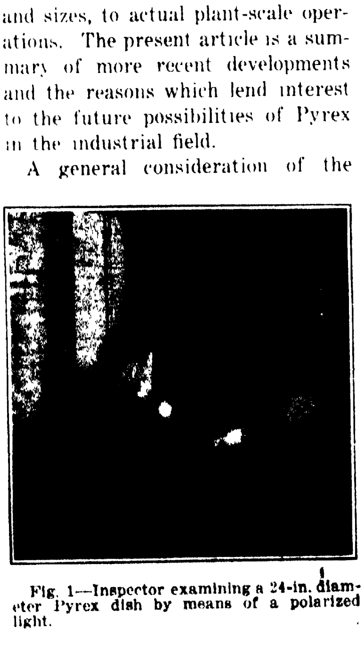

Fig. 1—Inspector examining a 24-in. diameter Pyrex dish by means of a polarized light.

No single manufactured product completely meets all of these requirements, although nature has provided certain precious metals which possess ideal characteristics. In the case of precious metals, however, the quantities available and high cost largely remove them from consideration as industrial possibilities. Plant materials have therefore to be selected with due regard to a balancing of useful properties against known limitations.

A survey of the chemical and physical characteristics of Pyrex indicates many desirable factors coupled with certain present limitations in size which somewhat restrict its field of application or call for the development of new types of construction based on available shapes. Some of

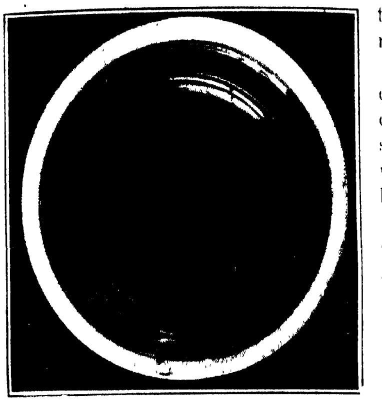

FIG. 2 End view of a 6-in. Pyrex socket pipe showing uniformity of wall of socket portion.

the basic engineering data for Pyrex glassware follow:

Specific gravity	2.25
Specific heat	0.20
Elasticity coefficient	6230 kg. per sq. mm.
Linear expansion coefficient (19°-350° C.)	0.0000032 per deg. C.
Thermal conductivity	0.0027
Electrical resistivity (surface)	10^{14} ohms at 34 per cent humidity

Mineral acids, with the exception of hydrofluoric and phosphoric, have no appreciable action up to their respective boiling points.

LIMITATION ON SIZE VARIES WITH METHOD OF FABRICATION

The limitations of size which have been referred to are of importance to the engineer, as lack of this information may call for substantial changes in design. An appreciation of the present limits can best be secured through a consideration of the various processes employed in fabricating industrial Pyrex. The principal methods of production are: Pressing, blowing and working by lamp.

The maximum size of a pressed article is a factor of weight of glass and nature of shape. Simple shapes such as hemispherical dishes can be made 24 in. in diameter, 30 liters capacity; such a dish shown in Fig. 1. More complex shapes have smaller limits, centrifugal pump liners, for instance, being a possibility up to 15 in. maximum diameter. Pressed shapes are desirable whenever fairly accurate external dimensions are desired, although it should be realized that the precision of a machined metal product cannot be obtained in Pyrex except with an extremely high rejection factor.

The second process, blowing, is restricted, in the case of industrial Pyrex, to blowing into molds. This gives a useful degree of external surface accuracy and also permits manufacture with wall thicknesses adapted to the intended use. Condenser parts made in molds can be held to $\frac{1}{16}$ to $\frac{1}{8}$ in. walls and high cooling efficiencies secured in the complete condensing apparatus. Conversely, socket pipes can be made with heavy walls to withstand the abuse of careless handling and mechanical shocks. Fig. 2 is a photograph of a 6-in. socket pipe viewed from above the socket. It illustrates a desirable thickness for the socket portion and also shows the uniformity of wall. Present sizes of mold-blown ware range from 72 liters capacity for flask or retort shapes to 12-in. diameter for socket pipes and cylinders.

The third process, working in the lamp, is an extension of glass-blowing practice to the manufacture of complex shapes incapable of production by pressing or blowing. T's, L's and other fittings are made by lamp working and have a present limit of 3-in. bore. Lamp work is also resorted to in the attachment of side connection, spigots, etc., to articles produced by the mold-blown process.

All three processes are being gradually developed toward the production of larger sizes, and an evidence of this progress is best supplied by a comparison of material available 6 months ago and at the present time. The final limits of size will of course be set by structural consideration, but these limits are a long way beyond any of the available methods of manufacture.

FIG. 3 TYPICAL PYREX SOCKET PIPE

USES OF INDUSTRIAL PYREX

Industrial uses of Pyrex can be grouped under specific applications of properties, as this method affords a useful guide to the consideration of new apparatus not included in the list. Four classifications have been followed in preparing the summary, although it will be recognized that in some cases several factors are concerned in the one piece of equipment.

1. Uses where acid resistance is important: Acid distillation sets, Hart nitric acid condenser tubes, "S" bend nitric acid condenser, hydrochloric acid coolers, pipe lines for acid gases and liquids, small tanks and pots.

2. Uses where resistance to heat shock is desirable: Condensers for organic liquids, parts for tubular evaporators, receivers for hot condensates, etc., pans and trays for driers.

3. Uses where purity of product is essential: Evaporating and crystallizing dishes, pipe lines for liquid food products, drying trays for biologicals, alkaloids, etc., tanks for precious metals solutions, reels for silk dyeing machines.

4. Uses involving transparency: Sight glasses for stills, etc., gage tubes for boilers, tanks, etc., tail boxes for distilling columns, sight pipe sections for chamber plants, apparatus for photochemical synthesis.

The majority of the applications given above relate to complete pieces of equipment, so in these cases special features of construction are not involved. The user of industrial Pyrex should remember, however, that while the material has a remarkably low coefficient of expansion, it should not be heated by a direct flame. Suitable provision in the design of the heating arrangement to obviate direct flame contact does not imply any appreciable loss in utilization of heat units.

Pyrex pipe lines, whether of the flanged or socket type, call for modification of usual methods of construction. Flanged pipes are not bolted together direct, but use is made of an extra pair of loose flanges (aluminum, cast iron or pressed steel) and external rubber gaskets between the metal flanges and the pipe. The surfaces of the Pyrex pipe flanges are ground true and suitable gaskets inserted.

Socket pipes should not be cemented with hard setting socket fillers, but a cement employed which will give the desired resistance to the acid gas or liquid with retention of plasticity. An asbestos rope ring

forced into the bottom of the socket space has been found often to be a desirable feature of this form of construction.

Development work on a number of new industrial applications of Pyrex is being actively carried on, and it is confidently expected that Pyrex will soon pass from the "new material" stage and become one of the accepted standard materials for chemical plant construction.

Vitreosil in Acid Manufacture

Greater Facility of Manufacture Has Permitted a Wide Extension of the Use of Fused Silica in Industry

BY S. L. TYLER
Thermal Syndicate, Ltd

THE early manufacture of fused quartz was carried on by the blowpipe method, the oxyhydrogen flame used as the source of the heat for fusing rock crystal. Later developments made possible the use of electrical energy as the source of heat and with this the possibility of producing much larger pieces and a greater range of shapes than had even been practical before.

Pure fused silica has a melting point at about 1,750 deg. C. It softens slightly at 1,400 deg. C. but does not reach the truly fluid condition until temperatures well above 2,000 deg. C. are reached and at these temperatures only under increased pressure. At a temperature of about 1,100 deg. C. there is a reversion back from the vitreous state to the crystalline state, but this change is very slow. At higher temperatures the devitrification is more rapid, but at no point does it occur suddenly. The coefficient of expansion of fused quartz is 0.00000054 per deg. C. over the range of 0 to 1,000 deg. C., this being the lowest coefficient of expansion of any material known over a similar range.

HIGH CORROSION RESISTANCE

It is not affected in any way by any of the mineral acids with the exception of hydrofluoric acid and phosphoric acid at high temperatures. It can be used in the handling of solutions or the making of fusions where conditions are acid or neutral. Alkaline solutions or fusions react directly with vitreosil. Ammonia is the exception to the foregoing.

Because of its high acid-resistant nature fused silica has been extensively used in the concentration of sulphuric acid, the cooling and concentration of nitric in the cooling and absorption of hydrochloric and also in the concentration of phosphoric acid and other corrosive liquids such as zinc chloride.

The sulphuric acid concentration units are of the cascade type composed of a number of basins with long spout set in cascade over the fire flue. The weak acid is fed in at the upper end of the cascade and flows by gravity to the lower and hotter portion with a continuous increase in concentration of the acid. In this type of plant the fire gases are kept entirely out of contact with the acid itself and the silica does not introduce any impurities into the acid, so the concentrated acid obtained contains no added impurities. The cascade type of concentrator is generally limited to the production of sulphric acid 66 deg. Bé.

In the cooling and condensation of nitric acid vapors the S bend type of plant is used and from these units an acid of very good quality and strength are obtained. No difficulty whatever is experienced in the packing of the joints, and by operating the condenser on the reflux principle the majority of the acid obtained is water white.

THE SILICA ABSORPTION VESSEL

The cooling of hydrochloric acid gas, whether obtained by the salt sulphuric acid or the combustion method, is carried out in S bends which are thoroughly water cooled and the absorption is carried out in a new absorption unit which has already been described. (*Chem. & Met.*, Aug. 2, 1922, vol. 27, No. 5.)

Fused silica, because of its low coefficient of expansion and good heat transfer, is especially well adapted to the cooling of corrosive gases. It is compact in design and light in weight, which tends toward reducing erection costs considerably. Indications are that the field for this material will be bigger and more extensive in the future because the greater facility in fabrication has permitted the manufacture of numerous shapes.

Fused Silica in Radium Production

Replacing Expensive Porcelain Ware, This Material Has Established Its Industrial Utility—Some Hints About Its Use

BY CHARLES H. VIOL
Director, Vanadium Co. of America

AT the outbreak of the war in 1914, we were using in our refining operations, which involved the fractional crystallization of thousands of pounds of radium barium chloride per year, the best porcelain which the market afforded, this being the Royal Berlin porcelain. The war soon ended our ability to secure these porcelain dishes and we hit upon the use of the larger sized vitreosil fused silica dishes. At that time the dishes were not as large as we would like nor were they provided with an altogether satisfactory lip, but in all other respects they were eminently satisfactory, and in their durability they were superior to porcelain. Later we were able to secure the larger dishes with the good pouring lip as manufactured for the sulphuric acid concentration work, and this form of dish has given us the greatest satisfaction, fulfilling every requirement that could reasonably be asked in ware of this class.

Enameled metal would probably be more durable, but an investigation of this ware convinced us that the cost was prohibitively high for our particular use and while, from the standpoint of mechanical strength, it might be more durable than the silica, it is problematical whether such ware would withstand, as well as does the silica, the fumes and acid liquors which would come in contact with it.

WOODEN STIRRERS DIMINISH BREAKAGE

We have had breakage with this ware from time to time, a large part of which was traceable to the use of heavy glass stirring rods, which have since been replaced by wood. With this change we have been able to heat the dishes directly over a gas flame, supporting the dish by contact with a metal plate provided with a circular opening, and this rather rough treatment of the ware more than anything else goes to show the sturdy quality of the fused silica.

CHEMICAL & METALLURGICAL ENGINEERING

Tenth Avenue at 36th Street, New York

H. C. PARMELEE, *Editor*

Market Section

The Summary of the Week

The weighted index of chemical prices showed a moderate reduction for the first time in weeks, reflecting, to a large extent, an easier situation in fertilizer materials.

Phenol on spot, resale parcels, sold at 53@55c. per lb., which compares with 26c. per lb. the contract price at which producers are making deliveries.

Firmer prices were named in some directions for citric acid, spot and shipment.

Cables from Europe reported a higher market for tartaric acid and cream of tartar.

Shipment prices on German chemicals are unsettled, with doubt about deliveries.

Consumers of cresylic acid appoint committee to petition Tariff Commission for reduction in tariff duty on this material.

Trial examiner of Federal Trade Commission recommends dismissal of complaint against the Procter & Gamble Distributing Co., charged with selling its goods with a guarantee against price reduction.

Estimates on supplies of calcium arsenate show increase over earlier figures, but still indicate a shortage.

Caustic potash and potash first sorts sold at higher prices in the spot market.

Consolidations of large manufacturing companies reported, with others in prospect.

Prices for linseed oil were advanced 3c. per gallon on the scarcity of spot stocks.

Federal Trade Commission announces that its investigation into arsenic and calcium arsenate situation fails to disclose any concerted effort of producers to manipulate prices.

Uniform Sales Contract for Heavy Chemicals

AS reported last week in the news columns of *Chem. & Met.*, the Salesmen's Association of the American Chemical Industry has taken up the question of adopting a uniform contract to be used in transactions involving heavy chemicals. Through a committee, consisting of men prominent in the industry, the association already is engaged in the preliminary work of drawing up the provisions of a suitable contract. The committee will welcome suggestions and constructive advice with the sole purpose in view of producing a document that will meet with the approval of the trade and will operate efficiently.

The advantages of such a contract are apparent. To begin with, there is no good reason why a standard contract for heavy chemicals should not be adopted and put into operation. There are many reasons—reasons making for economy, efficiency, simplicity and avoidance of possible misunderstandings—why a uniform contract should supersede the individual and sometimes widely varying contracts now in force.

Trading in imported vegetable oils is regulated by a contract that has been universally adopted by importers and dealers in these oils. There are two features to this contract to which we would direct the attention of the committee now engaged in working out a contract for the heavy chemical trade.

In the first place, it was sponsored by the New York Produce Exchange and functions under the sanction and protection of that institution. Buyers and sellers alike have implicit confidence in a contract wherein terms and conditions have been standardized and where the contract is labeled with the official approval of a recognized organization. The proposed chemical contract will be similar in this respect—that it will be representative of an organization of acknowledged standing in its own field.

This leads up to the second feature to which we have referred, consisting in a clause in the vegetable oil contract wherein it is provided that any disputes arising out of the contract shall be submitted to arbitration in accordance with the rules of the Produce Exchange. These oil contracts can carry an arbitration clause because there is an organization ready and equipped to handle the arbitration. A contract espoused by the Chemical Salesmen's Association likewise can carry an arbitration clause with arbitrations conducted under the auspices of the association.

The advantages of arbitrating commercial disputes may be briefly summed up in the words of the past president of the National Association of Credit Men in session last week:

"Aside from the settlement of disputes in commercial transactions, the arbitration plan could comprehend disputes over contracts in allied fields. Why should the dockets of courts be congested? Why should delays be suffered in the adjudication of contentions when arbitration would insure justice and with very considerable saving in time and cost?"

We respectfully commend the arbitration clause as an integral part of the contract for heavy chemicals.

Government Investigations Establish Validity of Calcium Arsenate Prices

Federal Trade Commission Reports Production Inadequate for Demand—Supply Larger Than Had Been Expected

TWO separate investigations by the government have failed to disclose any evidence of concerted action by manufacturers of calcium arsenate to fix prices. One inquiry, by the United States Department of Agriculture and the Geological Survey in response to a Senate resolution, found that uncertainty of the demand was responsible for the present shortage of the insecticide, resulting in price variations that were not brought about by price fixing. In a preliminary report just made public, the Federal Trade Commission, which also investigated the calcium arsenate industry, confirms these findings.

No Unfair Practices

"No widespread or important specific cases of unfair practices in the trade," says the commission in summing up its report, "have been found down to the present stage of the inquiry."

The commission concludes:

"The great increase in the Southern demand for calcium arsenate and the inadequacy of the available supply of white arsenic prevented the insecticide manufacturers from producing sufficient quantities of calcium arsenate to meet this demand, the result being a marked increase in the price of white arsenic and of calcium arsenate during the seasons of 1922 and 1923.

"The low price paid in the State of Georgia during the term of the Sherwin-Williams contract with that state was, in part at least, responsible for the opinion that an injustice was being done by the insecticide manufacturers to those customers outside the state who were paying a price as high in some cases as 100 per cent greater than that named in the above-mentioned contract, an opinion which was shared by the Georgia consumers after the expiration of this contract, when they likewise had to pay similarly high prices for calcium arsenate.

No Evidence of Price Fixing

"While efforts were made by the insecticide manufacturers to establish an association, one of the objects of which seems to have been the adjusting or at least discussion of price discrepancies, it does not appear that these efforts resulted in price-fixing or open-price activities."

The investigation by the commission was made in response to a Senate resolution. Demands for an inquiry were based upon wide variations in the price of calcium arsenate. Prices, which in October, 1922, ranged from 10 to 12 cents a pound, increased rapidly during the next 30 to 60 days, and in February, 1923, had reached a range of 18 to 19 cents.

Increased Supply in Sight

In connection with the supply of calcium arsenate B. R. Coad of the Bureau of Entomology estimates that twenty-five million pounds will have been made available by June. This is practically double the amount of the estimate made last October. "This great increase has not been brought about," says Mr. Coad, "by any sudden discovery of a large quantity of material, but merely by accelerated production throughout the raw arsenic-producing industry, together with readjustments in programs throughout the arsenic-consuming industry, resulting in more arsenic being used for calcium arsenate production than was anticipated at first."

Demand Has Fallen Off

Continuing, Mr. Coad says: "About the first of February a survey of the situation showed that apparently around eighteen or nineteen million pounds had already been contracted for delivery by the manufacturers, and the margin thus left for sale was comparatively small. Since that time, however, there has been a decided lull in buying, and a considerable amount of cancellation of these contracts by jobbers and others, who had bought without any very definite idea of the amount they would be able to distribute. As a consequence, for at least the past few weeks the manufacturers have for the first time been confronted with the possibility of production of material for which there is no immediate demand, and if this situation continues very long, we must expect some curtailment of calcium arsenate production programs.

Shortage Is Predicted

"Every year so far, since calcium arsenate has been used for cotton dusting, we have seen a very heavy last-minute demand during the months of May and June, and particularly during 1922 this demand was so exceedingly heavy that it was impossible to produce material to meet it. As the situation stands today, there are probably several million pounds of material which will be available for this late demand, if present manufacturing programs are carried out, but, as has been pointed out, this production will be reduced somewhat if the demand continues to fall off.

"Furthermore the prices at which the arsenic has been purchased are such that the manufacturers cannot afford to turn it into calcium arsenate to sell at a price very much below the present levels, and thus they will take no chance on overproduction. At the same time, however, if we may judge at all by past experience, the late demand will be far in excess of the margin available for its satisfaction. In other words, as nearly as can be foretold at this time, even with continued maximum production of calcium arsenate and at prices now prevailing, there will be a definite shortage of calcium arsenate by the time dusting becomes active, and probably somewhat earlier, but this shortage will not be nearly as acute as was anticipated in the early fall."

Chemical Salesmen to Meet Wednesday

The April meeting of the Salesmen's Association of the American Chemical Industry will be held Wednesday evening, April 18, at the Chemists' Club, 52 East 41st St., New York City. Dinner will be served at 6.30 p.m. sharp, but members and their friends are urged to be on hand early for the purpose of getting acquainted. H. B. Prior, chairman of the entertainment committee, has arranged an interesting program for the occasion. The principal speaker will be Paul T. Cherington of the J. Walter Thompson Company, one of the leading firms in the advertising field.

Mr. Cherington was formerly professor of marketing in the Graduate School of Business Administration of Harvard University and later was secretary-treasurer of the National Association of Wool Manufacturers. He has had a wide range of experience on the general subject of merchandising and advertising and has earned a reputation as an able writer and a clear speaker. He will speak on the subject: "Problems Experienced in Marketing a Consumer Product." The speaker will be introduced by Charles Wadsworth, 3rd, assistant editor of *Chem. & Met.*, who will also outline a program which has been suggested with the idea of making these meetings more interesting and beneficial.

Washington News

German Chemical Exports Are Restricted

Chance for American Manufacturers to Supply Foreign Markets

The volume in which German chemical exports continue to move is occasioning some surprise, but reports reaching Washington indicate that these exports are confined largely to the United States and to Great Britian, countries in which Germany is particularly anxious to build up credit and to retain markets. Reports from Austria, Germany's next-door neighbor, which has relied on Germany since the war for its entire chemical requirements, indicate that the country is in desperate straits as a result of the practical cessation of chemical supplies from Germany. The situation is one which is expected to force the Austrian chemical plants to reopen. Since the war the financial situation in that country has been such as to discourage any resumption of manufacturing activities.

U. S. and England Favored

The reports from Austria and from other countries indicate that Germany is exporting almost exclusively to the United States and to Great Britain. It is believed, however, that the rate of exportation will diminish sharply from this time forward. An indication of the situation in Germany is had in the fact that inquiries looking to the purchase of chemicals are being received in this country from Germany. Another indication is the increasing shortage of German patented products.

Opportunity for America

Information reaching Washington indicates that chemical manufacturers in this country, engaged as they are in an effort to supply a very active domestic market, are paying very little attention to the opportunities now offered to annex foreign markets. In that connection it is pointed out that such an apportunity rarely knocks twice in a generation. During the war the American chemical industry had an opportunity to annex permanently certain of the foreign markets that had been supplied theretofore by Germany. This opportunity was not improved to any great extent, but at that time the industry had had little experience in foreign merchandising and there were difficulties as to quality and uniformity, which now have been overcome. The opinion is expressed that if the industry does not improve this second opportunity in the scramble to take full advantage of the peak to which the wave of prosperity has pushed domestic demand it would be well now to enter upon manufacturing expansion without losing sight of the volume of domestic business in the off-peak period.

Recommends Dismissal of Price Maintenance Suit

Final arguments were heard on Wednesday before the Federal Trade Commission on its complaint against the Procter & Gamble Distributing Co. of Cincinnati, which was charged with giving rebates to jobbers and with selling its products with a guarantee against price declines. Warren R. Choate of the Federal Trade Commission recommended that the complaint be dismissed.

Although the examiner suggested that an order be issued dismissing the complaint, the commissioners listened to exhaustive arguments by both sides.

In recommending dismissal of the case Mr. Choate stated that the practice of guaranteeing jobbers against price declines and of giving rebates on credit allowances had existed in the soap industry for 30 or 40 years and that the Procter & Gamble Co. had not taken advantage of competitors who did not give price decline guarantees. As used by the respondent, it was declared that the practice did not deter manufacturers from reducing prices, and did not encourage speculation by jobbers.

American Phosphate Rock Shut Out of the Ruhr

Shipments of American phospate rock are not being permitted to enter the occupied portion of Germany, protests to Washington indicate. Representatives of this government in Germany have been asked to ascertain whether this is deliberate action on the part of German authorities or is being occasioned by transportation embargoes incident to the disturbed situation.

Invoices of Coal-Tar Imports Must Show Makers' Name

In compliance with the new tariff act, the Treasury Department has requested the State Department to notify consuls to require additional information with invoices of coal-tar dyes and chemicals.

A proviso of the coal-tar paragraph stipulates that 6 months after passage of the act each invoice and container shall state the name of the manufacturer, the trade name of the article, the chemical formula with the trade name or identification number, if the article is not classified and identified chemically in the Schultz or some other similar publication, the Schultz or other number if any, or if none, the class or color—that is, whether it is an alizarine, azo or sulphur color, etc.; the percentage exclusive of diluents of the pure dye contained in the article, and that these particulars shall also be stated in the case of each dye contained in a mixture of two or more dyes.

Alsatian Output of Potash Increased in 1922

During 1922 the potash mines in Alsace exceeded the production of any previous year. In 1922 the total output was 1,326,727 tons. In 1920 the Alsatian production was 1,222,370 tons. This greatly exceeded, however, the 1919 production, which was 592,365 tons. The 1921 production was 903,134 tons.

Potassium chloride is being produced at the rate of 250,000 tons, which is the maximum which can be produced with the existing plants. In addition to the chloride production, however, there is a very material production of potassium sulphate.

"Turpentine" Is Unfair Name for Turpentine Substitute

Advertising a product so as to give the impression that it is turpentine when such product is a coal-tar distillate and not obtained from the sap of the pine tree is declared by the Federal Trade Commission to be an unfair business practice. The commission in its investigation of the International Paint & Oil Co., of Peoria, Ill., developed the fact that the concern used the name "Tar-Pentine" in marketing a commodity resembling turpentine and made various claims of the superiority of its product over turpentine. The commission's order specifies that respondent must stop using the words "Tar-Pentine," "Tarpentine" or words of similar import, in connection with the sale or offer for sale of a commodity which is not turpentine.

Production of Methanol Declined in February

Acetate of Lime Output for That Month Also Lower

The production of acetate of lime and of methanol declined still further in February from the high mark set in December. Acetate of lime output amounted to 13,894,000 lb., as against 16,544,000 lb. in January, and methanol production was 773,179 gal., as against 933,171 gal. in December. Consumption of wood declined to 85,105 cords and stocks of wood at chemical plants declined to 807,782 cords, the lowest since November, 1921.

The following table shows total comparative figures for the past 5 months, as reported by firms with a daily capacity of 4,500 cords (or prorated to that capacity in months where some reports were lacking), and the comparable monthly figures for 1922, taken from the *Survey of Current Business* published by the Department of Commerce:

	Acetate of Lime Thous. of Lb.	Methanol Gal.
1922		
October	12,217	664,933
November	15,440	835,687
December	16,814	942,008
1923		
January	16,544	933,171
February	13,894	773,179

Mergers of Manufacturing Companies Completed and in Prospect

Certain-Teed Products Corporation Absorbs Linoleum and Cement Companies—Cotton Oil and Linseed Oil Companies Figure in Merger Rumors

GEORGE BROWN, president of the Certain-Teed Products Corporation, which is one of the largest manufacturers of paints and roofing materials in this country, has confirmed earlier announcements to the effect that the company had acquired control of Cooks Linoleum Co., Trenton, N. J., the Acme Cement Co., St. Louis, and Thomas Potter & Sons Co., manufacturer of linoleum at Philadelphia. In confirming the merger of interests Mr. Brown stated:

"These large additions to our present manufacturing facilities and administrative organizations means the completion of our line of products for the construction, protection and equipment of buildings and the distribution of these closely related necessities through the same channels, eliminating all avoidable waste."

The amount involved in completing the merger of these companies was $8 000,000. The consolidation brings under one producing and administrative organization the leading linoleum manufacturers of the United States and also puts the corporation in the fore rank of gypsum producers. The Certain-Teed Products Corporation has shown remarkable growth in the last sixteen years.

Another Merger Rumored

Following the confirmation of this consolidation of interests rumors were heard that a merger of the American Cotton Oil Co., the Portsmouth Cotton Oil Refining Co. and the Gulf & Valley Cotton Oil Co. has progressed to a point where definite terms of consolidation had been agreed on. According to reports the consolidation would require $10,000,000 new capital, which would be used chiefly in retiring outstanding notes of the American Cotton Oil Co. and for working capital. A syndicate was said to have charge of underwriting this stock issue.

The report further stated that no name had yet been selected for the new company and that the stock distribution had not been worked out, but in the case of the American Cotton Oil Co., which has a common stock capital of nearly $21,000,000, it was stated this would be scaled down to about one-third and that holders of this stock would be asked to accept one share of stock in the new company for each three shares of American Cotton Oil stock.

Royal Victor, counsel for the American Cotton Oil Co. and one of its directors, issued a statement denying the accuracy of the reported merger. He stated that: "If any plan of consolidation or merger with other interests is effected, the management will give authentic information concerning it."

The American Linseed Co. and the Midland Linseed Products Co., leading producers of linseed oil, were most prominently connected with still another reported merger. The latter reports apparently originated in financial circles and could not be pinned down to anything definite. The rumor was that the American Linseed Co. would absorb one of its competitors and apparently the Midland Linseed Products Co. entered into the report because of its prominence in the industry.

To Apply for Lower Tariff on Cresylic Acid

More than twenty representatives of consumers, producers and importers of cresylic acid met at the Old Colony Club, New York, on April 9, to discuss the tariff situation, and it was agreed to ask for a lower rate under the flexible rate clause of the tariff. Unless a lower rate is granted, many consumers will be forced to abandon using this important coal-tar product, according to members of the trade. The tariff provides for a rate of 55 per cent ad valorem plus a specific duty of 7c. a pound. Domestic production has been below requirements. Under the tariff cresylic acid cannot be imported under $1.30 per gallon, while producers here are delivering this material against existing contracts at approximately 79c. per gallon. Consumers not protected by contract are at a great disadvantage.

The following were appointed at the meeting to present the matter before the United States Tariff Commission: M. M. Marcus, West Disinfecting Co.; W. E. Jordan, Jordan Coal-Tar Products Co.; W. H. Gesell, Lehn & Fink; P. C. Lemley, William Cooper & Nephews; R. N. Chipman, Chipman Chemical Engineering Co.

Austrian Company to Produce Calcium Nitrate

A message from Munich states that the Stickstoff A. G., which belongs to the Bayerische Stickstoffwerken A. G. of Munich and is an Austrian company working with German capital, is about to construct important works for the production of calcium nitrate at Gollingen. The company will utilize chalk from the neighboring quarries, native peat coke and nitrogen from liquid air, and will obtain electric power from hydraulic forces which can be utilized in the region. The construction at a later period is also contemplated of electric works on the Kapruner-Ache.

Trade Brevities

Ferdinand Kieckheffer has been elected director of the National Enameling & Stamping Co., succeeding W. G. MacQuire, recently made president of the St. Louis Coke & Chemical Co.

Percy J. Flint, for many years connected with the American Agricultural Chemical Co., is now associated with Eugene Suter & Co.

Robert Tomlinson, the 7-year-old son of G. H. Tomlinson, manager of the New York office of the Midland Linseed Products Co., was killed on Sunday while playing at Owen Field, Maplewood, N. J.

E. J. Barber, of the White Tar Co., Inc., returned last week from a business trip to New England.

The export and import business of the Hagemeyer Trading Co., Inc., 17 Battery Place, has been merged into that of William E. Peck & Co., Inc., whose offices are in the Peck Building, 140 Front St.

The offices of Irving R. Boody & Co., vegetable oils and Oriental products, formerly located on the fifth floor of 82 Beaver St., have been moved to Suite 1211, the same building.

The Brooklyn plant of the Kasebier-Chatfield Shellac Co., which was destroyed by fire last fall, has been rebuilt and has resumed operations.

R. E. Dorland, manager of the New York office of the Dow Chemical Co., is on a visit to the main plant of the company at Midland, Mich.

Frank McCartney, general sales manager of the Monsanto Chemical Works, St. Louis, is at the New York office for a stay of a few weeks.

The Republic Trading Co. of New York City has increased its capital stock from $25,000 to $2,000,000.

The Bureau of Foreign and Domestic Commerce announces that C. C. Batchelder has recently returned from Calcutta, India. For the next week or longer he will make his headquarters at the bureau's New York office, room 734, Custom House, where he will be pleased to consult with manufacturers, importers, exporters and others interested in trade with India.

Loss estimated at $50,000 was suffered by the Chemical Utilities Co., Cincinnati, on April 6, when fire destroyed a warehouse stored with large quantities of sulphuric acid along with chemicals of a highly explosive nature. This building had just been acquired by the company and was being remodeled for occupancy. Firemen prevented the blaze from spreading to the adjoining property belonging to Fries & Fries, chemical manufacturers.

William C. Schwarz of New York has joined the Bureau of Foreign and Domestic Commerce at Washington and will have charge of statistical work in connection with imports of dyes.

American Institute of Chemistry Holds First Annual Meeting

The first annual meeting of the American Institute of Chemistry was held at the Hotel Breslin, Monday evening, April 9. The meeting was preceded by a dinner which was very well attended.

The secretary announced a charter membership of 150 and a list of 100 applicants whose credentials had not yet been passed upon by the council. The membership roll reveals the fact that both charter members and applicants represent practically every state in the Union. Even in the short period of preliminary organization the scope of the organization extended from coast to coast. The initial steps for the organization of two chapters of the institute in states where the membership is already more than sufficient were announced at the meeting. These two states are New Jersey and New York. Plans for several other state chapters are under way.

The temporary officers and the council chosen at the organization meeting were confirmed for the ensuing year. The following committees and their personnel were announced:

Professional Education—Dr. Casimir Funk, director H. A. Metz Laboratories; Dr. Arthur E. Hill, head of the department of chemistry, N.Y.U.; Dr. Guy Y. Williams, professor of physical chemistry, University of Oklahoma.

Ethics—Dr. Mathew A. Hunter, professor of electrochemistry, Rensselaer Polytechnic Institute; Dr. Benjamin Harrow, associate in biochemistry, College of Physicians and Surgeons; Dr. H. B. Gordon, chemist, U. S. Testing Co.

Membership — C. L. Bryden, 381 Fourth Ave., New York City; H. L. Lourie, U. S. Tariff Commission, Washington, D. C.; James R. H. Stevens, James H. Wallace Co., Stamford, Conn.; Robert E. Pittman, Sloss-Sheffield Steel & Iron Co., Birmingham, Ala.

Publicity — Dr. Leon W. Parsons, chief chemist, Tidewater Oil Co., Bayonne, N. J.: Prof. Glen V. Brown, professor of chemical engineering, Bucknell University, Lewisburg, Pa.; Dr. Frederick W. Zons, consulting chemist, 239 Center St., New York City; Adriaan Nagelvoort, chemical engineer, 52 East 41st St., New York City.

Legal—Dr. Lloyd Van Doren, patent attorney, 21 West 44th St., New York City; Dr. W. Lee Tanner, research chemist, Grasselli Chemical Co., Cleveland, Ohio; Dr. Carleton Ellis, consulting chemist, Montclair, N. J.

Classification — Dr. Frederick W. Crane, consulting chemist, Montclair, N. J., and professor of chemistry, Newark Technical College; Dr. Stewart J. Lloyd, professor of chemistry, University of Alabama; Dr. Henry G. Knight, director of the Experiment Station, University of West Virginia.

Employment—L. R. Seidell, manager N. Y. Testing Laboratories; Maximilian Toch, Toch Brothers, 110 East 42nd St., New York City; C. V. Bacon, consulting chemist, 3 Park Row, New York City.

Explosion Rends Dye Plant

An explosion which killed two and injured several others occurred at the plant of the National Aniline & Chemical Co. at Buffalo, N. Y., on April 3. The property damage was slight. The explosion occurred in the mixing and grinding department during an operation common to several other plants belonging to the company. The cause of the accident therefore is unknown and consequently is being carefully investigated.

A representative of the National Aniline & Chemical Co. has stated to a member of the *Chem. & Met.* staff that, contrary to early rumors, no picric acid was present or in process at the time of the blow. The possibility of a dust explosion was also doubted.

Calendar

The following important technical meetings are scheduled for the immediate future:

American Assn. of Engineers	Norfolk, May 7-9
American Chemical Society, Regular meeting	New York, May 4
American Electrochemical Society	New York City, May 3-5
Amer Society Mechanical Engrs.	Montreal, May 28-31
American Foundrymen's Association	Cleveland, O., April 30-May 3
American Oil Chemists' Society	Hot Springs, Ark., April 30-May 1
American Welding Society	New York, April 24-27
American Zinc Institute	St. Louis, May 7-8
Canadian Institute of Chemistry	Toronto, May 29-31
Interstate Cotton Seed Crushers Assn.	Hot Springs, Ark., May 2-5
Society of Chemical Industry, Canadian Section	Toronto, May 29-31
Society of Industrial Engineers	Cincinnati, O. April 18-20

New Furnace Tested at M.I.T.

A remarkable series of tests was recently carried out at the Massachusetts Institute of Technology on the Cannon radiating furnace. Essentially this is a combustion chamber in which fuel oil or pulverized coal may be burned at a high rate of speed. This of course implies that the conductivity of the chamber walls is very high, and that is the reason for using carborundum in the walls. As a matter of fact, the Carborundum Co. has purchased the patent rights for this equipment.

The tests at the M.I.T. carried out by Professors Miller and Eames showed a capacity of 320,000 B.t.u. per cubic foot of combustion space for a short time. This is a remarkable figure and gives distinct industrial promise.

Noted Men Receive Medals

The Franklin medal, highest award of the Franklin Institute, was given Sir J. J. Thompson, F.R.S., at a special meeting of the American Philosophical Society in Philadelphia on April 19. He likewise received the John Scott medal and award of $1,000. At the meeting he discussed the possibility of a new form of water molecule.

Other recipients of the Scott medal and the premium were Dr. C. Eijkman of the University of Utrecht, Holland, for his contributions to medical science; Dr. A. L. Day, director of the Geophysical Laboratory of the Carnegie Institute, Washington, for his work in the interpretation of geological phenomena and for producing optical glass, and Dr. F. W. Aston of Trinity College, a leading student of the disintegration products due to radio-activity, who developed a special instrument, known as the mass spectograph, capable of an accuracy of one part in one thousand.

The Scott medals are awarded by the city through the Board of City Trusts. Funds for the purpose were bequeathed to the city in 1816 by John Scott of Edinburgh.

A. De Graeffe, Minister from the Netherlands, received the medal and the premium for Dr. Eijkman, and H. G. Chilton of the British Embassy at Washington accepted them for Dr. Aston.

Fluorspar Situation Alarms Non-Metals Specialists

That the War and Interior Departments in their war minerals activities should include fluorspar is a contention raised by some of the government's non-metals specialists. Some of them go so far as to state that fluorspar is more essential than manganese, since it is possible, in an emergency, to use manganiferous iron ores or to make use of the lower grade manganese deposits. On the other hand, with one exception, no new deposit of fluorspar has been brought in since the beginning of the war.

From this time forward, it is contended, much will be heard of the fluorspar situation. The more readily mined deposits are being exhausted and the apparent lack of domestic resources of this essential flux for the making of basic open-hearth steel is causing apprehension.

A recent questionnaire sent out by the Bureau of Mines to the chief chemists of the principal steel companies brought forth, among other things, the fact that there is no substitute for fluorspar in the making of steel, even at greatly increased prices. In addition, it is the only source of hydrofluoric acid, which also is an essential commodity in carrying on a war.

Cryolite is occasionally used as a substitute for fluorspar. Since the only commercial deposit of cryolite is in Greenland, it would have little bearing on the situation in an emergency.

Phosphate Gains Attention

Extensive Deposits in Idaho Have Been Investigated—Florida's Resources Next to Receive Attention

There are more than 100,000 acres of land in northern and middle Florida believed to contain phosphate rock which have been withdrawn from entry by the Interior Department. Individuals assert patent rights to some of this property and a number of discrepancies in records have developed. Much of the land, however, never has been claimed for patent by private individuals.

Geological work of investigation of these lands is to be conducted by G. R. Mansfield and G. W. Holland of the Geological Survey. The latter already is in Gainesville comparing records and he will be joined by Mr. Mansfield before the end of the month.

The phosphate deposits of Florida are rated as the richest in the United States, particularly the pebble phosphate east of Tampa. In the northern part of the state, the phosphate is hard rock or slate rock. The deposits on private lands have been extensively developed, principally for export demand. Development has slackened recently owing to a decrease in this demand occasioned in part by the development of phosphate in northern Africa, which, although of a lower grade, is closer to the German and French fertilizer markets.

Mr. Mansfield is completing a report on the phosphate deposits of Idaho which will be submitted to Acting Director P. S. Smith of the Survey before he goes to Florida. The Idaho deposits are extensive and of good grade. The greatest development in that state is that of the Anaconda Copper Co. which has built a 7-mile railroad to its phosphate mine and has established a plant to produce superphosphates, using acids from its other plants.

Glass Patent Question Closed

The Supreme Court will not consider the validity of the basic patents involved in the conversion of the glass industry from a hand-blowing to a machine-drawing art. Considerable interest is attached to this decision by the glass industry.

The Window Glass Machine Co. and the American Window Glass Co. sought to bring up for review a case against the Pittsburgh Plate Glass Co. in which the federal District Court for western Pennsylvania held that the patents had not been infringed. It was contended by the companies interested in maintaining control under the patents that in a long list of adjudicated cases presenting similar controversies the federal courts had sustained the validity of the patents. The main patents at issue, it was asserted, had "revolutionized" the industry.

The Third Circuit Court of Appeals affirmed the decision of the District Court, which, it was declared, had reversed a long line of decisions.

Develops Successful Mask

Development of a "universal gas mask" which is considered to have the widest application of any gas mask thus far devised and which fills every demand that may reasonably be made on a gas mask is announced by the Department of the Interior as the result of experimental work performed by the Bureau of Mines at its Pittsburgh, Pa., station. The department also announces the development of a "fireman's canister" which is similar to the "universal canister" but is smaller and lighter, thus making it more convenient for the use of city firemen. By the use of these types of gas masks, workers in many metallurgical and chemical plants may encounter a variety of gases and city firemen may meet almost any type of gas or vapor and do work that they could not do otherwise except at the risk of death or serious disability.

The canister contains granular absorbents, consisting of activated charcoal, for removing organic vapors; a filter of cotton wool for removing smokes, dusts and mists; caustic soda fused on pumice stone for removing acid gases; another cotton-wool filter; fused calcium chloride for extracting water vapor that inhibits action of the next absorbent; "hopcalite," a mixture of oxides of manganese and copper with sometimes silver and cobalt that destroys carbon monoxide; and finally silica gel for absorbing ammonia.

News Notes

French metallurgical production is again gaining slowly. Coke supplies available are gradually growing up. Belgium and Holland are supplying small amounts, while a considerable quantity is beginning to come in from Czechoslovakia.

Technical courses of broad range are to be given at Carnegie Tech. during the coming summer. The school will open June 25 for 8 weeks. The colleges of engineering and industries are to offer an especially good choice in the work which may be taken.

Three airplanes, loaned by the War Department, are now being fitted up for the boll weevil campaign by the Department of Agriculture. If this work is successful, further funds will be used in dusting calcium arsenate by this means.

Five research fellowships, each of value of $810 per year, are open at the College of Mines, Seattle, Wash. The following subjects have been selected for investigation. Coal washing, electrometallurgy, ferrous metallurgy, super-refractories, and white ware bodies. Applications are due not later than May 10 and should be addressed to Dean Milnor Roberts.

Newsprint, woodpulp and lumber are the chief products that contributed to the increase in Canada's exports to the United States for the 11 months of the present fiscal year, as compared with the corresponding period of the last fiscal year, ended March 31. The group of wood, wood products and paper, to which these articles belong, account for more than half of the total increase of $63,000,000 in the total exports to the United States.

Ceramic wares of all kinds are to be produced in growing volume in the United States if the present expansion of the pottery industry is a correct indication of the tendency of the times. Many new additions are in sight in every line from heavy sanitary ware to fine china. The Westinghouse High-Voltage Insulator Co. is to open a new plant in California early in June for the production of electrical insulating porcelains.

Paper men in New York during the week of April 9 staged many affairs of unusual interest. The Technical Association held several sessions, very largely attended, of definite practical value. The exposition at Grand Central Palace lived up to expectations. An account of the week's proceedings and of the exposition will appear in next week's *Chem. & Met.*

Hartford engineers and chemists are considering the formation of an engineers' club. Six technical societies have chapters in or near the city. On April 21 a joint trip, dinner and meeting of all interested is to be held. At this time the new plant of the Hartford Rubber Works is to be open to inspection.

Over 4,000,000 lb. of various metals is to be placed open for bids by the navy on April 19. Brass, copper, aluminum, zinc, bronze and Monel metal are included in the list.

Varied industrial plants, thirty in number, have just been visited by the senior class of the engineering college of the University of Kentucky in a spring tour covering the Buffalo-Pittsburgh centers.

The Ruhr export situation, despite much discussion and many assurances of improvement, remains practically unchanged. German exporters have been instructed by their government not to pay the 10 per cent duty imposed by the French. The blockade remains as effective as ever.

The Gypsum Industries Association of Chicago has been found not guilty of violation of anti-trust laws. The government, through the Federal Trade Commission, has dropped its charge of manipulation to obtain monopoly.

Lignite or brown coal is being used in many German industries, including those producing potash and nitrogenous fertilizer. Power stations, glass and potteries factories are also using lignite for fuel, mainly in form of briquets.

Exceptionally strong fertilizers are obtained by the treatment of Vesuvian lava, according to a dispatch just received from Milan. A phosphoric solution is used in this treatment. If practical results bear out expectations a new fertilizer for Italian agriculture will be available.

Facts and Figures
That Influence Trade
in Chemical Products

Market Conditions

Current Prices
Imports and Exports
The Trend of Business

Active Movement in Heavy Chemicals Absorbs Domestic Output

Trading in German Chemicals for Shipment Restricted—Permanganate of Potash in Strong Position—Arsenic Irregular—Active Call for Tartaric Acid—Higher Prices for Imported Potassium Bromide

CONTINUED call for contract deliveries of heavy chemicals is taking up the bulk of production. New business placed during the week was not large, but this is accounted for by the fact that the large consuming trades are covered ahead. The total movement so far this month has assumed record proportions. The situation surrounding chemicals of German origin is growing more complex. This has resulted in uncertainty regarding shipments and in some cases importers have withdrawn quotations, as no assurance can be given that deliveries will be made within the time limits specified. This condition is true not only of chemicals coming from the Ruhr Valley but also of those from other sections of Germany, as the raw materials in many cases are drawn from the Ruhr. Furthermore the imposition of export taxes on goods shipped from the latter section has a demoralizing effect on business. To add to the confusion the German Government is reported to have advised exporters not to pay the export taxes and if this policy is followed out, no permits for shipment will be issued.

Building Operations Increase

Reports on building operations show that activity in that line is going on unabated. This accounts for the heavy consumption of such chemicals as enter into the dry color trade and other branches of the paint and varnish industries. Substantial decreases in the shortage of freight cars also is reported and fewer complaints are heard about delays in shipping chemicals.

Prices for the majority of chemicals of domestic origin have held a steady position with a firm tone generally noted, due to good consuming demand and strong producing costs. Most imported chemicals have shown a tendency to advance and this is especially true of all potash compounds. Arrivals of foreign made chemicals were of good volume but in most cases they were sold ahead and had little if any influence as price factors. Some speculation has arisen with reference to new contract prices for soda ash and other basic chemicals as it is feared that advances in price are probable, but as these new prices will not be announced for a long time, there may be many changes in fundamental conditions which will nullify present calculations.

Acids

Acetic Acid—Glacial is reported to be easy with some resale lots to be had at price concessions. First hands quote the market unchanged at $12.05@12.85. The lower grades are moving steadily to consumers and prices are well maintained. Quotations are on a basis of $3.17½ for 28 per cent and $6.35 for 56 per cent.

Boric Acid—Producing costs are fairly steady and consuming requirements are up to expectations. The market is reported to be established on a steady basis and no price fluctuations seem in prospect for the near future. Powdered and crystals are quoted at 11c. per lb. in sacks, 12c. per lb. in barrels and 12c. per lb. in kegs.

Citric Acid—Cables indicate a strong market abroad and 52c. per lb. is given as the lowest price for shipments. Consuming interest is good and unless a change takes place in the foreign situation the probability of still higher prices is bright. Domestic goods are firm at 49@50c. per lb.

Hydrofluoric Acid—Buying has been along quiet lines and prices are steadied only by the strong position of raw materials. Export demand is not in evidence. Prices are held at 7@7¾c. for the 30 per cent and 11@11½c. for 48 per cent.

Lactic Acid—Shipment prices for foreign material have been high enough to shut off much business from that direction and that is one reason for the firm condition of the present market. Domestic makes have been finding a ready outlet and prices for all selections are strong. Quotations are 4½@5½c. for 22 per cent dark and 5½@6½c. for 22 per cent light.

Oxalic Acid—Only small lots of imported material were on the market and they were held at 13¼@13¾c. per lb. One lot of 30 bbl. was reported to have been offered at the outside figure. Demand has not been active but restricted imports has a steadying effect on values. Domestic oxalic holds at 12¾c. per lb. at the works with small lots commanding the usual premiums.

"Chem. & Met." Weighted Index of Chemical Prices

Base = 100 for 1913-14

This week	181.48
Last week	181.61
April, 1918 (high)	286.00
April, 1919	231.00
April, 1920	261.00
April, 1921 (low)	140.00
April, 1922	158.00

The weekly index number shows a moderate decline of 0.13 point occasioned by the slightly easier situation in fertilizer materials and a ½c. drop in refined glycerine.

Sulphuric Acid—Contract deliveries are taking up the bulk of production and many producers are unable to accept orders for prompt shipment. This places the market in a strong position. Quotations are $9@$10.50 per ton for 60 degree and $15@16 per ton for 66 per cent. These prices are for tank cars at the works.

Tartaric Acid—Active buying has featured this material. Consumers have covered as far ahead as possible and with prices going up they have taken spot offerings in large volume. Imported could still be procured at 34c. per lb. but 34½c. per lb. was asked in several directions. Domestic grades were steady at 35c. per lb.

Potashes

Bichromate of Potash—Transactions have been confined to small lots and sellers have been eager to book whatever business was in sight. Prices as low as 10½c. per lb. f.o.b. works were heard and ranged upward to 10¾c. per lb. Offerings are not heavy and price fluctuations seem to be influenced more by the volume of trading than by any other factor.

Chlorate of Potash—The shipment situation with reference to most potash compounds has given concern regarding future supplies of foreign goods. This has been noted in the market for chlorate and as spot stocks are pretty well depleted, a firm market has been created. Quotations on spot are given at 7½@7¾c. per lb. but there is not much to be had, especially at the inside figure. Domestic chlorate is offered at 8¼@9c. per lb. f.o.b. works.

Carbonate of Potash—Business has been held down to small proportions by the absence of spot goods. Small lots of hydrated 80-85 per cent have changed hands at 7¾c. per lb. Calcined 80-85 per cent is in a wholly nominal position. Shipment prices are based on so much uncertainty regarding deliv-

eries that they mean hardly anything. Demand has not been active, as most consumers laid in supplies when danger of curtailed shipments first became manifest.

Caustic Soda—Higher prices for shipment have been quoted and this has resulted in a very firm market for spot holdings. Sales of 88-92 per cent have been made at 8¼c. per lb. on spot with some sellers asking 8½c. per lb. Shipment prices are quoted at 8¼c. to 8⅜c. per lb., according to seller. Home producers are firm in their views and maintain carlot quotations for 88-92 per cent at 8¼c. per lb. f.o.b. works.

Permanganate of Potash—Irregularities in price have continued to feature the market for permanganate. This undoubtedly was caused by sales of odd lots at private terms and at prices which did not represent the market, as further lots were not available at those terms. The general asking price at the close was fixed at an inside figure of 25c. per lb. Some goods afloat sold at 25c. per lb. Some importers have withdrawn all quotations for shipments and futures can not be quoted at any level with assurance that deliveries will be made within the contract specifications.

Potash First Sorts—Last trading went through at 8c. per lb., but late in the week leading handlers marked up the quotation to 9c. per lb. nominal. Offerings were scanty, as production has been restricted because of the low selling prices obtaining at the different centers of distribution.

Sodas

Acetate of Soda—Buyers have been showing but little interest and this has given an easy tendency to prices. Leading factors are reluctant to lower quotations and are giving 6c. per lb. as the asking price but on firm bids there is no difficulty in shading that figure materially.

Bichromate of Soda—Although producers are finding a good call from contract holders and a good part of production is being absorbed in this way, there is no scarcity of stocks and selling competition is a factor. The quotation is held at 7½c. per lb., f.o.b. works, but some reports say that equalizing freight rates on delivered prices has practically resulted in price cutting. However, there are different instances where sellers are known to have maintained the quoted price levels, and the business has gone to the maker whose plant was nearest the point of delivery. Fundamentally the market appears to be in a firm position, as producers are operating on a small margin. Chrome ore is quoted at $20.50 per ton, c.i.f. Atlantic ports for Indian, $24@$26 per ton for New Caledonian, and $20@$22 per ton for Rhodesian.

Caustic Soda—There is no abatement to the heavy movement to domestic consumers. Buyers not only hold contracts for amounts considerably above normal, but they also are prompt in asking for deliveries and it is evident that consumption is keeping pace with production. Some producers are unable to accept new business for April delivery, while others quote former prices of 2½c. per lb., works, basis 60 per cent, and are able to make prompt shipments. Dealers are asking 3.50c. to 3.60c. per lb. on spot for 76 per cent solid and small lots sold this week as high as 3.80c. per lb. ex-store. Recent sales for export were made at 3.40c. per lb., f.a.s., and while this price is still heard it is purely nominal for prompt shipment, as the sellers admit they are sold ahead. The best price for export is given at 3.45c. per lb. f.a.s. and up to 3.50c. per lb. has been paid.

Chlorate of Soda—A lot of imported chlorate was scheduled to be sold at auction on Thursday. This lot was held in bonded warehouse in Brooklyn and different members of the trade were on hand at the appointed time to present bids, but the owner paid the charges which had accrued and the auction did not take place. Offerings of imported on spot are limited and values for good quality are steady at 6½@6¾c. per lb. Domestic makers continue to ask 6¾c. per lb. at the works and upwards on a quantity basis.

Fluoride of Soda—Consumers have been taking more interest in this chemical and the volume of business placed shows a material gain. The undertone to prices is strong, and quotations have been marked up to an inside figure of 9½c. per lb.

Hyposulphite of Soda—Recent lowering in prices has failed to stimulate buying to any pronounced degree and another quiet week was reported by sellers. Foreign offerings continue to compete actively with domestic makes and this prevents any real stability to values. Quotations are repeated at $2.50@$2.75 per 100 lb.

Nitrate of Soda—Current business is fairly good for this time of year and while demand in the South has fallen off, there is a steady movement to Northern consumers. Prices are quotably unchanged at $2.65 per 100 lb. ex-vessel, although some sellers have tried to effect sales at higher levels. Business for forward positions is quiet, as domestic buyers feel that new price schedules may work out more in their favor in view of slow call for nitrate from European countries.

Nitrite of Soda—Some improvement in trading was reported in the past few days, but the market is still far from active. Importers are offering freely, but already are quoting close to actual laid down cost and are unwilling to shade prices further. Asking prices for imported are given as 8¾@9c. per lb. depending on quantity and seller. Domestic grades are quiet at 10@10½c. per lb.

Soda Ash—While new contract prices are still several months off, there is considerable speculation on the part of buyers regarding them. In view of the unusually heavy movement so far this year and the increased cost of production it is believed that the new prices will be established on higher price levels than are now quoted. There was no change in the spot on shipment market during the week. Some sellers say if deliveries continue throughout the month on the same scale as during the first half of the month, that April will show a record disappearance. Prompt deliveries of light ash are offered by dealers at $1.75 in bags and $1.95 in barrels. Producers quote contracts at $1.20 in bags and $1.40 in barrels, carlots works, basis 48 per cent. Dense ash holds at $1.25 in bags and $1.45 in barrels.

Miscellaneous

Acetone—Producers reported a steady market, production in several directions being well sold up. The prices were maintained by first-hands at 22@22½c. per lb., the inside figure obtaining on carload lot transactions.

Antimony Oxide—While the undertone of the market reflected the firmer situation in China, prices underwent no further change. White oxide, 99 per cent, held at 9c. per lb. Standard needle antimony, powdered, was available at 8c. per lb. On the lump 7¾c. per lb. represented the market. Several shipments arrived here during the past week.

Acetate of Lime—Demand was moderate, but prices held on the old basis of $3.50 per 100 lb. Production in February was officially placed at 13,894 lb., against 16,544 lb. in January and 7,993 lb. in February a year ago.

Arsenic—Sales of spot goods were reported at 15¼c. per lb. and some material afloat sold at the same figure. The general asking price for spot, however, was 15½c. per lb. Moderate sized arrivals reached the local market from different foreign countries, but most of this went out direct to consumers and there has been no gain in the holdings of local sellers.

Calcium Arsenate — Reports from Washington state that the supply of calcium arsenate will be considerably larger than had been forecast some time ago, but still there will be a scarcity of something like 6,000 tons. Orders for large amounts are reported to be on the market. Prices are firm at 17¾@18c. per lb.

Copper Sulphate—Arrivals of imported sulphate were again noted during the week. Prices for imported grades are rather easy and range from $5.70 to $5.85 per 100 lb. Domestic makes are not moving freely and in general a quiet week was reported. Quotations of domestic sellers are $6.25@$6.50 per 100 lb.

Potassium Bromide—Imported potassium bromide was raised 1c. per lb., closing prices ranging from 16½@17c. per lb., immediate and nearby delivery. Importers refused to name a flat price on forward material because of the shipping situation abroad and the market on futures was entirely nominal.

Coal-Tar Products

Phenol on Spot Higher—Consumers of Cresylic to Ask for Lower Tariff Rate—Naphthalene in Demand and Firm

THE inquiry for phenol was active and the market in "outside" channels developed further strength, resale parcels moving at higher prices. At least three new sources of production will compete for business this fall, but until the output of domestic producers can be increased the trade expects prices to hold relatively firm. The situation in cresylic acid attracted widespread attention. The supply available from domestic sources is inadequate and large consumers have been hard hit by the high tariff on foreign material. At a meeting of importers and consumers held early in the week, a committee was appointed to present the matter before the Tariff Commission in the hope that something might be done to change conditions. The committee will apply for a 50 per cent reduction in the duty. Importers were not disposed to quote on shipment goods except on a flat c.i.f. basis, the buyer to look after all tariff charges, etc. In naphthalene the market presented a rather firm front covering spot and nearby goods, but on futures the outlook appeared to favor buyers. Foreign cables on crude were nominally unchanged. Easier exchange was a factor at different times. Importations of aniline colors from Germany have been larger of late, but apprehension is felt in regard to the supply situation from now on, as the developments in the Ruhr have been decidedly unfavorable. Domestic producers, of course, welcome this opportunity to push their wares in domestic as well as foreign markets. The intermediates reflected the steady situation in the important bases, but prices named covered a wide range, depending upon the make, quantity and delivery.

Coal-Tar Crudes, Etc.

Benzene—Leading factors reported the market unchanged, the demand being sufficient to hold prices on the old basis. Production has been larger and some traders feel that the demand will have to improve considerably in order to bring out any showing of strength in the market. The contract price held at 27c. per gal.

Cresylic Acid—Interest in the tariff situation attracted the attention of producers. Consumers of cresylic acid are dissatisfied with the rate of duty now in force and an attempt will be made to have the rate cut in two. Trading in foreign material was limited in volume because of the "prohibitive" tariff, although it was common gossip that certain consumers were much in need of supplies. English material for shipment held around 85c. per gal., in bond, c.i.f. basis. On spot the market for cresylic ranged from \$1.30@\$1.50 per gal., as to quality, etc. Domestic producers were "sold up" and from all indications will not be in a position to offer supplies in the open market for some time to come.

Naphthalene—Several shipments of crude arrived from abroad last week. The foreign markets for crude ruled firm at the recent advance to 3¼@3½c. per lb., c.i.f. New York basis. Demand for flake and balls was good, the former holding at 9½c. per lb., while the latter was more or less nominal at 10½@11c. per lb.

Phenol—Resale offerings were limited to small lots only and prices developed further strength, actual business passing at 53@55c. per lb., immediate delivery. At the close 55c. apparently was the general asking price. Leading domestic producers were not in a position to quote, the output being sold up around 26@28c. per lb. It was reported in trade circles that three manufacturers were pushing plans to re-enter the field, but new production cannot reach the open market for some months to come. Surplus war material is being consumed at a rapid rate and the supply situation is regarded as a serious one.

Solvent Naphtha—A report to the effect that a large petroleum refiner was in a position to offer solvent naphtha in a liberal way could not be confirmed. Producers regard the situation as firm, having nothing to offer because of the sold-up condition of the market. The nominal quotation on the water-white was unchanged at 37@40c. per gal.

Toluene—Trading was inactive, but with nothing pressing on the market prices were reported at 30@35c. per gal.

Beta-Naphthol—The market was a little irregular in outside channels, scattered lots offering at a shade under 23c. per lb. for the technical variety. Producers, as a rule, hold out for 23½c. per lb. Demand was quiet.

Alpha-Naphthylamine—A firmer undertone featured the market and there was talk of higher prices in some directions. At the close prices ranged from 36@38c. per lb., according to quantity and seller.

Benzoic Acid—There were offerings of the U.S.P. grade for immediate delivery at 72@74c. per lb. Demand was fairly active and prices presented a firm appearance.

Naphthionic Acid—The crude closed at 55@60c. per lb. Prices were unsettled on freer offerings.

Ortho-Toluidine—Closing prices were firmer and the range was revised to 14@15c. per lb. for spot material.

Para-Amidophenol — The base was available at \$1.20@\$1.30 per lb., depending on the brand and quantity. A firmer undertone was apparent in nearly all quarters.

Resorcinal—There were offerings of the technical at \$1.40@\$1.50 per lb., in kegs, with the pure nominal at \$2@\$2.10 per lb. Trading was slow, but prices at the close were steady.

Quiet Week for Alcohol

First hands reported a quiet week, yet prices did not change. Denatured alcohol was a shade easier in some directions because of the seasonable slump in the demand. The No. 1, 188 proof, held at 39c. per gal., with the No. 5 grade at 38c. Ethyl spirits, 190 proof, closed nominally at \$4.75@\$4.85 per gal. Methanol, 95 per cent, settled at \$1.19@\$1.21 per gal. Production of methanol in February was placed at 773,179 gal., against 933,171 gal. in January and 457,656 gal. in February a year ago.

Chemists Investigate Ruling on Glycerine Patent

A committee of the Manufacturing Chemists' Association is investigating the recent action of the Commissioner of Patents in upholding a German allegation of infringement on a patent covering a process for glycerine reduction.

A government employee named Eoff obtained a patent on this process in 1917, which he dedicated to the public. After the enactment of the Nolan act, a German interest filed a contest proceeding, alleging infringement. In that protest it was stated that the reduction process had been perfected in Germany prior to 1917 and had not been patented in the United States solely because of war-time restrictions. The contention of the Germans was upheld by the Commissioner of Patents.

The Manufacturing Chemists fear that were this ruling allowed to stand it would constitute a dangerous precedent in that it would give aliens an opportunity to claim patent rights to which they are not entitled.

Commodity Markets in France

In the naval stores industry the first gathering of the new crop is now taking place under good conditions. Some turpentine from the new crop will be on the market toward the end of April, and the dry products about the middle of May. The French Government denies prohibition of exports.

Stocks of essential oils are too low for the demand.

The production of acids in general is increasing and the market is strong. Of these, sulphuric acid is the most active; the superphosphate and sulphate of ammonia industries, however, are flourishing. Nitric acid is calmer because of difficulties in the metallurgical industry. The secondary chemicals are active largely on account of the Ruhr developments.

The paint and dyestuffs markets are active; buyers, however, are hesitating to cover themselves for long periods because of high prices.

The production of alcohol in France during the period Sept. 1 to March 1 totaled 1,323,000 hl., compared with 1,027,000 for the same period the previous year. The prohibition of the export and import of molasses was re-established by decree on March 14.

Vegetable Oils and Fats

Linseed Oil Again Higher—Crude Cottonseed Steadies—Coconut at 8¾c. Coast—Palm Oils Unsettled

TRADING in vegetable oils and fats was not active, but with stocks available for immediate consumption rather light, the tendency of prices, in the main, favored sellers. Linseed was marked up 3c. per gal. Coconut sold off a little on the Pacific Coast on resale offerings, but this failed to unsettle the market in first-hand quarters. Cottonseed ruled firm despite the talk of a substantial increase in the cotton acreage. Tallow ruled firm on the 9c. basis for the extra.

Linseed Oil—Closing prices were 3c. per gal. higher than a week ago, car lots, April-May shipment, settling at $1.17 per gal. Several crushers refused to quote on full carlot business, nearby delivery, and restricted operations to less than carlots at $1.20 per gal. June oil, carlots, settled at $1.14 per gal., with July forward at $1.10@$1.11 per gal., according to the seller. A parcel of six cars of raw oil sold for July-August-September delivery, two cars each month, at $1.09 per gal., this sale going through just before the advance was announced. Crushers in the East are operating at full capacity, but with the output of the Western mills restricted the supply situation remains tight. A crusher in the West went on record with a statement to the effect that no improvement in the domestic situation could set in before June, at which time the Western plants should have enough seed on hand to resume operations on a normal scale. Foreign oil sold at $1.09 May shipment. April shipment was offered at $1.11½ per gal., duty paid, landed weight, c.i.f. New York. There was a good inquiry for nearby foreign oil.

Cottonseed Oil—Late in the week several cars of crude sold at 10⅝c. per lb., f.o.b. Memphis, indicating that prices stiffened a little. Actual consuming demand for refined oil and compound lard held up well, considering the increased competition with lard, and the trade is speculating on a favorable March report, private estimates on the disappearance ranging from 190,000 to 230,000 bbl. The available supply for the remainder of the season is short of requirements, calculating on a normal volume of business, and most refiners favor the long side of the market. Bleachable oil sold at 11½c., buyers' tanks, f.o.b. Boston. Lard compound held at 13½c. per lb., carlots, f.o.b. New York. Oleo stearine closed steady at 11c. per lb. asked. Hogs in Chicago brought from $7@$8.50 per cwt.

Corn Oil—There were sales of crude in the Middle West at 10⅝c. per lb., tank cars, f.o.b. mills.

Coconut Oil—The sale of two tanks of Ceylon type oil on the Pacific Coast at 8¾c. per lb., a decline of ¼c., failed to shake the confidence of local traders. This sale involved resale material and leading handlers continued to quote the market at 9c., sellers' tanks, coast, and 9½@9¾c., sellers' tanks, New York. A mill on the coast has been forced to shut down temporarily because of the shortage in copra. Copra, sundried, held nominally at 5⅝c. per lb., c.i.f. coast.

China Wood Oil—Meager spot holdings were maintained at 35@37c. per lb. A parcel of May arrival oil was available at 30c., while May-June shipment from the Orient sold at 26½c. per lb. Shorts are being badly squeezed.

Palm Oil—A cargo arrived from Africa, but this oil went directly into consuming channels. Lagos oil for shipment was irregular at 8½@8⅝c. per lb. Niger oil for shipment was available at 8½c., c.i.f. New York, a decline of ⅛c.

Sesame Oil—Prompt shipment from Rotterdam closed at 12½c. on the refined grade, duty paid, New York. On May business the nominal quotation was 12¼c., with intimation that 12c. might go through on May-June.

Peanut Oil—Crude peanut in the South was scarce and 14c. was the general asking price, tank cars, f.o.b. mills.

Soya Bean Oil—Sales of April shipment from the coast went through at 10⅜c., duty paid, sellers' tanks. At the close 10½c. was asked for April and 10⅝c for May, Pacific Coast ports. In New York the market for nearby oil held at 10¾c., duty paid, tank car basis. On bulk oil for shipment from the Orient 8c. was asked, in bond, c.i.f. New York.

Menhaden Oil—The sale of a round lot of crude menhaden oil was reported last week at 55c. per gal., tank car basis, f.o.b. northern plant, an advance of 5c. from the trading level of the week previous. The oil sold on the "if made" basis. It is estimated that more than 22 000 barrels have been disposed of to date.

Tallow and Greases—Bids for city extra tallow at 9c. ex-plant were turned down. The market settled at 9¼c. asked. At the London weekly auction, held on April 11, 1,018 casks of tallow were offered and 721 sold at prices that were 6d. to 1s. higher. Greases in the New York trade were firm on scanty offerings. Good quality yellow settled at 8½@8⅝c. per lb.

Miscellaneous Materials

Glycerine—Chemically pure glycerine was not subjected to any further price changes, leading refiners holding the market on the 18c. per lb. basis, drums included. The demand was inactive, but with no weakness in crude the undertone steadied. Dynamite was quiet, yet producers' ideas held at 16½@17c. per lb., carlots, f.o.b. shipping point. No sales were reported. In crude the feature was the apparent willingness on the part of refiners to consider foreign offerings. Soap-lye, basis 80 per cent, sold in the West at 10¼c., carlots. At the close 10½c. was considered inside. Saponification held around 12c., loose, carlots, f.o.b. point of production.

Casein—Several round lots of casein arrived at New York from foreign ports. The offerings were scanty, as production in this country has not yet assumed normal proportions. Nominal spot prices for the technical grades ranged from 23@26c. per lb. Shipment prices were wholly nominal, as buyers could not be interested at this time.

Lithopone—Producers reported a steady call for lithopone, and with no change in basic products the market ruled firm in all quarters. Domestic held at 7c. per lb. in bags, carlots, nearby positions.

Naval Stores—The new crop season is now at hand and consumers refuse to anticipate in their wants. As a result prices for turpentine softened a little and nominal quotations at the close ranged from $1.58@$1.59 per gal. Export demand, according to advices from Savannah, has suffered by the recent sharp advance in prices. It is yet too early to forecast production. Rosins were nominally unchanged. The "B" grade held on the basis of $6.20 per barrel.

Pyrites—Prices were steady in sympathy with foreign markets. Imported lump and fine held at 12c. per unit, ex-steamer, Atlantic port.

Shellac—With no important change abroad and inquiry here much better, the market for shellac was fairly steady at the close. T. N. sold at 76c. on spot, and 75c. ex-dock. Bleached, bone dry, was offered at 89c. per lb., immediate delivery, while on futures nominal quotations of 85@86c. were named. Superfine orange on spot was traded in at 80c. per lb. T. N. for shipment from Calcutta settled at 70c. c.i.f. New York.

White Lead—The official contract price of the metal did not change, holding at 8.25c. per lb., New York. Corroders report an active market for white lead and with no accumulation in stocks regard the situation as firm. Painting operations are of huge proportions and the output of corroders will be taxed to the limit. Standard dry white lead, basic carbonate, held at 9⅞c. per lb., in casks, carload lots or more. Dry red lead was quotably unchanged at 11.40c. per pound, round-lot basis.

Zinc Oxide—With no important change in the metal prices for oxide were repeated on the old basis. Demand was active and the undertone was steady in all directions. American process, lead free, was offered at 8c. per lb., carload lot basis. The leaded grades held at 7@7½c. per lb. Domestic producers quote 9⅞c. on the French process, red seal.

Imports at the Port of New York

April 6 to April 12

ACIDS—33 dr. cresylic, Glasgow, Order, 147 dem. formic, Hamburg, Innis, Speiden & Co., 40 cs. stearic, Rotterdam, M. W. Parsons; 376 bales stearic, Rotterdam, Smith & Nichols, Inc.; 30 csk oxalic, Rotterdam, Freeff & Co., 5 cs. butyric, Hamburg, Order; 141 pkg. formic, Hamburg, Int'l Accept. Bank.

ALUM, CHROME—20 bbl., Hamburg, Hummel & Robinson.

AMMONIA—14 dr., Callao, Duncan, Fox & Co.

AMMONIUM BIFLORID—14 bbl., Hamburg, Innis, Speiden & Co.

AMMONIUM NITRATE—10 cs., Bremen, Pfaltz & Bauer; 1,157 csk., Hamburg, Kuttroff, Pickhardt & Co.

AMMONIUM PERSULPHATE—20 kegs, London, J. Turner & Co.

ANTIMONY OXIDE—190 bg., London, Wah Chang Trading Corp.

ANTIMONY SULPHIDE—7 csk., London, F. B. Vandegrift & Co.

ARSENIC—188 csk., Hamburg, A. J. Marcus & Co.; 195 cs., Kobe, McKenzie & Foster, 250 cs., Kobe, H. Sundheimer, Inc., 271 cs., Kobe, Takata & Co.; 127 cs., Kobe, S. W. Bridge & Co., 120 cs., Kobe, Busk & Daniels; 600 cs., Yokohama, Chipman Chem Eng. Co.; 46 csk., London, Order; 100 csk., Hamburg, R. W. Greeff & Co.; 200 csk., Hamburg, Order.

BARIUM CARBONATE—252 bg., Hamburg, Hardy & Ruperti, 149 csk., Hamburg, Order.

BARIUM CHLORIDE—56 bbl., Hamburg, Innis, Speiden & Co; 72 csk., Hamburg, Meteor Prod. Co.

BARIUM NITRATE—40 csk., Hamburg, Roessler & Hasslacher Chem. Co.

BARYTES—550 bg., Hamburg, L. A. Salomon & Bros., 135 csk., Hamburg, A. Klipstein & Co.

BORATE LIME—6,744 pkg., Mejillones, Pacific Coast Borax Co.

CASEIN—1,668 bg., Buenos Aires, Bank of America; 1,161 bg., Buenos Aires, Order, 350 bg., London, C. Tennant & Sons.

CALCIUM CHLORIDE—146 dr., Hamburg, Order; 95 dr., Hamburg, Bauer & Co.

CAMPHOR—50 cs., Kobe, Iwai & Co.; 225 cs., Kobe, Mitsui & Co.; 50 cs., Kobe, Vick Chem. Co.; 50 cs., Kobe, E. J. Barry, Inc.; 100 cs., Kobe, Nivoa Nitration Works

CHEMICALS—18 cs., Havre, Order; 47 csk., Hamburg, Chaplain & Bibbo; 30 dr., Hamburg, Order; 17 cs., Bremen, Pfaltz & Bauer; 20 bg., Danzig, Hardy & Ruperti, Inc.; 312 pkg., Hamburg, Roessler & Hasslacher Chem. Co.; 74 dr., London, Mallinkrodt Chem. Wks.; 539 pkg., Hamburg, Order; 114 bbl., Hamburg, Truempy, Faesy & Besthoff, Inc.

CHALK—500 tons, London, Taintor Trading Co.; 1,000 bg., Antwerp, Irving Bank.

COAL-TAR DISTILLATE—30 dr., Glasgow, Order.

COLORS—21 pkg., Havre, Irving Bank, 10 pkg., Marseilles, Order; 90 pkg. earth, Leghorn, H. J. Waddell & Co.; 12 bbl. aniline, Rotterdam, Wetterwald & Pfister; 4 bbl do., Rotterdam, Order; 10 csk dry, Southampton, Order; 10 bbl. dry, Hamburg, Kuttroff, Pickhardt & Co.; 18 pkg. aniline, Hamburg, Kuttroff, Pickhardt & Co.; 32 csk. aniline, Hamburg, H. A. Metz & Co.

COPPER SULPHATE—98 csk., Marseilles, P. H. Brothers; 329 csk., Hamburg, Order; 200 bbl., Hamburg, Order; 102 csk., Hamburg, Order; 200 csk., Liverpool, Nitrate Agencies Co.; 200 csk., Liverpool, Order.

CUTCH—300 cs., Singapore, Order.

DEXTRINE—100 bg., Hamburg, L. A. Salomon & Bros.

DIVI-DIVI—1,685 bg., Maracaibo, Suzarte & Whitney.

DYES—21 cs., Havre, B. Weiner.

EPSOM SALT—5,900 bg., Hamburg, Superfos Co.; 500 bg., Hamburg, Brown Bros. & Co.; 7,000 bg., Hamburg, Irving Bank.

GLAUBERS SALT—200 bg., Hamburg, Order; 253 csk., Hamburg, Globe Shipping Co.; 250 bbl., Hamburg, E. M. Sergeant & Co.; 158 bbl., Hamburg, Order.

GLYCERINE—100 dr. Marseilles, Order; 140 bbl., Marseilles, Order.

GRAPHITE—150 bg., 254 csk., Marseilles, Order.

GAMBIER—150 bg., Singapore, Bank Line Trans. & Trdg. Co.

GUM 20 pkg. tragacanth, Thurston & Braidich, 40 cs. olibanum, Glasgow, Brown Bros. & Co., 32 bg. myrrh., Glasgow, Am. Ex. Nat'l Bank, 210 bg. copal, Singapore, Guaranty Trust Co., 271 bg. copal, Singapore, L. C. Gillespie & Sons, 199 bg copal, Singapore, Brown Bros. & Co.; 100 cs. damar, Singapore, Chase Nat'l Bank; 210 bg. copal, Singapore, Order, 100 bg. arabic, London, Order, 200 bg. copal, Antwerp, A Hurst & Son; 600 bg. copal, Antwerp, Brown Bros.

HEXAMETHYLENE—80 cs., Hamburg Industrial Trust Co.; 10 cs., Hamburg, A. Klipstein & Co.

IRON OXIDE—228 bbl, Malaga, Hummel & Robinson, 76 bbl, Malaga, Reichard, Coulston, Inc, 70 bbl., Malaga, J. L. Smith & Co., 319 bbl., Malaga, C. K. Williams.

MAGNESIUM—1,119 bg., carbonate, Glasgow, Order; 170 bbl., chloride, Hamburg, A. Blanc, 70 csk., chloride, Hamburg, Order; 551 csk, calcined, Rotterdam, H. J. Baker & Bro.; 165 dr., Hamburg, Innis, Speiden & Co.; 502 bbl, Hamburg, Hansa Co., 89 bbl, Hamburg, A. Blank; 151 pkg., Hamburg, Order; e

MYROBALANS—9,600 pkg., Calcutta, Order.

MENTHOL—10 cs., Kobe, Equitable Trust Co., 50 cs., Kobe, Order

NAPHTHALENE—500 bg, Hamburg, W. H. Muller & Co, 495 bg., Hamburg, Irving Nat'l Bank; 750 bg., London, Irving Nat'l Bank, 566 bg., Hamburg, Irving Nat'l Bank.

OILS—Codliver—400 bbl., Bergen, Scott & Bowne, 50 bbl., Bergen, C Hulsking; 50 bbl., Bergen, A. Stallman & Co.; 155 bbl., Bergen, Order; **China wood**—100 bbl., Hankow, Mitsui & Co.; 15,000 piculs, Hankow, L. C. Gillespie & Sons; **Fusel**—30 csk., Marseilles, Order, 70 pkg., Hamburg, Order; 23 dr., Darien, I. Naiditch; 18 csk., Hamburg, Guaranty Trust Co, 10 dr., Malaga, Du Pont de Nemours & Co.; **Linseed**—100 bbl, Rotterdam, Nat'l City Bank; 283 bbl., Rotterdam Order; 88 bbl., London, International Comp. Co.; **Palm**—320 csk., Marseilles, Order, 202 bbl., Hamburg, African & Eastern Trading Corp.; 200 csk., Koke, Niger Co.; 641 csk, Bevinter, Irving Bank; 430 csk., Opobo, Niger Co; 354 csk, Abonema, African & Eastern Trading Corp; 80 csk., Abonema, W. A. Leaman; 800 csk., Abonema, Niger Co.; 570 csk., Port Harcourt, Niger Co.; 72 csk., Lagos, G. B Ollivant & Co., 415 csk, Cotonio, J Holt & Co, 47 csk., Cotonio, Order; 175 csk., Grandpope, Thornett & Fehr; 392 csk., Liverpool, African & Eastern Trading Corp., 155 csk., Liverpool, Order; 380 csk., London, African & Eastern Trading Corp.; **Peanut**—400 csk., Rotterdam, H. S. Head; **Perilla**—250 bbl., Koke, Balfour, Williamson & Co.; 150 bbl., Kobe, Bank of N Y; 325 bbl., Dairen, Cook & Swan Co.; 106 bbl., Dairen, East Asiatic Co., **Sardine**—1,900 cs, Kobe, Cook & Swan Co.

SESAME—279 bbl, Rotterdam, Nat'l City Bank; 292 bbl., Rotterdam, Order.

SULPHUR (olive foots)—500 bbl., Naples, Banca Comm Ital.; 300 bbl., Palermo, Order, 100 bbl., Seville, Chem Nat'l Bank; 600 bbl., Seville, Bank of the Manhattan Co, 100 bbl., Seville, Order; 250 bbl., Malaga, Order; 450 bbl., Naples, Banca Comm. Ital., 300 bbl, Catania, Order.

POTASSIUM SALTS—131 bbl., nitrate, Hamburg, Innis, Speiden & Co.; 10 bbl. prussiate, Hamburg Bank of America; 129 pkg., salts, Hamburg, A. Klipstein & Co.; 227 bbl., nitrate, Hamburg, Order; 10 csk., bisulphite, Hamburg, Order; 70 bbl, carbonate, Hamburg, Order; 596 bbl, chlorate Hamburg, Order, 39 cs., chloride, Bremen, Pfaltz & Bauer; 1,500 csk., chlorate, Hamburg, Mech. & Metals Nat'l Bank; 54 csk., salts, Hamburg, Kuttroff Pickhardt & Co., 55 dr, permanganate, Rotterdam, Order; 644 csk., nitrate, Hamburg, Kuttroff, Pickhardt & Co.; 103 csk., carbonate, Hamburg, Goldschmidt Corp; 30 bbl., carbonate, Hamburg J. Munroe & Co., 702 dr., caustic, Hamburg, A Klipstein & Co; 17 csk., potash salts, Hamburgh, Roessler & Hasslacher Chem. Co; 100 csk., alum, Hamburg, A Klipstein & Co.; 100 dr. permanganate Hamburg, E. M. Sergeant & Co; 22 csk, carbonate Hamburg, Order; 2,000 bbl., chlorate, Hango, Amer Kreuger & Toll Corp.; 33 csk., Hamburg, Am. Ex. Nat'l Bank; 30 dr., permanganate, Antwerp, Ellis Jackson & Co; 140 csk., carbonate Hamburg, Peters, White & Co.; 60 dr., caustic, Hamburg, Peters, White & Co.; 1,200 bbl., chlorate, Hamburg, Mech. & Metals Nat'l Bank, 100 dr, permanganate, Hamburg, Order; 20 kegs prussiate, Liverpool, H. J. Baker & Bro., 22 csk, carbonate, London, Order.

QUEBRACHO—988 bg., Buenos Aires, Columbia Trust Co., 16,740 bg., Buenos Aires, Tannin Corp.; 2002 bg., Buenos Aires, Equitable Trust Co

SEEDS—Linseed—19,316 bg., Buenos Aires, Bank of the Manhattan Co.; 7,450 bg., Buenos Aires, Merchants Nat'l Bank, Boston; 5,940 tons, Rosario, Spencer Kellogg & Sons; 67,806 bg., Santa Fe, Order; 12,255 bg., San Nicolas, Order; 53,595 bg., Santa Fe, L. Dreyfus & Co.; 44,121 bg., Rosario, Order, 48,074 bg., Ibicuy, Order; 5,378 tons, Rosario, Order. **Sesame**—600 bg., Shanghai, Wah Chang Trading Co., 1,200 bg., Shanghai, East Asiatic Co.

SHELLAC 1,800 pkg., Southhampton, Order, 2,291 bg, Southampton, Order, 22 bg garnet, Hamburg, Order; 150 bg., London, Order, 45 cs. garnet, Hamburg, A. Murphy & Co., 45 bg., Hamburg, Order; 200 bg., Calcutta, Chase Nat'l Bank; 47 bg., Calcutta, Nat'l City Bank; 100 chests seed, Calcutta, Bank of America; 100 bg. keerie lac, Calcutta, First Nat'l Bank of Boston, 230 bg., Calcutta, Bank of Br. West Africa, 378 bg., Calcutta, First Federal Foreign Banking Corp., 1,238 pkg., Calcutta, Order.

SAL AMMONIAC—426 bbl., Hamburg, Order; 98 csk., Hamburg, Order; 46 bbl., Hamburg, J Munroe & Co.

SODIUM SALTS 58 cs. cyanide, Marseilles, Nat'l City Bank, 4,105 bg. synthetic nitrate 375 csk. nitrite, Brevik, Order; 400 csk. hyposulphite, Marseilles, Order; 61 csk. sulphide, E. Suter & Co.; 72 bbl. fluoride, Hamburg, Innis Speeden & Co.; 97 cs. bromide, Hamburg, Farmers Loan & Trust Co.; 63 dr. perborate, Hamburg, Chem. Nat'l Bank, 39 csk prussiate, Hamburg, Meteor Products Co.; 291 dr. sulphide, Hamburg, Order; 10,808 bg. nitrate, Iquique, Wessel, Duval & Co., 11,183 bg. nitrate, Iquique, Du Pont de Nemours & Co.; 38,220 bg. nitrate, Antofagasta, Wessel, Duval & Co.; 18,870 bg., Antofagasta, for Norfolk; 30 csk. perborate, Hamburg, Blackburn Trading Co.; 500 sk. nitrate, Hamburg, Kuttroff, Pickhardt & Co.; 150 csk. perborate, Hamburg, Order, 19 cs carbonate, T. Nevin; 53,800 bg nitrate, Tocopilla, W. R. Grace & Co., 49,926 bg., Iquique, W. R. Grace & Co., 17 csk. Rotterdam, A. Klipstein & Co. 9,161 bg. nitrate, Iquique, Baring Bros. & Co.; 26 csk perborate, Hamburg, Globe Shipping Co, 27 csk fluoride, Hamburg, Order; 396 dr sulphide, Hamburg, Order; 54 bbl. acetate, Antwerp, Roessler & Haslacker Chem Co; 94 bbl. phosphate, Antwerp, A Klipstein & Co.; 86 dr. sulphide, E Suter & Co.; 200 bg. sulphide, Hamburg, Equitable Trust Co; 200 bbl. hyposulphide, Hamburg, Order, 10 csk. prussiate, Liverpool H. J. Baker & Bros.

STRONTIUM NITRATE—38 csk., Hamburg, Meteor Products Co.; 100 bbl., Hamburg, Hummel & Robinson.

TANNIN—17 csk., Havre, Geigy Co.

TARTAR, CRUDE—100 sk., Marseilles, 200 sk., Marseilles, C. Pfizer & Co.; 100 pkg., Marseilles, Brown Bros. & Co.; 365 bg., Valencia, C. Pfizer & Co.; 277 bg., Alicante, C. Pfizer & Co.; 484 bg., Alicante, Order; 293 bg., Rotterdam, C. Pfizer & Co; 34 bg., Valparaiso, Order.

TALC—200 bg., Marseilles, Order.

TALLOW—280 csk., Buenos Aires, Bank of the Manhattan Co., 296 csk., Buenos Aires, Armour & Co.

VERDIGRIS—20 cs., Marseilles, C. Hensking; 20 csk., Marseilles, A. Klipstein.

WAXES—100 bg. carnauba, Recife, Elbert & Co.; 121 bg. carnauba, Ceara, Strohmeyer & Arpe Co.; 50 bg., Ceara, Lazard Freres; 2 bg., Ceara, Order; 200 cs. vegetable, Kobe, H. R. Lathrop & Co.; 32 bg. bees, London, Order; 50 bg. bees, Valparaiso, Strohmeyer & Arpe Co.; 40 bg. bees, Valparaiso, Order; 294 bg., Antwerp, Elbert & Co.

WOOL GREASE—90 bbl., Antwerp, Elbert & Co.

ZINC CHLORATE—50 csk., Hamburg, A. Klipstein & Co.

ZINC CHLORIDE—69 csk., Hamburg, Order; 33 csk., Hamburg, Hardy & Ruperti, Inc.

ZINC OXIDE—200 bbl., Marseilles, Bankers Trust Co.; 500 bbl., Marseilles, Nat'l City Bank.

Current Prices in the New York Market

For Chemicals, Oils and Allied Products

THESE prices are for the spot market in New York City, but a special effort has been made to report American manufacturers' quotations whenever available. In many cases these are for material f.o.b. works or on a contract basis and these prices are so designated. Quotations on imported stocks are reported when they are of sufficient importance to have a material effect on the market. Prices quoted in these columns apply to large quantities in original packages.

General Chemicals

Acetic anhydride, 85%, drums	lb	$0 38 -	
Acetone, drums	lb	22	23
Acid, acetic, 28%, bbl	100 lb	3 17½	3 92½
Acetic, 56%, bbl	100 lb	6 35	6 37
Glacial, 99½%, bbl	100 lb	12 05 -	12 80
Boric, bbl	lb	11 -	11½
Citric, kegs	lb	49 -	50
Formic, 85%	lb	.14½ -	17
Gallic, tech	lb	.45 -	50
Hydrofluoric, 52%, carboys	lb	12 -	12
Lactic, 44%, tech, light, bbl	lb	11½ -	12
22% tech, light, bbl	lb	05½	06
Muriatic, 18° tanks	100 lb	90 -	1 00
Muriatic, 20°, tanks	100 lb	1 00	1 10
Nitric, 36°, carboys	lb	04½	05
Nitric, 42°, carboys	lb	06 -	06½
Oleum, 20%, tanks	ton	18 50	19 00
Oxalic, crystals, bbl	lb	13½	13½
Phosphoric, 50%, carboys	lb	07½	08½
Pyrogallic, resublimed	lb	1 50 -	1 60
Sulphuric, 60°, tanks	ton	9 00 -	10 00
Sulphuric, 60°, drums	ton	12 00 -	14 00
Sulphuric, 66°, tanks	ton	15 00	15 50
Sulphuric, 66° drums	ton	19 00	20 00
Tannic, U.S.P., bbl	lb	.65	70
Tannic, tech, bbl	lb	.45	50
Tartaric, imp crys, bbl	lb	.34	
Tartaric, imp, powd, bbl	lb.	.34 -	
Tartaric, domestic, bbl	lb	.35 -	
Tungstic, per lb	lb	1 10 -	1 20
Alcohol, butyl, drums, f.o.b works	lb	.27	.29
Alcohol ethyl (Cologne spirit), bbl	gal.	4 75 -	4 95
Alcohol, methyl (see Methanol)			
Alcohol, denatured, 188 proof No. 1, bbl	gal	39	40
Alum, ammonia, lump, bbl	lb	03½ -	03¾
Potash, lump, bbl	lb	.03 -	03½
Chrome, lump, potash, bbl	lb.	05½ -	05¾
Aluminum sulphate, com., bags	100 lb.	1.50 -	1 65
Iron free bags	lb	.02½ -	02¾
Aqua ammonia, 26°, drums	lb.	.06½ -	07½
Ammonia, anhydrous, cyl	lb.	.30 -	30½
Ammonium carbonate, powd casks, imported	lb.	.09½ -	.10
Ammonium carbonate, powd domestic, bbl	lb.	.13 -	.14
Ammonium nitrate, tech, casks	lb	10 -	11
Amyl acetate tech, drums	gal.	3 50 -	3 75
Arsenic, white, powd, bbl	lb	.15½ -	16
Arsenic, red, powd, kegs	lb	.14½	15
Barium carbonate, bbl	ton	78 00 -	80 00
Barium chloride, bbl	ton	90 00 -	95 00
Barium dioxide, drums	lb	18 -	18½
Barium nitrate, casks		08 -	08½
Barium sulphate, bbl	lb	.04 -	04½
Blanc fixe, dry, bbl	lb	.04½ -	04¾
Blanc fixe, pulp, bbl	ton	45 00 -	55 00
Bleaching powder, f.o.b. wks., drums	100 lb.	2 15 -	
Spot N.Y. drums	100 lb	2 60 -	2 70
Borax, bbl.	lb	.05½ -	05¾
Bromine, cases	lb	.28 -	30
Calcium acetate, bags	100 lb	3 50 -	3 60
Calcium carbide, drums	lb	.04½ -	04¾
Calcium chloride, fused, drums	ton	22 00 -	23 00
Gran. drums	lb	.01½ -	.01¾
Calcium phosphate, mono, bbl.	lb.	.06½ -	.07
Camphor, cases	lb.	.89 -	.91
Carbon bisulphide, drums	lb.	.07 -	07½
Carbon tetrachloride, drums	lb.	10 -	
Chalk, precip—domestic, light, bbl.	lb.	.04½ -	.04¾
Domestic, heavy, bbl.	lb.	.03½ -	.03¾
Imported, light, bbl	lb.	.04½ -	.05
Chlorine, liquid, cylinders	lb.	.06 -	06½
Chloroform, tech., drums	lb	.35 -	.38
Cobalt oxide, bbl	lb.	2.10 -	2.25
Copperas, bulk, f.o.b. wks.	ton	16.50 -	20.00
Copper carbonate, bbl	lb.	.19 -	20
Copper cyanide, drums	lb.	.47 -	.50
Copper sulphate, crys., bbl	100 lb.	6 25 -	6 50
Cream of tartar, bbl	lb.	25½ -	26½
Epsom salt, dom., tech., bbl.	100 lb	2 00 -	2.25
Epsom salt, imp., tech., bags	100 lb.	1 10 -	1.25
Epsom salt, U.S.P., dom., bbl.	100 lb	2 50 -	2.75
Ether, U.S.P., drums	lb.	.13 -	.15
Ethyl acetate, com., 85%, drums	gal.	.80 -	.85
Ethyl acetate, pure (acetic ether, 98% to 100%)	gal.	.95 -	1.00
Formaldehyde, 40%, bbl	lb	.14½ -	.16
Fullers earth, f.o.b. mines	net ton	16 00 -	17.00
Fullers earth—imp., powd.,	net ton	30.00 -	32.00
Fusel oil, ref., drums	gal.	3.55 -	4 05
Fusel oil, crude, drums	gal	2 30 -	2.40
Glaubers salt, wks., bags	100 lb.	1.20 -	1.40
Glaubers salt, imp., bags	100 lb	$1 00 -	$1.25
Glycerine, c.p., drums extra	lb	18 -	.18½
Glycerine, dynamite, drums	lb	16½ -	
Iodine, resublimed	lb.	4 55 -	4 65
Iron oxide, red, casks	lb.	.12 -	.18
Lead:			
White, basic carbonate, dry, casks	lb.	.09¾ -	.10
White, basic sulphate, casks	lb	09¾ -	
White, in oil, kegs	lb.	.12¾ -	.14
Red, dry, casks	lb.	.11¾ -	.12
Red, in oil, kegs	lb.	.13¼ -	.15
Lead acetate, white crys., bbl.	lb.	.13¼ -	.14
Brown, broken, casks	lb.	.12½ -	..
Lead arsenate, powd., bbl.	lb	.23 -	.24
Lime-Hydrated, bbl.	per ton	16 80 -	17 00
Lime, Lump, bbl	280 lb	3.63 -	3.65
Litharge, comm., casks	lb.	.10¾ -	.11
Lithophone, bags	lb.	.07 -	.07¼
in bbl	lb	07¼ -	.07½
Magnesium carb., tech., bags	lb	08 -	.08½
Methanol, 95%, bbl	gal.	1 21 -	1.23
Methanol, 97%, bbl.	gal.	1 23 -	1.25
Nickel salt, double, bbl.	lb.	.10½ -	.
Nickel salts, single, bbl.	lb.	.11½ -	....
Phosgene	..	.60 -	.75
Phosphorus, red, cases	lb.	.35 -	.40
Phosphorus, yellow, cases	lb.	.30 -	.35
Potassium bichromate, casks	lb.	10½ -	.10¾
Potassium bromide, gran., bbl	lb.	.16½ -	.23
Potassium carbonate, 80-85%, calcined, casks	lb.	.06½ -	.07
Potassium chlorate, powd.	lb.	.07½ -	.08
Potassium cyanide, drums	lb.	.45 -	.50
Potassium, first sorts, cask	lb.	09	.09½
Potassium hydroxide (caustic potash) drums	100 lb.	8.25 -	8.50
Potassium iodide, cases	lb	3.65 -	3.75
Potassium nitrate, bbl.	lb.	.06½ -	.07½
Potassium permanganate, drums	lb.	.25 -	.25½
Potassium prussiate, red, casks	lb.	.80 -	.85
Potassium prussiate, yellow, casks	lb.	.37½ -	.38
Salammoniac, white, gran., casks, imported	lb.	.07 -	.07½
Salammoniac, white, gran., bbl, domestic	lb.	.07½ -	.08
Gray, gran., casks	lb.	.08 -	.09
Salsoda, bbl.	100 lb.	1.20 -	1.40
Salt cake (bulk)	ton	26 00 -	28.00
Soda ash, light, 58% flat, bags, contract	100 lb.	1 60 -	1.67
Soda ash, light, basis, 48%, bags, contract, f.o.b. wks.	100 lb.	1.20 -	1.30
Soda ash, light, 58%, flat, bags, resale	100 lb.	1.75 -	1.80
Soda ash, dense, bags, contract, basis 48%	100 lb.	1.17½ -	1.20
Soda ash, dense, in bags, resale	100 lb.	1 85 -	1.90
Soda, caustic, 76%, solid, drums, f.a.s.	100 lb.	3.45 -	3.70
Soda, caustic, 76%, solid, drums, contract	100 lb.	3.35	3.40
Soda, caustic, basis 60%, wks., contract	100 lb.	2.50 -	2.60
Soda, caustic, ground and flake, contracts	100 lb.	3.80 -	3.90
Soda, caustic, ground and flake, resale	100 lb.	4.00 -	4.15
Sodium acetate, works, bags	lb.	06 -	.06½
Sodium bicarbonate, bbl	100 lb	2 00 -	2.50
Sodium bichromate, casks	lb.	.07¾ -	.08
Sodium bisulphate (niter cake)	ton	6.00 -	7.00
Sodium bisulphite, powd., U.S.P., bbl	lb.	.04½ -	.04¾
Sodium chlorate, kegs	lb.	.06½ -	.07
Sodium chloride	long ton	12.00 -	13.00
Sodium cyanide, cases	lb.	.20 -	.23
Sodium fluoride, bbl	lb	$0 09¼ -	$0 10
Sodium hyposulphite, bbl	lb.	.02½ -	.03
Sodium nitrite, casks	lb.	.08½ -	09
Sodium peroxide, powd., cases	lb.	.28 -	.30
Sodium phosphate, dibasic, bbl	lb.	.03¾ -	04
Sodium prussiate, yel drums	lb.	.18 -	.18½
Sodium silicate (40°, drums)	100 lb.	80 -	1 25
Sodium silicate (60°, drums)	100 lb.	2.00 -	2 25
Sodium sulphide, fused, 60-62% drums	lb.	.04½ -	04¾
Sodium sulphite, crys., bbl.	lb.	.03½ -	03¾
Strontium nitrate, powd., bbl.	lb.	.09½ -	10
Sulphur chloride, yel drums.	lb.	.04½ -	.05
Sulphur, crude	ton	18.00 -	20 00
At mine, bulk	ton	16 00 -	18 00
Sulphur, flour, bbl.	100 lb.	2.35 -	3.15
Sulphur, roll, bbl.	100 lb.	2 00 -	2 50
Sulphur dioxide, liquid, cyl.	lb.	.08 -	08½
Talc—imported, bags	ton	30.00 -	40 00
Talc—domestic powd., bags	ton	18.00 -	25 00
Tin bichloride, bbl.	lb.	.13¾ -	.14
Tin oxide, bbl.	lb.	.52 -	.54
Zinc carbonate, bags	lb.	.14 -	.14½
Zinc chloride, gran, bbl.	lb.	.06 -	.07
Zinc cyanide, drums	lb.	.37 -	.38
Zinc oxide, lead free, bbl.	lb.	.08 -	.08½
5% lead sulphate, bags	lb.	.07½ -	..
10 to 35 % lead sulphate, bags	lb	.07 -	..
French, red seal, bags	lb	09¾ -	
French, green seal, bags	lb.	10¾ -	
French, white seal, bbl	lb.	.12 -	.
Zinc sulphate, bbl.	100 lb.	2.75 -	3.00

Coal-Tar Products

Alpha-naphthol, crude, bbl	lb.	$0 70 -	$0.80
Alpha-naphthol, ref., bbl	lb.	85 -	.95
Alpha-naphthylamine, bbl.	lb.	36 -	38
Aniline oil, drums	lb.	16 -	.16½
Aniline salts, bbl.	lb.	24 -	.25
Anthracene, 80%, drums	lb.	.75 -	1 00
Anthracene, 80%, imp., drums, duty paid	lb.	70 -	.75
Anthraquinone, 25%, paste, drums	lb.	.70 -	.75
Benzaldehyde U.S.P., carboys	lb.	1.40 -	1.45
Benzene, pure, water-white, tanks and drums	gal.	.32 -	.35
Benzene, 90%, tanks & drums	gal.	.27 -	.30
Benzene, 90%, drums, resale	gal.	.30 -	.33

Pine tar, ref., thin, bbl	gal.	.... - .25
Pinewood creosote, ref., bbl	gal.	.... - .52

Animal Oils and Fats

Degras, bbl	lb	$0 03¾ - $0 04¼
Grease, yellow, bbl	lb.	.08½ - .08¾
Lard oil, Extra No. 1, bbl	gal.	.92 - .94
Neatsfoot oil, 20 deg. bbl	gal	1 28 - 1 32
No. 1, bbl	gal	.92 - .94
Oleo Stearine		.11 -
Red oil, distilled, d.p. bbl	lb.	.11½ -
Saponified, bbl	lb.	.11½ -
Tallow, extra, loose	lb	.09 -
Tallow oil, acidless, bbl	gal.	.96 - .98

Vegetable Oils

Castor oil, No. 3, bbl	lb	$0.14 - ...
Castor oil, No. 1, bbl	lb.	.14½ - ...
Chinawood oil, bbl	lb.	.35 - .37
Coconut oil, Ceylon, bbl	lb.	.10½ - .10¾
Ceylon, tanks, N.Y.	lb	.09½ - .09¾
Coconut oil, Cochin, bbl	lb.	.10½ - ...
Corn oil, crude, bbl	lb.	.12½ - ...
Crude, tanks, (f.o.b. mill)	lb	.10¼ - .10½
Cottonseed oil, crude (f.o.b. mill), tanks	lb.	.10½ - .10¾
Summer yellow, bbl	lb.	.12½ - .13
Winter yellow, bbl	lb.	.13¼ - .13½
Linseed oil, raw, car lots, bbl	gal	1 17 - ..
Raw, tank cars (dom.)	gal	1 12 - ..
Boiled, cars, bbl (dom.)	gal.	1 19 - ..
Olive oil, denatured, bbl	gal.	1 15 - ...
Sulphur, (foots) bbl	lb.	.09½ - .09¾
Palm, Lagos, casks	lb.	.08½ - .08¾
Niger, casks	lb	.08¼ - .08½
Palm kernel, bbl	lb	.09½ - .09¾
Peanut oil, crude, tanks (mill)	lb.	.13½ - .14
Peanut oil, refined, bbl	lb.	.17 - ..
Perilla, bbl	lb	.16½ - .16¾
Rapeseed oil, refined, bbl	gal.	.85 - .86
Rapeseed oil, blown, bbl	gal.	.90 - .91
Sesame, bbl	lb.	.13½ - .13¾
Soya bean (Manchurian), bbl	lb.	.12½ - ...
Tank, f.o.b. Pacific coast	lb.	.10½ - .10¾
Tank, (f.o.b. N.Y.)	lb.	.10½ - .11

Fish Oils

Cod, Newfoundland, bbl	gal.	$0 70 - $0 72
Menhaden, light pressed, bbl	gal.	.76 - ..
White bleached, bbl	gal.	.78 - ..
Blown, bbl	gal.	.82 - ..
Crude, tanks (f.o.b. factory)	gal.	.55 - ......
Whale No. 1 crude, tanks, coast	lb.	.06½ - ...
Winter, natural, bbl	gal.	.76 - .78
Winter, bleached, bbl	gal	.79 - .80

Oil Cake and Meal

Coconut cake, bags	ton	$36 00 - ....
Copra, sun dried, bags, (c.i.f.)	lb.	.06½ - $ .06¾
Sun dried Pacific coast	lb.	.05½ - .05¾
Cottonseed meal, f.o.b. mills	ton	40 00 - 41 00
Linseed cake, bags	ton	36 00 - ...
Linseed meal, bags	ton	38 00 - ...

Dye & Tanning Materials

Albumen, blood, bbl	lb.	$0 45 - $0.50
Albumen, egg, tech, kegs	lb.	.72 - .75
Cochineal, bags	lb.	.35 - .36
Cutch, Borneo, bales	lb.	.04½ - .05
Cutch, Rangoon, bales	lb.	.12 - .12½
Dextrine, corn, bags	100 lb.	3.39 - ......
Dextrine, gum, bags	100 lb.	3.74 - ......
Divi-divi, bags	ton	38.00 - 39.00
Fustic, sticks	ton	30.00 - 35.00
Fustic, chips, bags	lb.	.04 - .05
Logwood, sticks	ton	28.00 - 30.00
Logwood, chips, bags	lb.	.02½ - .03½
Sumac, leaves, Sicily, bags	ton	65.00 - ....
Sumac, ground, bags	ton	$55 00 - $60 00
Sumac, domestic, bags	ton	35 00 - ..
Tapioca flour, bags	lb.	.03½ - .05

Extracts

Archil, conc., bbl	lb.	$0.17 - $0 18
Chestnut, 25% tannin, tanks	lb.	.02 - .03
Divi-divi, 25% tannin, bbl	lb.	.04 - .05
Fustic, crystals, bbl	lb.	.20 - .22
Fustic, liquid, 42°, bbl	lb.	.08 - .09
Gambier, liq., 25% tannin, bbl	lb.	.08 - .09
Hematine crys., bbl	lb.	.14 - .18
Hemlock, 25% tannin, bbl	lb.	.04 - .05
Hypernic, solid, drums	lb.	.24 - .26
Hypernic, liquid, 51°, bbl	lb.	.14 - .17
Logwood, crys., bbl	lb.	.19 - .20
Logwood, liq., 51°, bbl	lb.	.09 - .10
Quebracho, solid, 65% tannin, bbl	lb.	.04½ - .05
Sumac, dom., 51°, bbl	lb.	.06½ - .07

Dry Colors

Blacks-Carbongas, bags, f.o.b. works	lb	$0.16 - $0.18
Lampblack, bbl	lb	.12 - .40
Mineral, bulk	ton	35.00 - 45 00
Blues-Bronze, bbl	lb.	.55 - .60
Prussian, bbl	lb.	.55 - .60
Ultramarine, bbl	lb.	.08 - .35
Browns, Sienna, Ital., bbl	lb.	.06 - .14
Sienna, Domestic, bbl	lb.	.03½ - .04
Umber, Turkey, bbl	lb.	.04 - .04½
Greens-Chrome, C.P. Light, bbl	lb.	.32 - .34
Chrome, commercial, bbl	lb.	.12 - .12½
Paris, bulk	lb.	.30 - .35
Reds, Carmine No. 40, tins	lb.	4.50 - 4 70
Oxide red, casks	lb.	.10 - .14
Para toner, kegs	lb.	1 00 - 1.10
Vermilion, English, bbl	lb.	1 30 - 1.32
Yellow, Chrome, C.P. bbls	lb.	.20 - .21
Ocher, French, casks	lb.	.02½ - .03

Waxes

Bayberry, bbl	lb.	$0.28 - $0.30
Beeswax, crude, bags	lb	.21 - .25
Beeswax, refined, light, bags	lb.	.32 - .34
Beeswax, pure white, cases	lb.	.40 - .41
Candellila, bags	lb.	.24 - .25
Carnauba, No. 1, bags	lb.	.39 - .40
No. 2, North Country, bags	lb.	.23 - .23½
No. 3, North Country, bags	lb.	.19½ - .....
Japan, cases	lb.	.14½ - .15
Montan, crude, bags	lb.	.04½ - .04¾
Paraffine, crude, match, 105-110 m.p.	lb.	.04½ - .04¾
Crude, scale 124-126 m.p., bags	lb.	.03 - .03½
Ref., 118-120 m.p., bags	lb.	.03½ - ..
Ref., 125 m.p., bags	lb.	.03¾ - ..
Ref., 128-130 m.p., bags	lb.	.04 - .04¼
Ref., 133-135 m.p., bags	lb.	.04½ - .04¾
Ref., 135-137 m.p., bags	lb.	.05 - .05½
Stearic acid, sgle pressed, bags	lb.	.14 - ......
Double pressed, bags	lb.	.14½ - ...
Triple pressed, bags	lb.	.16 - ......

Fertilizers

Ammonium sulphate, bulk, f.o.b. works	100 lb.	$3.25 - $3 30
F.a.s. double bags	100 lb.	4 00 - ..
Blood, dried, bulk	unit	4 50 - .
Bone, raw, 3 and 50, ground	ton	27 00 - 30.00
Fish scrap, dom., dried, wks.	unit	3 75 - 10.00
Nitrate of soda, bags	100 lb.	2.65 - 2.67½
Tankage, high grade, f.o.b. Chicago	unit	4.25 - 4 50
Phosphate rock, f.o.b. mines, Florida pebble, 68-72%	ton	$4.00 - $4.50
Tennessee, 78-80%	ton	8.00 - 8.25
Potassium muriate, 80%, bags	ton	35.00 - 36.00
Potassium sulphate, bags basis 90%	ton	45.67 - ....

Crude Rubber

Para—Upriver fine	lb.	$0.30 - ......
Upriver coarse	lb.	.27 - ....
Upriver caucho ball	lb.	.29 - ....
Plantation—First latex crepe	lb.	.33½ - ....
Ribbed smoked sheets	lb.	.33½ - ....
Brown crepe, thin, clean	lb.	.31½ - .32..
Amber crepe No. 1	lb.	.32½ - .....

Gums

Copal, Congo, amber, bags	lb	$0.18½ - $0.19
East Indian, bold, bags	lb	.22 - .23
Manila, pale, bags	lb.	.21 - .22
Pontinak, No. 1 bags	lb.	.21 - .22
Damar, Batavia, cases	lb.	.30½ - .31
Singapore, No. 1, cases	lb.	.34 - .35
Kauri, No. 1, cases	lb.	.62 - .66
Ordinary chips, cases	lb.	.18 - .20
Manjak, Barbados, bags	lb.	.09 - .09½

Shellac

Shellac, orange fine, bags	lb.	$0.78 - ....
Orange superfine, bags	lb.	.80 - ....
A. C. garnet, bags	lb.	.77 - ......
Bleached, bonedry	lb.	.89 - ......
Bleached, fresh	lb.	.77 - ......
T. N., bags	lb.	.76 - .77

Miscellaneous Materials

Asbestos, crude No. 1, f.o.b., Quebec	sh. ton	$450.00 - $550.00
Asbestos, shingle, f.o.b., Quebec	sh. ton	$60.00 - $80.00
Asbestos, cement, f.o.b., Quebec	sh. ton	15.00 - 17.00
Barytes, grd., white, f.o.b. mills, bbl.	net ton	16.00 - 20.00
Barytes, grd., off-color, f.o.b. mills bulk	net ton	13.00 - 15.00
Barytes, floated, f.o.b. St. Louis, bbl	net ton	28.00 - ....
Barytes, crude f.o.b. mines, bulk	net ton	10.00 - 11.00
Casein, bbl., tech	lb.	.23 - .25
China clay (kaolin) crude, f.o.b. Ga.	net ton	7.00 - 9.00
Washed, f.o.b. Ga.	net ton	8 00 - 9.00
Powd., f.o.b. Ga	net ton	13.00 - 20.00
Crude f.o.b. Va.	net ton	8 00 - 12.00
Ground, f.o.b. Va.	net ton	13 00 - 20.00
Imp., lump, bulk	net ton	15 00 - 20.00
Imp., powd.	net ton	45 00 - 50.00
Feldspar, No. 1 pottery	long ton	6 00 - 7.00
No. 2 pottery	long ton	5 00 - 5.50
No. 1 soap	long ton	7.00 - 7.50
No. 1 Canadian, f.o.b. mill	long ton	25.00 - 27.00
Graphite, Ceylon, lump, first quality, bbl	lb	.06 - .06½
Ceylon, chip, bbl.	lb.	.05 - .05½
High grade amorphous crude	ton	35.00 - 50.00
Gum arabic, amber, sorts, bags	lb.	.15 - .16
Gum tragacanth, sorts, bags	lb.	.50 - .60
No. 1, bags	lb.	1.75 - 1.80
Kieselguhr, f.o.b. Cal.	ton	40 00 - 42.00
F.o.b. N.Y.	ton	50 00 - 55.00
Magnesite, crude, f.o.b. Cal.	ton	14 00 - 15.00
Pumice stone, imp., casks	lb	.03 - .05½
Dom., lump, bbl	lb.	.05 - .05½
Dom., ground, bbl	lb.	.06 - .07
Silica, glass sand, f.o.b. Ind.	ton	2 00 - 2.50
Silica, sand blast, f.o.b. Ind	ton	2.50 5.00
Silica, amorphous, 250-mesh, f.o.b. Ill	ton	17 00 - 17.50
Silica, bldg. sand, f.o.b. Pa	ton	2 00 - 2.75
Soapstone, coarse, f.o.b. Vt., bags	ton	7 00 - 8.00
Talc, 200 mesh, f.o.b., Vt., bags	ton	6 50 - 9.00
Talc, 200 mesh, f.o.b. Ga., bags	ton	7.00 - 9 00
Talc, 200 mesh, f.o.b. Los Angeles, bags.	ton	16 00 - 20.00

Mineral Oils

Crude, at Wells

Pennsylvania	bbl	$3 75 - ......
Corning	bbl	2 15 - ......
Cabell	bbl	2 41 - ......
Somerset	bbl	2 20 - ......
Illinois	bbl	2 37 - ......
Indiana	bbl	2 38 - ......
Kansas and Oklahoma, 28 deg	bbl.	1 50 - $1.60
California, 35 deg. and up	bbl.	1.04 - ......

Gasoline, Etc.

Motor gasoline, steel bbls	gal.	$0.24½ - ......
Naphtha, V. M. & P. devd, steel bbls	gal	.23½ - ......
Kerosene, ref. tank wagon	gal.	.15 - ......
Bulk, W. W. export	gal.	.08 - ......
Lubricating oils		
Cylinder, Penn., dark	gal	.27 - .30
Bloomless, 30@31 grav.	gal.	.20 - .22
Paraffin, pale	gal.	.24 - .25
Spindle, 200, pale	gal.	.25 - .26
Petrolatum, amber, bbls.	lb	.05 - .05½
Paraffine wax (see waxes)		

Refractories

Bauxite brick, 56% Al_2O_3, f.o.b. Pittsburgh	ton	$45-50
Chrome brick, f.o.b. Eastern shipping points	ton	50-52
Chrome cement, 40-50% Cr_2O_3	ton	23-27
40-45% Cr_2O_3, sacks, f.o.b. Eastern shipping points	ton	23.00
Fireclay brick, 1st quality, 9-in. shapes, f.o.b. Ky. wks.	1,000	40-46
2nd. quality, 9-in. shapes, f.o.b. wks.	1,000	36-41
Magnesite brick, 9-in. straight (f.o.b. wks.)	ton	65-68
9-in. arches, wedges and keys	ton	80-85
Scraps and splits	ton	85
Silica brick, 9-in. sizes, f.o.b. Chicago district	1,000	48-50
Silica brick, 9-in. sizes, f.o.b. Birmingham district	1,000	48-50
F.o.b. Mt. Union, Pa.	1,000	42-44
Silicon carbide refract. brick, 9-in.	1,000	1,100.00

Ferro-Alloys

Ferrotitanium, 15-18% f.o.b. Niagara Falls, N.Y.	ton	$200.00 - $225.00
Ferrochromium, per lb. of Cr, 6-8% C	lb.	.11½ .11¾
4-6% C	lb.	.12 - .13
Ferromanganese, 78-82% Mn, Atlantic seabd. duty paid	gr. ton	115.00 - 120.00
Spiegeleisen, 19-21% Mn.	gr. ton	35.00 - 37.00
Ferromolybdenum, 50-60% Mo, per lb. Mo	lb.	1.90 - 2.15
Ferrosilicon, 10-15%	gr. ton	38.00 - 40.00
50%	gr. ton	86.00 - 89.00
75%	gr. ton	150.00 - 160.00

Ferrotungsten, 70-80%, per lb. of W	lb.	$0.85 –	$0 90
Ferro-uranium, 35-50% of U per lb. of U	lb.	6 00 –	
Ferrovanadium, 30-40%, per lb. of V	lb	3 75 –	4 00

Ores and Semi-finished Products

Bauxite, dom. crushed, dried, f o b shipping points	ton	$6 50 –	$8 75
Chrome ore, Cuban concentrates, 50% min. Cr_2O_3	ton	22 00	23 00
C.i f Atlantic seaboard.	ton	20 50	26 00
Coke, fdry, f o b ovens	ton	8 25 –	8 50
Coke, furnace, f o b ovens...	ton	7 00	7 25
Fluorspar, gravel, f.o b. mines' Illinois	ton	21 50	
Ilmenite, 52%, TiO_2	lb.	01¼	01½
Manganese ore, 50% Mn, c i f Atlantic seaport	unit	33 –	
Manganese ore, chemical (MnO_2)	ton	75 00	80 00
Molybdenite, 85% MoS_2, per lb MoS_2, N Y.	lb	65 –	70
Monazite, per unit of ThO_2, c i f, Atl seaport .	lb	06	08
Pyrites, Span, fines, c i.f Atl seaport	unit	11½–	12

Financial, Construction and Manufacturing News

Construction and Operation

Arizona

MESA The Attaway-Phelps Cotton Co. has perfected plans for the erection of a new cottonseed oil mill on local site, estimated to cost about $50,000. Four primary presses and auxiliary machinery will be installed E G Attaway is president

California

SAN MATEO -The McClenahan Products Co 601 Howard St., San Francisco, manufacturer of brick, sewer pipe and other burned clay products, has plans under consideration for the erection of a new plant on site selected at East San Mateo It is estimated to cost close to $40,000, with machinery

VINDALE STATION—The Rio Grande Oil Co, operating in the Montebello field, near Santa Fe Springs, has acquired a local site, comprising about 100 acres, for the construction of a new oil refining plant, estimated to cost in excess of $100,000, with machinery The company is operating other refineries in this district L E Lockhart is president

LOS ANGELES The Pacific Coast Borax Co, Kohl Bldg, San Francisco, will commence the immediate erection of the first unit of its proposed new plant in the harbor district to be equipped for general reduction and refining service It will be 3-story, with foundations to provide for two additional floors at a later date, estimated to cost approximately $500,000, with machinery Albert C Martin, Higgins Bldg., Los Angeles is architect

OAKLAND The California Salt Co, Mills Bldg San Francisco, will enlarge its plant at Alvarado, near Oakland, in connection with the rebuilding of the portion of the works destroyed by fire in January Plans are being completed and operations will soon be commenced. The cost is estimated at $300 000, with machinery

Connecticut

SOUTH COVENTRY— The Willimantic River Paper Co will soon commence the erection of an addition to its plant, comprising the former mill of the South Coventry Paper Co and has work in progress on alterations and improvements for considerable increase in capacity. New paper-making machinery and power equipment will be installed. Charles E Clute is president

THAMESVILLE—The Uncas Paperboard Co. has completed plans for enlargements in its local mill to increase the capacity from 100 to 200 tons a day Considerable new machinery will be installed James E Smith is president

Delaware

NEW CASTLE -The Wilmington Fibre Specialty Co has commenced preliminary work for the erection of 3 new additions to its plant, consisting of a 1-story structure, 86x170 ft., for enlargements in the sheet-making department, 3-story, 64x108 ft, for general manufacture; and 1-story, 30x100 ft New machinery will be installed, including fiber-making equipment, rolls, hydraulic presses and power apparatus. The expansion is estimated to cost in excess of $250,000. The Austin Co., Bulletin Bldg., Philadelphia, Pa, is the general contractor.

Georgia

SUMMERVILLE—The plant of the Standard Chemical Co., devoted to the manufacture of fertilizers, has been acquired by C. F. Hoffman. Gadsden, Ala., and associates. The new owners plan for extensions and improvements, and will place the works in service at an early date.

ATLANTA—The Atlanta Glass Mfg. Co. is taking bids for the erection of two new plant units on site recently acquired, and purposes to commence work at an early date The structures will be equipped for the production of glass bottles and containers.

Illinois

URBANA—The Clifford Jacobs Forging Co. has tentative plans under consideration for the rebuilding of the portion of its foundry, destroyed by fire, March 27, with loss estimated at $75,000, including equipment.

Indiana

NEW PALESTINE—The Indianapolis Steel Products Co has work under way on a new 1-story plant, 100x200 ft, on local 14-acre site, lately acquired, to be equipped for the manufacture of small steel specialties. Initial employment will be given to about 100 men, and this number considerably increased in the near future W M Lewis and Walter Bledsoe head the company

INDIANAPOLIS—The Jones X-Plo Mfg Co has arranged for the operation of a plant at 341 West 26th St, for the manufacture of chemicals and chemical byproducts.

UPLAND—Fire, April 2, destroyed a portion of the plant of the Upland Flint Bottle Co., including blowing department, with loss estimated at $100,000, including equipment. It is planned to rebuild

Kansas

WICHITA -The Derby Oil & Refining Corp has commenced enlargements in its local oil refinery to increase the capacity from 1 000 to 5 000 bbl per day. Other extensions and improvements will be made in the plants in this section A preferred stock issue of $2,325,000 is being sold, to be used, in part, for the expansion. A. L. Derby heads the company.

ANTHONY—Fire, March 29, destroyed a large section of the local plant of the Anthony Salt Works, Inc, with loss approximating $250,000, with buildings, machinery and stock.

Louisiana

MONROE- The Zeigin-Clarke Oil & Gas Co., recently organized with a capital of $150,000, has plans in progress for the erection of a new gasoline-refining plant, estimated to cost approximately $75,000, with machinery G. W Zeigin and W B Clarke head the company. Henry Walton is engineer in charge.

MERREAUX The Sinclair Refining Co. has tentative plans under consideration for the rebuilding of the portion of its oil-refining plant at Merreaux, near New Orleans, destroyed by fire March 28, with loss reported in excess of $750,000, including equipment Headquarters of the company are at 45 Nassau St, New York.

Maine

LINCOLN—The Lincoln Eastern Pulp Mill is planning for the rebuilding of the portion of its plant destroyed by fire March 22, with loss reported at $23,000.

Maryland

CRISFIELD—The Crisfield Light & Power Co., recently acquired by new interests headed by Isaac H. Tawes and associates, has plans under consideration for extensions and improvements in the local artificial gas plant, including the installation of additional equipment.

Massachusetts

EAST WALPOLE—Bird & Son, Inc., manufacturer of paper and composition roofing, has commenced excavations for a 1- and 2-story plant addition, 90x540 ft., to cost close to $300,000, with equipment. The general contract was awarded recently to *the Central Engineering & Construction Co.*, Pawtucket, R. I. Monks & Johnson, 99 Chauncey St., Boston, are architects and engineers.

NATICK—The Griess-Pfleger Tanning Co.

Sycamore St., Cincinnati, O., has acquired the tannery of C. W. Dean & Co., and will occupy the structure at an early date. Improvements and alterations will be made; a large portion of the works will be given over to leather-cutting and similar operations.

Michigan

LUDINGTON—The Morton Salt Co. is planning for the erection of a 1-story addition at its local plant, 120x139 ft., for considerable increase in capacity. New grainer pans and other equipment will be installed.

JACKSON—Plans are being completed for the construction of a new 1-story heat-treating plant, 75x125 ft., at the works of the American Gear & Mfg. Co., a subsidiary of the Hupp Motor Car Corp., Detroit.

GRAND RAPIDS—The National Brass Co. will commence immediately the erection of a new 1-story addition, 45x230 ft., at Evergreen and Madison Aves., estimated to cost $25,000, exclusive of equipment.

Missouri

JOPLIN—The Mogul Mining Co., Miami, Mo., has plans in progress for the erection of a new concentrating plant, with capacity of about 200 tons per day. A. E. Dunlap is general manager.

MOUND CITY—The Mound City Roofing Tile Co. is planning for the rebuilding of the portion of its plant on Morganford Ave., recently destroyed by fire with loss of about $25,000.

New Jersey

TRENTON—The New Jersey Porcelain Co. has filed plans for the erection of a new plant on the block bounded by Plum and Strawberry Sts., and Pennsylvania and New York Aves., estimated to cost $60,000. A list of equipment to be installed will be prepared at an early date. Fowler, Seaman & Co., Broad St. Bank Bldg., are architects.

PAULSBORO—The Vacuum Oil Co., 61 Broadway, New York, will commence the erection of a new oil storage and distributing plant here, consisting of a 3-story structure, 100x120 ft., and 2-story building, 60x60 ft. A general contract for the work has been let to the Turner Construction Co., 242 Madison Ave., New York.

MILFORD—The Warren Mfg. Co., specializing in the production of glassine papers, will install additional machinery at its local mill for considerable increase in capacity.

BOUND BROOK—Fire, March 26, destroyed a portion of the foundry of the Bolte Piano Plate Co., Middlesex Borough, near Bound Brook. An official estimate of loss has not been made. It is planned to rebuild. Harry Bolte heads the company.

New York

ROME—The Rome Brass & Copper Co., Bouck St., has plans in progress for the construction of a 1-story and basement addition at its local mill, 50x175 ft., estimated to cost $180,000, including machinery. The company specializes in the manufacture of brass and copper tubing, sheets, etc. Alfred F. Pashley, 431 South Dearborn St., Chicago, Ill., is architect.

BUFFALO—The General Castings Corp., 577-89 Tonawanda St., has tentative plans under consideration for the rebuilding of the portion of its foundry, destroyed by fire March 27, with loss estimated at about $50,000, including equipment.

LITTLE FALLS—The Little Falls Chemical Co., is planning for the erection of a 1-story addition to its plant, 50x100 ft., estimated to cost about $35,000. Louis Vandermeer is treasurer.

ALBANY—Construction will soon be commenced on a new 1-story foundry at the local plant of the Federal Signal Co., to be equipped primarily for the production of steel castings.

TONAWANDA—Officials of the American Radiator Co., Buffalo, have organized the Tonawanda Iron Co., with capital of $1,500,000, to take over the local blast furnaces of the Tonawanda Iron & Steel Co., controlled by the Donner Steel Co., Buffalo. Immediate possession will be taken, and the two stacks remodeled and improved. The plant has a rated capacity of 180,000 tons of pig iron per annum, and will be run on this basis by the new owner, the material to be used at the different radiator works. B. M. Wooley is president, and Wetmore Hodges, secretary and treasurer.

BUFFALO—The Kelly Island Lime & Transport Co., Cleveland, O., will build an addition to its local limekiln plant on the Buffalo River, to cost about $30,000.

North Carolina

RALEIGH—The State Highway Commission has tentative plans for the construction and operation of a cement manufacturing plant, to be used as a source of supply for state road work. Frank Page is chairman.

Ohio

AKRON—The Miller Rubber Co. will commence the immediate erection of a 4-story addition to its tire manufacturing plant, 98x285 ft., estimated to cost about $325,000, with machinery. It will be located in the South Akron section.

HUBBARD—The American Sintering Co., Youngstown, O., has commenced the construction of a new local plant, to be equipped to handle about 1,000 tons of sinter per day.

AKRON—The Anaconda Copper Co. is planning for the immediate construction of a new building at its recently established zinc oxide plant in the North Akron section. The works is giving employment to about 150 men and this force will be increased in the near future.

TOLEDO—The United States Malleable Castings Co. has preliminary plans under consideration for the rebuilding of the portion of its plant, destroyed by fire March 29, with loss estimated at about $500,000, with equipment.

Oklahoma

TULSA—The proposed new local plant of the Union Carbide Co., 30 East 42nd St., New York, on property recently acquired, will be used by its subsidiary organizations, the Prest-O-Lite Co. and the Linde Air Products Co., manufacturers of acetylene products and industrial oxygen specialties, respectively. The works for the last-noted organization will consist of a main 1-story building, 150x200 ft., with smaller structures adjoining.

OKMULGEE—The Waite-Phillips Refining Co. will make enlargements in its local oil refinery, to increase the output from 3,000 to 5,000 bbl. per day. New pressure stills and other equipment will be installed.

HASKELL—The Coleman-Nelson Corp., Tulsa, has acquired the refinery of the Southern Oil Refining Co., at Haskell, with rated capacity of 1,000 bbl. daily. The new owner will take possession immediately and plans for extensions and improvements, including the installation of additional equipment.

Oregon

PORTLAND—The Portland Gas & Coke Co., Gasco Bldg., will commence immediately erection of a new 2-story oil purification plant on St. Helens Rd.

Pennsylvania

LANCASTER—Bids are being taken for the erection of a new 1-story foundry at the plant of the E. T. Fraim Lock Co., Park Ave., 43x170 ft., estimated to cost about $17,000, exclusive of equipment. J. Wilmer Hershey, 1012 East Orange St., Lancaster, is architect.

PITTSBURGH—Fire, March 31, destroyed a portion of the plant of the American Window Glass Co., in the vicinity of New Kensington, near Pittsburgh, with loss estimated at about $200,000, including equipment. It is planned to rebuild. Headquarters of the company are in the Farmers Bank Bldg.

LANCASTER—The city council has tentative plans under consideration for the construction of a filtration plant at the municipal waterworks.

EDGELY—The Margaree Paper Co., Modena, Pa., will break ground at once for the construction of its proposed new local plant on site recently acquired, comprising two main mills, each 180x200 ft., estimated to cost about $550,000, including machinery. The works will include a power house.

Tennessee

CHATTANOOGA—The Crane Enamelware Co. has tentative plans for the erection of an addition to its local plant, estimated to cost in excess of $150,000, with machinery. It is purposed to develop a large increase in capacity.

Texas

BRECKENRIDGE—The Columbian Carbon Black Products Co. has been granted permission to construct and operate a local plant, on site recently acquired about 5 miles from the city. It will consist of a number of buildings and is estimated to cost approximately $350,000, with machinery. J. W. Hassell heads the company.

MIRANDO—The Tex-Pata Pipe Line Co. has plans under way for the construction of a new oil refinery on local site, with initial capacity of about 2,000 bbl. per day. Oliver W. Killam is president.

DALLAS—The Centrifugal Concrete Products Co. of America has leased a portion of the factory site of the Liberty Yeast Co. for the establishment of a new plant for the manufacture of special concrete pipe products, made under a centrifugal process.

Washington

CAMAS—The Crown Willamette Paper Co. is arranging for the immediate erection of an addition to its plant, 57x60 ft., to be used as a digester building. R. O. Young is manager at the mill.

Wisconsin

WHITEWATER—Fire, March 30, destroyed a portion of the plant of the Kinzie Rubber Co., occupying a portion of the Kiser Bldg., with loss reported at about $30,000. It is planned to rebuild.

TOMAHAWK—The Tomahawk Kraft Paper Co., recently organized, has taken over the local plant of the Pride Pulp & Paper Co., including mill, water power sites and other property. Plans are under consideration for the construction of a new pulp mill in the vicinity of Grandmother Falls. The Tomahawk plant will be improved and remodeled, and used for the production of kraft papers. Henry M. Thompson and D. C. Everest, the latter of Wausau, Wis., head the company.

Industrial Developments

GLASS—The Inland Glass Co., Chicago, Ill., has increased operations at its new local plant, recently completed, representing an investment of about $500,000, and purposes to develop maximum production at an early date. The mill will be devoted to the manufacture of illuminating glassware. The company was incorporated recently with a capital of $750,000. J. B. Weaver is president.

Decorated glassware plants in all parts of the country are running at maximum capacity and are from 30 to 90 days behind on orders. It is said that the present basis of operations will be maintained throughout the year.

The Ball Brothers Glass Mfg. Co., Muncie, Ind., manufacturer of glass jars, is operating full at its local plant, giving employment to about 1,500 persons. It is expected to run on this schedule for an indefinite period.

Window glass mills in West Virginia are advancing production and additions are being made to the working forces. A number of plants have orders on hand insuring maximum output for a number of months to come.

CERAMIC—The Edwards Brick Co., Columbia, Mo., is arranging for increased production at its plant, and will install considerable new equipment for this purpose. It is planned to develop the 6-kiln plant to maximum, with an output of about 55,000 bricks per kiln, including paving, face and common brick.

The La Junta Clay Products Co., La Junta, Colo., has resumed production at its plant, following the installation of additional equipment, and plans for full operations for an indefinite period. The company specializes in the manufacture of face brick, blocks, drain tile and other burned clay products.

Sanitary ware plants in the Raritan River section of New Jersey are running at full capacity, with full working forces. Orders on hand insure this basis for some months to come.

Brick-manufacturing plants in the Hudson River district, New York, are making ready for early resumption of production following a shut-down through the winter. It is expected to develop maximum output at the majority of the plants at the earliest possible date.

The Marshfield Brick & Tile Co., Marshfield, Wis., is advancing production at its plant, and plans for improvements to provide for greater capacity. Considerable additional equipment will be installed, both for brick and drain tile manufacture.

PAPER—The Scott Paper Co., Chester, Pa., has completed the installation of additional equipment at its local plant and will main

tain capacity operations for some time to come. A full working force is employed Heavy incoming orders are reported

The Backus-Brooks Co., Kenora, Ont., has commenced operations at its new pulp mill and will place other departments of the plant in service as soon as completed The plant is expected to develop a total capacity of 80 tons of pulp daily.

The Lincoln Paper Co., Elkhart, Ind., is maintaining capacity production at its local plant, giving employment to a full working force. The mill will be continued on this basis for an indefinite period.

The Spruce Falls Co., Ltd., Kapuskasing, Ont., is running at close to normal at its local sulphite plant, averaging about 90 tons per day The company has plans under consideration for the establishment of a paper mill in the near future

MISCELLANEOUS - E I du Pont de Nemours & Co Wilmington, Del, have advanced the wages of employees at their explosive and dye works at Carneys Point, Gibbstown and Deepwater, N J, 10 per cent, or an hourly wage increase of about 6 cents per hour Approximately 2,000 persons are affected

The Oklahoma Production & Refining Corp., Muskogee, Okla., has closed its local refining plant as a result of the scarcity of crude oil It is expected to resume at an early date

The Vacuum Oil Co., New York, has increased the wages of employees at its Paulsboro, N J, works 5 cents an hour, effective April 4

The Carnegie Steel Co., has resumed operations at the first unit of its coke plant at Farrell, Pa, giving work to about 500 men The plant has been inactive for 24 months past Other units will be started up until the entire 182 ovens are charged The benzol plant has also been placed on the active list.

The American Vulcanized Fibre Co Wilmington, Del, is running at full capacity at its mill at Newark, Del, giving employment to an increased working force

New Companies

THE ROLLSTONE PAPER CO, Fitchburg Mass, has been incorporated with a capital of $300,000, to manufacture paper products Louis T Stevenson is president, and Henry M. Wheelwright, Newton, Mass, treasurer The last noted represents the company

THE BARON PRODUCTS CORP, New York care of S T Stern, 11 Park Row, representative, has been incorporated with a capital of $100,000 to manufacture chemicals and affiliated products. The incorporators are H Meier, L Javitz and L Baker

CHARLES E SALMON, INC, Detroit, Mich, has been incorporated with a capital of $25,000, to manufacture inks and kindred products. The incorporators are William H Wendell, G. W and Charles E. Salmon, 2501 Gladstone Ave, Detroit The last noted represents the company

THE FLORIDA CHINA CLAY CO, Leesburg, Fla., has been incorporated with a capital of $100,000, to operate clay properties and clay refining plants R L Fox is president, and R B Bourlay secretary treasurer, both of Leesburg

THE NEW PRESSMAN TIRE & RUBBER CO, Newark, N J, has been incorporated with a capital of $2,000,000, to manufacture tires and other rubber products The incorporators are Herman Pressman, Herbert G Tully and Joseph E. Monteith, 776 Broad St, Newark. The last noted represents the company

THE RADEX LABORATORIES, INC, care of the Corporation Service Co, Equitable Bldg., Wilmington, Del, representative, has been incorporated under Delaware laws with capital of $100,000, to manufacture chemical products.

THE GILMOUR CHEMICAL CO, Waterbury, Conn, has been incorporated with a capital of $50,000, to manufacture chemical compounds, paint and varnish removers and kindred specialties The incorporators are A L and John Gilmour, 21 Newell Place, Waterbury

THE NEW JERSEY WAXED PAPER CO Passaic, N J, has been incorporated with a capital of $50 000, to manufacture paper products The incorporators are Walter M and E M Crowell, and Benjamin H Ballard, 36 Vineyard Place, Passaic The last noted represents the company

THE MARKER CHEMICAL CO, Fairmont, W. Va, has been incorporated with a capital of $1,000,000, to manufacture chemicals, fertilizers, etc The incorporators are R. L Long and S. S. Burke, Fairmont; and Earl Van Horr, Clarksburg, W. Va.

THE AMALGAMATED LEAD-ZINC SMELTERS CORP, care of the Corporation Trust Co. of America du Pont Bldg, Wilmington, Del., representative, has been incorporated with a capital of $1,250,000, under Delaware laws, to operate metal smelting and refining plants

THE CONROE BRICK CO, Conroe, Tex, has been incorporated with a capital of $15,000, to manufacture brick, tile and other burned clay products. The incorporators are B. E. Hinchcliffe, B. J. Lacka and W M Merriss, all of Conroe

THE HOLLAND FOUNDRY CO, Holland, Mich has been incorporated with a capital of $35,000, to manufacture iron and other metal castings The incorporators are Theodore Fisher, Chicago, Ill, Robert H Carnahan, Jr, and Frank P Parish, both of Holland The last noted represents the company

THE HERMAN CHEMICAL CO OF MASSACHUSETTS, INC, Boston, has been incorporated with a capital of $10,000, to manufacture chemicals and chemical byproducts. John N. Penick is president, and Walter T. Hannigan, Newton, Mass, treasurer The last noted represents the company

THE MARSHALL REFINING CO, Kansas City, Mo, has been incorporated with a capital of $49,000, to manufacture refined petroleum products. The incorporators are W S Primley and D. B Sevastian, both of Kansas City

THE VAN PELT CONCRETE CO, Milltown, N J has been incorporated with a capital of $50,000, to manufacture cement and concrete products. The incorporators are Archie Van Pelt, Conrad W Kuhlthau and Howard J Booream all of Milltown

THE AGRILIN CHEMICAL CO, New York, care of the Delaware Registration Trust Co, 900 Market St, Wilmington, Del, representative, has been incorporated under Delaware laws with a capital of $550,000, to manufacture chemicals and chemical byproducts The incorporators are Horace N. Taylor and Louis Pavelek, New York; and William I Brophy, Rockaway Beach, L. I

THE W. P. COLLINS OIL CO, 2619 Mary St, Chicago, Ill, has been incorporated with a capital of 900 shares of stock, no par value, to manufacture oils, greases, lubricants, etc The incorporators are John J, Thomas J, and William J Collins

THE BRILLIANT PRINTING INK CO, Philadelphia, Pa, has been incorporated with a capital of $5 000, to manufacture printing and other inks Ernest Osborne, 5636 Belmont Terrace, Philadelphia, is treasurer

Industrial Notes

C W HUNT CO, INC., West New Brighton N Y, designer and manufacturer of material-handling equipment, announces that the exclusive license to manufacture and sell the Mitchell electric vibrating screen has been acquired by it More than 300 of these screens are in operation throughout the world.

THE GIFFORD-WOOD CO, Hudson, N Y., announces that A. W. Berghoefer has again become associated with it.

THE PURE CARBON CO, Wellsville, N. Y., announces the recent establishment of a northern West Virginia representative in the person of Norman Strugnell of Clarksburg, W Va

F J RYAN & CO, Philadelphia, announce that J. L. Edwards, for the past 4 years district engineer for the Mahr Mfg. Co., with headquarters at Pittsburgh, Pa., has resigned to take the position of district manager of the Pittsburgh territory of the Ryan Company. Mr. Edwards has been actively participating in the design, installation and sale of steel plant equipment in the Pittsburgh district for nearly 10 years, having been associated with the Westinghouse Electric & Mfg Co. and the Fairbanks company previous to becoming connected with the Mahr company. The Ryan company's offices will be located in the Oliver Bldg, Pittsburgh, and this office will have supervision over the entire territory of eastern Pennsylvania, certain sections of eastern Ohio and the northern section of West Virginia. Mr. Edwards will be assisted by a corps of trained men.

THE UEHLING INSTRUMENT CO., manufacturer of CO_2 recorders and other power plant gages, has placed Charles J. Schmid in charge of sales in Greater New York and Long Island. Mr. Schmid is well qualified for his duties in this important territory due to his close contact with power plant operators in the interest of fuel economy when formerly in charge of the Boston office. Temporarily Mr. Schmid will make the home office in Paterson, N. J., his headquarters.

Coming Meetings and Events

AMERICAN ASSOCIATION OF CEREAL CHEMISTS will hold its ninth annual convention at Hotel Sherman, Chicago, June 4 to 9.

AMERICAN ASSOCIATION OF ENGINEERS will hold its annual convention in Norfolk, Va., May 7 to 9.

AMERICAN ELECTROCHEMICAL SOCIETY will hold its spring meeting May 3, 4 and 5, 1923, at the Commodore Hotel, New York.

AMERICAN FOUNDRYMEN'S ASSOCIATION will hold a meeting in Cleveland, O., April 30 to May 3.

AMERICAN GAS ASSOCIATION will hold its annual convention the week of Oct. 15 at Atlantic City An elaborate exhibition of gas-making and gas-utilization equipment is planned.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS will hold its summer meeting June 20-23 at Wilmington, Del.

AMERICAN LEATHER CHEMISTS ASSOCIATION will hold its twentieth annual convention at the Greenbrier, White Sulphur Springs, W Va., June 7, 8 and 9.

AMERICAN OIL CHEMISTS' SOCIETY will hold its annual meeting at the Eastman Hotel, Hot Springs, Ark., April 30 and May 1

AMERICAN SOCIETY OF MECHANICAL ENGINEERS will hold its spring meeting May 28 to 31 in Montreal, Canada

AMERICAN SOCIETY FOR TESTING MATERIALS will hold its twenty-sixth annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, beginning Monday, June 25, 1923, and ending either Friday or Saturday of that week

AMERICAN WELDING SOCIETY will hold its annual meeting April 25 to 27 at the Engineering Societies Building, New York.

AMERICAN ZINC INSTITUTE, INC., will hold its fifth annual meeting at the Hotel Chase, St. Louis May 7 and 8.

CANADIAN INSTITUTE OF CHEMISTRY will hold its annual meeting in Toronto, May 29 to 31.

ENGINEERING SECTION of the National Safety Council will hold a mid-year safety conference April 17 in the auditorium of the Western Society of Engineers

INTERSTATE COTTON SEED CRUSHERS ASSOCIATION will hold its annual convention at Hot Springs, Ark., May 2 to 4

IRON AND STEEL INSTITUTE (London) will hold its annual meeting May 10 and 11 at the House of the Institution of Civil Engineers, London, S W. 1.

NATIONAL ASSOCIATION OF MANUFACTURERS OF THE UNITED STATES OF AMERICA will meet in annual conference May 14 to 16, inclusive, at the Waldorf-Astoria, New York City

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (NINTH) will be held in New York Sept. 17-22

NATIONAL FOREIGN TRADE COUNCIL has postponed its annual conference from April 25, 26 and 27, to May 2, 3 and 4. It will be held in New Orleans, La.

NATIONAL LIME ASSOCIATION will hold its fifth annual convention at the Hotel Commodore, New York City, June 13 to 15

NATIONAL SYMPOSIUM ON COLLOID CHEMISTRY will be held at the University of Wisconsin, June 12 to 15.

SOCIETY OF CHEMICAL INDUSTRY Canadian Section, will meet in Toronto, May 29 to 31

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stetters Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month.

SOCIETY FOR STEEL TREATING — Eastern sectional meeting will be held June 14 and 15, in Bethlehem, Pa.

SOCIETY OF INDUSTRIAL ENGINEERS, with headquarters in Chicago, will hold its spring convention in Cincinnati, April 18, 19 and 20, 1923. The major subject will be "Management Problems of the Smaller Plants."

The following meetings are scheduled to be held in Rumford Hall, Chemists' Club, East 41st St., New York City: May 4—American Chemical Society, regular meeting May 11—Société de Chimie Industrielle (in charge) American Chemical Society, American Electrochemical Society, Society of Chemical Industry, joint meeting. May 18—Society of Chemical Industry, regular meeting. June 8 — American Chemical Society, regular meeting.

Intelligent Caution Or Careless Ignorance

NEWSPAPERS recently featured a tragedy in Chicago in which six persons died in a flat in consequence of the seepage of fumes of hydrocyanic acid gas from a restaurant on another floor, which was being fumigated. The reporter described the insecticide thus: "It is made of cyanide of sodium, sulphuric acid and water. The combination forms a substance that eats up the oxygen and hydrogen in air, leaving only a poisonous gas." Blatant ignorance of the characteristics of the poison, however, was not confined to the narrator of the event; the account showed that the fumigation was being directed by an individual who styled himself the manager of the National Hygienic Corporation of Buffalo! The history of the disaster was traced back to the dissemination of pamphlets throughout the city. When apprehended, the director of the enterprise is reported to have affirmed that the gas used was non-poisonous. He was held by the police on a charge of criminal negligence; to us it would seem to have been a case of criminal ignorance.

The inculcation of fear in the public mind as to the effects of the so-called deadly poisons is detrimental to the progress of civilization. Cowardice is the father of superstition, and superstition is the antithesis of science. Knowledge and familiarity in the handling of the products of science are all that are needed to insure their full utilization for the benefit of humanity. Popular prejudices must be overcome by education. The drawback to hydrocyanic acid as an insecticide has been due almost entirely to the slipshod methods of preparation by those who are inexperienced in the handling of chemicals and ignorant of their effects. The combination of sodium cyanide and sulphuric acid leaves a residuum that invites accident. The use of liquid hydrocyanic acid leaves no residuum; in experienced hands, it is a safe and efficient insecticide. Its extended use in the near future for the extermination of pests from fruit trees will mark a new phase in the science of horticulture.

The fact that familiarity with poisons is the best insurance against accident is exemplified in the history of the cyanide process for the recovery of gold and silver from ores. When JOHN STEWART MACARTHUR developed a practicable scheme of operations for the use of potassium cyanide as the solvent, many were the apprehensions that its use in large plants would lead to frequent accident and heavy loss of life. As a matter of fact, the opposite was the result. The number of poisonings that have occurred in cyanide plants, despite the world-wide application of this method of hydrometallurgical extraction, has been negligible. The death rate is as low as or lower than in any other industry that is considered to be free of appreciable hazard. This result has come about because of a wide education in the properties and effects of cyanide.

The so-called accidents that happen from time to time are often the effects of ignorance or carelessness, sometimes both. Intelligent technicians are conquering the inanimate world; and those bolder spirits are deserving of credit who can make fire and flood and poison the servants, rather than the masters, of humanity. But until that happy day arrives we shall persist in demanding that those who offer to serve the public with chemical products shall not only use them intelligently but also safeguard the people against the results of carelessness or ignorance.

A Week of Paper and Pulp

APRIL 9 to 14 was a history-making week for the pulp and paper industry. Many healthy signs of the times were in evidence at the meetings of the American Paper and Pulp Association and its affiliated societies which were held in New York coincident with the Paper Industries Exposition. Perhaps the most encouraging development to the technologist was the changing attitude toward industrial research, which is paralleling the paper industry's trend away from rule-of-thumb operation and unscientific methods. Other signs of progress are to be seen in the increasing interest in process efficiency and in the war on waste both in production and distribution.

The Technical Association of the Pulp and Paper Industry—known more familiarly as TAPPI—has had a large part in co-ordinating and directing the research activities of the industry. By standardizing processes and materials, defining units of measurement and establishing fixed objectives in its experimental work, the association is putting paper research on a comparative basis and making its results intelligible and of value to investigators in other plants and other fields.

The Paper Industries Exposition, the first of the kind ever held, proved its worth quite convincingly. By bringing together under one roof all the interests of the industry—from standing tree to a highly fabricated paper product—the exposition acted as an effective means of demonstrating the intrarelations of the industry and the dependence of the different branches upon one another. Production men carried away many practical ideas from the equipment exhibits. The purchasing and marketing men exchanged views and learned of latest developments in their respective fields. And not the least important was the educational value to the public, for all who came in contact with the exposition went away with a keener appreciation of the importance of America's seventh industry and its essential rôle in modern life and progress.

Pekinese Or Pekiner?

OUR late editorial comment on an excellent method of teaching chemistry in China has called forth a protest from an esteemed Chinese reader. The offence consisted in the quotation from BRET HARTE'S poem to the effect that "the heathen Chinee is peculiar." We hasten to assure all readers from the Orient that no offence was intended. The adjective heathen has lost its sting to many of us, and we believe the subject debatable whether it is not better to be a heathen than a member of the Ku Klux Klan, which boasts of something like 120 per cent Americanism. To be peculiar is really a virtue, and we cherish the hope that we are a bit peculiar ourselves—at least enough so to be individual.

About the expressions Chinee and Chinaman, to which our correspondent objects, we are a little bewildered, because Chinese, which is the term he approves, properly speaking is an adjective, and we are at a loss for a good noun to indicate a native of China. True, American is both an adjective and a noun, because custom makes it so, and in time it may be the same for Chinese. If a better contemporary substantive than Chinaman is suggested we promise to be good and to use it, so long as it accords with our literary conscience. We have immense admiration for people and things Chinese, and we want to be set right in this matter. We want to make friends among them, not enemies. We acknowledge frankly our lack of the Oriental slant in expression. For instance, we should hesitate to refer to a gentleman from Pekin as Pekinese, on account of the infernal little dogs that women carry about and which are called Pekinese. What should we call him? Would Pekinian do? We call a man from New York a New Yorker, but if we call one from Pekin a Pekiner that would be German, not English. We're in a quandary. We're doing our best, and we seek enlightenment.

Researching the Staff of Life

ON ANOTHER page there is indicated, in an article on baking, the practical, dollar value of engaging in research, even as pioneers. Here was a household art, developed into a major industry which was supposed to have its beginning and its end in kitchen culture. Twenty years ago there was no one less welcome in a bakery than the chemist. So long as ignorance reigns we think we know it all, but as soon as we begin to prosecute research intelligently the problems spring up as did the fabled warriors when dragons' teeth were sown. Now, in this baking industry, research has only begun. The baker with scientific curiosity has questions enough to baffle the wisest of us. Here are a few of his inquiries:

He would like to ferment his dough in the pan—that is, to ferment each loaf separately. The yeast plant converts into alcohol and CO_2 about 4 per cent of the dry material used, and any reduction of this waste of flour and sugar would be worth while. By fermenting in the pan it might be accomplished.

The problem of the flavor of bread needs better control. Knowing how to make it good and agreeable to the taste is far from a complete solution. If he only knew why it has the desired flavor he would be in a position to make all kinds of bread taste better. This would be an important contribution to economics. A bushel of wheat is converted into food and fuel to the extent of 90 per cent of its weight. A cow will convert 18 per cent of wheat or grain into milk, the pig 15½ per cent into pork, hens 5 per cent into eggs, and fowls a little over 4 per cent into dressed poultry. The amount of bread eaten is determined even more by its tastiness than by its nutritive value.

The baker needs to know more than he does of the effect of moisture on the baking and keeping qualities of flour. And what is the physical effect of mixing dough? Different types of flour require different degrees and periods of mixing. This fact is determined by tests, but what's the chemistry of it? There is a relationship between the hydrogen-ion concentration of dough and its requirements as to mixing, but what is that relationship?

What is the actual function of shortening—i.e., of the fats used in baking? What is the proper protein content of bread, and which proteins are most wholesome and most desirable? What are the changes that take place in canned eggs, more especially in reference to their food value? Why does bread deteriorate so rapidly, and how may deterioration be delayed? How may mold be controlled and avoided?

Indian corn or maize lacks gluten, and therefore it does not leaven properly; it cannot be made into a loaf with holes in it. To make a light, tasty cornmeal bread such as that made of wheat or rye would be another real contribution to economics.

And how much heat can cornmeal stand in milling? It is almost always much better if ground between slow-moving burr stones than in a Hungarian roller mill. It appears that the greater velocity and consequent heat of the roller mill injures the flour.

These are merely a few of the many problems that present themselves, but they are far and away from being the complete substance of things hoped for. They are, indeed, merely a few trivial wishes about the portals of research. If bread should ever be made into a ration at once complete, varied and desired by all, as well as healthful for all, we might have a different organization of society as its sequel.

The Portland Cement Industry And Its Association

AN editorial bearing this title appeared in *Chemical & Metallurgical Engineering* on July 26, 1922. It was written after an extended trip during which many executives and engineers connected with the manufacture and use of portland cement were interviewed and was designed to represent a chemical engineer's estimate of the industry and the association.

We believe that recent developments in the industry deserve such comment that a revision of the former editorial is in order. Before discussing this, however, two mistakes have come to our attention in the former editorial. The first was the crediting of the Portland Cement Association with the good work of developing standards for portland cement. As a matter of fact this work was actually done by the American Society for Testing Materials, the confusion arising because many of the committee were prominent in the Portland Cement Association. The second mistake was more serious in its implication than in its statement. "Invariably every improvement in concrete making which

is announced [by the association] indicates the desirability of using more cement [in the mix]. After a certain time this becomes monotonous and then suspicious." Since then recommendations have come to our attention in which the association has advised a smaller quantity of cement than that recommended for the same purpose by the Department of Agriculture and other bodies. Our statement was published with complete confidence in a hitherto reliable source of information. We accept complete responsibility for the error and believe that, while the opinion has following, it is decidedly unfair, being based partly on prejudice and partly upon an unfortunate interpretation of the policy of the Portland Cement Association of giving minimum requirements for cement in concrete specifications, leaving the upper limit open.

There were two main criticisms advanced in the former editorial—criticisms of the cement industry as a whole and of the association as its representative. The first had to do with the grading of cement and the second with the absence of fundamental research in the industry. We believe that the present standard specifications of portland cement are inadequate in that a wide variation in quality can be labeled "standard." These variations are known to many large consumers who purchase on their own specification and to experienced concrete foremen throughout the country, who will frequently designate a brand of cement which will be more desirable for a given type of work. We have therefore in part at least a grading of cement which we believe must become universal and which so far as our acquaintance goes would be unwelcome to the industry, since it would vastly complicate both sales and manufacturing.

With regard to fundamental research we are delighted to be able to withdraw our criticism. In our former editorial we had deplored the absence of fundamental research in the cement industry. "No work was being done to improve the product." We did not mean the more obvious improvements such as uniformity or fineness, but the study of fundamentals such as is carried out in Schenectady in the electrical industry or at Whiting and many other places in petroleum refining. There seemed to be an absence of research vision which would make it comparable to progressive industries. What constituted good cement? What factors improve the quality? What are the limiting percentages of the various constituents? Is it conceivable that other ingredients would be better? There was no interest in such questions.

Now, however, the research laboratory of the association has been instructed to undertake a comprehensive inquiry into the many fundamental questions. Most happily the association has enlisted the co-operation of the Bureau of Standards in this work so that both the producer and the consumer interest will be represented. It means further that the outstanding figures in cement and concrete work will be pulling together for the best interests of all.

Our enthusiasm is kindled and we wish to extend our congratulations upon the splendidly constructive program. It complements the work which the Portland Cement Association has already done toward educating the consumer in the use of concrete. This work has been well conceived and splendidly carried out for a long time.

Henry Ford Works Miracles

THE Associated Press has announced, and the newspapers have been giving the widest publicity to the statement, that HENRY FORD has purchased undeveloped coal lands in Kentucky and that he intends not only to provide for his own fuel requirements by this means but to induce others to join him in his "coal conservation scheme." The scareheads declare that "he has a plan "to burn the coal twice" and that "he will ask all industrial users of his coal to install furnaces that will remove only the gas, leaving a fuel unimpaired for domestic purposes. The coal, after the process, would be sold to heat the homes of hundreds of thousands of workers throughout the country. According to a technical explanation of the gas-removing process, the fuel would then be more valuable than ordinary coal for heating." This reminds us of the "Dere Mable" letters. "That's teckenickle, Mable," said the swain, "you wouldn't understand."

It probably takes a publicity bureau to put over a statement like the despatch quoted. Editors do their best to avoid this kind of free advertising, but now and then a blurb of this sort gets through. In this instance the Associated Press and all its subscribers, followed by those who copied the news, have effectively joined to present Mr. FORD as a miracle man who will keep poor folks warm in winter. Many papers which printed this as an item of news would refuse to accept it as an advertisement if their business managers knew how misleading it was. The reason is, of course, that the man of science has no place in a newspaper organization. Without saying so, it appears from the statement that the great HENRY FORD can induce manufacturers generally to equip their plants not only with a gas system but a briquetting outfit as well, or else that he can persuade the "hundreds of thousands of workers throughout the country" to burn coke. Thus far they haven't taken to it any too well. How does he propose to transport his domestic coke? And what argument has he for gas making that the manufacturers of gas equipment have not urged for years? Has he anything new? Not a word is said of his method. All we have is the misleading intimation that he plans to persuade manufacturers to "extract the gas" and that then they will have more heat units left over in the coke than they had in the coal. While not saying so in measured words, it gives the impression that HENRY can do what others cannot do. He may aspire toward conservation, but a more effective and immediate step in this direction would be to redesign the Ford automobile engine so that it consumes less gasoline. Mr. FORD is a genius at making cheap cars and selling them, and at getting rich, but thus far we have not heard of his successful efforts at conservation.

The article goes on to say that he will "devote his energies" to reforestation of the timber lands where he has half a billion feet standing, *without cutting down a single tree*. How can he reforest if he doesn't deforest? Without definitely announcing it, the impression is given that the hills are covered with virgin timber. And it is indicated that half a billion feet are ready for harvesting. If that is true the mature trees should be cut. The only value in letting the timber stand would be to teach know already.

Dirt In Steel

To the Editor of Chemical & Metallurgical Engineering

SIR:—I should like to second most heartily Mr. Epstein's plea, in your issue of March 14, for better preparation of specimens before taking micrographs for publication. Almost any sample of steel, no matter how clean, can be made to look dirty like his Fig. 1 by careless work, and the ease with which erroneous conclusions are arrived at in this way cannot be emphasized too strongly. I congratulate Mr. Epstein on his clear exposition of this point and of the importance of stating the magnification, and it is to be hoped that this article will be brought to the attention of every metallographist in the country.

There is just one criticism which I would make of this excellent contribution, and that is that the statement that a pit invariably forms around each inclusion during polishing is exaggerated. Alumina is the only inclusion which has invariably given this effect in my experience. Sulphides, iron oxide and silicates can be polished without the slightest pitting of the steel around them, and in soft, unhardened steel too. The way to accomplish this is to do as much of the abrasive work as possible with dry emery papers, and to reduce all wet abrasion to the absolute minimum, on a cloth like "duck" without too much "nap." The final polishing with rouge is of course a wet process, but need not cause any pitting.

Two photomicrographs are offered herewith as illustrations of inclusions in unhardened steel which show a few pits within the area of the inclusion (this is indeed often unavoidable unless the inclusions are small), but absolutely no pitting of the steel around the inclusion. The boundary between inclusion and steel is sharp and flat, even in the soft steel. In the writer's opinion there is no excuse for any other result where silicates or sulphides are photographed.

It seems rather unfortunate therefore that the Bureau of Standards should have to admit that it is necessary for it to harden its steel samples to reduce the "invariable" pitting around inclusions. Nevertheless it is to be hoped that the main point of Mr. Epstein's article will not lose anything in force on account of this minor detail in which his methods may seem somewhat open to criticism.

GEORGE F. COMSTOCK.

The "Modification" of Aluminum-Silicon Alloys

To the Editor of Chemical & Metallurgical Engineering

SIR:—G. W. Walker's comments in the April 9, 1923, issue of *Chem. & Met.* on a particular case of the modification of aluminum-silicon alloys are concerned with an alloy sufficiently different in composition from that described by the writer in *Chem. & Met.*, Aug. 23, 1922, to account for the difference in structure observed.

Mr. Walker's specimen contained iron 1.75 per cent and manganese 0.26 per cent, against iron 0.70 per cent and manganese 0.01 per cent in the material used by the writer.

It seems quite probable that the structure in Mr. Walker's sample is thoroughly modified and that the needles remaining consist of an iron silicide with possibly some similar manganese compound.

These needles are similar to those shown in Figs. 4 and 6 of the article by Jeffries, *Chem. & Met.*, April 19, 1922, representing an alloy of "approximately the same chemical composition—namely, Si 10 per cent, Fe

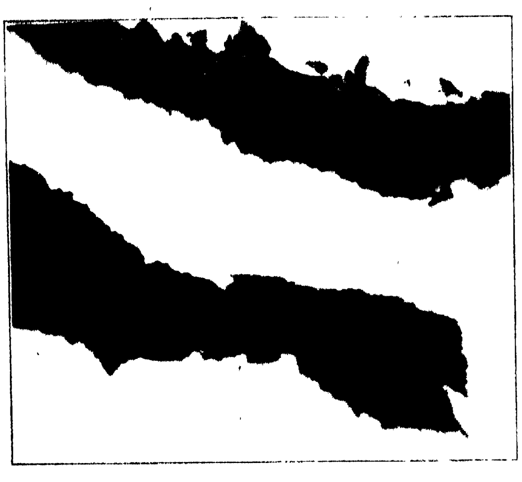

FIG. 1—SLAG IN CENTER OF WEB OF OPEN-HEARTH STEEL RAIL. × 200

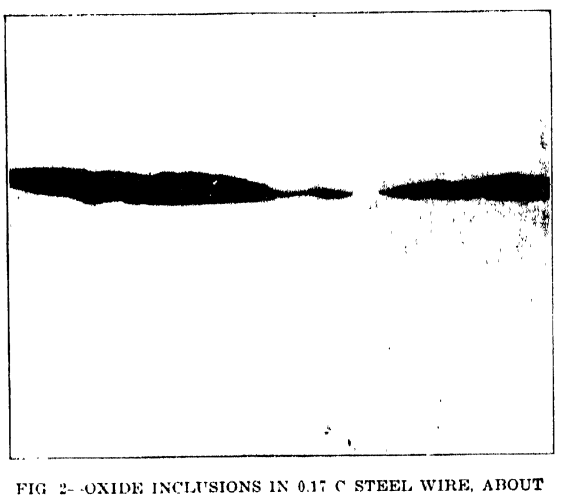

FIG. 2—OXIDE INCLUSIONS IN 0.17 C STEEL WIRE, ABOUT 0.2 IN. DIAMETER. × 200

about 1 per cent." If we choose to consider the "about 1 per cent" as a low estimate, the similarity in both structure and composition becomes more pronounced.

In this connection it is of interest to note in the summary of Jeffries' article: "Iron makes the aluminum-silicon alloys more corrodible and in general weakens and embrittles them." "The greater the amount of silicon used the less is the permissible iron." Also, in a publication of the Aluminum Co. of America, "Silicon-Aluminum Alloys," the following statements and recommendations are made: "The proportion of iron in the alloy should be strictly limited for the best result. Iron forms with silicon an iron silicide, which appears as needles in the microstructure. The modifying treatment has little refining effect on the particle size of this constituent, and its presence tends to reduce the ductility. The alloy as cast should preferably contain not over 0.5 to 0.6 per cent iron." . . . "High-grade ingot should be used in diluting the rich alloy to the required composition, so as to keep the iron content to a minimum. This point is mentioned again, for the highest strength and ductility are developed only when the iron is 0.6 per cent or under, and the rich silicon alloy, although made from a specially pure grade of silicon, may unavoidably contain more iron than 99/100 per cent ingot."

THE HENRY SOUTHER ENGINEERING CO.,
Hartford, Conn JAMES J. CURRAN

The Purpose Of a Standard

To the Editor of Chemical & Metallurgical Engineering

SIR:—Dr. Skinner's article on "Food Standards" is an excellent and forceful presentation of the subject. The fundamental functions of a standard, as applied to chemical products, are also clearly expressed in your editorial. I believe, however, it is worth while to call you attention to the fact that somewhat the same ideas are expressed in the annual report of the director of the Bureau of Standards for the fiscal year ended June 30, 1922. The following paragraphs are pertinent in this connection:

Standards of Quality:

Specifications for material (by description, sample, or both), known as *standards of quality*, fixing in measurable terms a property or group of properties which determine the quality.

The numerical magnitude of each constituent property pertinent to the quality involved, and specific magnitude in units of measure of such significant factors as uniformity, composition, form, structure and others.

Purpose:

To secure ***high utility*** in the *products* of industry by setting an attainable standard of quality.

To furnish a *scientific basis* for *fair dealing* to avoid disputes or settle differences.

To *promote truthful branding* and *advertising* by suitable standards and methods of test.

To *promote precision* and *avoid waste* in science and industry by affording quality standards by which materials may be made, sold and tested.

A standard of quality for a given material necessarily takes into account the purpose for which the material is to be used. To set the standard too low results in losses, poor efficiency and even loss of life; to make it too high may result precisely in the same thing—that is to say, the material must be suitable for the purpose intended, and the bureau's investigations in connection with the properties of materials are to enable the user of these materials, first, to select intelligently the material best suited for the purpose; second, to specify it in terms which the producer cannot mistake; and third, to make the necessary tests to ascertain whether or not the material supplied is in accordance with the specifications.

As you doubtless know, the Bureau of Standards is also authorized to deal with standards of measurement, standard values of constants, standards of mechanical performance, and standards of practice. These subjects are discussed in the annual report cited.

As an outstanding result of the government's work on standardization, it should be noted that the Federal Specifications Board is bringing about the use of standard specifications by all departments and independent establishments of the government for use in connection with the purchase of the more important materials.

The fundamental functions of a standard will depend on the type of standard in question. The annual report of the director of the Bureau of Standards sets forth the fundamental functions of each type of standard listed above. F. W. SMITHER.

Bureau of Standards,
Washington, D. C.

Gas in Monel Metal

The Bureau of Standards has just completed determinations of oxygen and hydrogen in samples representing three stages of the deoxidation of Monel metal. The samples were all from 50-lb. blocks cast during the progress of a regular heat: (1) The metal at the time of tapping the furnace before the addition of any deoxidizers; (2) the above metal after the addition of ferromanganese in the ladle, and (3) the above metal after the further addition of magnesium in the ladle—that is, after all additions have been made. Both oxygen and hydrogen in the metal decreased rapidly with the progress of the deoxidation. The finished metal, as represented by the last sample of this heat and by samples of completely deoxidized metal from two other heats, contains from 0.002 to 0.005 per cent oxygen. All samples appear rather porous under a magnification of 100.

A sample of Monel metal prepared as above, except that a portion of the deoxidation was carried out in the furnace, showed no porosity, and no oxygen could be detected. A sample of Monel metal from a Heroult furnace heat which had been completely deoxidized in the furnace likewise was entirely sound and contained no oxygen. Thus of the five samples of finished Monel metal examined, the three which were deoxidized by addition of ferromanganese and magnesium in the ladle were porous and contained from 0.002 to 0.005 per cent oxygen, while the two which were deoxidized entirely or in part in the furnace were sound and contained no oxygen.

Huge New Government Camera

The largest metal camera in the world is located in the Department of the Interior. It weighs 7,000 lb., occupies two complete rooms, takes a picture 1 yd. square and is operated either by electricity or by hand as easily as a tiny kodak in the hands of a tourist. Reorganization of the Interior Department's photographic activities, now in progress, is centered around this mastodon.

The lens, bellows and copy holder are in one room and the plate holder and dark room in the other. Focusing is done by an electrical contrivance which flashes a signal when the proper focus is reached. The 3½-ton giant was designed by A. H. Linsenmeyer, leading photographer of the Geological Survey of the Department of the Interior.

Technical Developments in the British Chemical Industries

Report of Progress in Radiant Heat Utilization, Use of Refractories, and Industrial Applications of Rubber Latex and Colloid Mill

FROM OUR LONDON CORRESPONDENT

RESEARCHES carried out in Great Britain before the war by Prof. W. A. Bone and the late C. D. McCourt on the flameless combustion of combustible gases when mixed with practically the theoretical quantity of air and in contact with special refractory surfaces culminated in the development of a type of boiler which under suitable conditions showed a thermal efficiency of 93 per cent or more. The boiler has been commercially developed both here and in America and successive modifications have brought it to a form quite different from the original form, in which 3-in. tubes were filled with granular refractory material. At present very large units can be supplied with tubes 12 in. in diameter and 20 ft. long and filled with special iron or brick spirals or other packing taking up very little room but sufficient to produce the radiant heat which gives the tube such a high efficiency and an evaporation of up to 20 lb. per sq.ft.

USE OF RADIANT HEAT

Bone and McCourt also developed a refractory diaphragm, the surface of which becomes red hot owing to the flameless combustion of the explosive mixture of gas and air on its surface. These are likely to have application in the chemical industry and for industrial heating operations generally. Thus the evaporation of liquids by radiant heat thrown down on their surfaces and the heat-treatment of any articles passed through a tunnel kiln or kindred heating or drying appliances should be facilitated and rendered more efficient, particularly as the products of combustion consist almost entirely of inert gases, and if necessary a reducing atmosphere can be used. The more general applications that have been developed so far comprise machinery for the baking of biscuit and the making of confectionery, and grillers and toasters for hotels. Other domestic heating operations and more particularly the introduction of highly efficient domestic gas fires and hot plates are foreshadowed and a modification consisting of a granular bed surrounding the furnace or apparatus to be heated enables metallurgical operations and the melting and heat-treatment of metals to be carried out in a convenient and efficient manner. Almost any industrial gases can be used as well as oil or gasoline, and the convenience of such local applications of radiant heat should be useful in many chemical manufacturing operations. It is understood that Professor Bone is preparing one or two scientific papers for the Royal Society of Arts in connection with the development of these methods.

SPALLING OF REFRACTORY BRICKS

Recent investigations have thrown some light on the considerable variation in the life of high-temperature furnace linings. Failures and short life do not necessarily prove that the bricks used were not up to specification and the spalling or progressive splitting away of the brick surfaces have in some cases been traced to small variations in the sodium chloride and sulphate content of the fuel used. With refractory brick a kind of hard porcelain glaze appears to be formed, which on cooling is liable to lateral cracking or spalling, and the formation of the glaze has been traced to volatilized chlorides and sulphates. The use of a coal the inorganic residue of which contains, say, 18 per cent of sodium sulphate and 2 per cent of sodium chloride may add 10 or 15 per cent to the life of the brick lining as compared with a content of 36 per cent of sulphate and 4 per cent of chloride. The method of firing, quantity of excess air and fire mouth design are not without importance. The best results have been obtained by careful limitation of the salt content of the fuel and by using furnace linings lower in silica and higher in alumina.

PROGRESS IN OTHER TECHNICAL PROCESSES

An interesting possible development in connection with the use of dehydrated liquid rubber latex in accordance with the process mentioned in these notes of February is the possibility of mixing this special product with viscose solution, by which it is hoped to render artificial silk less hygroscopic and more resistant. The idea is similar to the use of liquid latex in paper manufacture, and kindred applications in connection with casein and like products are foreshadowed.

The concerns exploiting the colloid mill appear to be developing a more rational selling policy and progress is reported in certain directions such as the intimate mixing of water with tar or bitumen, partly for spreading on roads and also for watering them in dry and dusty weather. It is claimed that with a very small proportion of tar suspended in the water, evaporation is so slow that watering is not again required for several days, and the method employed is to take a relatively concentrated suspension and mix this with a large bulk of water before spraying.

A firm in Manchester is now carrying out extensive experiments on rubber roadways using slabs of rubber 2 in. thick and weighing about 600 lb. The slabs are reinforced with steel bars and their surface is corrugated. The slabs are set on a concrete foundation with tar joints.

GENERAL NEWS AND NOTES

The organization of the chemical exhibits at the British Empire Exhibition, Wembley Park, near London, to be held next summer, has already begun and it is understood that Mr. Woolcock, general manager of the Association of British Chemical Manufacturers, is likely to be one of the principal organizers. In spite of the heavy cost involved, this exhibition is expected to be an important factor in the industry and the most elaborate preparations are to be made for the accommodation and convenience of overseas visitors.

Chemical engineering education seems to be the latest vogue and the Ramsay Chair of Chemical Engineering at London University is now open. Liverpool is likely to follow and the newly formed Institution of Chemical Engineers, which has just held its first corporate meeting, is likely to play an important part in promoting and advising upon recognized courses in chemical engineering.

Among recent nominations to the Royal Society may be mentioned Prof. J. W. MacBain, professor of physical chemistry at Bristol, who was among those visiting the United States last year.

What Chemical Technology Has Done in the Shoe-Manufacturing Industry

Comparatively Recent Invasion Has Resulted in the Development of Many New Raw Materials of High Quality as Well as Profitable Byproducts—Improvements in Standard Processes Making for More Efficient Production

BY STANLEY P. LOVELL
Chief Chemist, George E Keith Co., Brockton, Mass.

ABOUT a decade ago chemistry invaded the shoe-manufacturing industry. The assault was of such meager proportions that it provoked only general mirth in the strongly intrenched shoe world. The making of footwear centers in and about Brockton, Mass., and although many other focal points of the trade exist, nowhere is the technique nor the high art of the Brockton district maintained. When the cult of scientific management swept American industries, it made no impress on the shoe business. That was already organized and specialized to an extent not found in any other fabricating art. Two hundred and thirty-six separate operations converge to make the finished shoe. Thirty-two separate crafts supply the shoe artisan with his materials. The method of shoemaking is furthermore so tangible, so apparent to eye and hand, so obvious in its gradations, that the mere thought of chemistry having a place in its craft or contributing anything of value to its product was somehow a capital joke.

If you will consider the primitive sandal or slipper, you will recognize it as an assemblage of three elements—the sole, the cap extending over the toes and receiving the forward impetus (now called the "box toe") and the support around the side wall of the heel receiving the backward impetus (now called the "counter").

THE FIRST CHEMICAL SUBSTITUTE

It was with the last two articles—the box toe and the counter—that the original chemical approach to the shoe industry concerned itself. Both were made from sole leather by separate companies that specialized in these parts and had brought them to a high degree of fabrication. Although sole leather had been the material used for these stiffening parts of footwear, it was apparent that it possessed inherent defects. When exported it would not stand the heat and humidity of the hold of a ship; it was easily attacked by the ordinary mold and maggot growths; and it was softened by but not soluble in water, thus losing when wet the delicate lines of the shoe last.

The method used to demonstrate these weaknesses of sole leather to shoemakers has possibly more so-called "human interest" than chemical interest, but it is nevertheless presented for what it is worth. A negro coal-heaver in the yard was asked to wear a pair of white socks for a week. These socks had been boiled in castile soap, rinsed repeatedly in distilled water, then extracted in alcohol and ether. After a week's wear, the socks were finely comminuted and extracted in a Soxhlet apparatus for water solubles, which were found to be as follows: Urea, sodium chloride, formic and butyric acids (trace).

Then into a concentrated solution of these substances was immersed a No. 1 grade sole-leather box toe, every substitute material on the market and a new product which proved to be the initial answer of chemistry to this problem. In 60 hours the materials were all destroyed except the chemical product, which was a mixture of cotton-wool fiber and nitrocellulose of the following composition by weight: Pyroxylin (nitrogen content 11.1 per cent), 81 per cent, and cotton-wool fiber, 19 per cent. From this indication of adaptability the use of nitrocellulose in one form or another has grown to the sizable amount of 2 tons a week.

A UNIQUE SOLUTION OF A CHEMICAL PROBLEM

It was soon found that the product must conform itself to the established time of shoe operations. In order to change the pyroxylin to a plastic condition it had to be treated with a solvent and the time required to soften the box toe or counter blank when made with any of the familiar solvents was found to be too great. How to make a nitrocellulose blank relatively instantly soluble throughout was a desperately serious problem and promised to bring to ruin all our fine hopes of success. This problem we met by a unique treatment. Always previously it has been the endeavor of persons skilled in the use of pyroxylin to condition their product so that precipitation of the film (so-called "blushing") did not occur. To this end the name of John H. Stevens will always be famous. For this purpose some makers have even frozen out the entire moisture content of the air in their factories in order to insure against precipitation from atmospheric moisture.

Reversing this line of thought, we first impregnated

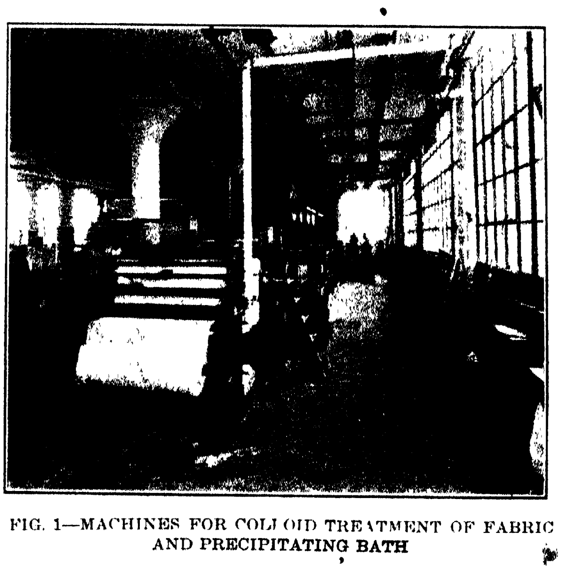

FIG. 1—MACHINES FOR COLLOID TREATMENT OF FABRIC AND PRECIPITATING BATH

our fabric skeleton or vehicle with pyroxylin in a water-miscible solvent, then immediately passed it into a precipitating bath. The precipitation, which at first is a mere surface condition, gradually penetrates throughout the sheeted material. Under a magnification of 300 diameters it shows itself to be composed of precipitated colloidal aggregates of the average diameter of 7μ. This gives a material of very high capillarity, there being countless ducts or capillary avenues opened from the former film surface to the center of the goods. This allows an immediate entry and instantaneous dispersion of the solvent into which the blank is dipped. In turn a flaccid, limp condition is produced, which with no appreciable loss of time allows the piece to be lasted and will faithfully reproduce every contour of the wooden last.

Thus we met our first obstacle of instant solubility by simply precipitating our nitrocellulose so finely that it was open to solvent action from every side of its vastly increased surface.

FIG. 2 ONE CORNER OF A BATTERY OF DIGESTORS

A web treated with precipitated colloid is to be seen winding up in the background.

Lowering Production Costs

The chemist and chemical engineer has at his elbow daily, hourly, the problem of putting production costs on an economical, competitive basis. Viewed with an unprejudiced eye, all leather is a byproduct of the production of foodstuff. It is for the meat, not the skin, that a Calabrian goat, an Indian cow, an American or pampas steer is grown. Therefore the skin, which must be removed to make the meat marketable, will either be allowed to decompose or will be preserved by such chemical agents as tannic acid, chromic acid, formaldehyde or alum and salt. Thus it follows that the skin or hide in the form of leather can be sold and would be sold at only a nominal profit over the cost of preserving or tanning should a synthetic chemical product be developed that would threaten to replace leather in industry.

Costs must be reduced to a wide margin under the production of leather. Seen from this angle, it early became important that the solvents used in the production of our precipitated sheet for box toes and counters should be recovered for re-use. Recovery was made relatively easy by the fact that these solvents, passing directly to a miscible precipitant, were never allowed to leave the vapor phase. By keeping them always as liquids even at extreme dilutions of 5 per cent, two ends were met:

(1) Their economical and continuous distillation was made possible without scrubbing towers, refrigeration or all the paraphernalia of the gas-to-liquid change.

(2) The fire and explosion hazard was reduced to a point where factory-scale production was practicable.

This twofold recovery advantage was not achieved without bitter experience with alcohol vapor—an experience which ended in an explosion of almost fatal proportions.

Camphor a Byproduct

It developed that pyroxylin plastics (such as celluloid, etc.) of good quality were preferable to straight nitrocellulose. The problem of a uniform raw material was solved by the easy scheme of "averaging out"—that is, the plastics were used in such large amounts that the variation in nitrogen content or in camphor content were averaged to a constant factor.

If you will retrace the steps taken to that stage where the colloid is precipitated in and on its fibrous base, you will see that if the solvent used is, for example, acetone and the precipitant is water, a relatively high acetone layer will surround the sheet as it passes through the bath. Into this stratum the camphor diffuses with a constantly increasing tendency to precipitate as it reaches greater dilutions of acetone. Eventually it becomes suspended like the casein suspension in milk, although scarcely colloidal. As the total volume of weak liquor passes into the base section of our continuous still the camphor passes up through the column to a point of maximum concentration. Fortunately this does not occur at the higher acetone or alcohol concentrations where the column might become obstructed and serious consequences result, but at the narrow range of 65 to 69 per cent acetone or alcohol. From these decks it is extruded at high velocity into a water jet of equal force, the impact throwing out the camphor as flowers of camphor. For ordinary use it is a commercial product at this stage, but for pharmaceutical uses it must be sublimed. Many tons of this grade of camphor have been absorbed by the American market. It is a highly important byproduct of our business.

One phase of this work has baffled the writer for many years. In the precipitating bath the urea or other antacid stabilizer must of necessity be completely removed by washing. Samples of the colloid-treated fabric show no trace of urea and the theoretical urea content is nicely balanced by the ammonia-carbon dioxide gases produced under the conditions of distillation. Nevertheless, samples of the product manufactured in 1915 and subsequently show no signs of decomposition, nor has the development of free acid in the nitrocellulose so precipitated ever been observed. Perhaps it is possible that the fact that urea has been there is sufficient to maintain stability almost indefinitely.

All of the camphor is not removed, between 5.1 and 9.3 per cent remaining in the sheet material entrained in the colloid. This has a most unexpected and desirable result. Being a remarkable insecticide, it prevents bacterial growth with mold and maggot formations not only in the box toe and counter but in the whole shoe as well. This is of first moment in the export of American shoes to sub-tropical countries and to the Orient.

The solvents used to colloidallize the finely precipitated celluloid just before its incorporation by the assembler in the shoe were various ethyl esters. These

solvents developed a most serious fault. The footwear would leave the factory in excellent condition, but upon being worn would develop a very disagreeable odor—not the pleasant fruity smell of the ester, but an offensive odor highly discreditable to the wearer. We found that when warmed repeatedly to 30 or 35 deg. C. the residual deposit of the solvent gave off the same odor. Nothing will more quickly stop the sale of footwear than this trouble. Furthermore, the factory operatives were finding the solvent unpleasant to work with and in the confined, close application which shoemaking compels, it would soon have proved a serious health hazard. Worden truly observes that the pyroxylin arts expand only as solvent knowledge grows.

It was imperative, then, to find a solvent of nitrocellulose that would have no appreciable odor under working conditions nor a residual odor in the shoe. After a prolonged research we found our answer in diacetone alcohol. This chemical, with a boiling point of 163 deg. C. and a specific gravity of 0.924, is miscible in all proportions with ethyl and methyl alcohol, acetone, benzol, water or any of the common esters. It is expressed chemically as 4 hydroxy-2 keto-4 methyl pentan. It leaves no residual odor and its rate of evaporization is so slow that it cannot be detected by smell in the workrooms. By diluting it, a degree of softening or solution may be maintained in the box toe for any desired length of time, thus allowing the product to conform to any established usage or schedule in shoemaking.

FIG. 3—CONTROL AND RESEARCH LABORATORY IN A SHOE FACTORY

No investigator seems to have observed that it is the only solvent of cellulose esters that has at once a high boiling point, is miscible in all proportions with water and leaves no residual odor. Most books of reference on applied chemistry such as Watts, Thorpe, Olsen and the Condensed Chemical Dictionary do not cite it. To those industries where the odors invariably associated with cellulose esters have been handicapping factors diacetone alcohol should prove of great value.

We erected and operate a large plant for the production of diacetone alcohol. Its manufacture by the polymerization of c.p. acetone is expressed by the following equation:

$$2CH_3{\cdot}CO{\cdot}CH_3(+\text{ Catalyst}) \rightarrow CH_3CO{\cdot}CH_2{\cdot}C(CH_3)_2OH$$

Since the balance between the c.p. acetone and diacetone alcohol produced in the presence of the catalyst is in direct proportion to the temperature and greater at lower temperatures, the utilization of sulphur dioxide or ammonia refrigeration is strongly indicated.

The catalysis building shown in Fig. 4 has a daily capacity of 600 gal. of diacetone alcohol of specific gravity 0.910. Sufficient water is used for condensing to warrant two artesian wells which deliver an unlimited supply of water at 10 deg. C.

The box toe and counter produced are waterproof, sweatproof and safe against the ordinary forces of destruction. They have the peculiar property of resisting distortion. This true elasticity retains the lines of footwear in a way never before possible.

Chemical technology having met with tolerable success in the make-up of a shoe, the same approach was tried on the innumerable items applied to the outside of a shoe. These comprised dressings, polishes, waxes, inks, washes, etc., to a degree of complexity fairly confusing. We now manufacture over one hundred and thirty separate materials of this sort. All were subjected to analysis, made interesting because the method of analysis had first to be worked out. Many weird combinations were unmasked, but on the other hand many combinations were shown to possess a high degree of observation and skill.

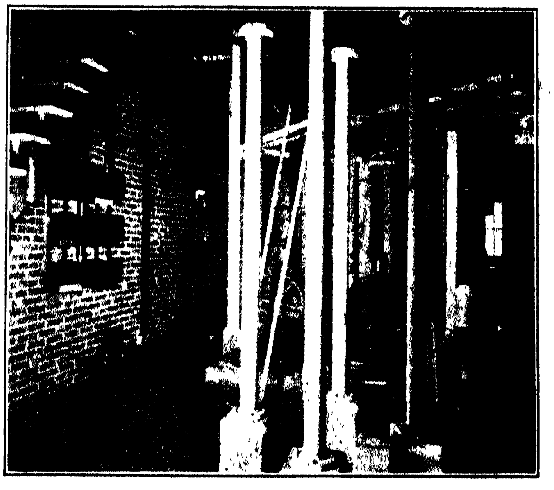

FIG. 4—CATALYSIS BUILDING WHERE 600 GAL. OF DIACETONE ALCOHOL IS PRODUCED DAILY

I strongly advise any industrial chemist who scoffs at rule-of-thumb products (and I am one) to make a water paste for shoe use. I have a record of over three hundred experiments before satisfactory results were obtained on this product. That with so little understanding of the nature of their materials the non-technical men can accomplish so much will always be a source of wonderment to me.

I think it is conservative to say that chemical engineering has a place even in such an apparently barren field as shoemaking. It has led to one of the large uses for pyroxylin, it has produced diacetone alcohol on a basis never before attempted and it has made camphor a small byproduct of shoes. But more than that, it has allowed the production of a better shoe than before chemical technology entered shoemaking, and that is the test of its worth.

The Incidence of Research On the Baking Industry

Pioneering Work in the Application of Science to a Successful Commercial Enterprise

By Ellwood Hendrick
Consulting Editor, Chem. & Met.

THE penetration of the industries by science is sometimes along curious roads, and it is well to bear in mind that these are often in their beginnings far from academic. The active research that has developed within the baking industry during the past few years induced us to visit the Ward Baking Co.'s establishment in New York, to note the incidence of research upon this ancient domestic art, to inquire into the way in which it was begun, what problems are pressing and what fields are tempting them toward further study. We selected the Ward company because we knew them to be progressive and also that the president of the corporation had been an active supporter of research for a number of years. It was done with no unfavorable reflection on competitive baking establishments.

We found a large bakery operated under laboratory cleanliness, with standard machinery which we shall not attempt to describe, because such details are available elsewhere. Two laboratories are maintained, one for control that is predominantly chemical, and a separate research laboratory in which biochemistry leads. About twenty-five chemists and biologists are employed constantly.

The central control laboratory functions for the company's various bread and cake bakeries, of which there are seventeen of the former and nine of the latter in different localities throughout the country. This calls for over 20,000 analyses or tests per year. The capacity of the bread bakery attached to the main office in the Bronx in New York City is over a quarter of a million loaves a day.

Beginning of Baking Research

The beginning of research, which has continued to be coincident with the progress of the company, is an instructive tale. The president of the concern was a hard-working neighborhood baker in Allegheny, Pa., and he was so diligent in extending his trade that he became pressed for funds. His bank of deposit would not increase his credit, and a second bank visited felt in the same way. Then, unknown, he called at the Mellon bank in the hope of securing an accommodation of $10,000. He saw the present Secretary of the Treasury, Andrew W. Mellon, and told him his story. Mr. Mellon surprised him with a more complete report of his standing and business than he expected him to have, and said he didn't see how $10,000 would solve his problem. The banker figured the situation over, and it did not look promising. What the baker really needed was about $25,000. So Mr. Mellon declared that he couldn't see his way clear to lending him $10,000 although if he wanted $25,000 he could have it. That was a jolt up rather than a shake down, and it will be easily understood that from that time forth George S. Ward was a frequent visitor at the Mellon bank.

Then came the organization of the Mellon Institute of Industrial Research at Pittsburgh, and by this time Mr. Ward had prospered. He had bakeries in various cities—in Pittsburgh, Chicago, New York, Cambridge, Mass., and elsewhere. Mr. Mellon was full of enthusiasm for the Research Institute, and the prosperous baker had enthusiasm for Mr. Mellon's opinions as well as a sound belief that whatever happened must be due to a cause and if the cause lay hidden it was his business to look for it. He started with an open mind toward and a prepossession in favor of scientific research. He already had laboratory control of his various bakeries. This fact is the text for a longer sermon than we have the space to preach. Without at least one successful man in an industry who has an abiding faith in the value of scientific research there can be no real beginning. The baking industry was one of the last of the major industries to come under scientific control, and yet its present rate of progress is remarkable.

The First Problem

In later years laboratory control has developed important refinements, but even then the flours were tested for gluten, moisture, ash, etc., and several bakings were made to obtain uniform results. Flours differ according to their origins and according to the year in which the wheat is grown. Some require long mixing, others short, some long and others short fermenting, and some long and others quick baking and the like. Yeast also requires constant testing. But with the same flour, the same yeast and the same apparatus and methods, the bread from one city differed from that baked in another, and the reason for this was a problem in research.

There had been a research fellowship in bread baking established at the University of Kansas by the National Bakers Association before Dr. Duncan left there for Pittsburgh, but this had been allowed to lapse. The problem before the baker as patron of research was the contumaceousness of that bread which should have been the same, whether made in Cambridge, Mass., or Pittsburgh, Pa.—but wasn't. He applied for one of the early fellowships of the then new Mellon Institute and Dr. Duncan was ready for it with Drs. Kohman and Hoffman, who have not quit the study of baking from that day to this. Investigation began with comparison of waters used, and their differences showed their effects mainly on the yeast, which responded quickly to differences of salts in solution.

For maximum health and growth yeast needed more nitrogen in simple fixation, more calcium and other mineral salts than are available for it in ordinary dough. It was also discovered that when these usually delinquent salts are added to the dough, the yeast grows so lustily and acts so vigorously that only one-half the amount of it is needed to produce the same or even better bread. Experience shows that by using the mineral salts in the dough a saving is made of one-half the amount of yeast, one-sixth the amount of sugar and about 2 per cent of the flour. The yeast food mixture was patented and named "Arkady" after the initials of Dr. Robert K. Duncan, the director of the Mellon Institute, and it has now come into general use in the baking industry. The owners of the patent make it in carload lots in their New York bakery, and they have additional factories in England and Canada.

The Fight Over Yeast Food

But improvements have hard sledding when they are introduced. Trouble arose in one commonwealth where the gifted statesmen of the Legislature took a hand and assumed a firm stand against any effort to "cheapen"

the staff of life. They knew from their blessed mothers and the faithful wives of their manly bosoms that only certain ingredients should be used in making bread, and they passed a law that said so. Otherwise each loaf was to be labeled as containing in the original mix whatever was not indicated in the statute as proper. Calcium sulphate, for instance, was an important factor in this yeast food, but inasmuch as it was not recorded in the law, it had to be mentioned in the label, along with potassium bromate, ammonium chloride, etc. Despite the fact that calcium salts are sorely needed in human nutrition and that human diet of today is often inadequate in this respect, it shocked the lawmakers to think that there should be such a thing as lime in bread. Soon the fight was on, although bread so baked and labeled continued to sell. The legislative plan was to educate the public down to its own level —rather than to educate it up; but this time it did not work. Then a law was proposed forbidding altogether the use of yeast food in baking, but this was defeated, and finally the fight was won. It took time and vigorous effort and money for lawyers. Today yeast food is in general use, and even manufacturers of yeast whose sales are decreased by it recommend it because it reduces complaints about this product to a minimum.

An old and serious trouble in baking is the occasional presence of "rope," or stringiness, in bread. It is due to an organism present in all flours, but more abundant—and therefore worse—in some than in others. We understand that the defect has been practically overcome by the proper control of the p_H values in the dough.

In the course of time the more progressive bakers recognized the value of research, organized the American Institute of Baking, first at Minneapolis and now located at Chicago, under the competent supervision of Dr. H. E. Barnard. But private research for the Ward company continues also at the Mellon Institute in Pittsburgh, under Dr. Kohman, and in the laboratory of the New York bakery under Dr. Hoffman.

Food Value and the Vitamines

Bread making has only so lately entered into the domain of science from rule-of-thumb control that it fairly bristles with questions. For instance, bread is a food, but how much of a food is it? This was the beginning of a long work at research by the Ward company, from which, in the end, positive results of an interesting character were achieved. It was found that a good bread is adequate in carbohydrates, but deficient in protein, mineral salts, especially lime, and in all three vitamines. Quantitative determinations were made. Whole wheat bread, it was observed, adds vitamine B from the bran and wheat germ contained in it, and it is adequate in carbohydrates, but research proved it to be lacking in other respects. Experiment demonstrates it to be an incomplete food, although better than an ordinary white bread.

Now the major purpose of this research was to make a bread at once good, and at the same time having a maximum nutritive value. It is easy enough to throw a number of nutritive ingredients into a dough that will serve as a "complete food," but when it is baked it will be more of a dog biscuit than a bread.

The problem was to provide, as carrier of these exceptional nutritive values, a fine, tasty and attractive loaf of white bread. This involved thousands of feeding tests as part of the work. Another step was the extraction of the germ of the wheat, which is ordinarily discarded in white flour, and this involved a new process and finally a separate plant equipped at large cost at Warren, Ohio. The final loaf is made far richer in milk than ordinary bread; it contains the germ extract that is as rich in vitamine B as the best brewer's yeast, and it contains abundant mineral salts, which are greatly needed for the maintenance of health and for healthy growths, even to the extent of the slight but requisite amount of manganese.

Feeding Experiments

The final loaf is white, looks and tastes rather like home-made bread, and it is already in active demand. It is not only rich in vitamine B but carries enough of the A type to support life, growth and reproduction. Ordinarily the vitamine A is provided by spreading bread with butter, but this bread also contains a supply from the extra whole milk. Tests made with white rats and white mice show remarkable results with no other food than this new, enriched bread and water. With any other type, including the best whole wheat bread, as the sole diet with water, they fail to grow, fail to reproduce and in time starve for lack of one or another kind of nutrition. With this new bread as sole diet, growth is vigorous and healthy, and already a fifth generation of white mice that, beginning with the first, have never had any other food, is thriving and growing normally.

Observations are now being made and recorded of children from pre-school age up to adolescence who include this bread in their diet, compared with those who do not. While results are not ready for publication, they appear to confirm the animal feeding experiments already made, and promise to add materially to our knowledge of nutrition. One point we are allowed to mention is that less meat seems to be desired along with this special bread than if ordinary bread is eaten.

Large Quantities of Copper Imported

In *Commerce Monthly* it is reported that large amounts of copper have been imported into the United States in the form of ore, matte or blister copper, the smelting and refining of which are done in this country. Imports from Chile have shown a remarkable gain from pre-war years, when they were very much less than those from Mexico, Canada, Peru or Spain. During the past few years they have constituted more than one-third of the total imports.

Shipments from Peru and Cuba have also increased. Peru sends chiefly blister copper, while most of the Cuban shipments are in the form of ore and concentrates. From Japan and Australia, however, a very much smaller quantity has been imported recently because of the decline in production in those countries. Mexican and Spanish imports have also declined. From the average rate for the first part of the year it appears that Canadian shipments in 1922 were as large as before the war. Most of the copper was in the blister form.

Of the total imports in the first part of 1922, 53 per cent was blister, 21 per cent refined, 14 per cent ore, 6 per cent old copper and clippings and 4 per cent concentrates. Imports of matte constituted the remaining 2 per cent. Composition metal in which copper forms the chief value amounted to only 0.2 of 1 per cent of the total.

A Modern Tar Distillation Plant

A Description of the Plant of the American Tar Products Co., in Chicago, Illinois, an Example of Permanent and Conservative Design Which Warrants Study

BY WILBERT J. HUFF
Chemical Engineer, The Koppers Co.

THE Chicago plant of the American Tar Products Co., which commenced operation for the first time only a few months ago, undoubtedly ranks as one of the leading, if not the very first, merchant tar plants in the United States. A brief description of its salient features will be of interest to those who are engaged in this and related industries.

The plant was built by the Koppers Co., which has installed several other tar distillation plants for the American Tar Products Co. It is situated on a 35-acre tract at South 52nd Ave. and West 39th St., directly south of the once famous Hawthorne Race Course, and immediately north of the Chicago & Illinois Western R.R. and the Chicago Drainage Canal. The plant of the Chicago By-Product Coke Co., at present the chief source of the tar distilled, is east about one mile, in plain view across the prairie. Switching facilities are provided both to the C. & I. W. (a belt line) at the south and to the Illinois Central (a trunk line) about 1½ miles to the north. Should the proposed development of the drainage canal occur, service to any plant on the Chicago waterfront will be available by barge.

Only about 20 of the 35 acres are at present occupied; and the arrangement of the equipment upon these 20 acres is such that the inevitable expansion of the plant may proceed along orderly lines until the entire 35 acres can be occupied, without necessitating the misplacement of any part.

The general plan of the present plant is shown in the accompanying diagram (Fig. 1). The observer, upon first entering the plant, will be impressed not only with the systematic plan and convenient arrangement, but especially with the quality and permanency of the equipment. The construction throughout, save of the barrel shed, is of brick and steel, with concrete foundations and cement floors and platforms; and all shipping and receiving wharves and platforms are elevated to car level. The exposed brick surfaces are buff and yellow. All elevated platforms, walkways, ladders and stairs have been designed and erected in accordance with the best practice as regards safety.

Before considering in detail the component parts of the plant it may be well to recall the general technology of tar distillation. This was discussed by the writer in this journal recently,[1] accordingly only a brief mention is warranted here. Coal tar, the primary condensation product from the carbonization of coal, is a complex mixture chiefly of aromatic hydrocarbons and tar acids, with small amounts of tar bases, organic sulphur compounds, variable amounts of so-called "free carbon" and other materials. Some water is also present.

As produced these are so thoroughly incorporated that it is necessary to resort to a process of fractional distillation in order to effect separation. This process the writer has shown diagrammatically in the accom-

[1]*Chem. & Met.*, vol. 26, No. 3, Jan. 18, 1922

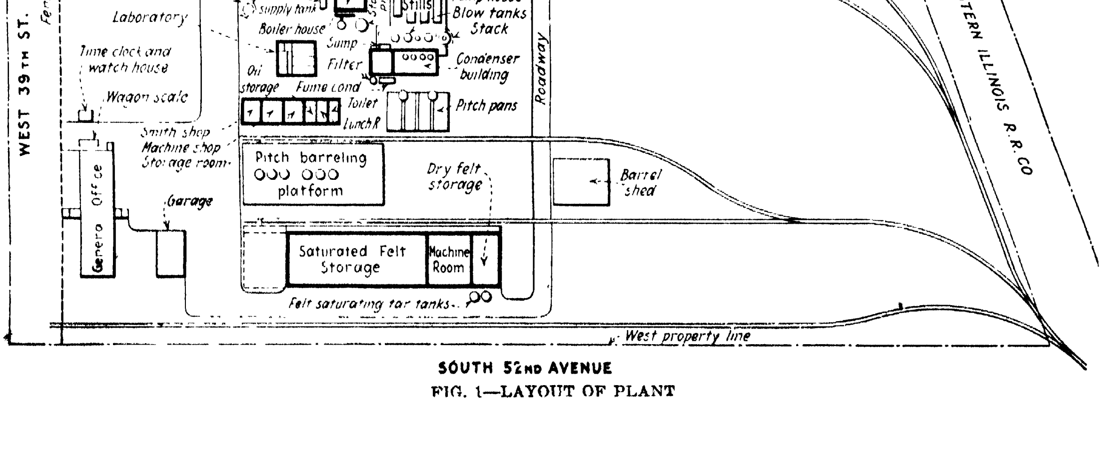

FIG. 1—LAYOUT OF PLANT

panying sketch (Fig. 2). The residue remaining in the still, generally amounting to over 50 per cent of the raw tar and sometimes as much as 70 per cent, is the familiar bituminous aggregate known as pitch. Depending upon the amount of oil removed, it may be soft or hard; and if only a little oil is removed, it may be called merely a refined tar.

Handling of Tar

Procedures are, of course, modified to meet varying local conditions. Thus, if the water content of the coal tar available is low, it is not always necessary to subject it to a preliminary dehydrating process. Instead the raw tar is often charged directly into the still and the water removed by cautious firing. Not all of the fractions need necessarily be taken. The number is determined by the kind of residue which must be produced, and as the character of this is varied to meet the wishes of the purchaser, so too the character of the distillation must be varied. Nor are all the products shown necessarily manufactured. Thus, while at this

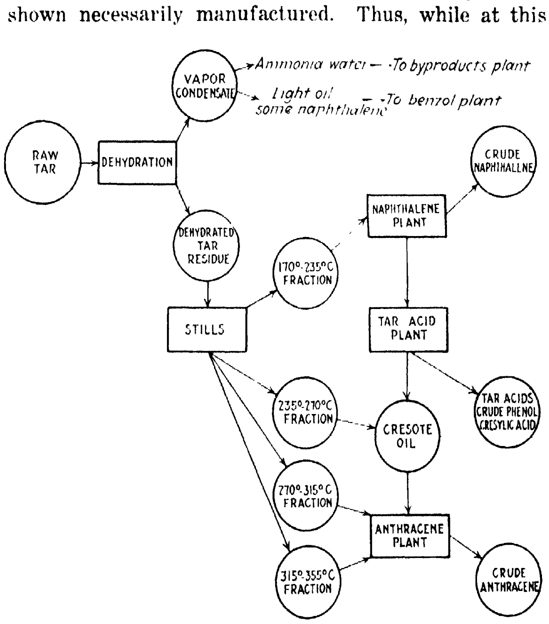

FIG. 2—FLOWSHEET FOR TAR REFINING

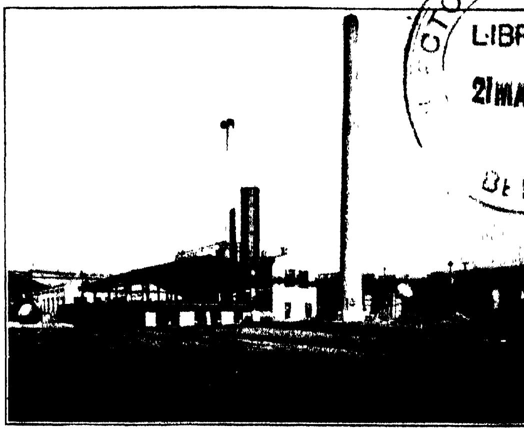
plant provision has been made for the future recovery of anthracene, naphthalene, tar acids and other materials from the distillate oils, and detailed drawings and specifications for the buildings and equipment have been prepared, construction has not yet begun, and the distillate oils are not treated further here.

The tar is brought to the plant in a tank car. Here it is placed over one of three concrete sections of the unloading pit, where it is emptied by gravity through the bottom cock. Each section holds 10,000 gal., so three cars can be unloaded simultaneously without calling upon the tar pumps. These are two in number, steam driven, all iron-fitted duplex pumps, having a capacity of 20,000 gal. per hour. They are situated in a pump house adjacent to the tar unloading pits and are mounted on a floor depressed about 6 ft. below the yard level. Connections are provided so that the pumps may be applied as needed in the transportation of tar from the unloading pit to the tar receiving tanks or to the tar storage tanks; and for pumping tar to the stills, to mixing tanks and to cars. A large amount of water-gas tar is produced at the plant of the Chicago By-Product



GENERAL VIEW OF PLANT—PITCH PANS IN FOREGROUND

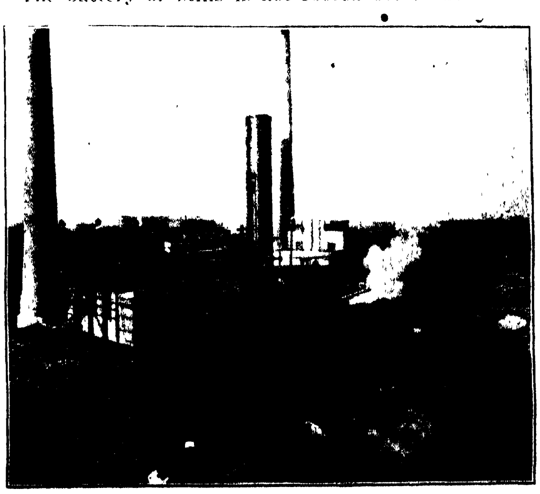
Coke Co. and much of this is re-handled here. The car-loading appliances (swing pipes with swivel joints), three in number, are located just east of the unloading pit and so placed that three cars can be loaded without shifting.

Distilling Tar

Tar for distilling is pumped from the appropriate tar tank to any one of the stills which are grouped in battery. They are mounted in brick settings with underground concrete and brick breeching leading to a 130-ft. brick stack and are equipped with grates of the rocking type for coal firing by hand and burners for firing with liquid fuel when such firing is economical. Coal is brought up to the stills in the railway cars and is discharged from an elevated track, parallel to and in front of the firing doors. This same track also serves the boiler house, adjacent to and north of the stills. The concrete floor from the stills and boiler house extends under this track. A concrete wall parallel and east of the track retains the discharged coal upon this floor.

From the stills may be seen two other details which further illustrate the attention and care expended in the construction and management of the plant—a concrete subway affording convenient passage under the fuel track, and the practice of painting different pipe lines in distinctive colors.

The battery of stills is not roofed over. This dim-



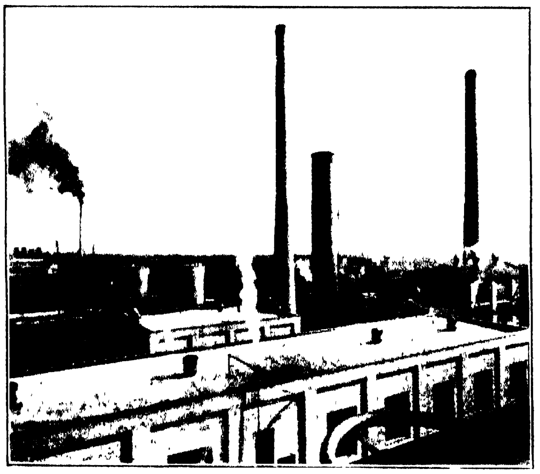
TANK CAR LOADING AND UNLOADING
Stills, pumphouse and standpipe in background.

inishes the fire hazard, for experience has shown that fires are much less serious when no overhead roof deflects the flames from one still to another. The firemen, however, are well protected by a corrugated steel roof extending over the firing floor, and access to manholes and connections on the top of the stills is rendered convenient by railed steel walkways and two steel stairways, one on each side of the battery. Provision is made to facilitate cleaning of the stills. The tar used, however, has so far shown little tendency to deposit objectionable material, and this cleaning consequently has been very simple. A special sampling winch is mounted above each still, for the stills are designed and calked to withstand a vacuum of 26 in. of mercury, and special provision must be made to permit sampling without breaking this vacuum. Each still is equipped with safety valves so piped that such of the still contents as may blow over is discharged into a sump about 60 ft. distant from the nearest fire door. Provision is also made that the contents of any still may be diverted from the usual receiving tank to this sump.

Condenser House

Between the battery of stills and the condenser house are pitch blow-tanks, measuring and mixing tanks. All blow, storage and receiving tanks, wherever situated, are equipped to permit easy access. Every large tank is provided with hand rails and is accessible by wide, easily scaled stairs and walkways. Above the pitch blow-tanks extend four insulated condenser lines from the still domes to the condenser house. Here they enter four elevated coil condensers of equal size. At the discharge of every condenser is a receiving tank, divided into two compartments, each of which may be completely cut off from the other. The condensate may be directed into either of the two receiving compartments at will. This permits easy fractionation under vacuum, as one compartment may be cut out and drained under atmospheric pressure while the vacuum is carried on the other.

Each compartment is equipped with an indicating device to mark the oil level and a manhole to permit easy cleaning, and is piped so that it may drain by gravity into any one of the run-down tanks, which are of various capacities to suit the size of fractions being made. Provision is made for easy access to all parts. Two independent sets of pyrometers, operating and master, are mounted so that their dials may be read from the platform that commands the four receiving tanks. This permits the operator to follow simultaneously the pitch and vapor temperatures, and the volume of oils condensed.



SHOPS. TANK FIELD IN BACKGROUND

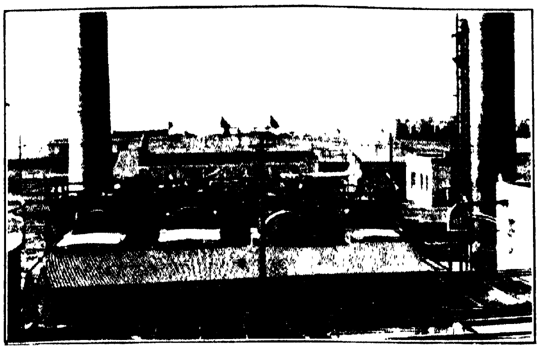
TAR AND CREOSOTE STORAGE TANKS

The condenser house also provides protection for two steam-driven air compressors; two steam-turbine exhausters, so piped that any uncondensed vapors from the receivers carried by these exhausters are expelled into a secondary condenser; two steam-driven, all iron-fitted, duplex oil transfer pumps, and one steam-driven duplex emergency pump. Provision is made so that the final stages of the distillation may be completed under vacuum, or by the aid of steam or air agitation, if desired.

The Power Equipment

North of, and adjacent to, the battery of stills is located the boiler house, containing two 250-hp. Stirling boilers, of which one is in daily use, while the other is held in reserve. These are both arranged in one setting, and are supported on a structural steel frame independent of the setting. At present they are equipped with non-dumping rocking grates for hand firing, but are set at such height and arranged so that chain grate stokers may be installed at some future time. The foundations are also arranged with ashpit and tunnel to facilitate such installation. In times of coal shortage, these boilers may be fired by liquid fuel pumped from a tank north of the boiler house through an overhead return system running parallel to the fuel track and extending to the southern end of the battery of stills. Provision for steam heating the liquid fuel to diminish its viscosity is made. The liquid fuel consumed is metered. Draft is provided by means of a 150-ft. stack. The boilers are fed by two steam-driven duplex feed pumps and are provided with an open type feed water heater.

An extensive equipment for protection against fire is provided. Capacity and auxiliary water pressure is obtained by means of a standpipe about 90 ft. high and 15 ft. in diameter located just south of the boiler house stack. This is divided into two compartments by means of a partition 60 ft. above the ground, and the top compartment is held full in reserve for fire, while the lower compartment serves as a general service water supply. In the boiler house is located the fire pump—a standard



STILLS AND CONDENSER HOUSE

duplex fire pump having a capacity of four standard fire streams. Six twin fire hydrants are located at advantageous points about the plant, and five 250-ft. lengths of hose are distributed in convenient boxes. In addition, hand foamite and carbon tetrachloride extinguishers are located in the buildings.

Oil and Pitch Handling

From the oil run-down tanks, the distillate oil may be pumped to one of three oil barreling tanks above the pitch barreling platform, or to any one of the creosote storage tanks situated between the boiler house and tar storage tanks, or to either of two mixing tanks on line with and just south of the creosote storage tanks, or to the pitch blow and mixing tanks or the mixing storage tank.

Hot liquid pitch is transferred by compressed air from the pitch blow tanks to the barreling tanks or chilling tanks. Proper piping and other equipment have been installed to condense all vapors or fumes incident to handling hot pitch, thus recovering some oil otherwise lost and also avoiding trouble caused by the nuisance of tar, oil and pitch fumes.

When a hard pitch is produced, it may be blown to one of two tanks located above the pitch pans, west of the condenser house. These pans are of steel, four in number, supported on steel beams about 6 ft. above the yard level. Each pan is about 50 ft. long and about 20 ft. wide, and not quite 2 ft. deep. The hard pitch, when sufficiently cool, is discharged from the tank by means of a trough into either of the two pans immediately below it, where it is allowed to solidify. Pitch of this quality is sufficiently hard and brittle to permit it to be broken up and loaded in bulk. The pans are covered by a galvanized steel roofing, supported on steel beams; but the sides are not inclosed.

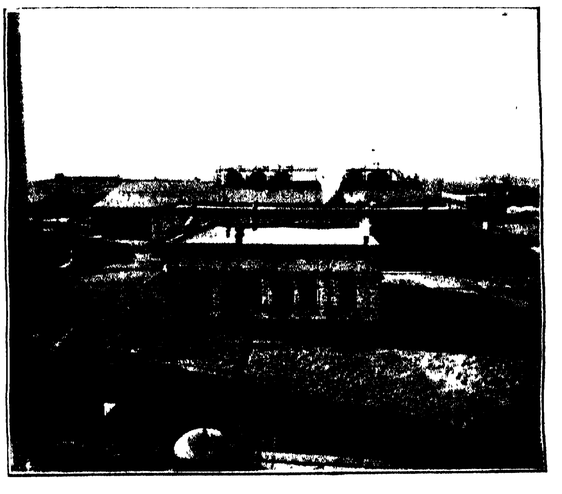
The soft grades of pitch may be blown to one of the pitch barreling tanks supported on steel framework above the pitch barreling platform. This platform is approximately 200 ft. long and 80 ft. wide, and consists of concrete walls a little over 4 ft. high, between which is filled well-tamped earth to within a foot of the platform level. Cinders and concrete are placed above the earth and the whole is topped with a smooth coat of cement and sand cut off into squares. In addition to the pitch barreling tanks, there are oil tanks for the drumming of distillate oils. All tanks are of the same size and are located above the north and central portion of the platform.

About the tanks and over the entire platform extends a galvanized steel roof supported on steel framework. The sides are, of course, not inclosed. Access to the tanks is provided by means of a ladder and a walkway placed above the roof. The southern portion of the platform serves as storage for steel drums, and it is to this portion of the platform that the empty barrels are delivered from the barrel storage shed. This is isolated well to the south of the present equipment, thereby minimizing its fire hazard. The floor consists of well-packed cinders and the roof and sides are of galvanized sheet steel, supported upon a wooden framework. The sides are inclosed from the roof to a height 12 ft. above the ground. The barrels are rolled to the platform by placing them upon the inclined elevated barrelway which extends from a point a few feet north of the barrel shed to the southern end of the barreling platform.

Felt Saturating

West of the barreling platform is located the felt-saturating building. This is of light structural steel construction with walls of Chicago yellow building brick and a roof of gypsum covered with pitch and gravel. The interior is well lighted by numerous windows along both sides. It is divided into a warehouse which occupies the northern and central two-thirds of the building, a machine room, and a dry felt storage room which divide the remaining space equally between them. The floor is of concrete. Roof and floor are extended to form a covered wharf the height of a car floor along the entire eastern side of the building. Dry felt is continuously saturated with especially prepared tar in such a manner that evenness of saturation is obtained and sticking of felt in the small tarred felt rolls as delivered to the roofer is eliminated. The hot saturator baths give off tar vapors which are somewhat objectionable, so the necessary ventilation is secured by means of two steel stacks about 2½ ft. in diameter extending about 25 ft. above the roof. Storage for the saturating tar is provided by two tanks just outside the west wall of the machinery room and the drip tanks from the saturators drain into an underground tank. This drain tank is emptied by air pressure into drums located on the machinery room floor.

East of the pitch barreling platform is located the shops and service building, containing machine and blacksmith shop, storeroom, oil room, service room and lunch room. The machine shop contains the necessary pipe-fitting machines, drill press, lathe, grinding ma-



LABORATORY, SERVICE BUILDING, PITCH-BARRELING SHED

chine, forge and anvil for local repair and equipment purposes. Power is supplied by a steam engine. The service room is provided with lockers and the usual complement of showers, wash stands, toilets, etc. Three solid brick walls within the building separate the lunch room, the service room, the oil room and store room, so that the first three are accessible only from the outside and are protected from each other in case of fire. In harmony with the others, this building is of Chicago yellow building brick.

LABORATORY AND OFFICE

East of the shops, in the north central portion of the plant, is the laboratory—a one-story building containing not only the regular plant laboratory but also a large research laboratory devoted to chemical problems common to the numerous plants of the company, together with an office for the chemical director of the company and his stenographer, a library, a locker and toilet room and store rooms. A sketch of the floor plan is shown (Fig. 3). The building is approximately

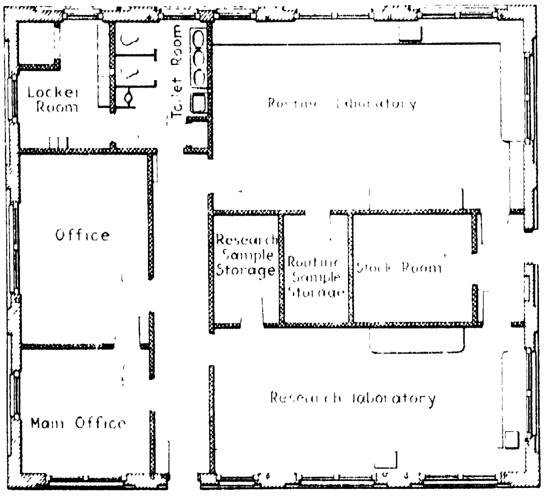


FIG. 3—LABORATORY

43x54 ft. with 10-ft. ceiling, and with a concrete floor at yard level. There is no basement. An emergency shower for extinguishing blazing clothing is provided in each laboratory.

In addition to the foregoing, there is a garage north of the felt saturating building. This serves the usual trucks and cars and the motor-driven distributors employed by the company for the hot application of road tar. An office building will be located at the northwest corner near the gate and wagon scales, but the erection of this has not yet been begun.

A plant such as that described above can supply a large number of tar, oil and pitch products—such as creosote oils, wood-preserving oils, high-tar acid oils, tar felt, dehydrated tar, refined tar, tar and oil mixtures such as the rather well-known 20 tar 80 oil mixture used in wood preserving, and such pitch products as pitch paints for the protection of iron and steel, for acid-proofing and alkali-proofing and waterproofing, roofing pitches and patching compounds, waterproofing pitches, paving pitches for hot or cold application, for concrete and for tar macadam, and as a filler for block and for brick pavements, core pitch, briquet pitch, and pitch for the preparation of pitch coke.

Action of Water on Zinc Chloride in Wood

Although zinc chloride is one of the most effective of wood preservatives, it will not give permanent protection. Under the action of water this preservative loses its strength in two ways. In time a considerable amount of the solution is leached out of the wood, and that remaining is not of sufficient strength to be effective. It has also been brought out in a study of preservatives at the Forest Products Laboratory at Madison, Wis., that water eventually causes a chemical decomposition of zinc chloride by the removal of excess amounts of chlorine.

Samples of ties analyzed after service had a zinc content equivalent to 0.4 lb. of zinc chloride, with scarcely enough chlorine present for 0.08 lb. of zinc chloride per cu.ft. Treated blocks leached for a month at the laboratory lost about 90 per cent of their chlorine content and only 70 per cent of their zinc.

The disappearance of the chlorine from zinc chloride explains decay which has been found in treated ties and timbers which still have high zinc content. Although the zinc is the toxic or poisonous part of zinc chloride, it is not effective against the fungi which cause decay unless it is combined with some acid radical which makes it soluble. In analyzing zinc-chloride-treated wood after service, it is necessary to determine both the chlorine and zinc content in order to calculate the amount of preservative solution present in the wood. Even then only a rough estimate can be formed, for some of the chlorine which would be obtained in the analysis is in the wood in the form of an insoluble basic chloride of unknown composition.

Paint and Varnish Production

During 1922 the production of white lead in oil amounted to 292,588,900 lb., as compared with 274,226,900 in 1921, an increase of 6.7 per cent. Zinc oxide in oil produced during the past year amounted to 9,944,400 lb., representing an increase of 62.1 per cent from the previous year. Figures reported for the production of paste paint show an increase of 29.4 per cent. The paste paints as a group increased considerably during 1922. The large increase is found, however, in ready mixed and semi-paste paints, varnishes, japans and lacquers—44.4 per cent in the case of the former and 54.5 per cent for the latter group.

Distillation of Hardwood in Canada

The majority of the destructive distillation plants in Canada have been absorbed by the Standard Chemical Iron & Lumber Co. of Canada, Ltd., now reorganized as the Standard Chemical Co., Ltd., Montreal. Central alcohol refineries have been established at Longford Ont., and Montreal, Que., acetone plants at Longford and Sault Ste. Marie, Ont., acetic acid and formaldehyde plants in Montreal. Considerable quantities of charcoal are used by a subsidiary, the Standard Iron Co., Ltd. in making charcoal iron. Distributing companies have been formed to market charcoal in the principal cities as household fuel.

During the war the demand for acetone, methyl hydrate, formalin and other hardwood distillation products was very great and it is a significant fact that a single well-organized company handles practically all operations from the cutting of the wood to the manufacture and sale of the finished chemicals.

Eighth Annual Convention of T.A.P.P.I.

Many Paper Technologists Take Part in Program Covering the Most Vital Problems of the Industry—First Paper Industries Exposition a Success

THE Technical Association of the Pulp and Paper Industry held its annual spring meeting at New York during the week of April 9. The American Paper and Pulp Association and other affiliated organizations also held meetings at the same time in order that as many paper men as possible might attend the first Paper Industries Exposition, which was likewise held during the week.

At its annual election of officers the Technical Association made H. S. Taylor of Dayton, Ohio, president, with G. N. Collins of Philadelphia vice-president. These men succeed G. F. Williamson and F. C. Clark respectively. The only vacancy on the executive committee was filled by the election of B. T. McBain to this body. W. G. MacNaughton continues as secretary-treasurer of the association.

At the first session of T.A.P.P.I. reports of officers and of standing committees were read showing what progress had been made along the various lines of association activity during the war. The bibliography committee has begun the work of indexing all the literature available on paper and pulp. The executive committee has obtained the co-operation of several other societies, including the American Society of Mechanical Engineers, the Cost Association of the A.P.P.A., the National Lime Association, the National Safety Council and the Wire Manufacturers' Association.

Vocational Work Centers Much Interest

The vocational work of the association is being more actively supported in every way in Canada than in the United States. Greater contributions to the fund for preparation and publication and greater use of the texts are reported in that country than in this. The fourth volume on the preparation of stock for paper manufacture is nearly ready for the press. The final volume will probably be published about January, 1924.

Feel Decided Need of Standardization

Nearly every committee reporting on research emphasized the increasing demand for standardized specifications and methods throughout the industry. Investigational and operative data require adoption of standard units for measurement and test. Apparatus used for test purposes is especially in need of this standardization. Uniform tests are in demand more and more for unusual products.

Increase Production Efficiency by Cutting Waste

G. E. Williamson, chairman of the waste committee, presented three main subjects for discussion, white water losses, bark utilization, and broke loss prevention. Fiber loss in mill effluent prevents maintenance of maximum efficiency in use of materials. This can be cut by use of save-alls—simple inclined screens over which white water (fiber-bearing water) flows, rotary screens such as ordinary continuous rotary filters, or more complex arrangements of tanks and screens. Large sedimentation tanks give very good recovery of pulp. In discussing this subject W. E. Baker, of the York Haven Paper Co., reported a fiber use efficiency of 98 per cent through the entire plant. Slime, which gives trouble in save-alls, can be reduced by frequent washings of the apparatus.

Bark and wood room scrap can be burned and one pound of steam can be made from a pound of bark 65 per cent dry by the use of a specially designed furnace. J. D. Rue, of the Forest Products Laboratory, showed that to be useful total moisture of material burned must not exceed 50 per cent. During the year a specially designed bark press for compressing and extracting moisture has been tested, with results showing that such a piece of apparatus is practical.

Broke or waste paper losses can be reduced by careful regulation of the consistency of the stock, by the analysis of records made regularly in each department, and most especially by maintenance of proper mechanical condition of machine.

Drying Losses Require Analysis for Prevention

To know what is happening to paper and to the bill for heat costs in drying, samples of paper should be taken at frequent intervals along the driers and tested for moisture. This work was carried out by Chairman S. B. Jones of the committee on drying, who plotted the results and presented them at the meeting. To reduce waste of heat, temperature must be regulated carefully in successive cylinders. Predetermined wet end moisture should be maintained and air circulation held within limits depending on control tests.

Norman Clark, having studied carefully the use of coloring matters for coated paper, finds that basic dyes usually fade due to the presence of alkali. Casein, which is usually used, also tends to precipitate the basic dye. Acid dyes are better as far as permanence is concerned but are less brilliant in color. Flat tones may well be obtained by use of insoluble pigments. Accurate control of pulp moisture in application is highly desirable. In discussing the desirable characteristics of a paper to be coated, Mr. Clark showed that the paper must be well formed, dirt free, of uniform color and thickness, free of slack edges, and of surface fuzz, that it should have the least possible finish required for uniform surfacing and that it should be leathery in "feel."

The relative merits of festoon and flat driers used in finishing of special coated papers were discussed by J. O. Ross. Festoon drying should be employed wherever space permits. Speed and width and the exact nature of the process determine the best system to employ. Throughout such processes accurate control of conditions is especially necessary to obtain economical production.

Newsprint Production Involves Grinder Development

The Groundwood Section Meeting under Chairman W. A. Munro held a symposium on Grinders. Magazine grinders must be employed and power input per unit increased if the man-per-hour production in the groundwood mill is to be efficient. The new chain-feed magazine grinder gives a more uniform grade of pulp and surpasses the pocket type of grinder in that it maintains constant pressure on the stone and constant load on the motor.

Screen rejections can be made into shipping wrappers. Two new refiners are being tested to turn these

screenings into No. 1 pulp. Success will make possible a closed system in the groundwood mill.

Use and standardization of the freeness-slowness tester now coming into use will make possible uniform grading of groundwood pulp and more accurate control of the product. White water can be re-used in groundwood manufacture.

Evaporation Problems Emphasized

Soda and sulphate men, meeting with G. K. Spence in the chair, agreed that no hard drawn lines can be drawn in solving evaporation difficulties. Boiling out at least once a week is necessary unless the liquor going to the evaporator is screened effectively. H. K. Moore advocates counter-current flow in multiple-effect systems, but many mill men find efficiency lowered by this procedure. Common practice in several mills is to introduce liquor into the second or third unit, thence to the first and finally to the fourth. Capacity required must be balanced against cost of steam and necessary exit temperature in deciding what type of evaporator best suits a given operation. Multiple-effect evaporators should operate at high vacuum and if proper conditions are obtained a double will evaporate 1.8 lb., a triple 2.7 lb. and a quadruple 3.6 lb. of water per lb. of steam consumed.

Excess use of bleach in bringing pulp to color can be avoided by knowing the history of the pulp. It must be cooked under exact conditions determined by test as best suited to wood in process. Thorough washing after blowing is the next essential. The bleach requirement, determined by test before the pulp reaches bleach system, should be largely added with the pulp at the start of the bleaching period. Under these conditions time and bleach required will be a minimum, according to G. M. Trostel.

The cause of color change in soda pulp on aging is shown by analysis to be the result of the building up of alkalis at surface by process of drying, etc. These alkalis, even in small quantities, will cause the change.

Light, Heat and Power Problems Most Essential

Freight rates will largely determine the possibility of substituting oil for coal as fuel. Oil is cheaper to handle and burn but more expensive to store.

H. S. Taylor, chairman of this section, led the discussion following J. O. Ross' thoughtful presentation of the problems of heat transfer in the machine room. Inside gutters on skylights and roof are essential. Skylights are a cause of inefficiency due to added amount of heat required to prevent condensation. Amount of air circulated, contrary to usual practice, should be balanced against amount of water being evaporated. Exit air should be held as close to dew point as possible. In general good operation should require a total about 4 lb. of steam per lb. of paper made. Hoods over machines will usually increase efficiency due to possible cutting down of live steam consumption.

In order to use steam and electricity to maximum advantage, according to recommendations of E. P. Gleason, these commodities should be measured in terms of units of output. Daily graphic records, weeding out of duplicate, wrong size or uncovered steam pipes, planning of load to keep it as constant as possible, avoidance of leaky traps and valves will reduce losses to a minimum.

Frictionless bearings are being used to an increasing extent because of the smaller amount of attention required and the increased speed obtainable by their use. Felt life may be increased by doing away with gear drive of rolls, since such arrangement sets up undue strains in the felt. Power consumption and lubrication difficulties are likewise lessened by use of ball bearings.

Froth troubles in the mill can be decreased by the use of a moving spray on the head box of the machine, by the moderate use of an oily medium in the washing of the pulp, by careful preliminary cooking and by careful avoidance of carbonates in presence of alum.

Paper Industries Exposition

The first Paper Industries Exposition, held at Grand Central Palace, New York, during the week of April 9 to 14, demonstrates another step of progress in the history of the paper industry. First conceived as a means of bringing the various branches of the industry closer together, this first Paper Exposition succeeded in a larger measure by showing the public a cross-section of the complex workings of the mills in the fabrication of this commonest of commodities. Larger in size than the first Chemical Industries show, according to the management, the first Paper Industries Exposition has shown what a single industry can do in this regard.

Despite the fact that there were empty booths, neither the layman nor the paper man could well be disappointed in the exposition. The story of paper was very well told. Nor did the exhibits end by showing paper and paper materials in their many ordinary forms. Tapestry, furniture, twine, fiber commodities, curiously shaped dishes, containers of broad utility, bags, boxes and bottles of all forms were on display as well. One exhibit showed those products which come largely from wood pulp or ground wood such as artificial silk, celluloid, and products having a wood flour base such as talking-machine records. Another showed what byproducts may be obtained from Southern pine wood when used for pulp, including rosin, pine oil, turpentine, tar oils, pitch and acetic acid.

Among the many exhibits, a few stood out especially. The Hammermill Co. demonstrated the fabrication of paper by a complete series of samples and illuminated panels at various stages of the process. The Nash Engineering Co. and the Sandusky Foundry & Machine Co. had bronze models of pumps and of couch rolls respectively, which because of size and remarkable workmanship were conspicuous. Bearings were well displayed by the S.K.F. Co. and by the Gurney Co., each using unusual mechanical ingenuity to demonstrate its products. The Mathieson Alkali Co. showed a small model of a modern bleach plant, and the Bird Machine Co. demonstrated its save-all in action.

In discussing the exposition with various exhibitors, it was the general feeling that considerable machinery had been sold, enough to cancel the expense of exhibiting; but, as expected, the chemical firms would have to call it advertising.

Correction

Through an error Dr. C. N. Vrol was referred to as "Director, the Vanadium Company," in our issue of April 16. He is Director of Radium Research Laboratories of the Standard Chemical Co.

Colloid Chemists Hear Donnan on Membrane Equilibria

A Feature of Physical and Inorganic Division Meeting at New Haven—Other Papers of General Interest

An outstanding feature of the symposium on colloids held by the Division of Physical and Inorganic Chemistry at New Haven, April 6, 1923, was a paper read by Prof. F. G. Donnan of London on "Membrane Equilibria." In the experiments described by Professor Donnan he used a copper ferrocyanide gel membrane supported by parchment. Solutions of various electrolytes were in turn placed on either side of the membrane and after a definite lapse of time the solutions were analyzed and the migration in either direction determined. Very close agreement was obtained with the theoretical equilibrium governing the concentration of the various ions in either solution. For example, in the case of sodium ferrocyanide on one side of the membrane and calcium ferrocyanide on the other, the cations alone diffusing through the membrane, the ratio of the two calcium concentrations, Ca_1/Ca_2, agrees splendidly with the ratio of the square of the two sodium ion concentrations, $(Na_1/Na_2)^2$:

Experiment	1	2	3	4	5
Ca_1/Ca_2	1.27	1.76	1.37	1.80	1.55
$(Na_1/Na_2)^2$	1.25	1.76	1.33	1.78	1.50

The sodium ratio is "squared," since for every one calcium ion that permeates through the membrane in one direction, two sodium ions must permeate in the opposite direction.

If only one ion moves through to one side and not the equivalent ion or ions the other way, then potential differences are set up, although these are very small. Professor Donnan's experimental results and the equations derived are all in full accord with our ideas and principles of adsorption and in general with thermodynamic principles.

Behavior of Pigments in Oil

Another interesting paper of the colloid symposium was entitled "Plasticity in Colloid Control," by Prof. Eugene C. Bingham and Alfred G. Jacques of Easton, Pa. The authors referred in particular to the behavior of pigments in oil. As an illustration it was shown that lithopone in linseed oil gave a yield value of 128, whereas in mineral oil the yield value was 1010. The respective fluidity values were 2.4 and 2.1. An interesting demonstration was the difference in elasticity and plasticity of two samples of sodium silicate. The one sample with one part of Na_2O to four of SiO_2 was very plastic but not elastic, whereas the second sample, composed of two parts of Na_2O to three of SiO_2, was very elastic but not plastic.

Adsorbent Gels

A paper of decided practical bearing was that by Prof. Harry N. Holmes and J. Arthur Henderson of Oberlin, Ohio, on the preparation of highly adsorbent gels. The authors slowly add a solution of ferric chloride to a water-glass solution, obtaining a deep yellow gelatinous precipitate, which is washed, dried, then activated at 145 deg. At 30 deg. it adsorbed 31 per cent of its own weight of benzene from a stream of air saturated with benzene. A precipitate dried at 50 deg. until hard before washing gave a gel of 43.1 per cent adsorptive power. A similar gel dried hard and then soaked with dilute HCl to convert the iron oxide into chloride was washed and activated. It adsorbed 49.3 per cent benzene. This was white silica gel. The product purchased from the Silica Gel Corporation adsorbed 33 per cent benzene. With xylene a similar higher adsorption was obtained. However, with sulphur dioxide there was practically no difference between the adsorptive power of Patrick's silica gel and the authors'. As regards the chemical constitution of the original iron-silica gel, this seems to be a mixture rather than a compound, otherwise the iron oxide would not dissolve out readily during treatment with HCl.

Rubber Chemists Hold Successful Meeting

More Than Two Hundred Present at New Haven Sessions—Goodyear Memorial a Delightful Feature

The meeting of the Rubber Division of the American Chemical Society at New Haven, April 5 and 6, was unquestionably one of the most successful meetings which this division has ever held. Attracted by a program containing many interesting and valuable papers, and the knowledge that Prof. Giuseppe Bruni, the distinguished Italian chemist, would be present and read a paper, rubber chemists to the number of about 200 turned out to the meeting. Valuable as were the papers which the authors presented to the meeting, their value was enhanced not a little by the careful attention with which they were received, and the interesting discussions which followed.

Goodyear Dinner

The Rubber Section had its first dinner party at the Lawn Club on April 5, and made it a delightful post-prandial spiritualistic séance instead of the usual speech-making. Mrs. Ellwood B. Spear came in and took her place at one end of the dining hall as "Medium Para." Straightway she went into a trance and called one ghost after another to appear at the other end of the room. The first was that of Charles Goodyear of New Haven, impersonated by Dr. Spear. He told the story of his invention of vulcanizing, of his many trials, and finally how he spent his declining days, always seeking new uses for rubber, although he died poor. Next Thomas Hancock, the English inventor of vulcanized rubber, materialized, and he told his story. Next Jan van Guens, the Dutch claimant for the invention, announced his claims with characteristic Dutch vigor. G. Stafford Whitby impersonated Hancock, and Winfield Scott was van Guens. The part of Thomas Rowley, who was the first to apply accelerators, was taken by C. W. Bedford, and finally Christopher Columbus in the person of C. Olin North, claimed to have discovered the place where rubber comes from, and demanded a proper recognition from the Rubber Section. It was an entertaining show and historically instructive.

Important Technical Papers

Space limitations preclude a discussion of all of the important papers discussed by the division, but it is believed that the following notes are of general interest:

Dr. H. L. Fisher summarized the recent work which has been done on the composition of crude rubber and pointed out that the exactness with which the work of

Pummerer and Burkhard was done justified our accepting their conclusions that the formula for rubber was not $C_{10}H_{17}$, as has recently been claimed, but that the rubber nucleus is really C_8H_8.

In addition to a review of his recent work on vulcanization accelerators, Prof. Giuseppe Bruni talked at some length on the various problems being studied at his laboratory in Milan. One of these was on the subject of tearability, having reference to the work of Zimmerman, Tuttle and others in this field. It may be noted that this field is one which only in the past few months has been considered by the rubber chemists, and results of considerable interest and value have been brought out. Other work deals with the effect of temperature upon the determination of the tensile properties of vulcanized rubber, the purpose of the investigation being centered about the determination of a constant that will permit of correction being made for the temperature at which the tests are made. If such a constant can be worked out, tensile tests would then be referred to a constant temperature and thus make such tests easier of comparison Professor Bruni has also been working upon the subject of the dispersion of crude rubber, with special reference to the work on this subject which has been published by J. B. Tuttle. Touching upon the subject of organic accelerators, Dr. Bruni brought out the point that the matter of most interest to them was the temperature at which the accelerators became active. He described briefly a method which he had employed for the determination of this effect.

Action of Litharge and Organic Acids

In previous work L. E. Weber had shown that when the resins of rubber are removed by solution in acetone, such extracted rubber shows a very poor cure when vulcanized with inorganic accelerators such as litharge. C. W. Bedford and H. A. Winkelmann gave the reason for this behavior. They showed that such extracted rubber will attain the normal vulcanization when there is added 1.5 to 2 per cent of such organic materials as oleic acid, stearic acid, pine tars, etc. This is particularly noticeable in the lower grades of rubber, in which there is a comparative deficiency of normal organic acids. The addition of a small amount of oleic acid to such rubbers materially increases the tensile properties when litharge is used as the vulcanization accelerator. They conclude from this that such a reaction is the true explanation for the improved results obtained when low-grade rubbers are vulcanized with the aid of lead oleate, but they point out that in such cases only a small amount of oleate is necessary for the purpose. They conclude that a material will not accelerate as an inorganic accelerator unless it is able to form a definite compound with the acetone soluble constituents of the rubber, and further that the resultant compound must be soluble in the rubber.

E. Hopkinson described L-S rubber, a new crude rubber obtained by spraying rubber latex on a rapidly revolving disk, the rubber spray being dried by a current of warm air. The resultant rubber sponge is compressed for purposes of shipment. This rubber contains all the solid substances of the latex, being high in water-soluble constituents (around 6 per cent). When vulcanized with the formula 90 per cent rubber, 10 per cent sulphur, this L-S rubber shows a much more rapid cure than is obtained under similar conditions with the ordinary smoked sheets or pale crepe.

Manufacture of Sulphuric Acid and Acid Phosphates During 1922

That a large increase in the production of sulphuric acid and acid phosphates occurred in the last half of 1922 over the first half of 1922 is apparent from the report of the Department of Commerce that has just been issued. From July 1 to Dec. 31, 932,747 net tons of sulphuric acid was used in the manufacture of fertilizer, while in the first 6 months of 1922 only 657,062 tons was used. The stocks of sulphuric acid on hand at the end of the year and at the beginning were substantially the same.

The concerns producing acid phosphates report the manufacture of 1,589,483 tons, containing 26,507,858 units (a unit is equal to 20 lb.) available sulphuric acid, during the second half of 1922, as compared with 1,198,724 tons, containing 20,104,992 units, during the first half, which makes a total production of the year of 2,788,207 tons containing 46,612,850 units. The stock of acid phosphate on hand at the end of the year amounted to 1,689,562 net tons, as compared with 2,129,339 tons at the beginning of the year.

In order to get an idea of the geographical distribution of the business done, the states were divided into two districts "Southern" and "Northern and Western," the Southern comprising all those states south of the Virginia-North Carolina line—namely, North and South Carolina, Georgia, Florida, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma and Texas. The remainder of the country designated is "Northern and Western" district. The Southern district reports 50.7 per cent sulphuric acid used in making fertilizer during the last half of the year, compared with 41.7 per cent for the first half; for the year the amount used was 47 per cent. With respect to acid phosphates the Southern district reports 30.1 per cent of the sales for the second half of the year, as compared to 56.9 per cent for the first half and 48.3 per cent for the year.

The data are compiled and made up from the reports of 198 fertilizer establishments, of which 127 are in the Southern district and 71 in the Northern and Western district. Of these various establishments sulphuric acid is manufactured in 71: 39 in the Southern district and 32 in the Northern and Western district.

Colloid Chemists Hear Donnan on Membrane Equilibria

A Feature of Physical and Inorganic Division Meeting at New Haven—Other Papers of General Interest

AN outstanding feature of the symposium on colloids held by the Division of Physical and Inorganic Chemistry at New Haven, April 6, 1923, was a paper read by Prof. F. G. Donnan of London on "Membrane Equilibria." In the experiments described by Professor Donnan he used a copper ferrocyanide gel membrane supported by parchment. Solutions of various electrolytes were in turn placed on either side of the membrane and after a definite lapse of time the solutions were analyzed and the migration in either direction determined. Very close agreement was obtained with the theoretical equilibrium governing the concentration of the various ions in either solution. For example, in the case of sodium ferrocyanide on one side of the membrane and calcium ferrocyanide on the other, the cations alone diffusing through the membrane, the ratio of the two calcium concentrations, Ca_1/Ca_2, agrees splendidly with the ratio of the square of the two sodium ion concentrations, $(Na_1/Na_2)^2$:

Experiment	1	2	3	4	5
Ca_1/Ca_2	1.27	1.76	1.37	1.80	1.55
$(Na_1/Na_2)^2$	1.25	1.76	1.33	1.78	1.50

The sodium ratio is "squared," since for every one calcium ion that permeates through the membrane in one direction, two sodium ions must permeate in the opposite direction.

If only one ion moves through to one side and not the equivalent ion or ions the other way, then potential differences are set up, although these are very small. Professor Donnan's experimental results and the equations derived are all in full accord with our ideas and principles of adsorption and in general with thermodynamic principles.

Behavior of Pigments in Oil

Another interesting paper of the colloid symposium was entitled "Plasticity in Colloid Control," by Prof. Eugene C. Bingham and Alfred G. Jacques of Easton, Pa. The authors referred in particular to the behavior of pigments in oil. As an illustration it was shown that lithopone in linseed oil gave a yield value of 128, whereas in mineral oil the yield value was 1010. The respective fluidity values were 2.4 and 2.1. An interesting demonstration was the difference in elasticity and plasticity of two samples of sodium silicate. The one sample with one part of Na_2O to four of SiO_2 was very plastic but not elastic, whereas the second sample, composed of two parts of Na_2O to three of SiO_2, was very elastic but not plastic.

Adsorbent Gels

A paper of decided practical bearing was that by Prof. Harry N. Holmes and J. Arthur Henderson of Oberlin, Ohio, on the preparation of highly adsorbent gels. The authors slowly add a solution of ferric chloride to a water-glass solution, obtaining a deep yellow gelatinous precipitate, which is washed, dried, then activated at 145 deg. At 30 deg. it adsorbed 31 per cent of its own weight of benzene from a stream of air saturated with benzene. A precipitate dried at 50 deg. until hard before washing gave a gel of 43.1 per cent adsorptive power. A similar gel dried hard and then soaked with dilute HCl to convert the iron oxide into chloride was washed and activated. It adsorbed 49.3 per cent benzene. This was white silica gel. The product purchased from the Silica Gel Corporation adsorbed 33 per cent benzene. With xylene a similar higher adsorption was obtained. However, with sulphur dioxide there was practically no difference between the adsorptive power of Patrick's silica gel and the authors'. As regards the chemical constitution of the original iron-silica gel, this seems to be a mixture rather than a compound, otherwise the iron oxide would not dissolve out readily during treatment with HCl.

Rubber Chemists Hold Successful Meeting

More Than Two Hundred Present at New Haven Sessions—Goodyear Memorial a Delightful Feature

THE meeting of the Rubber Division of the American Chemical Society at New Haven, April 5 and 6, was unquestionably one of the most successful meetings which this division has ever held. Attracted by a program containing many interesting and valuable papers, and the knowledge that Prof. Giuseppe Bruni, the distinguished Italian chemist, would be present and read a paper, rubber chemists to the number of about 200 turned out to the meeting. Valuable as were the papers which the authors presented to the meeting, their value was enhanced not a little by the careful attention with which they were received, and the interesting discussions which followed.

Goodyear Dinner

The Rubber Section had its first dinner party at the Lawn Club on April 5, and made it a delightful post-prandial spiritualistic séance instead of the usual speech-making. Mrs. Ellwood B. Spear came in and took her place at one end of the dining hall as "Medium Para." Straightway she went into a trance and called one ghost after another to appear at the other end of the room. The first was that of Charles Goodyear of New Haven, impersonated by Dr. Spear. He told the story of his invention of vulcanizing, of his many trials, and finally how he spent his declining days, always seeking new uses for rubber, although he died poor. Next Thomas Hancock, the English inventor of vulcanized rubber, materialized, and he told his story. Next Jan van Guens, the Dutch claimant for the invention, announced his claims with characteristic Dutch vigor. G. Stafford Whitby impersonated Hancock, and Winfield Scott was van Guens. The part of Thomas Rowley, who was the first to apply accelerators, was taken by C. W. Bedford, and finally Christopher Columbus in the person of C. Olin North, claimed to have discovered the place where rubber comes from, and demanded a proper recognition from the Rubber Section. It was an entertaining show and historically instructive.

Important Technical Papers

Space limitations preclude a discussion of all of the important papers discussed by the division, but it is believed that the following notes are of general interest:

Dr. H. L. Fisher summarized the recent work which has been done on the composition of crude rubber and pointed out that the exactness with which the work of

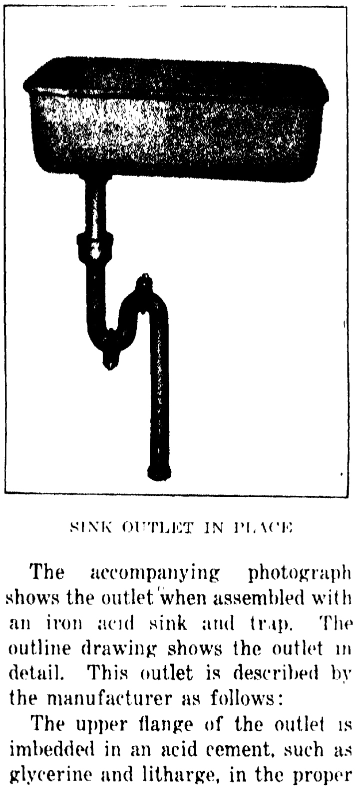
Materials and Accessories for Chemical Industries

Sink Outlet

The Duriron Co., of Dayton, Ohio has had on the market for a short time an acid-proof sink outlet which has not previously been called to the attention of chemical engineers.

This outlet is for use with acid sinks and can be used with wood, Alberene stone, stoneware, or Duriron. It is all Duriron except the locknut, which does not come into contact with the acid.



SINK OUTLET IN PLACE

The accompanying photograph shows the outlet when assembled with an iron acid sink and trap. The outline drawing shows the outlet in detail. This outlet is described by the manufacturer as follows:

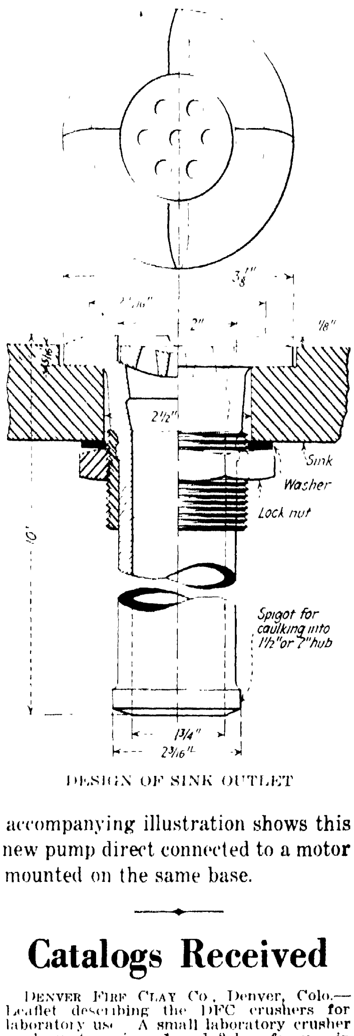
The upper flange of the outlet is imbedded in an acid cement, such as glycerine and litharge, in the proper recess in the bottom of the sink. Note this recess should be $\frac{3}{16}$ in. The washer and locknut are then applied, drawn up tight, and a permanent connection is made.

The wrought-iron nipple cast on the outside of the Duriron does not come in contact with any acid. The strainer is a loose piece, and can be removed readily for cleaning purposes.

The top of the flange is beveled upward from the edge; four grooves providing for complete drainage of the sink. This design adds strength to the connection at the proper point, and keeps filter papers from floating over the outlet and stopping it up.

The spigot end is calked in the hub of trap in the usual manner, using asbestos rope and lead.

The cost of this connection is low, considering the saving in time in making a permanent acid-proof joint; and expensive lead work and wiped joints are eliminated. This sink outlet will connect either to 1½- or 2-in. trap. It is carried in stock for immediate shipment.



DESIGN OF SINK OUTLET

Ball-Bearing Self-Priming Pump

A new ball-bearing, self-priming, centrifugal pump has recently been placed on the market by the Fulflo Specialty Co., of Blanchester, Ohio. This pump has a capacity of 75 gal. per minute. Its makers recommend it for use with oils, brines, enamels, cooling liquids, compounds and other similar materials.

The features of this pump are those already embodied in the smaller pumps marketed by this company. Self-priming is attained by having the outlet and the inlet above the level of the pump so that the liquid being pumped remains in the pump when it is stopped. This makes it necessary to prime the pump only when starting for the first time.

Clogging of the pump is prevented by having the openings in the impeller as large as the inlet, so that anything entering is free to flow through. Clearances are ample so as to reduce wear to a minimum. The accompanying illustration shows this new pump direct connected to a motor mounted on the same base.

Catalogs Received

DENVER FIRE CLAY CO., Denver, Colo.—Leaflet describing the DFC crushers for laboratory use. A small laboratory crusher made in two sizes, 1 and 2 hp., for use in crushing various materials for laboratory experiments.

J. H. DAY CO., Cincinnati, Ohio. Catalog 100. This catalog, entitled "Paint Machinery," is a new issue descriptive of the complete line of paint machinery, including various types of mills, mixers, cutters, kettles, chasers, fillers and other equipment used in the paint mill.

FRANKLIN FILING SUPPLY CO., 70 Duane St., New York City. Leaflet, "The Oxford Flexindex," descriptive of this company's method of indexing correspondence and data.

BAUSCH & LOMB OPTICAL CO., Rochester, N. Y.—Catalog describing the Bausch & Lomb contour-measuring projector, a device used for measuring contours of mechanical parts by optical projection of the magnified image.

COMBUSTION ENGINEERING CORPORATION, New York, N. Y.—Catalog on the Combusco Ash Conveyor, descriptive of new type of water-sealed drag chain ash conveyor, which has been introduced in this country recently by the Combustion Engineering Co. for the purpose of handling ashes from boilers in power houses.

Book Reviews

ELECTRIC BRASS FURNACE PRACTICE. By *H. W. Gillett* and *E. L. Mack*. 334 pp., 70 illustrations. Government Printing Office, Washington, D. C.

This publication (Bulletin 202 of the Bureau of Mines) records the progress so far made in melting brass in electric furnaces. It is designed to aid plants that have not installed such melting practice by pointing out the types of furnaces available, describing their performance and indicating their possibilities and limitations.

Messrs. Gillett and Mack have been in a unique association with the development of electric brass melting since the first commercial experiments in the United States. They are enabled to draw upon a wide experience and extensive notes of actual experiments in a way that brings out very clearly indeed the troubles encountered in developing the art. They describe the failures and the first halting steps. It is very seldom that an unsuccessful experiment is adequately described, although full information about such is nearly always far more instructive than an account of a successful operation. A perusal of these pages, therefore, will be of the greatest benefit to anyone who is attempting to design an electric furnace for a new alloy or an untried service.

Crucible furnaces heated by electric resistors were first tried, probably because the designers attempted to approximate the conditions existing in an ordinary melting hole. One attempt after another led to failure, and finally the designers turned to a hearth furnace, where the molten metal is contained in a basin rather than in crucibles, the laboratory being heated by various kinds of electrical resistors. This type of furnace quickly demonstrated that it had all the advantages of the crucible type—namely, production of high-quality metal with a low loss—with none of its disadvantages.

Fundamentals of successful commercial operation are discussed carefully: namely, the metallurgical fitness of a furnace, its reliability, a high rate of production, a good thermal efficiency, electrical characteristics that will not derange the entire supplying system, and finally a reasonable operating cost. Following some sound ideas to their correct conclusion, the authors were enabled to design a rocking furnace which was patented, and has, during the last 5 years, been manufactured and marketed by the Detroit Electric Furnace Co. This furnace, together with a very similar design made by E. H. Booth, has supplied to the large majority of users now making electric brass in the United States, and melt perhaps one-half the total tonnage. This furnace, however, is by no means given the lion's share of attention, and all of the present commercial furnaces are described in as much detail as necessary, giving figures for the operating characteristics, capacities, metal losses, and cost. A final chapter covers the electric melting of aluminum, copper and rarer alloys.

Altogether, this is a book that will not only prove most valuable to a prospective user of electric furnaces but will be eagerly read by all students of electric furnace design.

E. E. THUM.

THE PRINCIPLES OF RADIOGRAPHY. By *J. A. Crowther*. vi + 138 pp., illustrated. D. Van Nostrand Co., New York. Price, $2.

When the reviewer picked up this volume he hoped it would be the book to fill the need which he experienced when in 1907 he taught Radiology in the Medical Department of the American University at Beirut. This hope was encouraged by the standing of the author as a physicist and his position as University Lecturer in Physics applied to Medical Radiology at Cambridge, England.

In some respects the book meets expectations. The material is set forth briefly in a manner readily grasped by the intelligent but non-technical reader. But it is to be wished that, instead of confining attention to Radiography, it had covered the entire field of Radiology and so included the important region Radio-Therapy. Had this been done, we feel certain that more consideration would have been given to the so-called "interrupterless" equipments and their very decided advantages, and to the important properties of the Coolidge tube. As it is, the reader is led to believe that the alternating current transformer is an unsatisfactory source of power and that the Coolidge tube, in spite of its many advantages, is not convenient nor comparable with the gas-filled tube. For instance, on page 81 he says of the Coolidge tube: "Its main disadvantage, besides cost (which is very high), is the necessity for the auxiliary battery and apparatus. The accumulator cells need careful attention and frequent charging, and of course must be carefully insulated." There is no mention of the use of a transformer to supply the filament current, although this is now the common practice. If this omission is due to ignorance it is amazing, considering the author's position; if intentional, it is unpardonable.

There are other sins of omission, such as the failure to mention the use of films, double intensifying screens and cellular diaphragms between the patient and the film. The importance of protecting patient and operator is not stressed sufficiently and according to the reviewer's experience the protection mentioned is scarcely adequate. In comparing the X-rays generated by different sources of power the results published by Dr. A. W. Hull showing that with the same maximum voltage the energy distribution is practically the same have been overlooked or ignored.

These defects are so glaring that the book picked up with hope was laid down with disappointment.

ANCEL ST. JOHN.

AMERICAN FUELS. By *R. F. Bacon* and *W. A. Hamor*. 1245 pp., 382 illustrations. Two volumes. New York City: McGraw-Hill Book Company, Inc. Price $12.

This two-volume work brings together important material from a number of well-known authors whose opinions are always highly regarded. It is particularly valuable to the man who wishes to study the processing of fuels, for the chapters on technology of coke, briquetting of fuel, distillation of coal at low temperature, producer-gas technology, water gas, the Dayton process and others are of very great value. In fact, if these were the only chapters of the book, the contribution could not help finding most cordial welcome among fuel engineers.

Since the work is the composite of contributions from about twenty authors, it is not strange that there is considerable diversity in treatment and some variation in the value of the different chapters. However, any work including contributions by men like Sperr, Coffin, Blake and the other prominent authors is certainly as a whole worth while. Some of those chapters which in the present first edition do not come wholly up to the standard set by these more experienced writers will doubtless be strengthened in later editions so that in every respect the book can be of maximum usefulness.

The object of the volume as stated by the authors in their preface is to assist in "deciding upon the most suitable fuel to use or the changes to make in the utilization of fuel or of heat in order to get the highest efficiency in plant operation." In some respects, however, the reader must bear responsibility for decision on his own shoulders, as most of the authors are enthusiastic supporters of the form of fuel or method of processing about which they write. This is but a natural result of the fact that each is an expert in his particular line and therefore naturally enthusiastic about those materials or processes with which he has had the maximum experience. As a consequence of this practical experience on the part of the authors, the reader can be sure that he is getting reliable and usable information, not at all of an academic or theoretical sort. This advantage largely outweighs any overenthusiasm on the part of the several writers.

The authors have been most successful in eliminating from the work the impression that it is simply a composite "catalog," a failing all too common in works on mechanical engineering and fuels. The illustrations are well chosen and well presented, having in almost every case a significance as to types of equipment rather than any specialized significance with reference to particular makes of machinery or varieties of process. As a consequence not only the experienced but also the inexperienced engineer will find profitable and safe guidance in the work. The volumes should certainly be available in any library that makes a pretence of covering the subjects of fuels or technology.

R. S. MCBRIDE.

Synopsis of Recent Literature

Ammonia Losses in Carbonization

H. D. Greenwood in *Gas Journal* of March 21 (page 750) discusses this subject in some detail. He summarizes his conclusions as follows:

"It is evident that the most important factor is the rapid removal of the ammonia from the hot retort. The temperature of maximum ammonia evolution (about 800 deg. C.) corresponds with the temperature at which the evolution of hydrogen is also at a maximum, hence the ammonia is formed under the most favorable conditions as regards its gaseous atmosphere. The introduction of air and flue gases into the retort will increase the percentage of nitrogen in the gases, and may tend to increase the loss of ammonia by dissociation. An ideal condition for the preservation of the newly formed ammonia would be to maintain a certain percentage of moisture in the gases throughout the distillation, which condition is to some extent attained in steaming vertical retorts, where the steam may play a double rôle in increasing the initial formation of ammonia and in maintaining an atmosphere rich in moisture and hydrogen. From the results of recent research it appears probable that the ammonia yields in practice may be considerably influenced by the character of the coal ash, and to a lesser degree by the type of refractory material used; and the former factor may conceivably bear some relation to the widely different yields which are obtained from coals containing the same percentage of nitrogen and which are generally similar in character."

Buildings From the Manager's Viewpoint

The location, size and design of entrances, stairways and windows in factories are of paramount importance to efficient production and industrial safety. To obtain the most satisfactory service from these very necessary parts of the building, a manager in planning a new structure should keep in mind the factors pointed out by G. L. H. Arnold in his paper on this topic in *Management Engineering* for April, 1923. This is the second paper of the series, the first of which appeared in March.

Entrances. These should be located to avoid all conceivable hazards, as those caused by tracks and roadways. Care should be taken that entrances be not blocked in case of fire. The nature and extent of traffic through the entrance must be considered and the entrances located to avoid cross-currents and complicated routing.

There should be at least one entrance for each stairway. At least one entrance should be large enough to admit the largest piece of apparatus whose use can be foreseen. Doors should open outward for safety, and space allowed outside to permit full and safe opening. Entrance ramps should not exceed 7½ deg. slope and should be provided with anti-slip treads.

Stairways. The principal considerations in specifying stairs for an industrial building are: (1) Safety of employees in daily use. (2) Safety of employees in emergency use; (3) Safety of building in case of fire. (4) Convenience for daily use. (5) Effect on heating and ventilation. (6) Space occupied. (7) Cost.

Building codes usually govern the number of stairways. In the absence of a code, one stairway should be provided for each 5,000 to 6,000 sq.ft. of space except in special cases. In any case there should be at least two stairways. In considering stairways with relation to number of employees, there should be one 4-ft. stairway for each 250 persons using it.

Every stairway should communicate directly with an exit. The floor at the head and foot should always be level. Landings should be rectangular and as deep as the stairs are wide. A 7½-in. rise and 9-in. run is best practice in most cases. The general rule is length of run plus twice the rise equals 24 to 24½ in. The tread should be 1¼ to 1½ in. wider than the run. The best width is 44 to 48 in. between hand rails. A headroom of 7 ft. is a minimum. Safety treads 4½ to 5 in. wide are good practice. Open stairways should be avoided.

Windows. In placing windows the chief considerations are illumination, ventilation, spread of fires and appearance of buildings. It is well to have the window as near flush with the outside of the wall as possible.

The type of windows used largely depends on the extent to which they are depended on for ventilation. The double sliding sash and the double balanced pivot types are good where windows furnish most of the ventilation. Where the windows are not called on to supply much ventilation, the fenestral type with pivoted ventilating sash are cheaper and give better lighting. Casement windows are not recommended for industrial buildings.

Tests for High-Temperature Refractories

In changing from coal to oil firing for warships, the Navy Department encountered such difficulties from the failure of refractories used in boiler linings under the high furnace temperatures that it became necessary to establish new testing methods in order to obtain satisfactory brick. G. M. Galvin, of the Navy Department Fuel Oil Testing Plant, describes these tests under the title "Solving the Refractories Problem of the Navy" in the

Important Articles in Current Literature

More than fifty industrial, technical or scientific periodicals and trade papers are reviewed regularly by the staff of *Chem & Met*. The articles listed below have been selected from these publications because they represent the most conspicuous themes in contemporary literature, and consequently should be of considerable interest to our readers. Those that are of unusual interest will be published later in abstract in this department, but since it is frequently impossible to prepare a satisfactory abstract of an article, this list will enable our readers to keep abreast of current literature and direct their reading to advantage. The magazines reviewed have all been received within a fortnight of our publication date.

Journal of the American Society of Naval Engineers for February, 1923.

The test described in Bureau of Standards Paper 10, somewhat modified, was adopted by the navy for determining fusion point. This modified test is conducted in a Hoskins type electric furnace, capacity to 3,000 deg. F., and Seger cones are used for pyrometric agents. The test consists of comparing Seger cones under heat with similar cones made of the material under consideration.

Refractory Specifications

As a result of examining some hundreds of brands of refractories purchased on the open market, the navy established its standard specification 50B6, covering workmanship and physical and chemical properties. The workmanship clause is general. The physical requirements set 3,100 deg. F. as the minimum acceptable fusion point for firebrick and 3,000 deg. F. for fire cement. A composition of approximately 54 per cent SiO_2, 41 per cent Al_2O_3, and not over 5 per cent total basic fluxes (Fe, Ca, Mg, K, Na), determined as oxides, constitute the chemical requirements.

The procedure in using these standard specifications is to examine a refractory for general characteristics and workmanship, to subject it to chemical analysis and to determine the softening temperature. This last is considered of major importance and final acceptance is based upon it.

The Simulative Test

After a refractory has passed the acceptance test described above, it is subjected to a simulative test, which duplicates, in so far as is possible, the conditions encountered in service. This test is conducted in a small oil-fired furnace. One side wall of the combustion chamber is constructed of brick and cement of the kind on which a test is desired, the opposite side wall of brick and cement already proved satisfactory. A compressed-air-atomizing fuel oil burner is used. The flame sweeps the length of the furnace, returns and escapes to the stack. The test comprises three runs at temperatures of 2,800, 2,900 and 3,000 deg. F. respectively, each of 24 hours duration.

During the test temperatures are ascertained at 15-minute intervals with a Morse optical pyrometer, sighting into the furnace above the burner. To compare the heat-insulating properties of the walls, temperatures of the outer faces are read each half-hour with the pyrometer sighting on the brickwork through sillimanite tubes, the ends of which are placed flush with the walls.

Immediately after each run a spalling test is conducted by injecting cold air at high velocity into the furnace until the walls are cool. Results are obtained by comparison; the comparative heat-insulating properties, together with the relative conditions of the competing sidewalls at the conclusion of the test, determining whether or not the material under test is acceptable.

On Beilby's Amorphous Theory

Sir George Beilby's views on the flow of solids and on the amorphous phase in metals, and more particularly his beautiful volume on "Aggregation and Flow of Solids," having attracted considerable attention and facilitated the generalization of these views, C. Benedicks, (*Revue de Métallurgie, Memoires*, 1922, vol. 19, pp. 505-513), took occasion to draw attention to some important points, and, at the request of the *Revue de Métallurgie*, undertook to review critically the facts on which Beilby's theory is based.

In the author's opinion, some of the results obtained by Beilby may be explained without assuming the formation of a thin mobile amorphous skin or film in metals.

According to Beilby, the essential feature of polishing as distinguished from grinding is that the polished sur-

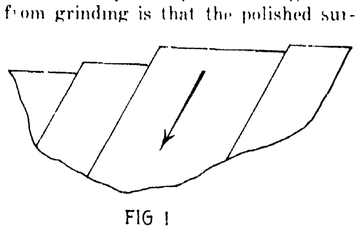

FIG 1

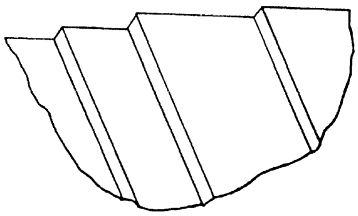

FIG. 2

FIGS 1 AND 2—MOVEMENT BY TRANSLATION AND TWINNING, RESPECTIVELY

face is formed by a kind of skin of vitreous material caused by *flow* of the superficial layers. Benedicks believes that it would follow from such theory that hard and fragile substances are more difficult to polish than the plastic ones. The experience, however shows the reverse. So, for instance, quartz is much easier to polish than the relatively plastic fluorite.

In the case of speculum metal, Benedicks observes that if the amorphous layer had really been the cause of the disappearance of scratches "partly filling them up and partly bridging them over" then a fortiori the network of the eutectic would have also been eliminated; however, Fig. 43 of Beilby's book shows that the structure remains perfectly visible.

Beilby finds in polished surfaces of pure metals, like antimony and copper, small rounded areas which he thinks are cavities roofed over with a thin film of a viscous layer. Benedicks rather ascribes these appearances to the presence of slag inclusions, Sb_2O_3 in antimony, or Cu_2O in copper. Since Cu_2O appears red in transmitted light but the complementary color blue in reflected light, microscopic inclusions of that oxide observed in an opaque ground like metallic copper will appear distinctly blue.

The most important application of Beilby's theory concerns the increase of hardness after cold work. In Benedicks' opinion, it is perfectly fair to assume that if the amorphous phase exists on the surface of a polished metal, it would also appear in the interior of a deformed metal. However, to consider the amorphous phase as being possessed of a great hardness is a quite new and distinct hypothesis and seems hardly to agree with facts. For instance, a bismuth filament drawn at ordinary temperature must become as amorphous as possible; that filament, however, is not hard at all. It seems, therefore, to the author, that the hypothesis of amorphous state does not appear to bring much light to the study of the nature of cold work.

In order to exonerate himself of a purely negative attitude, Benedicks advances the following theory not as yet published:

An originally plain surface after deformation may exhibit a "parallel translation" (Fig. 1) as shown by Ewing and Rosenhain, in which every particle slides over the next in the direction of the arrow, just as a pile of books or flat plates would. The same external shape "in steps" would, however, result from another regular deformation also known by crystallographers, the so-called "proportional translation" (Fig. 2). In this latter case there is no actual sliding, but rotation ("twinning") of the crystalline elements. The difference between these two kinds of movement is fundamental. In the former the space lattice remains identical, the optical properties remain the same and the amount of possible deformation is practically unlimited. In the latter, on the contrary, the space lattice is subjected to profound modification by the formation of twined lamellæ. This change is made apparent in polarized light; the amount of possible deformation is strictly limited by the angle of twinning. Thus, a metal, as for instance pure zinc, which deforms by "parallel translation," may be subjected to very great change of volume without any appreciable increase in hardness. On the other hand, the same zinc, containing some impurity as cadmium, twins, and thereupon deformation increases the hardness of the metal.

"Therm" Charges for Gas

The English authorities have been making a very extended investigation of the system of charging for gas on the basis of the "therm," 100,000 B.t.u. This committee has reported to the British Board of Trade recommending continuance of this system of charging, but providing for circulating additional information so that gas users will better understand it. The full text of the committee report is in *Gas Journal* (London), March 14, page 676.

Review of Recent Patents

Manufacture of Organic Oxides—In preparing organic oxides, such as propylene oxide and the oxide derived from trimethyl ethylene, by treating a chlorhydrin with an alkali, the yields may be increased by carrying out the reaction under as nearly anhydrous conditions as possible. Thus, the yield of ethylene oxide is only about 12 per cent theoretical when a 20 per cent solution of chlorhydrin is treated with 20 per cent caustic soda solution, while with 80 per cent chlorhydrin and solid caustic soda the yield is 83 per cent.

The process is carried out substantially as follows: A quantity of solid caustic alkali or calcium oxide is placed in an apparatus provided with means for stirring the contents, with an inlet for adding the chlorhydrin and an outlet through which the more volatile oxides may be distilled. The quantity of caustic alkali or lime taken should be in excess, preferably one and one-half to two times the amount theoretically required by the chlorhydrin. The chlorhydrin substantially free from water is then permitted to flow slowly in on the alkali, which is continually stirred to prevent caking and to effect good contact of the chlorhydrin with the alkali. In the case of ethylene, propylene and butylene oxides the heat of the reaction is sufficient to distill

American Patents Issued April 3 and 10, 1923

The following numbers have been selected from the latest available issue of the *Official Gazette* of the United States Patent Office because they appear to have pertinent interest for *Chem. & Met.* readers. They will be studied later by *Chem. & Met.*'s staff, and those which, in our judgment, are most worthy will be published in abstract. It is recognized that we cannot always anticipate our readers' interests and accordingly this advance list is published for the benefit of those who may not care to await our judgment and synopsis.

1,450,174—Nickeliferous Catalyzers and Process of Manufacturing Same. Albert Granichstadten and Emil Sittig, Vienna, Austria.

1,450,289—Apparatus for Entraining and Removing Fines From Conical Mills. Harry W. Hardinge, New York, N. Y.

1,450,290—Oversize Return for Mills. Harry W. Hardinge, New York, N. Y.

1,450,338—Apparatus for Producing Gaseous Fuel. Max Sklovsky, Moline, Ill., assignor to Deere & Co., Moline, Ill.

1,450,377—Method of Drying Colloids. George Perkins Lunt, New York, N. Y.

1,450,462—Method of Acidizing Rubber Waste. Richard A. Terhune, Fairhaven, Mass., assignor, by mesne assignments, to Conrad Gaschott, Caroma, N. Y.

1,450,463—Sulphurized Compound of Phenols. Alfred Thauss, Deutz, near Cologne, and Alfred Gunther, Cologne, Germany, assignors to Farbenfabriken vorm. Friedr. Bayer & Co.

1,450,464—Crystal Formation. Elihu Thomson, Swampscott, Mass., assignor to General Electric Co.

1,450,467—Silicate Cement. Hermann Weyland, Elberfeld, Germany, assignor to Farbenfabriken vorm. Friedr. Bayer & Co.

1,450,493—Ketone Body and Process of Making Same. Carleton Ellis and Alfred A. Wells, Montclair, N. J., assignors, by mesne assignments, to Seth B. Hunt, trustee, Mount Kisco, N. Y.

1,450,507—Method of Recovering Vanadium From Its Ores. Philip Alexander Mackay, London, England.

1,450,545—Apparatus for Separating Liquids of Different Densities. Oscar E. Hans, Bartlesville, Okla.

1,450,562—Process for the Treatment of Gases From Gas Producers. Olivier Piette, Brussels, Belgium.

1,450,569—Apparatus for Producing Ketones. Robert R. Williams, Chicago, Ill., and Herbert L. J. Haller, Cincinnati, Ohio, assignors, by mesne assignments, to Seth B. Hunt, trustee, Mount Kisco, N. Y.

1,450,617—Process of Purifying Mineral Oils. James Smith, Glasgow, Scotland.

1,450,661—Apparatus for the Manufacture of Sulphuric Anhydride. Paul Audianne, Paris, France, assignor to Etablissement Kuhlmann, Paris.

1,450,675—Process of Separating Isomeric Trinitrotoluenes. Charles M. Stine, Wilmington, Del., assignor to E. I. du Pont de Nemours & Co., Wilmington, Del.

1,450,677—Sulphur Burner. Horace G. Chickering, Wilmington, Del., assignor to E. I. du Pont de Nemours & Co., Wilmington, Del.

1,450,678—Process of Producing Phthalimids. Harry D. Gibbs, Penns Grove, N. J., assignor to E. I. du Pont de Nemours & Co.

1,450,685—Bituminous Emulsion and Process of Making Same. Lester Kirschbraun, Chicago, Ill.

1,450,688—Paint. John T. Lawrence, Newark, N. J.

1,450,692—Printing Ink. William J. McElroy, New York, and John Clarke, Manhasset, North Hempstead, N. Y., assignors, by mesne assignments, to Alchemic Gold Co., Inc.

1,450,704—Production of Zinc Oxide. James A. Singmaster and Frank G. Breyer, Palmerton, Pa., assignors to New Jersey Zinc Co., New York.

1,450,712—Process of Making Prepared Roofing. Walter H. Cady, Boston, Mass.

1,450,714-15-16—Cellulose-Ether Solvent and Composition. Stewart J. Carroll, Rochester, N. Y., assignor to Eastman Kodak Co.

1,450,856—Non-Conducting Material. Robert Illemann, Glasgow, Scotland.

1,450,865—Water-Soluble Product and Process of Making the Same. Joseph Pele, Cicero, Ill.

1,450,888—Coking of Coal. Stewart Roy Illingworth, Radyr, Glamorgan, Wales, assignor to Illingworth Carbonization Co., Ltd., Manchester, England.

1,450,912—Method of Making Anhydrous Magnesium Chloride. Paul Cathringer and William R. Collings, Midland, Mich., assignors to the Dow Chemical Co., Midland, Mich.

1,450,926—Composition of Matter for Silverplating Metals. Landolph Minar Sherow, Ossining, N. Y.

1,450,951—Wet-Filter Screen. Lucien Charles Cruyt, London, England, assignor to Heenan & Froude, Ltd., Worcester, England.

1,450,975—Process for the Manufacture of Borax and Boric Acid. Andrew Kelly, London, England, assignor to Borax Consolidated, Ltd., London, England.

1,450,982—Process for Removing Destructive Substances From Non-Aqueous Media. Melville J. Marshall and George S. Shaw, Shawinigan Falls, Canada, assignors to Shawinigan Laboratories, Ltd., Montreal, Que., Canada.

1,450,983—Manufacture of Aldehyde-Ammonia. Howard W. Matheson, Montreal, Canada, assignor to Shawinigan Laboratories, Ltd., Montreal.

1,450,984—Process of Making Condensation Products of Aliphatic Aldehydes. Howard W. Matheson, Montreal, Canada, assignor to Canadian Electro Products Co., Ltd., Montreal.

1,450,985—Process of Regenerating Beds of Exchange Silicates. Joseph M. Maxwell, Wichita, Kan.

1,450,990—Process of Making 2-Naphthol-3-Carboxylic Acid. Edmund C. Shorey, Washington, D. C.

1,450,992—Crystallizer. Truman E. Stevens, Omaha, Neb., assignor to Potash Reduction Co., Hoffland, Neb.

1,451,004—Method of Separating Zircon From Undesired Substances. Louis E. Barton and Charles J. Kinzie, Niagara Falls, N. Y., assignors to the Titanium Alloy Manufacturing Co., Inc., Niagara Falls, N. Y.

1,451,052—Treatment of Hydrocarbons. Heliodor Rostin, Vallo, Norway.

1,451,092—Cumaron Paint. Carleton Ellis, Montclair, N. J., assignor to Ellis-Foster Co.

1,451,113—Process of Producing Catalytic Material. George A. Richter, Berlin, N. H., assignor to Brown Co., Berlin, N. H.

1,451,125—Process for the Production of Paper Pulp and the Like. Bertrand S. Summers, Port Huron, Mich.

1,451,129—Method of and Apparatus for Oil Distillation. John W. Van Dyke, Philadelphia, Pa., assignor to the Atlantic Refining Co., Philadelphia, Pa.

1,451,135—Food Product and Process of Production. Albert W. Wright and Elisabeth H. Wright, San Francisco, Calif.

1,451,190—Gas Condenser. Frederick E. Voorhies, Tulsa, Okla.

1,451,313—Art of Reducing Inflammability of Materials. Arthur Arent, Des Moines, Iowa, assignor to Arthur Arent Laboratories, Inc., Des Moines, Iowa.

1,451,330-31—Manufacture of Cellulose Derivatives. Henry Dreyfus, London, England.

1,451,367—Process of Treating Shale. Stephan Marko, Chicago, Ill.

1,451,399—Process of Producing Halogen Acids. Frank S. Low, Niagara Falls, N. Y., assignor to Weaver Co., Madison, Wis.

1,451,472—Pulverizing Mill. Ralph E. H. Pomeroy, Canton, Ohio.

1,451,485—Composition for Fireproofing and Other Purposes and Process of Preparing Same. William Levis Wootton, Brooklyn, N. Y.

1,451,489—Process for the Manufacture of Azoxy, Azo, Hydrazo and Amino Compounds. Oliver W. Brown and Clyde O. Henke, Bloomington, Ind.

1,451,522—Mechanism for the Recovery of Paper Stock. Burke M. Baxter, Cleveland, Ohio, assignor to American Reduction Co., Pittsburgh, Pa.

1,451,540—Manufacture of Self-Hardening Refractory Articles. William A. France, Philadelphia, Pa.

1,451,543—Electroplating With Zinc. Joseph Haas, Jr., Muncie, Ind., assignor to the Roessler & Hasslacher Chemical Co., New York, N. Y.

1,451,574—Oil-Refining Device. Charles Fred Hillman, Wichita Falls, Tex.

1,451,575—Oil Shale Retort. George Edward Holmes, Salt Lake City, Utah.

1,451,589—Drier. Walter M. Schwartz and Elwood B. Ayres, Philadelphia, Pa., assignors to Proctor & Schwartz, Inc., Philadelphia, Pa.

1,451,603—Still. Henry C. P. Weber, Edgewood Park, Pa., assignor to Westinghouse Electric & Manufacturing Co.

1,451,666—Production of Alpha-Naphthylamine. Stuart P. Miller, Philadelphia, Pa., assignor to The Barrett Co.

1,451,670—Antiseptic and Insecticidal Soap or Composition. Robert MacPherson, Worthing, and William E. Heys, Bushel, England.

For complete specifications of any U. S. patent remit 10c to the Commissioner of Patents, Washington, D. C.

the oxides almost as fast as they are formed. For the higher alkylene oxides means for heating should be provided such as a jacket for steam or hot oil. It is important, in order to get the best yields, to remove the oxides as fast as formed, since other products are formed by the action of caustic alkali or lime on the oxides in the presence of water or glycol.

Oxides prepared in this manner may be used in various ways in the arts, as for example as blending or mixing solvents to cause liquids normally immiscible to mix. For example, gasoline or kerosene does not mix well with ethyl alcohol, but addition of oxides prepared from olefines of cracked petroleum brings about the desired miscibility. (1,446,872. Benjamin T. Brooks, of Bayside, N. Y., assignor to Chadeloid Chemical Co. Feb. 27, 1923.)

Manufacture of Potassium Sulphate—Camille Horst, of Wittelsheim, France, has obtained a patent for a process of treating gypsum with carbon dioxide suspended in an aqueous solution of caustic potash to obtain a saturated solution of potassium sulphate. The reaction is as follows:

$$CaSO_4 + 2KOH + CO_2 = CaCO_3 + K_2SO_4 + H_2O$$

This reaction is thought to take place in two steps; first forming a carbonate of potash, as follows:

$$2KOH + CO_2 = K_2CO_3 + H_2O$$

and the second reaction:

$$CaSO_4 + K_2CO_3 = CaCO_3 + K_2SO_4$$

This process is based upon the difference of solubility between the carbonate and the sulphate of calcium, the carbonate being practically insoluble and the sulphate very little. The reaction is said to be quantitative and the byproduct—namely, calcium carbonate—is a product capable of industrial application. (1,446,185. Feb. 20, 1923.)

Treatment of Raw Rubber and Like Plastic Substances—A patent has been issued to the estate of S. C. Davidson, of Belfast, Ireland, for an improved method in treating raw rubber and similar substances. Raw rubber freshly coagulated from the latex is placed in a machine consisting of three rolls, which act in the same manner as the usual massaging or kneading machines used for this purpose. The final traces of water may be removed in this process by rolling and elongating under pressure the mass to be treated. While still under full pressure the rolled mass is enveloped. The material used is substantially inextensible under any ordinary tensile stress and is at the same time readily suitable for the absorption of the moisture exuding from the mass. The wrapped material is then hung in an airy room, well ventilated, where after a few days its tendency to contract is entirely overcome. At this stage the final traces of moisture ooze out and evaporate from the wrapping. For the wrapping material a heavy strongly woven cotton tape or similar webbing is employed. An automatically attached string buckle is used in fastening the webbing to the roll. (1,446,737. Feb. 27, 1923.)

Acetyl Cellulose From Bleached Sulphite Paper Pulp—W. J. Stevenson of Charing Cross, England, has obtained a patent for improvement in methods of manufacturing acetyl cellulose. Instead of employing bleached cotton wool, as has been the case in the past, he makes use of bleached sulphite paper pulp, which he claims gives greater stability, better control, longer life and easier impregnation with dyes and colors. Glacial acetic acid and acetic anhydride are used in carrying out the reaction. As catalyzers zinc chloride, nitric acid or dimethyl sulphate are employed. These materials, thoroughly mixed, are allowed to stand for 7 to 8 hours at a temperature of 60 to 70 deg. C., submerged in an excess of water. The precipitate is washed and dried at a temperature of 100 to 120 deg. C. (1,441,541. Jan. 9, 1923.)

Oxy-derivatives of Anthraquinone—Oxy-derivatives of anthraquinone, especially alizarin, may be manufactured by the following method, patented by A. H. Davies of Carlisle, England. He has assigned the patent to Scottish Dyes, Ltd., of same address. If mono- or 2-chlor anthraquinone is autoclaved for 24 hours at 170 deg. C. in a caustic alkali solution in the presence of such an oxidizing agent as a chlorate or nitrate, the chlorine atoms are replaced by hydroxyl groups. Moreover, a further hydroxyl group is introduced into the molecule.

From 2-chlor anthraquinone, by using caustic soda as the alkali and sodium chlorate as oxidizing agent, alizarin is obtained. The dye is extracted by diluting and acidifying the filtered solution. (1,446,163. Feb. 20, 1923.)

Recovery of Products From Tinned-Iron Waste—A patent has been granted H. V. Welch and W. A. Sheek of Los Angeles and Long Beach, Calif., for the recovery of tin, lead and iron from scrap. The scrap is sheared or divided into fragments of suitable size and fed into a cupola furnace of special construction which allows more time than does the usual type of furnace for melting down. Carbonaceous material, also lime, may be fed into the furnace along with the material to be melted down. Air is supplied through tuyeres at the bottom of the furnace, as in usual practice. Gas may also be forced in at this point and burned with the carbonaceous material in order to obtain the reducing atmosphere desired in the furnace. To aid in the volatilization of the tin and lead which may be present, halogen gases or halide in solid form may be utilized. If in gaseous form, they are fed in at the tuyeres; if in solid form, they are fed in with the charge. The amount of gas required is at least 5 lb. for every 2 lb. of tin known to be present in the charge. Tin or lead which are volatilized in the process are recovered by a Cottrell or similar fume separator. The temperature employed for volatilization is as near the melting point of iron as is possible. (1,446,953. Feb. 27, 1923.)

Method of Treating Fibrous Material—A patent has been granted to Eduard Dyckerhoff of Hanover, Germany, for waterproofing material to make it useful for building or insulating purposes. The treatment consists in heating the material on trays or in drying drums to a temperature of approximately 120 deg. C. This process renders the material water-resisting and non-hygroscopic. Subdivided wood thus treated is suitable for filler material in the manufacture of cements, mortars, etc. (1,446,888. Feb. 27, 1923.)

Treatment of Products Made With Cellulose Derivatives—L. G. Richardson of Nottingham, England, has assigned to the American Cellulose & Chemical Manufacturing Co., Ltd., of New York, the following patent for treating of cellulose products. The saponification of cellulose acetate products (lower than tri-acetate) is carried out in a bath to which sodium acetate has been added in addition to the straight caustic solution usually employed. This addition intensifies and controls the partial saponification and enables level dyeing to be more easily obtained. A small amount of caustic soda is maintained in the bath at all times. As fast as this NaOH is exhausted the supply is replenished and in this way the bath may be maintained in active condition over an indefinite period. It is essential that the amount of free caustic in the bath at any time be maintained as low as possible and that the temperature at which the operation is carried out be held between 50 and 75 deg. C. (1,442,631. Jan. 16, 1923.)

Lubricants From Tar—This patent covers a process of obtaining lubricants from a low-temperature tar. The process starts with a low-temperature tar, rich in non-saturated compounds, whose constituent parts distill between 260 to 320 deg. C., and preferably between 275 and 300 deg. C., at atmospheric pressure, after being first freed of paraffin and phenols.

Polymerization is then effected together with some such means as blowing air through it while holding at some predetermined temperature or subjecting it to high tension electrical oscillations, while in an atmosphere of hydrogen and at a proper temperature. The lower the temperature during polymerization the better the properties of the final product. The viscosity can be increased at will according to the degree to which the polymerization medium is allowed to act. Viscosities up to 30 deg. Engler at 50 deg. C. are obtained. The final product is light colored. (1,450,026. Egen Eichwald and Hans E. R. Vogel, Hamburg, Germany. March 27, 1923.)

Men in the Profession

CARL L. ALSBERG, director, Food Research Institute, Stanford University, spoke before the Washington Chemical Society, April 12, on "Agriculture and Fuel Supply as the Limiting Factors in the Food Supply of the World."

C. L. BACHELDER has left the employ of the Consolidated Water Power & Paper Co. and is now with the Interlake Pulp & Paper Co., Appleton, Wis.

Dr. ARTHUR W. BROWNE, of the chemistry department of Cornell University, recently addressed the Syracuse Section of the American Chemical Society on "An Organic Compound of Sulphur."

C. B. CARPENTER, ARTHUR W. THOMAS and J. ENRIQUE ZANETTI have been raised from the rank of assistant professors to that of associate professors of chemistry at Columbia University.

Dr. ARTHUR B. CLARK, of the National Aniline & Chemical Co., of Buffalo, N. Y., read an interesting paper on Photomicrographic Records at a recent meeting of the Miscroscopical Section of the Buffalo Society of Natural Sciences.

C. R. DELONG, chief of the chemical section of the Tariff Commission, spoke before the American Drug Manufacturers Association, New York, April 17 on "The Tariff of 1922, and the Chemical Industry." Mr. DeLong made a comparison of some of the rates of duty on medicinal chemicals and drugs in the new tariff and previous tariffs, and explained the operations of the flexible tariff section of the act.

Dr. F. G. DONNAN, professor of chemistry, University College, London, and Dr. JAMES C. IRVINE, principal and vice-chancellor, University of St. Andrews, talked of their recent researches in chemistry, April 17, 1923, at a joint meeting of the Philosophical Society of Washington, the Chemical Society of Washington and the Washington Academy of Sciences. These gentlemen, accompanied by Prof. A. F. Holleman of Amsterdam and Prof. Giuseppe Bruni of Milan, Italy, spent practically the entire week of April 16 in Washington, visiting chemical laboratories of the government and attending special luncheons, dinners and other forms of social activities.

L. H. DUSCHAK, secretary of the California Section of the American Chemical Society, presented a paper on the chemical engineer's part in the fighting of mine fires, at the Mine Safety Conference recently held at Globe, Ariz.

Dr. E. C. FRANKLIN, president of the American Chemical Society, spoke before the New Jersey Chemical Society on April 13 and the Syracuse Section of the A.C.S. on April 17. His subject at both meetings was "Ammonia System of Compounds."

R. C. HARTONG, formerly chief chemist at the plant of the Goodyear Tire & Rubber Co., Akron, Ohio, has been elected president and treasurer of the Chemitex Products Co., recently organized by local interests to establish a plant at Mogadore, near Akron.

Dr. ELLWOOD HENDRICK, consulting editor of *Chem. & Met.*, spoke before the following local sections of the American Chemical Society: Lansing, Mich., April 18; Chicago, Ill., April 20; Purdue, Lafayette, Ind., April 21, and at Cincinnati, April 23. His subject at Chicago was: "Obligations of Physical Science."

RAYMOND HERTWIG, assistant chemist, San Francisco station, Bureau of Chemistry, has been assigned to the food-control laboratory of the bureau in Washington for 2 months

ARTHUR J. HOSKINS, research assistant professor of mining, has been appointed the acting head of the department of mining, University of Illinois, to fill the vacancy caused by the sudden death of Dr. H. H. Stoek, the founder of the department of mining at Illinois. Professor Hoskins has had 33 years experience in mining and metallurgy.

J. M. MALLORY, general industrial agent of the Central of Georgia R.R., and R. T. STULL, formerly the ceramic engineer in charge of the Columbus Experiment Station of the Bureau of Mines and who is now doing special work on Georgia clays, conferred recently with chemists in Washington on the general progress of the work.

Dr. ROYAL A. MEEKER, state commissioner of labor and industry, Pennsylvania, has resigned as chief of the scientific division, international labor organization of the League of Nations secretariat, Geneva, effective March 31.

Dr. E. S. MERRIAM has resigned as chief chemist of the Safe Cabinet Co. in order to resume his consulting work in connection with natural gas, casinghead gasoline and carbon black, at Marietta, Ohio.

Dr. R. B. MOORE, chief chemist of the Bureau of Mines, will discuss hafnium and other rare and suspected elements when he addresses the New York Section of the American Chemical Society on June 8.

EDMUND O'NEILL, for 45 years a member of the faculty of the University of California, recently announced his resignation as professor of inorganic chemistry to take effect after this semester. Professor O'Neill's personality has endeared him to all with whom he has come in contact, and he relinquishes active work to the regret of his colleagues and associates. He has been granted sabbatical leave by the university authorities and will travel in the Orient during the summer.

GEORGE H. RASCH, general manage byproducts department, Morris & C has resigned to become president a general director of the United Seru Co., with plants at Kansas City, Ka Wichita, Kan., and East St. Louis, I

P. O. ROSEWARN, of the Canadi Department of Mines, inspected t Bureau of Mines Cryogenic Laborato in Washington recently.

Dr. E. W. SCHWARTZE, pharmacol gist in charge of the pharmacologic laboratory, Bureau of Chemistry, r cently lectured before a class of grad ate physicians from the Veteran Bureau

Dr. WALTER O. SNELLING, director research for the Trojan Powder C gave an address on the subject of sy thetic chemicals, particularly relatir to new developments, before the men bers of the Allentown Radio Clu Allentown, Pa., March 26.

Prof. JULIUS STIEGLITZ, of the Un versity of Chicago, is to be the recipie of the J. Willard Gibbs medal, award annually by the Chicago Section of t American Chemical Society, for his r searches in organic chemistry. T medal will be presented in May.

Dr. ALBERT P. SY, of the departme of chemistry of the University of Bu falo, spoke before the alumni club the university April 7, on "Food an Food Values."

Obituary

ELMER A. COTTEN, refinery superi tendent of the Atlas plant of the Stan ard Oil Co., at Buffalo, N. Y., di April 11. Mr. Cotten had been 4 years with the Standard Oil Co. an had been refinery superintendent mo than a score of years.

J. EMIL FRANK, owner and publish of the *Textile Colorist*, died March 1 o pneumonia at his home in New Yor The journal was founded by his fathe Dr. Morris Frank, in 1879 and M Frank had been connected with throughout his life.

WILHELM KONRAD RONTGEN, who wa born in 1845, died recently in Munic Germany, at the age of 78. A Germa physicist, born at Lennep, in Rhenis Prussia, he received his doctor's degre in 1869 at the University of Zuric where he studied under Kundt. H was afterward professor at Hohenhei Strassburg, and Giessen, and in 1885 h became professor at the University o Würzberg. In 1899 he was appointe professor of experimental physics a the University of Munich. In Novem ber, 1895, before the Physico-Medica Society of Würzberg he read a paper o his discovery of the rays which bear hi name. For this discovery he receive many honors, including the Rumfor medal of the Royal Society of Londo and the Barnard medal of Columbi University, awarded in 1900 for th greatest discovery in science during th preceding 5 years. In 1901 he wa awarded the Nobel prize for physics.

Market Section

The Summary of the Week

Census reports show that domestic production of organic chemicals increased 177 per cent in the seven-year period from 1914 to 1921.

Local importers' protest against levying duty on arrivals of cresol from foreign markets overruled by Treasury decision.

Active trading in salicylic acid cleans up surplus holdings and causes the market to close in a strong position.

Copper sulphate sold down in price with supplies of imported grades pressed for sale. Domestic makes are not following the lead of the imported.

Tartaric acid was advanced one cent per pound due to continued good demand and lessened foreign competition.

March cottonseed products report indicates small supply of cottonseed oil for remainder of crop year.

The Upward Trend of Chemical Prices

PROBABLY there is no more convincing evidence of the return of business confidence than is to be seen in the upward surge of commodity prices. Since the first of the year the general level of wholesale prices has shown a consistent advance, but this movement has been most marked in the case of chemicals and a few related materials.

Measuring this trend of prices in terms of the index numbers of the Bureau of Labor Statistics, it will be observed that the "all commodities" index has risen from 142 in March, 1922, to 159 in March, 1923—a gain of 12 per cent. The chemical group stood at 131 in January, 1923, and increased to 132 in February and to 135 in March. Metal prices, in terms of the same index numbers, rose from 109 in March, 1922, to 149 in March, 1923. This is an increase of 36.4 per cent and the largest gain for any group.

Chem. & Met.'s weighted index of chemical prices, based on a somewhat different series of commodities, shows an even more striking improvement. Emerging from the slump of October, 1922, when this stood at 147, it has since climbed steadily until at the present time it is at a level of about 180—i.e., 80 per cent above the pre-war prices of 1913-14.

For the benefit of new readers it might be explained that *Chem. & Met.'s* index is a weekly compilation based on the average wholesale prices in New York for twenty-five representative chemicals. In order that these commodities might be considered according to their relative importance, a "weighting" factor was obtained by multiplying the production plus imports of each chemical during the last census year by its average price for the fiscal year 1913-14. After these factors had been reduced to a percentage basis the procedure is repeated using the weekly quotations for each commodity. The index number thus obtained gives a clear and accurate idea of the average fluctuations in the chemical industry and makes it possible to compare these fluctuations with those taking place in other industries.

Methods for Operating Flexible Provisions of Tariff Law

How Tariff Commission Will Obtain Production Costs—Individual Manufacturers' Costs Not to Be Made Public—Applications for Tariff Changes Held Confidential Until Investigations Are Justified

IN AN address before a meeting of the American Drug Manufacturers' Association at New York, last Wednesday night, C. R. DeLong, chief of the Chemical Division, United States Tariff Commission, discussed the tariff of 1922 with especial reference to its bearing on the chemical industry.

Mr. DeLong gave a very instructive exposition of the flexible features of the tariff, in which he said:

Flexible Tariff Provisions

"The flexible provisions of the present tariff act are an innovation in tariff law, and therefore I assume that you are more or less interested in the plans of the commission for investigations under these sections. They are found in sections 315, 316 and 317 of Title III of the law. It is apparent from the applications which the commission has received that there is considerable misapprehension as to what can be accomplished under these provisions. Many of the requests deal with questions of classification, which are clearly a function of the Treasury Department; others ask that commodities be changed from the dutiable list to the free list or *vice versa*, which is specifically prohibited by law. The maximum modification possible under the law is either an increase or a decrease of 50 per cent of the existing rates, or in the case of ad valorem duties a change in the basis of valuation from foreign value to American selling price of the domestic product. It is, however, impossible to increase the duty and at the same time change the basis of valuation. In the case of coal-tar products under paragraphs 27 and 28 no increase in duty can be made by the President under section 315; the only possible change in the duty on these products is a decrease, not to exceed 50 per cent.

Changes in Classification

"The law also states that changes in classification may be made. Many people have taken this to mean that changes in classification which would increase or decrease a duty could be made without consideration of the cost of production. This, however, is not the case, as any change in classification which would involve a change in the rate of duty must be warranted by the facts relative to costs of production, as set forth in the law.

"An important question, and one on which the workability of section 315 may depend, is whether or not actual and complete costs of production must be obtained both here and in the principal competing countries before changes may be made in rates of duty in pursuance of the flexible provisions of the tariff act. In other words, is the term 'cost of production' as used in the act limited to the ordinary understanding of what constitutes costs? It is readily conceivable that in certain cases considerable difficulty may be encountered in ascertaining foreign costs of production, and the question naturally arises as to whether or not section 315 can be effective in such cases.

Basis for Changes in Duty

"Wherever changes in rates of duty are referred to, it is stated that these changes shall be such that they will equalize the differences in costs of production. Subdivision (*c*), however, enumerates certain elements which may be taken into consideration, as far as practicable, in ascertaining differences in production costs, a qualification which may prove to be serviceable and important.

"If it should be held that actual costs of production must be obtained both here and abroad, it is evident that the usefulness of the flexible tariff provisions will be greatly impaired. On the other hand, it is conceivable that, if the commission makes an earnest effort to obtain costs of production from firms in foreign countries and meets with a refusal to divulge this information, other methods of arriving at costs may be employed. Accurate information can be obtained in this country as to prices of imported merchandise c.i.f. New York, ocean charges, packing charges, and the price f.o.b. foreign ports. With these facts and other information that may be obtained in foreign countries, such as costs of materials, power and fuel and wage rates, in many cases a close approximation can be made of the actual cost of production in foreign countries. It is not unreasonable to expect that such information would satisfy the law so far as costs of production are concerned.

Method of Obtaining Costs

"You may be interested to know the methods of procedure of the commission in obtaining costs of production here and abroad. At the present time all domestic firms engaged in the manufacture of the chemicals for which the commission has ordered investigations have been requested to submit their costs to the commission in accordance with a definite cost form. The commission is not requesting these firms to fill in cost schedules, but is using cost forms as an indication of the detail in which it is desired that costs be submitted. The costs may be submitted on the individual company's forms.

"A question that is naturally foremost in each manufacturer's mind is whether or not the costs of production of individual manufacturers are to be made public or held confidential. The commission has decided that costs of individual manufacturers will be held strictly confidential and for the exclusive use of the commission. Costs will be published or revealed only in the form of averages or so as not to reveal the operations of individual firms. The commission has also taken the same attitude in regard to costs that may be obtained from foreign manufacturers.

Publicity as to Applications

"The commission has adopted the policy of not making public information as to whether or not applications have

Calendar

The following important technical meetings are scheduled for the immediate future:

AMERICAN WELDING SOCIETY New York, April 24-27

AMERICAN OIL CHEMISTS' SOCIETY Hot Springs, Ark., April 30-May 1

AMERICAN FOUNDRYMEN'S ASSOCIATION Cleveland, O., April 30-May 3

INTERSTATE COTTON SEED CRUSHERS ASSN. Hot Springs, Ark., May 2-5

AMERICAN ELECTROCHEMICAL SOCIETY New York City, May 3-5

AMERICAN CHEMICAL SOCIETY Regular meeting, New York, May 4

AMERICAN ZINC INSTITUTE St. Louis, May 7-8

AMERICAN ASSN. OF ENGINEERS Norfolk, May 7-9

AMER SOCIETY MECHANICAL ENGRS. Montreal, May 28-31

CANADIAN INSTITUTE OF CHEMISTRY Toronto, May 29-31

SOCIETY OF CHEMICAL INDUSTRY Canadian Section Toronto, May 29-31

been filed on various commodities until it has been decided whether investigations are justified. It is, of course, impossible to prevent applicants from giving such information to the public, and the information which has appeared prior to the announcement of an investigation by the commission has come from this source. The commission is of the opinion that publicity in connection with each complaint as filed would tend to keep domestic manufacturers and other interested parties in an unsettled condition. Since all complaints may not warrant an investigation or may not for various reasons be investigated, it seems that it would be an unwise policy to keep business in a constant state of turmoil by giving publicity to each application as filed. The commission, however, assures you that following the announcement of an investigation, ample opportunity will be given to all parties to submit evidence and testimony, and to be heard at a public hearing.

"It is apparent that considerable stress has been placed by interested parties on the nature of applications—that is, whether they are for an increase or a decrease in duty, and also as to the names of the applicants. Although the commission has decided to make such information public, when an investigation is ordered, undue weight should not be given to these facts. The law clearly states that any changes resulting from investigations shall equalize the difference in cost of production in this country and in the principal competing foreign country. It is, therefore, clear that if an application is for an increase of duty and the facts show that a decrease in the rate is the only change that will equalize this difference in costs, such a decrease can be made. The same holds true for converse conditions. The facts should appear to warrant the desired change before an application for an investigation is filed. Otherwise, a change may result which would be adverse to the applicant's interest.

"That this situation is not fully understood is shown by the fact that since the commission has ordered an investigation of certain chemicals, requests have been made for a change contrary to that of the application which resulted in an investigation being ordered by the commission. It should be clearly understood that a finding by the commission may be made either way, depending upon facts in the case, regardless of the nature of the application."

Washington News

Investigate Production Costs of Casein

F. W. McSparren, a chemist of the Chemical Section of the Tariff Commission, and Edwin Schoenrich, an accountant and linguist, sailed from New York April 14 for the Argentine, where they will conduct an investigation into costs of production of casein, regarding which American manufacturers of coated paper have applied for a reduction in duty under the flexible tariff law. Their schedule calls for a month in the South American republic.

Hankow Cables Show Advance in Wood Oil Prices

Prices of china wood oil have advanced materially in China. A cable quotation indicates that $316 U. S. gold per ton was being paid on April 16 at Hankow. This is an increase from $260 the latest preceding quotation. Even with the very high prices being offered, spot oil is very scarce. The difficulty of getting stocks to Hankow from the interior is given as the cause of the shortage.

Japan Hoarding Dyestuffs

The dullness which has characterized the dyestuff market in Japan recently was transformed into a period of speculative activity in which prices throughout the list rose sharply. The situation was precipitated, it is believed, by the realization that supplies were being quietly hoarded and the realization that the situation in the Ruhr would not be a temporary one.

Good Car Service for Movement of Fertilizers

Fertilizer manufacturers are particularly pleased with the car service which is being afforded them for the movement of this season's fertilizers. The railroads have made a special effort to co-operate with the manufacturers, and general satisfaction is expressed at the result. The performance of the railroads during this period in which fertilizers must be moved is the first general recognition which has been given of the necessity of handling fertilizers with an understanding of their seasonal application.

Higher Prices for German Potash in May

A material increase in the export price of German potash is expected May 1. The present prices applying to potash exports for the United States are: Chloride, $32; sulphate, $41.10; manure salt, $9.50; kainit, $6.50.

The total German export of potash in 1922 was approximately one million long tons. Of that amount, 25 per cent came to the United States. The pre-war movement to the United States alone was about one million tons annually.

February Chemical Exports Show Gain in Value

Substantial Increases as Compared With Figures for January and for February, 1922

A material increase in the value of chemicals and allied products exported in February is shown in comparison with the value of exports in January and in February of 1922. In February of this year the value of all chemicals and allied products exported, according to the returns to the Department of Commerce, was $9,321,365. The exports in January were $8,638,779. The value of exports in February, 1922, aggregated $7,665,272.

The value of coal-tar products exported in February was $986,545. This is an increase of more than $300,000 over the volume of exports in January and is more than $600,000 greater than those of February, 1922.

Sodas and sodium compounds were exported in February to the extent of $760,859. This is a slight decrease when compared with the value of exports in January and with those of February of 1922.

Pigments, paints and varnishes valued at $1,020,989 were exported in February of 1923, which represents an increase of more than $250,000 over February of 1922 and shows a continuance of the large volume of these exports maintained during January.

Exports of fertilizer and fertilizer materials augmented appreciably. The movement in February of 1923 was valued at $1,448,804. This is nearly half a million dollars greater than the value of exports in January. The movement of sulphate of ammonia increased from $549,108 in January to $797,041 in February.

The shipment of explosives abroad continues to pick up. The February total was $1,485,011 lb., which is more than half a million pounds greater than the January export movement of these commodities.

Exports of soaps contributed to the February increase, with the exports of laundry soap reaching the high total of 5,739,720 lb., and those of toilet soap attaining an aggregate of 842,971 lb. Other soaps to the extent of 2,017,531 lb. were exported.

Other chemical products exported during February which show an increase over the January movement, with February totals, are as follows: Benzol, 5,637,621 lb; crude tar, 14,097 bbl.; other crude distillates, 36,934,756 lb.; coal tar, colors, dyes and stains, 1,338,395 lb.; acetic acid, 102,670 lb.; wood and denatured alcohol, 190,289 gal.; other alcohol, 33,699 gal.; ammonia and ammonium compounds, 1,511,518 lb.; copper sulphate, 636,448 lb.; glycerin, 87,760 lb.; cyanide of soda, 210,780 lb.; borax, 5,081,352 lb.; silicate of soda, 1,770,500 lb.; sal soda, 878,670 lb.; red lead, 576,062 lb.; white and sublimed lead, 614,884 lb.; prepared fertilizer mixture, 4,682 tons.

Organic Chemical Production Increases 177 Per Cent in 7-Year Period

Domestic Output Lower Than Abnormal Production of 1919, but Shows Healthy Expansion Over 1914 Totals

REPORTS made to the Bureau of the Census by establishments manufacturing organic chemicals that are not included in special chemical groups (listed below) show a production aggregating in value \$45,476,600 in 1921, as compared with \$72,141,542 in 1919 and \$16,377,955 in 1914—a decrease of 37 per cent as compared with 1919, but an increase of 177 per cent for the 7-year period 1921-1914.

	1921	1919	1914
Alcohols:			
Amyl alcohol, gal	107,200	241,254	(2)
Glycerin (glycerol).			
Crude, lb.	21,856,000	21,402,735	16,568,920
Refined, lb.	68,843,700	69,464,298	60,944,799
Alcohols other than amyl and ethyl, but including absolute ethyl alcohol produced in chemical establishments	\$804,800	\$553,234	(2)
Aldehydes			
Formaldehyde, lb	9,682,700	25,006,815	
Vanillin, lb.	191,700	134,687	120,619
Other aldehydes	\$484,000	\$1,794,268	(2)
Amines and amids, lb.	1,374,200	(2)	(2)
Carbon bisulphide, lb.	22,741,000	15,469,567	(2)
Hydrocarbons, including acetylene	\$8,289,800	\$8,060,541	(2)
Other carbon compounds, calcium carbide, decolorizing carbon, carbon electrodes, etc.	\$13,851,000	\$20,301,657	(2)
Esters:			
Amyl acetate, gal	56,300	125,692	
Ethyl acetate, gal	906,600	770,739	(2)
Ethyl nitrite, lb	59,400	43,153	(2)
Other esters	\$106,900	\$1,007,794	
Halogen compounds			
Chloroform, lb	944,300	1,677,641	1,333,954
Ethyl chloride, lb	208,300	248,103	(2)
Other halogen compounds and carbon tetrachloride, chloral hydrate, ethyl bromide, iodoform, etc	\$599,300	\$1,057,896	(2)
Ethers Ethyl (sulphuric) and other, lb	3,763,300	4,898,033	
Ketones			
Acetone, lb	4,380,100	6,045,914	10,425,817
Other ketones, lb	1,218,600	1,531,808	(2)
Other organic chemicals	\$2,135,300	\$1,409,158	(2)
Unclassified organic chemicals	\$1,245,700	\$4,138,359	(2)

(1) Not including (except as noted) ethyl or grain alcohol, the products of distilleries, or methanol (wood alcohol), for which see "Wood Distillation."

(2) Figures not available.

The special chemical groups for which separate reports are being issued are as follows: (1) Acids; (2) nitrogen compounds; (3) sodium compounds; (4) potash and potassium compounds; (5) alums, aluminum, and compounds; (6) bleaching compounds; (7) coal-tar chemicals; (2) plastics; and (9) compressed and liquefied gases.

The principal organic chemicals here included are the following:

Refined glycerin, with a production for sale in 1921 of 59,861,400 lb., valued at \$9,514,300, a decrease on a quantity basis of 11 per cent as compared with 1919, but a slight increase (less than 1 per cent) as compared with 1914.

Vanillin, with a production in 1921 of 191,700 lb., valued at \$1,496,900, an increase on a quantity basis of 42 per cent over 1919, and of 59 per cent over 1914.

Ethyl ether, with a production for sale in 1921 of 3,416,100 lb., valued at \$920,700, a decrease of 17 per cent in quantity compared with 1919, but an increase of 61 per cent over 1914.

Carbon bisulphide, with a production for sale of 14,942,000 lb., valued at \$795,900, an increase in quantity of 29 per cent compared with 1919.

Formaldehyde, with a production for sale of 6,088,700 lb., valued at \$649,000, a decrease in quantity of 69 per cent as compared with 1919, and of 28 per cent as compared with 1914.

Acetone, with a production of 4,380,100 lb., valued at \$441,700, a decrease of 27 per cent in quantity as compared with 1919, and of 58 per cent compared with 1914.

Chloroform, with a production of 944,300 lb., valued at \$289,300; a decrease of 44 per cent in quantity as compared with 1919, and 29 per cent as compared with 1914.

Ethyl acetate, with a production of 410,800 gal., valued at \$241,200, an increase in quantity of 16 per cent as compared with 1919.

The figures for 1921 are preliminary, and subject to such change and correction as may be found necessary from a further examination of the original reports.

The detailed statistics of production for 1921, 1919 and 1914, are given in the accompanying table.

Refractories Merger Looms

Negotiations for the purchase of American Refractories Co. by the General Refractories Co. have been concluded and it is said that the merging of the two companies now awaits only the formal approval of the stockholders of the two organizations.

By this purchase the General Refractories Co. increases its annual capacity to about 300,000,000 bricks, making it the second largest producer in the country. It has plants at Baltimore and at Danville and Joliet, Ill. The recent purchase will add particularly to the company's silica and magnesite brick capacity.

Chemical Salesmen Dine and Hold Business Meeting

A well-attended meeting of the *Salesmen's Association of the American Chemical Industry was held last Wednesday evening at the Chemists' Club, New York City. Dinner was served at 7 o'clock. While the dinner was in progress songs were sung under the* able leadership of F. E. Signer, D. F. Stewart and G. A. Bode. R. E. Dorland presided at the business meeting. Reports of progress were given by the committees on uniform sales contracts and return packages, as submitted by Messrs. Haynes and Tunison respectively. R. C. Anthony was appointed chairman of the entertainment committee for the next meeting, which will be held late in May or early in June and will be in the nature of an "outing." The following eight new members were admitted to the association: B. K. Hotchkiss, representing Hooker Electrochemical Co.; P. M. Dinkins, of the Kalbfleisch Corporation; H. G. Stephenson, of E. I. du Pont de Nemours & Co., Inc.; E. V. Finch, of the United States Alkali Export Association; John F. Martini, of Monsanto Chemical Works; Milton Louria of Maple Chemical Co.; Arthur J. Binder, of the Sherwin-Williams Co., and B. M. Van Clive, also from the Sherwin-Williams Co.

H. Seydel, of the Seydel Chemical Co., spoke briefly on the interdependence of the executive and sales branches of the industry. He was followed by Charles Wadsworth 3d, assistant editor of *Chem. & Met.*, who discussed problems of distribution. Mr. Wadsworth then introduced the principal speaker of the evening, Paul T. Cherington, of the J. Walter Thompson Co. Mr. Cherington delivered a very interesting and instructive address on the subject, "Problems Experienced in Marketing a Consumer Product."

Acid Accidents Must Stop

Tank cars carrying acids, more especially sulphuric, should not be subjected to pressures of over 30 lb. per sq.in. The tank car pressure committee of the Manufacturing Chemists' Association reported to the executive committee of that association at its New York meeting on April 18 that in many cases pressures as high as 80 lb. per sq.in. are being used. Serious damage to apparatus as well as personal injury has resulted due to accidents caused by neglect of heeding the 30 lb. per sq.in. pressure recommendation. A campaign of education to correct this malpractice among producers and consumers is to be carried on by the association.

The executive committee at the same time appointed two members to establish standard specifications for earthenware apparatus.

The annual meeting of the association is to be held at the Whitehall Club, New York, on June 6.

Foreign Chemists Amazed at Development Here

Such an ambitious program of meetings, visits and social affairs was arranged by the chemists of Washington and other scientists in the capital for the recent visit of foreign chemists that the visitors all but lacked the necessary physical strength to keep all of the appointments which had been made for them. The visiting chemists were: Dr. F. G. Donnan, professor of chemistry at University College, London; Dr. James C. Irvine, principal and vice-chancellor, University of St. Andrews, St. Andrews, Scotland; Prof. Giuseppe Bruni, of the Polytechnical School at Milan, Italy, and Prof. A. F. Holleman, of the University of Amsterdam.

The visitors were the guests of honor at a dinner on April 17 tendered jointly by the Washington Academy of Sciences, the Philosophical Society of Washington and the Chemical Society of Washington. After the dinner Dr. Donnan and Dr. Irvine delivered addresses in the auditorium of the Interior Department.

Dr. Charles L. Parsons, secretary of the American Chemical Society, on April 16 arranged a dinner for the visiting chemists and twenty other guests, including the Italian Ambassador, at the Cosmos Club. During the course of that dinner Ambassador Caetani announced that he had suggested to Italy's Premier that arrangements be made for the sending to America, at public expense, a number of graduate engineers each year, with the idea of giving them the advantage of a certain amount of American experience and contact with American ideas of engineering efficiency. On the same occasion Dr. Irvine stated that he is advising British students to do post-graduate work in the United States.

Each of the visitors expressed astonishment at the rapid growth of scientific development in the United States. Fifteen years ago, it was pointed out by one of the visitors, America was known as the source of certain scientific work of a very high character, but the amount of work being done was not great. The visitors also were much impressed by the facilities which we possess in the way of laboratories, books of reference and current technical publications.

Australia Has Surplus Arsenic

An increasing volume of white arsenic imported from Australia is expected as a result of reports reaching Washington from that country. Australia makes its own sheep dips and other arsenicals, but its production of white arsenic is in excess of those requirements. The present level of prices is sufficient to make it profitable to send this surplus to the United States.

Sir J. J. Thomson Visits G. E.

Sir Joseph J. Thomson, Master of Trinity College, Cambridge, England, spent 2 days of his stay in this country at the research laboratories of the General Electric Co., Schenectady, on April 6 and 7, previous to his series of lectures before the Franklin Institute on "The Electron in Chemistry."

He gave an informal talk to the laboratory staff and engineers, inspected the works, and evinced much interest in the latest developments as demonstrated during his visit. He inspected the various types of radio vacuum tubes employing thoriated filaments to obtain greater electron emission, examined the 1,000-kw. tube set and other features.

Sir Joseph was accompanied by Dr. R. B. Owens, secretary of the Franklin Institute, and W. C. L. Eglin, vice-president. In the accompanying photograph he is shown with them and with Dr. Irving Langmuir and Dr. Coolidge.

BEST MINDS IN SCIENCE MEET

Sir Joseph J. Thomson, Master of Trinity College, Cambridge, England, is here shown with Dr. Irving Langmuir, assistant director, G-E Laboratory; Dr. R. B. Owens, secretary of the Franklin Institute; W. C. L. Eglin, vice-president, the Franklin Institute; and Dr. W. D. Coolidge, inventor of the Coolidge X-ray tube. When this photograph was taken Sir Joseph was examining a 20-kw. radio tube.

A.E.S. Meets May 3-5

Two Symposiums, an Inspection of Dorr Plant and Social Events on Program

With headquarters at the Commodore Hotel, New York, the American Electrochemical Society is to hold its annual meeting May 3 to 5. Technical sessions are to be held on Thursday, Friday and Saturday.

Members of several New York sections of scientific organizations have been invited to attend these meetings. The list includes: American Chemical Society, Society of Chemical Industry, American Institute of Chemical Engineers, Société de Chimie Industrielle, New Jersey Chemical Society, American Institute of Mining and Metallurgical Engineers, Metallurgical Society of America, American Institute of Electrical Engineers, American Electroplaters' Society, National Electric Light Association and New York Electrical Society.

On Thursday, May 3, the program of the day includes a symposium on "Electrode Potentials." With W. G. Horsch as chairman the following men are to present papers in this connection: H. S. Taylor, H. C. Howard, M. Knobel, P. Caplan, M. Eiseman, N. H. Furman, A. H. Aten, A. Lowy, H. S. Frank, W. Blum, C. G. Schluederberg, F. A. J. FitzGerald, H. S. Rawdon, H. E. Haring, A. K. Graham, M. R. Thompson, H. D. Heneline, W. Baughman.

The program of the day includes an inspection of the McGraw-Hill plant at noon and an informal luncheon following. In the evening the Electrothermic Division Council is to hold a dinner.

The Friday morning session includes the following papers:

J. C. Woodson: Heat Insulating Material for Electrically Heated Apparatus.

F. W. Brooke: Methods of Handling Materials in the Electric Furnace and the Best Type of Furnace to Use.

M. deKay Thompson and P. K. Frölich: The Conversion of Diamonds to Graphite at High Temperatures.

A. E. R. Westman: The Relation Between Current, Voltage and the Length of the Carbon Arcs.

C. E. Williams, C. E. Sims and C. A. Newhall: Electric Furnace Detinning and Production of Synthetic Gray Iron From Tin Plate Scrap.

C. W. Drury: Cobalt—Its Production and Uses.

F. C. Kelley: Chromizing.

Following the technical meeting members will journey to Westport, Conn., where the plant of the Dorr Co. is to be visited. Following the plant inspection there is to be a dinner and dance at the Westport Country Club.

The final meeting on Saturday morning, includes a symposium on "Production and Application of Rarer Metals." Speakers include: C. James, H. S. Cooper, H. W. Gillett, E. L. Mack, B. D. Saklatwalla, R. W. Moore, J. A. Holladay, T. R. Cunningham, R. P. Neville, E. Wichers, L. Jordan and F. E. Carter.

Moroccan Phosphate May Rival Florida Deposits

Huge Amounts of Rich Rock Are Becoming Available Through Intensive Development

ADDITIONAL information as to the phosphate situation in Morocco has become available. The 1922 production was 80,583 tons. It is estimated that 300,000 tons will be exported in 1923 and that by 1927 a production of 1,100,000 tons will have been attained.

The increase in production is being made possible by the installation of mechanical handling at Casablanca, the port. The narrow-gage railway connecting Casablanca and the mines is being changed to a broad-gage line. The influence the broad-gage railroad will have on the movement of these phosphates is indicated by the fact that the freight rate will be reduced from 52 francs to 16 francs per ton.

The phosphate beds are situated 160 kilometers south of Casablanca. The beds themselves occur in an area 75 kilometers in length which varies from 5 to 35 kilometers in breadth. The beds are in horizontal layers several meters in thickness. The percentage of phosphate is said to average from 73 to 78 per cent. Reports from disinterested sources agree that there are very extensive deposits of very high-grade phosphate of lime.

For the past 2 years the deposits have been under the direct control of a state monopoly. It is conducted under a board of management with wide powers vested in a head manager, which gives it the flexibility of administration enjoyed by a private industry. At the same time the enterprise has been benefited greatly by its governmental character, as it has made easy the construction of railways and the providing of port facilities which would have taken a much longer time to arrange had private interests only been concerned.

While the Moroccan authorities claim that a small profit now is being realized from these operations, there is reason to believe that all phosphate exported is being sold at a loss. The development of the deposits, however, and the facilities connected with the whole enterprise are being conducted with assurance because Europe's annual requirements of phosphate exceed four million tons. When provisions are complete to handle production and shipments in quantity, there seems little doubt of the ability to compete successfully with the Florida product.

Gives Fund for Soap Study

The Palmolive Co., of Milwaukee, announces the establishment of a Fellowship for the study of the fundamental principles connected with the detergent action of soap. The Fellowship carries an annual stipend of $2,000. The Fellow will have the privilege of pursuing his studies at any institution in the country which is properly equipped for this purpose. The candidate must possess the equivalent of a Master's degree.

The Fellowship will be awarded by a committee consisting of the following: W. D. Bancroft, professor of chemistry, Cornell University; E. C. Franklin, American Chemical Society; H. N. Holmes, chairman colloid division, National Research Council; Victor Lenher, professor of chemistry, University of Wisconsin; J. C. Sellmer, representing Palmolive Co.

General Motors to Produce Anti-Knock Gasoline

A subsidiary of the General Motors Corporation, to be known as the General Motors Chemical Co., is about to use gasoline filling stations as a medium for placing a modified type of gasoline on the market. This new type of gasoline, it is announced, contains an anti-knock compound which has been developed after many years of experiment by the General Motors Research Corporation.

News Notes

The oldest powder yard in the country went out of existence recently when E. E. du Pont de Nemours & Co. closed their plant on the Brandywine. This yard was founded in 1802.

Cement manufacturers are reported to be considering a change from cloth to paper bags for handling their product. Decreased cost without increased loss of product through breakage or dampening is expected if the change is made.

Changes in tariff rates have been requested by no less than 159 applicants. It is understood that in addition to the list of seventeen commodities already being investigated another group of eight is now being prepared for investigation. The list will of course be acted on only with the President's approval.

Czecho-Slovakian industry is staging a "comeback" according to reports received here by the consul general of that country. The greatest improvements noted are in iron, coal and engineering industries. Machinery for sugar works, breweries and alcohol distilleries is being shipped in increasing amounts to France, Belgium and Italy.

Paper and ink as related in the printing industry were discussed before the Society of Chemical Industry at its New York meeting on April 13. The nature and composition of inks, the causes of fading of lithographs and the inter-relationship of paper and ink colors in printing were the topics of the evening.

The Electric Steel Founders' Research Group held a convention at East Aurora, N. Y., April 13 and 14. The gathering was one of the most successful in the history of the group, which has been in existence since 1920. Representatives and executives from the five electric steel casting plants forming the Research Group joined in a discussion of important steel foundry problems covering both technical and commercial phases. W. H. Worrilow, president of Lebanon Steel Foundry, Lebanon, Pa., presided over the sessions.

The principal effort of the Division of Research Extension of the National Research Council during the coming year will be to raise funds in sufficient amount to permit intensive work on the tables of physical and chemical constants, being edited by the Council.

Eighteen American students have been awarded scholarships by the American-Scandinavian foundation. Of this number several are to study chemistry, engineering and metallurgy in Denmark and Sweden.

French naval stores are now practically exhausted. Commercial Attaché C. L. Jones reports that there is probably not more than 100 tons in warehouses in the Bordeaux district. It is yet too early to estimate the size of the crop, but it is evident that it will exceed 1922 crop, which was about 32,000 metric tons of turpentine and 118,000 tons of rosin.

Spraying potatoes with copper salts such as Bordeaux, Pickering mixtures and likewise barium water not only has the effect of controlling the diseases for which they are applied but, according to the United States Department of Agriculture, thorough and timely spraying usually greatly increases the yield, influences the composition of the tubers and increases their keeping qualities in storage.

A course in illuminating gas manufacture and distribution is to be given at Columbia University this summer by Prof. J. J. Morgan. This course will include plant inspection, laboratory work and a thorough lecture treatment of the entire subject. To furnish a motive for the work the class is to be given the problem of laying out a gas plant for a small city.

To determine how long it takes to "tire" a metal to the point where it gives way under repeated strains or shocks the Engineering Foundation, in collaboration with the National Research Council, the Copper and Brass Research Association, the University of Illinois, the General Electric Co., Western Electric Co. and other corporations has undertaken a comprehensive program of research to establish the endurance limits or so-called "fatigue" of copper, brass, bronze and other metals.

Facts and Figures That Influence Trade in Chemical Products

Market Conditions

Current Prices Imports and Exports The Trend of Business

Speculative Trading in Chemicals No Longer A Market Factor

Consuming Buying Moderate Owing to Heavy Contract Holdings—Tartaric Acid Advances in Price—Fluoride of Soda Strong—Metal Salts Unchanged But Easy in Tone—Less Interest in Arsenic

CENSUS reports, just issued, covering production of chemicals for 1921, in general reveal a healthy growth as compared with 1914. However, material increases over the 1921 figures may be expected in the current year if present rate of output is maintained or even approximated for the balance of the year.

With different consuming trades covered by contracts, new business placed in the past week was not heavy. As prices for the speculative commodities are high enough to be considered dangerous, there is a decided falling off in activity on the part of speculators, and this gives the market a quieter appearance than actually is the case when measured by normal standards, as different sellers report a fair average volume of business. Prices for the most part are fluctuating within narrow limits. Seasonable demand and limited stocks have a strengthening effect on some chemicals and the position of foreign markets also has an influence on many commodities. The easy tone to basic metals has caused buyers of metal salts to regard present prices as safe from advances and they are buying in a hand to mouth way with the hope that values will work more in their favor. Permanganate of potash is holding attention, but prices are irregular and demand is in evidence only on dips in the market. There are well defined rumors of short interests in arsenic, but if correct, attempts to cover are well concealed; however, spasmodic buying on weak spots is regarded as significant. Copper sulphate, which was selling freely for export a year ago, is now depressed by the weight of foreign offerings in our markets, and prices went to still lower levels during the week as the result of selling pressure. Demand for fertilizer chemicals is not expected to show any immediate improvement, and interest is mainly confined to prices for deferred shipments. Sulphuric acid is in a very strong position, with producers sold ahead, and it is difficult to negotiate business for prompt deliveries. Tartaric acid moved into higher prices during the week and with German grades out of the question, the prospect for low priced imported material is not bright.

Acetic Acid—Demand has not picked up enough to bring about any material change and raw materials likewise offer nothing new, so the price schedule of makers is on an unchanged basis. Business during the week was described as routine. Asking prices are $3.17½ for 28 per cent and $6.35 for 56 per cent, with glacial at $12.05@$12.85.

Citric Acid—Firmness is the keynote in this market. Domestic offerings continue to be quoted at 49c. per lb., but the bulk of home production is sold ahead and this places considerable dependence on imported. Foreign markets are strong and 52c. per lb. is asked for shipments. Some spot offerings are held here which were imported at more favorable prices and holders are not eager to sell below replacement costs, so the latter also is quoted at 52c. per lb.

Formic Acid—Prices have not been disturbed by trading, in fact the call for fresh supplies is described as very moderate. For domestic acid the asking price is maintained at 16c. to 17c. per lb. for 85 per cent. Imported acid was not pressing for sale but was easy in tone because of the lack of buying interest. Prices for the latter were 14½@14¾c. per lb. Shipments were practically on the same level as spot.

Hydrofluoric Acid — Consumers are not active at present and seasonable dullness is found in most quarters. Considerable interest in future prices, however, has arisen because of reports that raw materials, especially fluorspar, are becoming scarcer and this is taken as an indication that values later in the year will be higher. Acid grades of fluorspar, 98½ per cent or better, crushed, are offered at $27.50 per ton delivered. No change in acid prices has taken place, and for the time slow consuming demand is the governing factor. Quotations are 7@7¾c. for the 30 per cent and 11@11½c. for 48 per cent.

Oxalic Acid—There has been less disposition on the part of sellers to shade prices and difficulties surrounding shipments have given a firmer feeling to prices, which is reflected in the market for domestic offerings as well as imported. Prices for domestic are reported as strong at 12¾@13c. per lb., f.o.b.

"Chem. & Met." Weighted Index of Chemical Prices

Base — 100 for 1913-14

This week	178.31
Last week	181.48
April, 1918 (high)	286.00
April, 1919	231.00
April, 1920	261.00
April, 1921 (low)	140.00
April, 1922	158.00

Another slight recession in the index number occurred last week. The decline was brought about by the ½c. reduction in crude cottonseed oil and the easier position of formaldehyde

works. Imported is held at 13½@14c. per lb., according to quantity and seller.

Tartaric Acid—Predictions of higher prices have been verified, as early last week there was a general rise of one cent per lb. for both domestic and imported. Demand is holding up well and recent advances have failed to check the buying movement. Current prices are 36c. per lb. for domestic and 35½c. per lb. for imported. Reports from the Italian market indicate firm conditions there.

Potashes

Bichromate of Potash—An easy tone continued throughout the week and while 10¾c. per lb. is given as the open quotation for round lots at the works, this price is not firm and 10½c. per lb. is said to be possible on firm bids. Despite the apparent easy tone to prices it is believed that there are no heavy stocks to work off and increased buying would be immediately felt.

Caustic Potash — Sales of two cars afloat were put through at 8c. per lb. Spot goods sold at 8½c. per lb. and despite reports of limited stocks the undercurrent seemed less strong than a week ago. Many consumers are interested only at price concessions and lack of actual buying interest prevents any real strength to prices.

Chlorate of Potash—This chemical has been marked by the steady position of values. Imported offerings are held at an inside figure of 7¼c. per lb. and shipments also are steady at that figure. Domestic is moving normally at unchanged price levels of 8½c. per lb. and upwards, according to quantity. These prices being f.o.b. works. Large consumers are covered by contracts.

Permanganate of Potash — Developments in permanganate are being followed more closely than most of the other items in the chemical list. Demand is fair, but buyers have their own views about values and place orders only when they think prices are

right. The general asking price on spot is 24c. per lb., but this has not been entirely adhered to and sales were reported fractionally under that level. *Goods afloat were available at 23c. per lb. On shipments 22½c. per lb. was asked for April and 21½c. per lb. for May.*

Potash First Sorts—*Leading sellers have turned down business under their asking levels and a very firm market continues. Buyers are not active, but this is offset by reduced production and limited stocks in sellers' hands. Prices are on a basis of 9c. per lb. for moderate sized lots.*

Sodas

Acetate of Soda—It is a buyers' market and values are easy under selling pressure. As low as 5½c. per lb. was heard during the week and even at the reduced prices, buying has not been stimulated to any extent.

Bichromate of Soda—Raw materials used in the manufacture of bichromate are holding a steady position and this is reflected in the market for the finished product. Producers are maintaining prices at 7½c. per lb., works, for round lots. Most of the present movement from the plants is against old orders with new business quiet. In the spot market 7⅞@8c. per lb. is the ruling quotation.

Caustic Soda—Independent interests which a short time ago were reported to be finding difficulty in placing goods for export are now said to be getting a good share of that business. The so-called outside brands have sold at 3.35c. per lb., f.a.s., while standard brands are held at 3.45c. per lb., although the latter do not seem to be as strong as previously. Domestic buyers were not much in evidence last week and small lot business predominated. The contract price is held at 2½c. per lb., works, basis 60 per cent. Spot material is offered at 3⅞c. per lb. for less carlots, 76 per cent solid.

Chlorate of Soda—Off-grade material of foreign make is still on the market with holders willing to do business on private terms. On prime goods the price is well maintained at 6½c. per lb. No change has taken place in domestic makes and sellers hold out for an inside price of 6½c. per lb., works.

Cyanide of Soda—Reports are now current that two new producing companies are preparing to enter the field in the West. Of course it will be some time before they will be able to influence values. Imported cyanide is offered rather freely in the local market but is not meeting with a ready sale and prices are easy at 20@21c. per lb. Domestic cyanide is steady at 22½@23c. per lb.

Fluoride of Soda—Producing costs are on the upward trend and indications point to further price advances. During the week business at 9½c. per lb. was said to have been turned down and 9½c. per lb. is held as the lowest figure at which sellers will accept orders.

Nitrate of Soda—With the heavy buying season over, prices for nitrate are a little weaker and selling pressure has become more of a factor. Importers as a rule are not disposed to shade asking *prices of $2.65 per 100 lb., but in the open market it was possible to do $2.60 per 100 lb. and possibly a little lower. Considerable interest is taken in future prices but offerings under $2.50 per 100 lb. have failed to bring buyers into the market. On the one hand is the attempt in primary points to curtail production and stabilize prices and on the other the uncertainty about the extent to which European markets may be expected to buy. If the latter purchase sparingly it is held that prices will be made attractive to stimulate American buying.*

Prussiate of Soda—Competing materials have been offered at more attractive relative prices and this has had the effect of cutting down the demand for prussiate. This may be illustrated in the case of dry colors where the chemical colors are not finding the outlet which is noted for the earth colors. Prices for yellow prussiate were decidedly easier last week. Offerings were available at 17¾c. per lb. and even this price was said to be none too strong.

Soda Ash—Scattered buying on new account is noted but contract withdrawals continue heavy and this is the feature of the market. Prices are steady, with hardly any chance for a lowering of values. In fact some well posted traders say indications favor rises in quotations. Production is still at close to capacity of plants but is equalled by consuming requirements. Quotations are holding at $1.75 in bags and $1.95 in barrels.

Miscellaneous

Arsenic—In spite of reports that prominent interests are said to need arsenic in order to take care of sales of calcium arsenate, the market last week showed a falling off in interest. Some sellers hold that buyers are holding out in order to let values ease off through lack of support. The undertone was a shade easier. Spot goods were quoted at 15½@15½c. per lb. Mexican arsenic for shipment was offered at 15c. per lb. and Japanese was reported to have sold at 14½c. per lb. Cables to Washington state that Australia has surplus stocks of arsenic which can compete in price in our markets.

Calcium Arsenate—Fundamental conditions have undergone no change and as demand is expected to continue for three months and no way is in sight to make up the prospective shortage, the outlook can hardly be interpreted as favoring price declines. Sellers appear to be willing to hold prices from advancing and during the week it was possible to do 17⅞c. per lb.

Copper Sulphate—Inquiry was more active and sales of round lots were reported in both imported and domestic grades. Yet many sellers say business is still below expectations. There is no definite quotation on imported and buyers are taking advantage of the situation to depress values by making low bids. Sales were made at 5½c. per lb. Domestic grades are more steadily held *than imported but there are differences according to brand and seller with 6½c. to 6½c. per lb. asked.*

Tin Oxide—*In common with the other metals tin has worked into an easier position, but, while this was reflected in a slightly easier feeling for tin oxide, the leading factors maintained prices on the basis of 52c. per lb. Trading was slow, buyers holding off for further developments because of the unsettled state of the metal.*

Formaldehyde—It was reported that the cheap lots have all been cleaned up, some business passing early in the week as low as 13¾c. per lb. Most of the sales went through around 14c. At the close the situation firmed up somewhat and "outside" lots were held at 14½c. per lb. First hands maintained prices on the 16c. basis. The market was irregular all through the early part of the week.

Sulphate of Ammonia—Local sellers report export inquiry of fair volume and sales are said to have been made to Japan in the past few days. The quotation, f.a.s. New York, is generally given at 3.90c. per lb., but with firm business in hand it is stated that 3.85c. can be done.

Alcohol Trade Slow

Some traders reported fair business in alcohol, but in the majority of instances business was described as quiet. Prices did not change, but the undertone was barely steady, especially on denatured spirits. The No. 1 denatured was offered freely at 39c. per gal., 188 proof. Ethyl spirits, 190 proof, was unchanged at $4.75@$4.85 per gal. Methanol, 95 per cent, was available at $1.19@$1.21 per gal.

Trade Notes

Export duty on copra from Fiji has been fixed at 10 shillings per ton, which is a reduction of 5 shillings per ton from the rate effective last year.

The Tannin Corporation will move on May 1 from 80 Maiden Lane to larger quarters in the new building at 11 Pershing Square.

J. M. Lowe, manager and chief chemist of the Edgewater, N. J., plant of the Midland Linseed Products Co., returned last week from Toledo.

Herbert J. Cantrell, identified with the cottonseed oil business since 1907 and a member of the New York Produce Exchange, has retired from business.

H. D. Ruhm of 136 Liberty St., New York, is now in the South in connection with his interests in phosphate rock and calcium arsenate interests.

Coal-Tar Products

Active Trading in Salicylic Acid—Phenol Higher in Second Hands—Steady Call for Naphthalene—Benzene Quiet

An active demand for salicylic acid set in toward the close and the market strengthened in all directions. While no actual advance in prices was announced by leading producers, the continued buying made operators more cautious and offerings late in the week were very much smaller. The buying came from a good source and it looked as if an upward movement in prices for the salicylates was in order. The phenol situation did not change for the better. The offerings were scanty and it was doubtful whether resale parcels could have been picked up for less than 56c. per lb., immediate delivery. Producers have not changed their views, being well sold up on nearby material. In naphthalene the demand continues active, with distributors anxious for goods purchased some time ago. It is reported that several domestic producers have not yet delivered March commitments. There was no buying interest in forward material; traders see no reason for a material reduction in prices, pointing to the strong market for crude.

The tariff situation in connection with cresol attracted attention. The Treasury Department, in a ruling handed down recently, held that the duty of 7c. per lb. and 55 per cent was the proper rate on cresol containing less than 5 per cent of tar acid distilling below 190 deg. C. Importers had little faith in the claim for free entry under paragraph 1549. However, it is felt that the application for a 50 per cent reduction in the rate of duty will be more successful, as domestic producers appear satisfied that the existing rate is too high. The market for cresylic acid at the close was firm. Benzene demand continues quiet, but prices were nominally unchanged. Solvent naphtha was in scanty supply and firm. Pure xylene was strong on spot around the 75c. basis. Second hands were asking around $1 per lb.

Coal-Tar Crudes, Etc.

Benzene—Offerings were plentiful, but prices underwent no change, as traders take the stand that new business will soon come forward in volume and surplus stocks are really not burdensome. Benzene, 90 per cent, in tanks. held at 27c. per gal., contract basis, the customary premium obtaining on small quantities. On the pure, water-white, the market held at 30@32c. per gal., immediate delivery.

Cresylic Acid—With no prospects for a change in the interpretation of the tariff law, traders have abandoned all hope for free entry of the lower grades of this acid. Attention will now be directed to the application for a 50 per cent reduction in the rate of duty on cresylic acid, which has been agreed upon by both importers and domestic producers, the prevailing rate being prohibitive and working many hardships on the consuming industry. The foreign markets were firm, holding on the basis of 85c. per gal., in bond, prompt shipment from the other side, New York, for the 97 per cent material. Spot 97 per cent acid closed nominally at $1.40 per gal., with the lower grades at $1.30.

Naphthalene—Demand for naphthalene was active and with producers behind in making deliveries, the market for spot goods presented a firm appearance. With the weather unseasonable, actual consuming demand for ball naphthalene has not been so urgent, but distributors, nevertheless, are anxious about their supplies. The market settled at 9¼@9¾c. per lb., carlot basis. Traders held out little hope for a material reduction in new contract prices, owing to the strong position of crude. Crude naphthalene of good color for shipment from abroad settled around 3c. per lb.

Phenol—The offerings of resale material were scanty and prices at the close were strong and more or less nominal. Early in the week several parcels brought 55c. per lb., but later it was said that nothing could have been picked up in outside channels at less than 56c. per lb., immediate delivery. Leading domestic producers have not changed their selling views, delivering all they can make on the old basis of 26c. per lb. New production can hardly come on the market for some time to come, with the result that the market prospects covering nearby material are in an exceedingly strong position. The extraordinary demand for phenol is attributed to the absorbtion of this material by manufacturers of phenol resins.

Aniline Oil—Producers report a moderate amount of business, but with stocks not pressing on the market, quotations were maintained on the basis of 16c. per lb., round lots. Scattered business was put through at this figure.

Beta-Naphthol—No further changes were reported in the market for beta-naphthol, leading handlers asking 23½c. per lb., while in outside quarters there were offerings at 23c. per lb.

Dimethylaniline—The demand for dimethylaniline was fair and producers reported a steady market, maintaining prices on the former basis of 42c. per lb., in drums, immediate delivery.

Paranitraniline—There was more buying interest and prices steadied in some directions. Quotations varied, depending upon the make, etc. Most traders were asking around 75c. per lb.

Toluene—The market was a featureless affair, production being restricted because of the limited outlet for this material. Nominal quotations were repeated at 30@32c. per gal.

Xylene—Because of higher manufacturing costs leading interests have raised their views on the pure to 75c. per gal., carlot basis, forward delivery, to consumers only.

Cottonseed Oil Visible Down to 846,000 Barrels

The Bureau of Census report on cottonseed products, issued on Tuesday, April 17, indicated that 167,000 barrels of cottonseed oil was consumed during the month of March. This compares with 194,000 barrels in February and 204,000 barrels in March a year ago. The showing was not so good as trade leaders expected, but, considering the small visible supply, the situation is regarded as firm and no real downward movement in prices of old crop oil is looked for at just this time. The visible supply of oil on March 31 is estimated at 846,000 barrels, which compares with 963,000 barrels on the corresponding date a year ago.

Receipts of cottonseed at the mills from Aug. 1 to March 31 amounted to 3,167,750 tons, against 2,857,824 tons for the corresponding period a year ago. The amount of seed actually crushed for the eight months ending with March 31 amounted to 3,016,865 tons, against 2,853,762 tons for the same time a year ago. Production of crude oil for the eight months ending with the last day in March amounted to 922,224,522 pounds, contrasted with 878,821,894 pounds for the corresponding period a year ago. The production of refined oil for the eight months covered by the report reached the total of 779,015,120 pounds, which compares with 744,804,378 pounds for the same period last year.

Stocks of cottonseed on March 31 were placed at 159,922 tons, against 101,193 tons on the same day a year ago. The stocks of crude oil on hand March 31 amounted to 60,137,116 pounds, which compares with 54,907,155 pounds a year ago. The stocks of refined cottonseed oil on the last day of March amounted to 239,925,412 pounds, contrasted with 299,860,679 pounds on the corresponding date a year ago.

Treasury Decision Upholds Duty on Cresol

The Collector of Customs at New York last week received a decision from the Treasury Department at Washington, upholding an appraiser's report on an importation of cresol, where the entry was classified as dutiable under paragraph 27 of the tariff act at the rate of 7c. per pound and 55 per cent ad valorem. Attorneys for the importers had contended that free entry should be given under paragraph 1549 of the tariff act, which provides for free entry of all distillates of any of the tars mentioned in the paragraph which, on being subject to distillation, yield in the portion distilling below 190 deg. C. a quantity of tar acids less than 5 per cent of the original distillate.

Vegetable Oils and Fats

Crude Cottonseed Lower—Coconut Sales at 9¼c. New York—Linseed Holds Firm—Tallow Steady

THE cottonseed oil market developed weakness on the showing made in March, which took the trade by surprise. The Bureau of Census report indicated consumption of 167,000 barrels, a good volume, but not quite up to expectations. Another feature was the activity in coconut oil. The New York market was unsettled early in the week but steadied later on buying for export, evidently to satisfy a short account in London. Linseed was nominally unchanged, with sentiment on futures somewhat easier because of the freer movement of Indian seed and the tendency to increase the Argentine estimates on the exportable surplus. Soya was higher in the forward positions. Trading, taken as a whole, was good on nearby material, but inactive on futures.

Linseed Oil—At the close crushers offered April-May oil at $1.17 per gallon, carload lots, cooperage included Several operators also named this figure on June business, but appeared willing to do $1.14 on July and $1.10 on August forward. New business was inactive and large consumers showed no anxiety for summer oil, many of them entertaining bearish views because of the more favorable seed situation. The Argentine Ministry of Agriculture revised the final estimate on the crop, bringing the figures up to 52,960,000 bushels. The previous "final" estimate put the crop at 47,023,000 bushels, while early in the season a production of 61,240,000 bushels was the forecast India shipped 528,000 bushels of new crop seed last week, indicating that the movement was on. An exportable surplus of 12,000,000 bushels may be expected from India. A full cargo of Argentine seed now afloat sold late in the week at $2.39½ per bushel, c.i.f. New York. Linseed cake was steady at $36 per ton, f.a.s. New York.

Cottonseed Oil—Prices eased off in all directions on the drop in lard and the less favorable showing on March consumption as revealed in the Census figures. The visible supply of oil on the last day of March was placed at 846,000 barrels, which compares with 963,000 barrels on the corresponding date a year ago, a bullish statistical situation according to trade authorities. At the close it was felt that prices will advance on the first showing of strength in lard. Lard stocks in Chicago on April 15 amounted to 29,327,935 pounds, against 13,495,496 pounds on April 1. Hogs were easy all week on heavy receipts. Exports of cottonseed oil for the eight months ending with March 31 amounted to 48,984,982 pounds, against 75,195,473 pounds for the corresponding period a year ago. Crude oil sold in the Southeast at 10c., f.o.b. mills. Bleachable oil sold at 11½c. per lb., buyers' tanks, f.o.b. New York. There were rumors of new crop (Oct.-Nov.-Dec.) crude selling at 7½c., f.o.b. Texas mills.

Coconut Oil—The sale of 35 tank cars of Ceylon type oil was reported at 9¼c. per lb., f.o.b. New York. One lot sold down to 9⅛c. during the past week. This naturally steadied prices a little and at the close 9⅜c. was the market. Europe bought here and, according to traders, this represented covering by shorts. The sale of 100 tons of Central American copra was reported at 5½c., c.i.f. New York. On Manila sun-dried, there were offerings at 5.75c., c.i.f. New York. Coconut cake was dull and the price was lowered to $33 per ton.

Corn Oil—Crude closed at 10¼@10⅜c. per lb sellers' tanks, Middle Western points. Refined in barrels, New York, held at 13½@13⅝c. per lb.

China Wood—A small lot brought 37c. per lb. on spot. May arrival was available at 30c. with June-July shipment at 25½@26c. per lb. On the Pacific coast 25c. was asked on May-June sellers' tanks.

Palm Oil—Trading was slow and prices on futures irregular. Niger oil for shipment closed at 8⅞c. asked. Lagos held at 8½c. With the movement of oil in Africa about to set in operators were disposed to hold off.

Soya Bean Oil—April shipments from the coast held steady at 10¼c., sellers' tanks, duty paid. On futures the asking price was raised to 10⅜c., coast basis. In New York City one car of prompt oil was held at 10⅞c., duty paid.

Fish Oils—The sale of several tank cars of crude menhaden oil was reported at 50c. per gal., which compares with 55c., the ruling price a week ago. The transactions, of course, cover futures "if made" as the season is fully two months away. Newfoundland cod oil was offered at 68c. per gal. A shipment of sardine oil arrived here from the Orient. There were no changes in the crude whale oil situation.

Tallow and Greases—The sale of 10 cars of extra special tallow was reported at 9c. per lb., f.o.b. plant, the prices showing no change for the entire week. Several shipments of South American tallow arrived here last week. At the weekly London auction, held on April 17, 1,442 csk. of tallow were offered and 720 csk. were disposed of. Prices were unchanged to 6d. higher. Oleo stearine sold at 10⅜c. and later at 10⅞c., f.o.b. New York. Choice yellow grease was scarce at 8½c. New York.

Miscellaneaus Materials

Glycerine—The market was a dull affair, but prices did not ease off. Refiners take the stand that contract business will come along in volume in a short time and, with a firm situation in crude, they refuse to force the market. C. P. held at 18c. per lb., in drums, carload lots, and 20c. in tins. Dynamite sold at 16½c. in this territory. The leading "buyers" have been reselling scattered lots without depressing the views of actual holders in producing circles. Crude soap lye, basis 80 per cent, held at 10¼c. loose in the West, and 10½@10¾c. in the East. Saponification was wholly nominal at 12¼@12¾c. per lb. loose, carload lots.

Casein—The past week witnessed the arrival of 7,450 pkg. of casein from various foreign sources of supply, but principally New Zealand and the Argentine. The market was unsettled on "nearby" material. On spot most traders held out for 25c. on the technical grade.

Naval Stores—The market was easy early in the week, the price for turpentine declining steadily until it reached $1.48 per gal. in New York and $1.40 per gal. in Savannah. Late in the week business showed moderate improvement. The arrival of new season's production is increasing and stocks are gradually accumulating. Export business was inactive. Steam distilled turpentine settled at $1.43 per gal. Rosins went off 5c. per barrel, the "B" grade settling at $6.15. Trading was slow, even after the decline. The market for tar and rosin oils was quotably unchanged.

Shellac—Lower cables from Calcutta and London unsettled the market and prices at the close were weak. T. N. was offered down to 71c. per lb., spot New York, round-lot basis. Superfine orange closed nominally at 76c., with the ordinary at 74c. per lb. Bleached, bonedry, closed at 84@86c. per lb., immediate and nearby delivery. Demand was moderate, the decline naturally frightening prospective buyers.

White Lead—The easier market for the metal failed to change the attitude of producers of lead pigments. Trading in the pigments since the first of the year has been active, notwithstanding the numerous upward revisions in prices. Standard dry white lead (basic carbonate) held at 9⅝c. per lb. in casks, carload lots. The sulphate was unchanged at 9¼c.

Zinc Oxide—There was an easier market for spelter as well as ore, yet this failed to weaken the ideas of producers of zinc oxide. First-hands reported a good volume of orders on their books and production appears to be sold up over the next two months in more than one direction. American process lead free was available at 8c. per lb., carload lots. French process, red seal, was offered at 9⅝c., carload lots.

Imports at the Port of New York

April 13 to April 19

ACIDS—2 bbl. coal tar, Hull, Merck & Co.; 10 csk. cresylic, London, T. G Cooper; 76 dr. cresylic, Liverpool, W. E. Jordan; 135 dr. cresylic, Liverpool, Order; 100 csk. citric, Palermo, R. F. Downing & Co; 150 csk. citric, Palermo, Order; 6 dr. cresylic, Liverpool, Monsanto Chem Wks.; 100 dr. cresylic, Liverpool, Order; 23 dr. cresylic, Hull, Order; 50 dr. cresylic, Glasgow, Irving Bank-Col. Trust Co.; 24 dr cresylic, Rotterdam, Bregent Corp of America.

ALUM—29 csk., Rotterdam, A. Klipstein & Co., 154 csk. sulphate, Rotterdam, Meteor Products Co.; 66 csk dr., 500 bg. hydrate, Rotterdam, Greeff & Co.

AMMONIUM—50 cs. chloride, Liverpool, Wing & Evans; 10 csk. carbonate, Liverpool, Brown Bros & Co.; 10 csk. carbonate, Liverpool, Order.

ANTIMONY SALT—10 bbl, Hamburg, Am. Exchange Nat'l. Bank.

ARSENIC—117 csk., Antwerp, Order, 8 cs, Liverpool, F B. Vandegrift & Co., 240 cs., Kobe, Mitsui & Co., 104 cs. Kobe, J. D. Lewis, 348 cs, Kobe, G. F. Taylor, 220 cs, Kobe, Takata & Co; 100 cs., Kobe, S L. John & Co.; 120 cs., Kobe, Order

ARGOLS- 140 bg., Lisbon, Royal Baking Powder Co.

BARIUM — 15 csk hydrate, Hamburg, Order; 52 csk. chloride, Antwerp, Order, 54 csk. chloride, Hamburg, United Hardware Mfg Co of Am.

BARYTES—134 bg., Bremen, Equitable Trust Co.; 100 csk, Bremen, Order.

BORATE LIME—6,467 bg., Mejillones, Pacific Coast Borax Co

CASEIN—165 bg, Hamburg, Manhattan Co; 120 bg., Melbourne, Order; 80 sk, London, Order, 1,502 bg., Buenos Aires, Brown Bros & Co.; 1,667 bg., Buenos Aires, Kalbfleisch Corp, 2,523 sk., Auckland, Asia Banking Corp.; 232 sk., Auckland, Bank of America; 383 sk, Auckland, Order, 175 bg, Bombay, Order.

CHALK — 1,100 bg., Antwerp, Irving Bank; 500 tons, London, Baring Bros & Co., 400 bg., London, W E Miller Co., 1,397,000 kilos in bulk, Dunkirk, Taintor Trading Co., 500,000 kilos in bulk, Dunkirk, J. Higman Co.; 1,000 bg., Antwerp, Bankers Trust Co; 200 bg powdered, Antwerp, Cooper & Cooper; 500 tons, London, Taintor Trading Co., 650 pkg. precipitated, Bristol, H. J. Baker & Bros

CHEMICALS—68 pg., Hamburg, Order; 3 cs Hamburg, Merck & Co.; 40 csk., Bremen, Roessler & Hasslacher Chem. Co., 117 pkg, Bremen, Pfaltz & Bauer, 26 pkg., Bremen, Order; 1,000 bg., Antwerp, Order; 430 bg., Hamburg, J. Munroe Co.; 573 bbl., Hamburg, Roessler & Hasslacher Chem. Co; 298 pkg., Hamburg, Jungmann & Co., 20 bbl., Hamburg, Pfaltz & Bauer, 20 bbl., Hamburg, Hummel & Robinson; 10 cs., Hamburg, H. Lieber & Co.; 54 csk., Hamburg, Order; 112 pkg, Rotterdam, Order.

COPPER SULPHATE—500 bg., Antwerp, Order; 330 csk., Antwerp, Am. Exchange Nat'l Bank.

COAL-TAR DISTILLATE—16 dr., Glasgow, Guaranty Trust Co.

COLORS—33 csk. earth, Bremen, L. H. Butcher & Co.; 27 pkg., Havre, Irving Bank-Col. Trust Co.; 18 csk. umber, Hull, L. H Butcher Co.; 20 csk umber, Hull, Tidewater Chemical Co; 5 pkg. aniline, Liverpool, Order; 17 pkg aniline, Genoa, Am. Ex. Nat'l Bank; 27 pkg., Genoa, Nat'l. Aniline & Chem. Co; 22 pkg., Genoa, Order, 18 bbl. ultramarine blue, Antwerp, Order; 37 csk. earth, Hamburg, Reichard, Coulston, Inc.; 10 csk., Hamburg, J. M Huber; 359 pkg. red earth, Bristol, Order; 10 csk aniline, Rotterdam, Kuttroff, Pickardt & Co.

COPRA—51 bg, Montego Bay, Franklin Baker Co.,

CHINA CLAY—200 bg., Bristol, Order; 103 csk., Bristol, C. F. Wilson Co.

CREOSOTE — 6 bbl. distillate, Hull, Merck & Co.

CUTCH—3,500 bg., Singapore, Order.

DIVI-DIVI—500 bg., Pampatar, Goldsmith & Co.; 40 bg, Curacao, R. Desvernine.

FULLERS EARTH—1,700 bg., Bristol, L. A. Salomon & Bro.

FERTILIZER—4,000 bg., Hull, Order.

GUMS—2,422 bg. copal, Antwerp, Order; 950 bsk. copal, Antwerp, Order; 60 pkg. copal, London, Chemical Nat'l Bank; 50 pkg. arabic, Hamburg, Order, 98 pg. kauri, Auckland, Brown Bros. & Co; 108 cs kauri, Auckland, Guaranty Trust Co.; 100 cs kauri, Auckland Coal & Iron Nat'l Bank; 706 sk kauri, Auckland, Nairn Linoleum Co.; 204 cs. kauri, Auckland, Order; 972 bg copal, Antwerp, W. Schall & Co.; 2,355 pkg. copal, Antwerp, Order; 256 bg. copal, Singapore, Guaranty Trust Co.; 280 bg. copal, Singapore, Order; 100 cs. damar, Batavia, Balfour, Williamson & Co; 700 cs. damar, Padang, Order; 886 bg. damar, 140 bg copal, Singapore, Kidder, Peabody & Co., 740 pkg. damar, 70 bg. copal, Singapore, Baring Bros & Co.; 489 pkg. copal, Singapore, Irving Bank; 120 pkg. copal, Singapore, Order; 100 cs. damar, Batavia, L. C Gillespie & Son; 400 cs. do., Batavia, Kidder, Peabody & Co.; 200 cs. do., Batavia, Bank of Manhattan Co.; 300 cs. do., Batavia, Order, 4,974 pkg. kauri, Auckland, various, 575 pkg. karaya, Auckland, Order.

GAMBIER — 261 cs, Singapore, East Asiatic Corp.; 635 pkg, Singapore, E. Baustead & Co.

GLAUBERS SALT—500 bg., Hamburg, A J. Marcus; 281 csk., Hamburg, Globe Shipping Co

GLYCERINE—40 dr., Antwerp, N. Y Trust Co., 10 dr., Hull, Marx & Rawolle.

HYDROGEN-PEROXIDE — 64 cs, Antwerp, Order

IRON OXIDE—22 csk., Liverpool, L. H. Butcher & Co.

IRON SULPHATE—92 csk., Antwerp, E M. Sergeant & Co.

LITHOPONE—180 csk., Bremen, Pfaltz & Bauer; 1,000 csk., Antwerp, Benj. Moore & Co; 600 csk, Rotterdam, Order

LOGWOOD EXTRACT—220 bbl., Cape Haitien, Logwood Mfg. Corp.

MAGNESIUM—282 dr. chloride, Innis, Speiden & Co.; 506 dr chloride, Hamburg, Brown Bros & Co.; 1,278 bg. carbonate, Glasgow, Bankers Trust Co.

MINERAL WHITE — 1,200 bg., Hull, Hammill & Gillespie; 300 bg., Hull, C. B. Crystal Co.

MYROBALANS — 8,000 pkt., Calcutta, Order; 16,687 pkt, Calcutta, Nat'l City Bank; 2,116 pkt, Calcutta, Standard Bank of South Africa; 7,000 pkt., Bombay, Order.

NICKEL SULPHATE — 25 csk., Hamburg, Blackburn Trading Corp.; 277 csk., Bristol, Perry, Ryer & Co.; 297 csk., Swansea, Order

NAPHTHALENE—695 pkg., London, Order; 500 bg., London, Irving Bank; 113 bg, Bristol, Order.

NUX VOMICA — 431 bg., Coronada, Order; 200 bg., Bombay, Order.

OILS—**Castor**, 56 bbl., Hull, Brown Bros. & Co., 200 bbl., Hull, Order. **Cod** — 100 bbl., Hull, Order; 305 csk., St. Johns, R. Badcock & Co; 300 csk, St Johns, National Oil Products Co. **Sardine**—2,000 cs., Kobe, C. A. Reddin; 1,700 cs., Kobe, Cook & Swan Co.; 4,400 cs, Kobe, Balfour, Williamson & Co. **Fusel**—9 dr., Antwerp, Guaranty Trust Co, 12 csk., Dunkirk, Guaranty Trust Co; 35 dr., Dunkirk, Order. **Soya Bean**—1,201 tons, Canton, Mitsubishi Shoji Kaisha. **Olive foots** (sulphur oil)—220 bbl, 60 csk Leghorn, Am. Co. for Int'l Commerce; 150 bbl., Leghorn, Order; 700 bbl., Bari, Nat'l City Bank; 500 bbl., Bari, Leghorn Trading Co, 400 bbl., Bari, Irving Nat'l Bank; 800 bbl., Bari, Fourth Street Nat'l Bank, Philadelphia; 200 bbl., Bari, Banca Comm. Ital.; 200 bbl., Bari, Bank of Manhattan Co.; 100 bbl., Messina, Leghorn Trading Co.; 100 bbl., Palermo, Order. **Peanut**—240 cs., Hongkong, Man Hing; 500 bbl, Bristol, Balfour, Williamson & Co; 160 bbl., Bombay, Order. **Linseed**—478 bbl., Hull, I. R Boody & Co.; 300 bbl., Hull, Balfour, Williamson & Co.; 750 tons (bulk), Hull, Midland Linseed Products Co.; 128 bbl., Bombay, Order. **Perilla**—500 bbl., Canton, Cook & Swan Co.; 100 bbl., Kobe, Balfour, Williamson & Co.; 2,000 cs., Kobe, Mitsui & Co.; 1,280 bbl., Kobe, Cook & Swan Co. **Palm**—87 csk., Liverpool, D. Bacon; 15 csk., Liverpool, African & Eastern Trading Co.; 156 csk., Liverpool, Order, 173 bbl., Belawan, Nat'l City Bank; 85 csk., Liverpool, D. Bacon, 81 csk., Liverpool, W. Leaman; 29 csk., Liverpool, Order; 534 csk., Rotterdam, Order. **Rapeseed**—200 bbl., Hull, Hudson Oil Co., 500 bbl, Hull Vacuum Oil Co.; 300 bbl, Hull, Nat'l City Bank; 385 bbl., Hull, Order, 154 bbl., Hull, Order. **China Wood**—100 csk, Shanghai, F. A. Cundill & Co.; 292 csk., Hankow, L. C. Gillespie & Sons, 299 csk., Hankow, Cook & Swan Co.; 237 csk., Hankow, Nat'l City Bank, 50 dr, Hong Kong, Order.

POTASSIUM SALTS—4,000 bg. muriate, Bremen, A. Vogel, 3,916 bg. and quantity in bulk, Antwerp, Société Commerciale des Potasses d'Alsace; 1,000 bg. kainit, Antwerp, Société Commerciale des Potasses d'Alsace; 106 csk perchlorate, Antwerp, Order, 3,000 bg. sulphate, Bremerhaven, A. Vogel; 9 bbl. prussiate, Hamburg, Broedermann & Litzrodt; 166 dr. caustic, Hamburg, Innis, Speiden & Co., 20 csk. perchlorate, Swansea, Order, 68 csk. alum, Rotterdam, Meteor Products Co.; 125 bbl. chlorate, Marseilles, Nat'l City Bank.

PITCH—259 bbl., Hull, Order.

QUEBRACHO—1,969 bg., Buenos Aires, Guaranty Trust Co; 1,836 bg., Buenos Aires, Order, 10,700 bg., Buenos Aires, Tannin Corp.

SOAP STOCK — 300 bbl., Liverpool, Order.

SODIUM SALTS—18 csk. bisulphite, Hamburg, Order, 168 cs cyanide, Havre, Asia Banking Corp.; 111 cs. cyanide, Havre, H W. Peabody & Co.; 134 dr. salts, Hamburg, C. S Grant & Co.; 5,627 bg. nitrate, Antofagasta, Wessel, Duval & Co.; 5,512 bg. nitrate, Mejillones, Anthony, Gibbs & Co; 5,572 bg. nitrate, Iquique, Wessel, Duval & Co; 96 cs. chlorate, Genoa, A. R. Pickering & Co.; 578 bbl. hyposulphite, Marseilles, E M. Sergeant & Co.

SEEDS—**Castor** 9,522 bg., Coconada, Order; 12,646 bg, Bombay, Order. **Linseed**—95,245 bg, Buenos Aires, American Linseed Co.; 8,887 bg, Buenos Aires, Order; 8,820 bg., Buenos Aires, L Dreyfus & Co

SHELLAC — 10 cs., Hamburg, Irving Nat'l Bank; 200 bg., Calcutta, Lee, Higginson & Co.; 100 bg, Calcutta, Iwai & Co.; 175 bg, Calcutta, Cont. Comm. Nat'l Bank, 500 bg., Calcutta, Chase Nat'l Bank; 100 bg., Calcutta, Bank of Br. West Africa; 100 bg., Calcutta, London & Liverpool Bank of Comm; 481 bg., Calcutta, Anglo South Am. Bank; 1,841 pkg., Calcutta, Order; 150 pkg, London, Order; 38 bg., garnet, Kasebier-Chatfield Shellac Co.; 200 bg., Calcutta, Am. Exchange Nat'l Bank; 100 pkg., Calcutta, London & Liverpool Bank of Comm; 425 pkg., Calcutta, Order; 314 pkg., Marseilles, Order.

STARCH—1,250 bg. potato, Rotterdam, Stein, Hall & Co; 500 bg. do., Rotterdam, Spier, Simmons & Co.

SUMAC—590 bg., Palermo, Order; 700 bg, Palermo, Equitable Trust Co.; 1,400 bg., Palermo, Am. Express Co.; 1,400 bg., Palermo, Bank of N. Y.; 550 pkg., Palermo, Order; 350 bg., Palermo, Order.

TALLOW—728 tc., Buenos Aires, Bank of New York & Trust Co.; 778 tc., Buenos Aires, Swift & Co.; 673 tc., Buenos Aires, Order; 452 csk., Montevideo, Bank of New York & Trust Co.; 78 csk., Buenos Aires, Swift & Co.; 279 csk., Buenos Aires, Order; 127 pipes, Melbourne, Nat'l City Bank; 111 pipes, Melbourne, Nat'l City Bank; 98 pipes, Sydney, Order.

TANNIN—24 csk., Antwerp, Geigy Co.

TALC—1,800 bg, Genoa, Italian Discount & Trust Co.; 900 bg., Genoa, Order.

WAX—2,400 bg. paraffin, London, Order; 72 bg. bees, London, Order; 26 bg. bees, Leghorn, Order; 5 bg. bees, Rio de Janeiro, D Steengrafe; 75 bg bees, Rio de Janeiro, London & Braz. Bank; 90 bg. carnauba, Pernambuca, Irving Nat'l Bank.

WHITING—2,000 bg., Antwerp, Brooklyn Trust Co.

WOOL GREASE — 50 bbl., Bremen, A. Klipstein & Co.

ZINC OXIDE — 250 bbl., Marseilles, Nat'l City Bank.

Current Prices in the New York Market

For Chemicals, Oils and Allied Products

General Chemicals

Acetic anhydride, 85%, drums	lb.	$0 38 –
Acetone, drums	lb.	.22 – .23
Acid, acetic, 28%, bbl	100 lb.	3 17½ – 3 92½
Acetic, 56%, bbl	100 lb.	6 35 – 6 37
Glacial, 99½%, bbl.	100 lb.	12 05 – 12 85
Boric, bbl	lb.	.11 – .11½
Citric, kegs	lb.	.49 – .50
Formic, 85%	lb.	.14½ – .17
Gallic, tech	lb.	.45 – .50
Hydrofluoric, 52%, carboys	lb.	.12 – .12½
Lactic, 44%, tech., light, bbl.	lb.	.11½ – .12
22% tech, light, bbl.	lb.	.05½ – .06
Muriatic, 18° tanks	100 lb.	.90 – 1.00
Muriatic, 20°, tanks	100 lb.	1.00 – 1.10
Nitric, 36°, carboys	lb.	.04½ – .05
Nitric, 42°, carboys	lb.	.06 – .06½
Oleum, 20%, tanks	ton	18.50 – 19 00
Oxalic, crystals, bbl.	lb.	.13½ – .13¾
Phosphoric, 50% carboys	lb.	.07½ – .08½
Pyrogallic, resublimed	lb.	1 50 – 1 60
Sulphuric, 60°, tanks	ton	9 00 – 10 00
Sulphuric, 60°, drums	ton	12 00 – 14 00
Sulphuric, 66°, tanks	ton	15 00 – 15 50
Sulphuric, 66° drums	ton	19 00 – 20 00
Tannic, U S P, bbl.	lb.	.65 – .70
Tannic, tech, bbl.	lb.	.45 – .50
Tartaric, imp. crys., bbl.	lb.	.35½ –
Tartaric, imp, powd, bbl.	lb.	.35½ –
Tartaric, domestic, bbl.	lb.	.36 –
Tungstic, per lb.	lb.	1.10 – 1.20
Alcohol, butyl, drums, f.o.b. works	lb.	.27 – .29
Alcohol ethyl (Cologne spirit), bbl.	gal.	4.75 – 4.95
Alcohol, methyl (see Methanol)		
Alcohol, denatured, 188 proof No. 1, bbl	gal.	.39 – .40
Alum, ammonia, lump, bbl.	lb.	.03½ – .03¾
Potash, lump, bbl	lb.	.03 – .03½
Chrome, lump, potash, bbl.	lb.	.05½ – .05¾
Aluminum sulphate, com., bags	100 lb.	1.50 – 1 65
Iron free bags	lb.	.02½ – .02¾
Aqua ammonia, 26°, drums	lb.	.06½ – .07½
Ammonia, anhydrous, cyl.	lb.	.30 – .30½
Ammonium carbonate, powd casks, imported	lb.	.09½ – .10
Ammonium carbonate, powd domestic, bbl	lb.	.13 – .14
Ammonium nitrate, tech., casks	lb.	.10 – .11
Amyl acetate tech., drums	gal.	3 50 – 3 75
Arsenic, white, powd, bbl	lb.	.15½ – .16
Arsenic, red, powd, kegs	lb.	.14½ – .15
Barium carbonate, bbl	ton	78 00 – 80 00
Barium chloride, bbl	ton	90 00 – 95 00
Barium dioxide, drums	lb.	.18 – .18½
Barium nitrate, casks	lb.	.08 – .08½
Barium sulphate, bbl	lb.	.04 – .04½
Blanc fixe, dry, bbl.	lb.	.04½ – .04¾
Blanc fixe, pulp, bbl	ton	45 00 – 55 00
Bleaching powder, f.o.b. wks., drums	100 lb.	2 15 –
Spot N. Y. drums	100 lb.	2 60 – 2 70
Borax, bbl.	lb.	.05½ – .05¾
Bromine, cases	lb.	.28 – .30
Calcium acetate, bags	100 lb.	3 50 – 3 60
Calcium carbide, drums	lb.	.04½ – .04¾
Calcium chloride, fused, drums	ton	22 00 – 23.00
Gran. drums	lb.	.01½ – .01¾
Calcium phosphate, mono, bbl	lb.	.06½ – .07
Camphor, cases	lb.	.88 – .90
Carbon bisulphide, drums.	lb.	.07 – .07½
Carbon tetrachloride, drums	lb.	.10 –
Chalk, precip —domestic, light, bbl	lb.	.04½ – .04¾
Domestic, heavy, bbl.	lb.	.03½ – .03¾
Imported, light, bbl	lb.	.04½ – .05
Chlorine, liquid, cylinders.	lb.	.06 – .06½
Chloroform, tech, drums	lb.	.35 – .38
Cobalt oxide, bbl	lb.	2 10 – 2 25
Copperas, bulk, f.o.b. wks.	ton	16 50 – 20.00
Copper carbonate, bbl.	lb.	.19 – .20
Copper cyanide, drums	lb.	.47 – .50
Coppersulphate, crys., bbl.	100 lb.	6.25 – 6 50
Cream of tartar, bbl.	lb.	.25½ – .26½
Epsom salt, dom., tech., bbl.	100 lb.	1.90 – 2.15
Epsom salt, imp., tech., bags	100 lb.	1.10 – 1.25
Epsom salt, U.S.P., dom., bbl.	100 lb.	2.50 – 2.60
Ether, U.S.P., drums	lb.	.13 – .15
Ethyl acetate, com., 85%, drums	gal	.80 – .85
Ethyl acetate, pure (acetic ether, 98% to 100%)	gal.	.95 – 1.00
Formaldehyde, 40%, bbl.	lb.	.14½ – .16
Fullers earth, f.o.b. mines	net ton	16.00 – 17.00
Fullers earth—imp., powd.	net ton	30.00 – 32.90
Fusel oil, ref., drums	gal.	3.55 – 4.05
Fusel oil, crude, drums	gal.	2.30 – 2.40
Glaubers salt, wks., bags	100 lb.	1.20 – 1.40

THESE prices are for the spot market in New York City, but a special effort has been made to report American manufacturers' quotations whenever available. In many cases these are for material f.o.b. works or on a contract basis and these prices are so designated. Quotations on imported stocks are reported when they are of sufficient importance to have a material effect on the market. Prices quoted in these columns apply to large quantities in original packages.

Glaubers salt, imp., bags	100 lb.	$1 00 – $1.25
Glycerine, c.p., drums extra	lb.	.18 – .18½
Glycerine, dynamite, drums	lb.	.16½ –
Iodine, resublimed	lb.	4.55 – 4 65
Iron oxide, red, casks	lb.	.12 – .18
Lead.		
White, basic carbonate, dry, casks	lb.	.09½ – .10
White, basic sulphate, casks	lb.	.09½ –
White, in oil, kegs	lb.	.12½ – .14
Red, dry, casks	lb.	.11½ – .12
Red, in oil, kegs	lb.	.13½ – .15
Lead acetate, white crys., bbl	lb.	.13½ – .14
Brown, broken, casks	lb.	.12½
Lead arsenate, powd., bbl.	lb.	.23 – .24
Lime-Hydrated, bbl	per ton	16 80 – 17 00
Lime, Lump, bbl	280 lb.	3 63 – 3 65
Litharge, comm., casks.	lb.	.10½ – .11
Lithophone, bags	lb.	.07 – .07½
in bbl	lb.	.07½ – .07¾
Magnesium carb., tech., bags	lb.	.08 – .08½
Methanol, 95%, bbl	gal.	1 21 – 1 23
Methanol, 97%, bbl.	gal.	1 23 – 1 25
Nickel salt, double, bbl.	lb.	.10½ –
Nickel salts, single, bbl	lb.	.11½ –
Phosgene		.60 – .75
Phosphorus, red, cases	lb.	.35 – .40
Phosphorus, yellow, cases	lb.	.30 – .35
Potassium bichromate, casks	lb.	.10½ – .10¾
Potassium bromide, gran., bbl	lb.	.16½ – .23
Potassium carbonate, 80-85%, calcined, casks	lb.	.06½ – .07
Potassium chlorate, powd	lb.	.07½ – .08
Potassium cyanide, drums	lb.	.45 – .50
Potassium, first sorts, cask	lb.	.09 – .09½
Potassium hydroxide (caustic potash) drums	100 lb.	8 25 – 8 50
Potassium iodide, cases	lb.	3 65 – 3 75
Potassium nitrate, bbl	lb.	.06½ – .07½
Potassium permanganate, drums	lb.	.24 – .24½
Potassium prussiate, red, casks	lb.	.80 – .82
Potassium prussiate, yellow, casks	lb.	.37 – .37½
Salammoniac, white, gran., casks, imported	lb.	.07 – .07½
Salammoniac, white, gran., bbl, domestic	lb.	.07½ – .08
Gray, gran, casks	lb.	.08 – .09
Salsoda, bbl.	100 lb.	1.20 – 1 40
Salt cake (bulk)	ton	26.00 – 28.00
Soda ash, light, 58% flat, bags, contract	100 lb.	1.60 – 1.67
Soda ash, light, basis, 48%, bags, contract, f.o.b. wks.	100 lb.	1.20 – 1.30
Soda ash, light, 58%, flat, bags, resale	100 lb.	1.75 – 1.80
Soda ash, dense, bags, contract, basis 48%	100 lb.	1.17½ – 1.20
Soda ash, dense, in bags, resale	100 lb.	1.85 – 1.90
Soda, caustic, 76%, solid, drums, f.a.s.	100 lb.	3.45 – 3.50
Soda, caustic, basis 60%, wks., contract	100 lb.	2.50 – 2.60
Soda, caustic, ground and flake, contracts	100 lb.	3.80 – 3.90
Soda, caustic, ground and flake, resale	100 lb.	3.72½ – ...
Sodium acetate, works, bags	lb.	.05½ – .06¼
Sodium bicarbonate, bbl	100 lb.	2.00 – 2.50
Sodium bichromate, casks	lb.	.07½ – .08
Sodium bisulphate (niter cake)	ton	6.00 – 7.00
Sodium bisulphite, powd., U.S.P., bbl.	lb.	.04½ – .04¾
Sodium chlorate, kegs	lb.	.06½ – .07
Sodium chloride	long ton	12.00 – 13.00
Sodium cyanide, cases	lb.	.20 – .23
Sodium fluoride, bbl.	lb.	$0.09½ – $0.10
Sodium hyposulphite, bbl.	lb.	.02½ – .03
Sodium nitrite, casks	lb.	.08½ – .09
Sodium peroxide, powd., cases	lb.	.28 – .30
Sodium phosphate, dibasic, bbl	lb.	.03½ – .04
Sodium prussiate, yel. drums	lb.	.17½ – .18
Sodium silicate (40°, drums)	100 lb.	.80 – 1.25
Sodium silicate (60°, drums)	100 lb.	2.00 – 2.25
Sodium sulphide, fused, 60-62% drums	lb.	.04½ – .04¾
Sodium sulphite, crys., bbl.	lb.	.03½ – .03¾
Strontium nitrate, powd., bbl.	lb.	.09½ – .10
Sulphur chloride, yel drums.	lb.	.04½ – .05
Sulphur, crude	ton	18.00 – 20.00
At mine, bulk	ton	16.00 – 18 00
Sulphur, flour, bbl.	100 lb.	2.35 – 3.15
Sulphur, roll, bbl	100 lb.	2.00 – 2.50
Sulphur dioxide, liquid, cyl.	lb.	.08 – .08½
Talc—imported, bags	ton	30.00 – 40.00
Talc—domestic powd., bags.	ton	18.00 – 25.00
Tin bichloride, bbl.	lb.	.13½ – .14
Tin oxide, bbl	lb.	.52 – .54
Zinc carbonate, bags	lb.	.14 – .14½
Zinc chloride, gran, bbl.	lb.	.06 – .07
Zinc cyanide, drums	lb.	.37 – .38
Zinc oxide, lead free, bbl.	lb.	.08 – .08½
5% lead sulphate, bags	lb.	.07½ – ..
10 to 35% lead sulphate, bags	lb.	.07 – ..
French, red seal, bags.	lb.	.09½ –
French, green seal, bags	lb.	.10½ –
French, white seal, bbl	lb.	.12 –
Zinc sulphate, bbl.	100 lb.	2.50 – 3.00

Coal-Tar Products

Alpha-naphthol, crude, bbl.	lb.	$0 70 – $0.80
Alpha-naphthol, ref., bbl	lb.	.85 – .95
Alpha-naphthylamine, bbl.	lb.	.36 – .38
Aniline oil, drums	lb.	.16 – .16½
Aniline salts, bbl	lb.	.24 – .25
Anthracene, 80%, drums	lb.	.75 – 1.00
Anthracene, 80%, imp., drums, duty paid	lb.	.70 – .75
Anthraquinone, 25%, paste, drums	lb.	.70 – .75
Benzaldehyde U S P, carboys	lb.	1.40 – 1.45
Benzene, pure, water-white, tanks and drums	gal.	.32 – .35
Benzene, 90%, tanks & drums	gal.	.27 – .30
Benzene, 90%, drums, resale	gal.	.30 – .33
Benzidine base, bbl	lb.	.85 – .90
Benzidine sulphate, bbl	lb.	.70 – .75
Benzoic acid, U.S.P., kegs	lb.	.72 – .75
Benzoate of soda, U S P., bbl.	lb.	.57 – .65
Benzyl chloride, 95-97%, ref., drums	lb.	.25 – .27
Benzyl chloride, tech., drums	lb.	.20 – .23
Beta-naphthol, subl., bbl	lb.	.55 – .60
Beta-naphthol, tech., bbl	lb.	.23 – .23½
Beta-naphthylamine, tech.	lb.	.80 – .90
Carbazol, bbl.	lb.	.75 – .90
Cresol, U S P, drums	lb.	.25 – .29
Ortho-cresol, drums	lb.	.24 – .26
Cresylic acid, 97%, resale, drums	gal.	1.40 – 1.50
95-97%, drums, resale	gal.	1.30 – 1.30
Dichlorbenzene, drums	lb.	.07 – .09
Diethylaniline, drums	lb.	.50 – .60
Dimethylaniline, drums	lb.	.42 – .43
Dinitrobenzene bbl.	lb.	.19 – .20
Dinitroclorbenzene, bbl.	lb.	.22 – .23
Dinitronaphthalene, bbl.	lb.	.30 – .32
Dinitrophenol, bbl	lb.	.35 – .40
Dinitrotoluene, bbl.	lb.	.20 – .22
Dip oil, 25%, drums	gal.	.25 – .30
Diphenylamine, bbl.	lb.	.50 – .52
H-acid, bbl.	lb.	.85 –
Meta-phenylenediamine, bbl.	lb.	1.00 – 1 05
Michlers ketone, bbl	lb.	3.00 – 3 50
Monochlorbenzene, drums	lb.	.08 – .10
Monoethylaniline, drums	lb.	.95 – 1.10
Naphthalene, crushed, bbl.	lb.	.08 – .09
Naphthalene, flake, bbl.	lb.	.09½ – .10
Naphthalene, balls, bbl.	lb.	.10½ – .11
Naphthionate of soda, bbl.	lb.	.58 – .65
Naphthionic acid, crude, bbl.	lb.	.55 – .60
Nitrobenzene, drums	lb.	.10 – .12
Nitro-naphthalene, bbl.	lb.	.30 – .35
Nitro-toluene, drums	lb.	.15 – .17
N-W acid, bbl.	lb.	1.25 – 1.30
Ortho-amidophenol, kegs.	lb.	2.30 – 2.35
Ortho-dichlorbenzene, drums	lb.	.17 – .20
Ortho-nitrophenol, bbl	lb.	.90 – .92
Ortho-nitrotoluene, drums	lb.	.10 – .12
Ortho-toluidine, bbl.	lb.	.14 – .15
Para-amidophenol, base, kegs	lb.	1.20 – 1.30
Para-amidophenol, HCl, kegs	lb.	1.25 – 1.35
Para-dichlorbenzene, bbl.	lb.	.17 – .20
Paranitraniline, bbl.	lb.	.74 – .75
Para-nitrotoluene, bbl.	lb.	.60 – .65
Para-phenylenediamine, bbl.	lb.	1.45 – 1.50
Para-toluidine, bbl.	lb.	.95 – .98
Phthalic anhydride, bbl.	lb.	.35 – .38
Phenol, U.S.P., drums	lb.	.55 – .57
Picric acid, bbl.	lb.	.20 – .22
Pyridine, dom., drums	gal.	nominal
Pyridine, imp., drums	gal.	2.50 – 2.75

Resorcinol, tech., kegs	lb.	$1.40 –	$1 50
Resorcinol, pure, kegs	lb.	2.00 –	2.10
R-salt, bbl.	lb.	.55 –	.60
Salicylic acid, tech., bbl.	lb.	.47 –	.48
Salicylic acid, U.S.P., bbl.	lb.	.50 –	.52
Solvent naphtha, water-white, drums	gal.	.37 –	.40
Crude, drums	gal.	.22 –	.24
Sulphanilic acid, crude, bbl.	lb.	.18 –	.20
Thiocarbanilide, kegs	lb.	.35 –	.38
Toluidine, kegs	lb.	1.20 –	1.30
Toluidine, mixed, kegs	lb.	.30 –	.35
Toluene, tank cars	gal.	.30 –	.35
Toluene, drums	gal.	.35 –	.40
Xylidines drums	lb.	.45 –	.47
Xylene, pure, drums	gal.	.75 –	.85
Xylene, com., drums	gal.	.37 –	...
Xylene, com., tanks	gal.	.32 –	...

Naval Stores

Rosin B-D, bbl.	280 lb.	$6.15 –	...
Rosin E-I, bbl.	280 lb.	6.25 –	...
Rosin K-N, bbl.	280 lb.	6.30 –	6.60
Rosin W.G.-W.W., bbl.	280 lb.	6 80 –	7 80
Wood rosin, bbl.	280 lb.	6.20 –	...
Turpentine, spirits of, bbl.	gal	1.47 –	1 48
Wood, steam dist., bbl.	gal.	1.41 –	1 42
Wood, dest. dist., bbl.	gal.	1.10 –	1 15
Pine tar pitch, bbl.	200 lb.	... –	6 00
Tar, kiln burned, bbl.	500 lb.	... –	12 00
Retort tar, bbl.	500 lb.	... –	11 00
Rosin oil, first run, bbl.	gal.	.45 –	...
Rosin oil, second run, bbl.	gal	.48 –	...
Rosin oil, third run, bbl.	gal.	.52 –	...
Pine oil, steam dist.	gal.	.80 –	...
Pine oil, pure, dest. dist.	gal.	.75 –	...
Pine tar oil, ref.	gal.	.48 –	...
Pine tar oil, crude, tanks f.o.b. Jacksonville, Fla.	gal.	.31 –	.31½
Pine tar oil, double ref., bbl.	gal.	... –	.75
Pine tar, ref., thin, bbl.	gal.	... –	.25
Pinewood creosote, ref., bbl.	gal.	... –	.52

Animal Oils and Fats

Degras, bbl.	lb	$0 03¾ –	$0 04¼
Grease, yellow, bbl.	lb	08½ –	08¾
Lard oil, Extra No. 1, bbl.	gal	92 –	94
Neatsfoot oil, 20 deg. bbl.	gal	1 28 –	1 32
No. 1, bbl.	gal	.92 –	94
Oleo Stearine	..	.10¾ –	.10¾
Red oil, distilled, d.p. bbl	lb.	.11½ –	
Saponified, bbl	lb	11½ –	..
Tallow, extra, loose	lb	09 –	
Tallow oil, acidless, bbl.	gal.	96 –	.98

Vegetable Oils

Castor oil, No. 3, bbl.	lb.	$0 14 –	.
Castor oil, No. 1, bbl.	lb	.14½ –	...
Chinawood oil, bbl.	lb.	.36 –	.38
Coconut oil, Ceylon, bbl.	lb	.10¾ –	.10½
Ceylon, tanks, N.Y.	lb	.09½ –	.09¾
Coconut oil, Cochin, bbl.	lb.	.10¾ –	...
Corn oil, crude, bbl.	lb.	.12½ –	...
Crude, tanks, (f.o.b. mill)	lb.	10¾ –	10½
Cottonseed oil, crude (f.o.b. mill), tanks	lb.	.10 –	10½
Summer yellow, bbl.	lb.	.12½ –	.12½
Winter yellow, bbl.	lb.	.13½ –	.13½
Linseed oil, raw, car lots, bbl.	gal.	1 17 –	...
Raw, tank cars (dom.)	gal.	1 12 –	...
Boiled, cars, bbl. (dom.)	gal.	1 19 –	...
Olive oil, denatured, bbl.	gal.	1 15 –	...
Sulphur, (foots) bbl.	lb	.10 –	.10½
Palm, Lagos, casks	lb.	.08½ –	...
Niger, casks	lb	.08¾ –	.08½
Palm kernel, bbl.	lb.	.09½ –	.09½
Peanut oil, crude, tanks (mill)	lb	.13¾ –	.14
Peanut oil, refined, bbl.	lb.	.17 –	...
Perilla, bbl	lb	.16½ –	16¾
Rapeseed oil, refined, bbl.	gal.	.84 –	.85
Rapeseed oil, blown, bbl.	gal.	.90 –	.91
Sesame, bbl	lb.	.13 –	.13½
Soya bean (Manchurian), bbl.	lb.	.12½ –	...
Tank, f.o.b. Pacific coast	lb.	.10¾ –	...
Tank, (f.o.b. N.Y.)	lb.	.10¾ –	.11

Fish Oils

Cod, Newfoundland, bbl.	gal.	$0 68 –	$0 70
Menhaden, light pressed, bbl.	gal.	.76 –	...
White bleached, bbl.	gal.	.78 –	...
Blown, bbl.	gal.	.82 –	...
Crude, tanks (f.o.b. factory)	gal.	.50 –	...
Whale No. 1 crude, tanks, coast	lb.	.06½ –	...
Winter, natural, bbl.	gal.	.76 –	.78
Winter, bleached, bbl.	gal.	.79 –	.80

Oil Cake and Meal

Coconut cake, bags	ton	$33 00 –	...
Copra, sun dried, bags, (c.i.f.)	lb.	.05¾ –	...
Sun dried Pacific coast	lb.	05¾ –	...
Cottonseed meal, f.o.b. mills	ton	39 00 –	40.00
Linseed cake, bags	ton	36 00 –	...
Linseed meal, bags	ton	38 00 –	...

Dye & Tanning Materials

Albumen, blood, bbl.	lb.	$0 45 –	$0.50
Albumen, egg, tech, kegs	lb.	.80 –	.85
Cochineal, bags	lb.	.35 –	.36
Cutch, Borneo, bales	lb.	.04¾ –	.05
Cutch, Rangoon, bales	lb.	.13 –	.13½
Dextrine, corn, bags	100 lb.	3 54 –	3 59
Dextrine gum, bags	100 lb.	3.89 –	3.99
Divi-divi, bags	ton	38.00 –	39.00
Fustic, sticks	ton	30.00 –	35.00
Fustic, chips, bags	lb.	.04 –	.05
Logwood, sticks	ton	28.00 –	30.00
Logwood, chips, bags	lb.	.02½ –	.03½
Sumac, leaves, Sicily, bags	ton	$70.00 –	$72.00
Sumac, ground, bags	ton	65.00 –	67.00
Sumac, domestic, bags	ton	40.00 –	42.00
Tapioca flour, bags	lb.	.05½ –	.06½

Extracts

Archil, conc., bbl.	lb.	$0.17 –	$0.18
Chestnut, 25% tannin, tanks	lb.	.02 –	.03
Divi-divi, 25% tannin, bbl.	lb.	.04 –	.05
Fustic, crystals, bbl.	lb.	.20 –	.22
Fustic, liquid, 42°, bbl.	lb.	.08 –	.09
Gambier, liq., 25% tannin, bbl.	lb.	.08 –	.09
Hematine crys., bbl.	lb.	.14 –	.18
Hemlock, 25% tannin, bbl.	lb.	.04 –	.05
Hypernic, solid, drums	lb.	.24 –	.26
Hypernic, liquid, 51°, bbl.	lb.	.14 –	17
Logwood, crys., bbl.	lb.	.19 –	.20
Logwood, liq., 51°, bbl.	lb.	.09 –	.10
Quebracho, solid, 65% tannin, bbl.	lb.	.04½ –	.05
Sumac, dom., 51°, bbl.	lb.	.06½ –	.07

Dry Colors

Blacks-Carbongas, bags, f.o.b. works	lb.	$0 16 –	$0.18
Lampblack, bbl	lb.	12 –	.40
Mineral, bulk	ton	35 00 –	45 00
Blues-Bronze, bbl	lb.	.55 –	60
Prussian, bbl	lb.	.55 –	60
Ultramarine, bbl	lb.	08 –	35
Browns, Sienna, Ital., bbl	lb.	.06 –	14
Sienna, Domestic, bbl	lb.	.03½ –	04
Umber, Turkey, bbl	lb.	.04 –	04½
Greens Chrome, C.P. Light, bbl	lb.	32 –	.34
Chrome, commercial, bbl	lb	.12 –	12½
Paris, bulk	lb.	.30 –	.35
Reds, Carmine No. 40, tins	lb.	4 50 –	4.70
Oxide red, casks	lb.	10 –	.14
Para toner, kegs	lb.	1.00 –	1 10
Vermilion, English, bbl.	lb.	1 30 –	1.32
Yellow, Chrome, C.P. bbls	lb	20 –	.21
Ocher, French, casks	lb.	.02½ –	.03

Waxes

Bayberry, bbl.	lb.	$0 28 –	$0.30
Beeswax, crude, bags	lb.	.21 –	.25
Beeswax, refined, light, bags	lb	.32 –	.34
Beeswax, pure white, cases	lb.	.40 –	.41
Candelilla, bags	lb	.24 –	.25
Carnauba, No. 1, bags	lb.	.42 –	.43
No. 2, North Country, bags	lb.	.23 –	.23½
No. 3, North Country, bags	lb.	.19½ –	...
Japan, cases	lb.	.14½ –	.15
Montan, crude, bags	lb.	.04½ –	.04½
Paraffine, crude, match, 105-110 m.p.	lb.	.04½ –	.04½
Crude, scale 124-126 m.p., bags	lb.	.03 –	03½
Ref., 118-120 m.p., bags	lb.	.03¾ –	
Ref., 125 m.p., bags	lb.	.03¾ –	...
Ref., 128-130 m.p., bags	lb.	.04¼ –	04½
Ref., 133-135 m.p., bags	lb.	.04¾ –	...
Ref., 135-137 m.p., bags	lb.	.05½ –	.05½
Stearic acid, sgle pressed, bags	lb.	.14 –	...
Double pressed, bags	lb.	.14½ –	.
Triple pressed, bags	lb.	.16 –	...

Fertilizers

Ammonium sulphate, bulk, f.o.b. works	100 lb	$3.25 –	$3 30
F.a.s. double bags	100 lb.	3.90 –	4 00
Blood, dried, bulk	unit	4 50 –	.
Bone, raw, 3 and 50, ground	ton	27 00 –	30.00
Fish scrap, dom., dried, wks.	unit	3 75 –	10 00
Nitrate of soda, bags	100 lb.	2.62½ –	2 65
Tankage, high grade, f.o.b. Chicago	unit	4.25 –	4 50
Phosphate rock, f.o.b. mines, Florida pebble, 68-72%	ton	$4.00 –	$4 50
Tennessee, 78-80%	ton	8.00 –	8.25
Potassium muriate, 80%, bags	ton	35.00 –	36 00
Potassium sulphate, bags basis 90%	ton	45.67 –	...

Crude Rubber

Para—Upriver fine	lb.	$0.28½ –	.
Upriver coarse	lb.	.26½ –	...
Upriver caucho ball	lb.	.27½ –	.
Plantation—First latex crepe	lb.	.32½ –	...
Ribbed smoked sheets	lb.	.32½ –	...
Brown crepe, thin, clean	lb.	.30½ –	...
Amber crepe No. 1	lb.	.32 –	.

Gums

Copal, Congo, amber, bags	lb.	$0 18½ –	$0 19
East Indian, bold, bags	lb.	.22 –	.23
Manila, pale, bags	lb.	21 –	22
Pontinak, No. 1 bags	lb.	21 –	.22
Damar, Batavia, cases	lb	31 –	31½
Singapore, No. 1, cases	lb.	.34½ –	.35
Kauri, No. 1, cases	lb	.62 –	.66
Ordinary chips, cases	lb.	18 –	.20
Manjak, Barbados, bags	lb.	.09 –	.09½

Shellac

Shellac, orange fine, bags	lb.	$0.76 –	...
Orange superfine, bags	lb.	.78 –	...
A. C. garnet, bags	lb.	.76 –	...
Bleached, bonedry	lb.	.86 –	...
Bleached, fresh	lb.	.75 –	...
T. N., bags	lb.	.72 –	.74

Miscellaneous Materials

Asbestos, crude No. 1, f.o.b., Quebec	sh. ton	$500.00 –	...
Asbestos, shingle, f.o.b., Quebec	sh. ton	$65.00 –	$85.00
Asbestos, cement, f.o.b., Quebec	sh. ton	20.00 –	25.00
Barytes, grd., white, f.o.b. mills, bbl.	net ton	16.00 –	20.00
Barytes, grd., off-color, f.o.b. mills bulk	net ton	13.00 –	15.00
Barytes, floated, f.o.b. St. Louis, bbl.	net ton	28 00 –	...
Barytes, crude f.o.b. mines, bulk	net ton	10.00 –	11.00
Casein, bbl., tech.	lb.	.23 –	.25
China clay (kaolin) crude, f.o.b. Ga.	net ton	7 00 –	9.00
Washed, f.o.b. Ga.	net ton	8 00 –	9.00
Powd., f.o.b. Ga.	net ton	13 00 –	20.00
Crude f.o.b. Va.	net ton	8 00 –	12.00
Ground, f.o.b. Va.	net ton	13.00 –	20.00
Imp., lump, bulk	net ton	15 00 –	20.00
Imp., powd	net ton	45.00 –	50.00
Feldspar, No. 1 pottery	long ton	6 00 –	7.00
No. 2 pottery	long ton	5.00 –	5.50
No. 1 soap	long ton	7.00 –	7.50
No. 1 Canadian, f.o.b. mill	long ton	25.00 –	27.00
Graphite, Ceylon, lump, first quality, bbl	lb	.06 –	.06½
Ceylon, chip, bbl	lb.	.05 –	.05½
High grade amorphous crude	ton	35.00 –	50.00
Gum arabic, amber, sorts, bags	lb.	.15 –	.16
Gum tragacanth, sorts, bags	lb.	.50 –	.60
No. 1, bags	lb	1.75 –	1.80
Kieselguhr, f.o.b. Cal.	ton	40.00 –	42.00
F.o.b. N.Y.	ton	50 00 –	55.00
Magnesite, crude, f.o.b. Cal.	ton	14 00 –	15.00
Pumice stone, imp., casks	lb	.03 –	.05½
Dom., lump, bbl	lb	.05 –	.05½
Dom., ground, bbl.	lb.	.06 –	.07
Silica, glass sand, f.o.b. Ind.	ton	2 00 –	2.50
Silica, sand blast, f.o.b. Ind.	ton	2 50	5.00
Silica, amorphous, 250-mesh, f.o.b. Ill.	ton	17.00 –	17.50
Silica, bldg. sand, f.o.b. Pa.	ton	2.00 –	2.75
Soapstone, coarse, f.o.b. Vt., bags	ton	7.00 –	8.00
Talc, 200 mesh, f.o.b., Vt., bags	ton	6.50 –	9.00
Talc, 200 mesh, f.o.b. Ga., bags	ton	7 00 –	9.00
Talc, 200 mesh, f.o.b. Los Angeles, bags	ton	16.00 –	20.00

Mineral Oils

Crude, at Wells

Pennsylvania	bbl.	$3 75 –	...
Corning	bbl	2 15 –	...
Cabell	bbl	2 41 –	...
Somerset	bbl	2 20 –	...
Illinois	bbl.	2 37 –	...
Indiana	bbl	2 38 –	...
Kansas and Oklahoma, 28 deg.	bbl.	1 50 –	$1.60
California, 35 deg. and up.	bbl.	1 04 –	...

Gasoline, Etc.

Motor gasoline, steel bbls	gal.	$0 24½ –	...
Naphtha, V. M. & P. devd, steel bbls	gal	.23½ –	...
Kerosene, ref. tank wagon	gal.	.15 –	...
Bulk, W. W. export	gal.	.08 –	...
Lubricating oils: Cylinder, Penn., dark	gal.	.27 –	.30
Bloomless, 30@31 grav.	gal.	.20 –	.22
Paraffin, pale	gal.	.24 –	.25
Spindle, 200, pale	gal.	.25 –	.26
Petrolatum, amber, bbls	lb.	.05 –	.05½

Paraffine wax (see waxes)

Refractories

Bauxite brick, 56% Al_2O_3, f.o.b. Pittsburgh	ton	$45–50
Chrome brick, f.o.b. Eastern shipping points	ton	50–52
Chrome cement, 40-50% Cr_2O_3	ton	23–27
40-45% Cr_2O_3, sacks, f.o.b. Eastern shipping points	ton	23.00
Fireclay brick, 1st quality, 9-in. shapes, f.o.b. Ky. wks.	1,000	40–46
2nd. quality, 9-in. shapes, f.o.b. wks.	1,000	36–41
Magnesite brick, 9-in. straight (f.o.b. wks.)	ton	65–68
9-in. arches, wedges and keys	ton	80–85
Scraps and splits	ton	85
Silica brick, 9-in. sizes, f.o.b. Chicago district	1,000	48–50
Silica brick, 9-in sizes, f.o.b. Birmingham district	1,000	48–50
F.o.b. Mt. Union, Pa.	1,000	42–44
Silicon carbide refract. brick, 9-in.	1,000	1,100.00

Ferro-Alloys

Ferrotitanium, 15-18% f.o.b. Niagara Falls, N.Y.	ton	$200.00 –	$225.00
Ferrochromium, per lb. of Cr, 6-8% C.	lb.	.11½	.11¾
4-6% C.	lb.	.12 –	.13

Industrial

Financial, Construction and Manufacturing News

Industrial Developments

RUBBER The Lee Tire & Rubber Co., Conshohocken, Pa., has advanced manufacture to a capacity schedule of 2,500 tires a day, and will continue on this basis for an indefinite period.

The Manhattan Rubber Mfg. Co., Passaic, N. J., manufacturer of mechanical rubber products, is maintaining capacity operations at its mill, and has advanced the wages of employees 10 per cent, effective April 1.

The Allentown Leather & Belting Co., Allentown, Pa., recently organized, has commenced production at its new local plant and plans to develop capacity at an early date. Additional workers will be added to the force.

The McGraw Tire & Rubber Co., East Palestine, O., has suspended operations and notified the working force, totaling 2,500 persons that it is indefinite when the plant will reopen. Operations have been on a part-time basis for several weeks past.

The New York Belting & Packing Co., Passaic, N. J., is operating at maximum at its local mills, and will continue on this basis for some time to come. Employees have been given a wage advance of 10 per cent.

The Kelly-Springfield Tire Co., Cumberland, Md., is running full at its new local mill, as well as at its smaller plant at Akron, O., with gross output at the two plants of 7,000 tires a day, or about 50 per cent in excess of the figures at this time a year ago.

The Goodyear Tire & Rubber Co., Akron, O., is producing on an average of 30,000 to 30,500 tires per day, giving employment to a working force of 13,300 persons. This compares with a production record in April, 1920, two years ago, of 35,780 tires a day, with a working force of 33,257 persons, showing the present greater plant and labor efficiency. The operatives are now working on a 10 per cent bonus plan, recently adopted.

GLASS—Flint glass manufacturers in the vicinity of Millville, N. J., are holding to full capacity, with greatest available working forces. There will be no compulsory shut-down this year, in accordance with agreement with operatives, and the only curtailment anticipated for months to come will be caused by necessary equipment repairs.

The Illinois Glass Co., Chicago, Ill., is said to be negotiating for the sale of its plant at Minotola, N. J., recently abandoned for a new and larger plant in a neighboring district. It is expected that the local factory will be reopened at an early date.

All sheet glass and window glass plants in western Pennsylvania are holding to maximum production schedules and every effort is being made to secure additional labor. The mills will continue on the present basis for a number of months to come.

The Pennsylvania Glass Sand Co., Hancock, Md., has resumed full operations at its plant, following a brief suspension caused by a strike of about 50 of the men, who demanded a flat wage advance of \$1 a day. The company has agreed to an increase of 50 cents, and this has been accepted by the operatives.

CEMENT—All mills in the Lehigh Valley district, Pennsylvania, are continuing under maximum production schedules, and giving employment to all available men. A call is out for more operatives, and advanced wage scales have been adopted to attract workers. The Lehigh Portland Cement Co., New Castle, has announced an increase of 10 per cent, affecting about 800 men at the local mills. The Atlas Portland Cement Co., Northampton, has made a similar advance. The other smaller mills are expected to follow before the close of the month.

The Riverside Portland Cement Co., Riverside, Calif., is running under a heavy production schedule at its plant with full working force. This schedule will be continued indefinitely.

MISCELLANEOUS—The Grasselli Chemical Co. has advanced production at its plant at Grasselli, near Elizabeth, N. J., increasing the working hours from 9 to 9½ hours per day. Wages have also been advanced 3 cents an hour. The plant is giving employment to about 1,500 operatives.

The American Powder Mills, Inc., Concord, N. H., is giving employment to approximately 150 persons at its black powder and smokeless powder plants, on a full time basis. Wages have been advanced 20 per cent, effective at once.

Employees at the plant of the Long Valley Paint Co., Hancock, near Reading, Pa., have declared a strike, with demand for increased wages. The plant has been compelled to curtail production, pending a settlement.

The Diamond State Fiber Co., Bridgeport, Pa., is giving employment to more than 1,000 operatives on a full-time basis, and will maintain production at this basis for an indefinite period. Wages have recently been increased 5 cents an hour, or 50 cents a day.

Construction and Operation

Alabama

PELL CITY—The Anniston Refractories Co., Anniston, has plans for the construction of a new plant on local site for the manufacture of firebrick and refractory shapes. Six kilns will be built.

California

SAN FRANCISCO—The Glidden Co., Madison Ave., N. W., Cleveland, O., manufacturer of paints, varnishes, etc., has acquired the plant of the Natoma Rice Mills, Hubbel St., near 16th St., for a consideration of \$300,000, and will remodel and improve the factory for a new branch works. The structure is 1-story totaling 50,000 sq.ft. of space, and equipment will be installed to give employment to about 150 operatives.

RIVERSIDE—The Snowolene Refining Co., Pacific Mutual Bldg., Los Angeles, with plant at Florence Ave. and Alameda St., that city, is negotiating for a site at Riverside for the construction of a gasoline-refining plant, to be equipped for a handling capacity of 1,000 bbl. of crude oil per day. It is estimated to cost \$300,000, with machinery. F. E. Snowden and Ralph Arnold head the company.

COALINGA—The Mohawk Oil Co., recently organized to take over the plants and properties of the Coalinga-Mohawk Oil Co. and the Continental Refining Co., has plans for the construction of a new refining plant in the Santa Fe Springs district. A bond issue of \$500,000 has been sold to defray the cost. Alfred L. Meyerstein is president.

SAN DIEGO—Elbert M. Vail, president of the California Chemical Co., and Stanley H. Barrows, president of the National Kellestone Co., are planning for the joint erection of a new plant on local site for the manufacture of an oxychloride cement, produced under a special chemical process. It will cost approximately \$60,000.

SISSON—J. F. Mackey, formerly connected with the Kaiser Construction Co., has organized a company to operate a local plant for the manufacture of cement and concrete products.

VENTURA—The Seaside Refinery Co. has acquired a local site of 8 acres, for the erection of a new oil-refining plant, to cost about \$80,000, with equipment. It will be designed to handle light oils only.

Florida

JACKSONVILLE—The Non-Acid Fertilizer & Chemical Co., Lakeland, Fla., is perfecting plans for the erection of a new branch plant here to cost approximately \$85,000, with machinery. The company will also increase the capacity of its main works at Lakeland. C. W. Deen is president.

Illinois

CHICAGO—The Midwest Sugar Refining Co., recently organized, has acquired the beet sugar and glucose mills of Charles Pope, Riverdale, near Chicago, with adjoining tract of 14 acres of land. Plans are in preparation for remodeling the existing works, to include the installation of additional machinery, estimated to cost $125,000. A second plant unit will also be built at an early date, with capacity of 50,000 tons per annum, estimated to cost $1,000,000, with machinery. The plant will be arranged to refine both cane and beet sugars. Theodore W. Bunte, head of Bunte Brothers, 730 West Munroe St., confectioners, is president of the new company.

Louisiana

NEW ORLEANS—The Amalgamated Seaport Petroleum Co., organized with a capital of $25,000,000, has acquired a tract of land on the Mississippi River, near the city, and plans for the construction of a large oil refinery. Plans for the first unit are being prepared; it is estimated to cost $1,500,000, with machinery.

Maryland

BALTIMORE—The Baltimore Paint & Color Works, Inc., Frederick and Calverton Rds., will soon commence the rebuilding of the portion of its plant destroyed by fire April 11, with loss estimated at $50,000. Albert A. Shuger is general manager.

Massachusetts

EAST BOSTON—The Acme White Lead & Color Works, Inc., 266 Border St., plans for the early rebuilding of the portion of its plant destroyed by fire, April 6, with loss approximating $65,000, including equipment.

FALL RIVER—The E. S. Park's Shellac Co., South Main and Oliver Sts., will erect a new 1-story building at its plant, 50x100 ft., to cost about $20,000.

New Jersey

ARLINGTON—E. I. du Pont de Nemours & Co., Forest St., will commence the construction of a new fume stack at the nitration house at its local plant, to replace a stack recently destroyed.

CARTARET—The Cartaret Oil & Refining Co. has plans for an addition to its local oil storage and distributing plant.

New York

BUFFALO—The Federal Concrete Co. Inc., has commenced excavations for a new plant on property recently acquired at Wyoming and Kensington Aves., for the manufacture of cement and concrete products. It will consist of a number of buildings with main structure 85x110 ft., estimated to cost $35,000. W. E. Jones is president.

Ohio

WARREN—The Trumbull-Cliffs Furnace Co. will construct a battery of 47 byproduct coke ovens, Koppers type, with an auxiliary plant for gas and tar recovery, and for the production of benzol and ammonia sulphate. The project is estimated to cost $3,000,000, and bonds for this amount have been sold. William G. Mather is president.

AKRON—Plans have been completed for the construction of a plant for the production of alum for use at the municipal filtration plant to be equipped for a capacity of approximately 1,000 tons a year. M. P. Tucker is city manager, in charge.

Oklahoma

ARDMORE—The Pure Oil Co., Pure Oil Bldg., Columbus, O., will make extensions and improvements at its local oil-refining plant, including the installation of new process stills and other equipment, estimated to cost $250,000.

TULSA—The Roxana Petroleum Corp., Roxana, Ill., operating a local plant, has acquired a tract of 200 acres of land near Wichita, Kan., as a site for a new refining plant, to be equipped to handle 10,000 bbl. of crude oil per day. It is estimated to cost $3,500,000, with machinery.

WYNNEWOOD—The Texas-Pacific Coal & Oil Co. has construction under way on a new oil refining plant, and will soon commence the installation of machinery.

GUTHRIE—The Pioneer Petroleum Co. has work in progress on extensions and improvements to the oil refinery of the Carbo Refining Co., recently acquired, and will install considerable additional equipment.

Pennsylvania

SPRINGDALE—The Heidenkamp Plate Glass Corp., recently organized to acquire the local plant and business of the company of the same name, has plans in progress for the construction of a number of new buildings to increase the capacity about 50 per cent. The expansion is estimated to cost close to $1,000,000, and bonds for this amount have been sold. Frank E. Troutman is vice-president and general manager.

PHILADELPHIA—The W. J. McCahan Sugar Refining & Molasses Co., Foot of Tasker St., has commenced the construction of an addition to its sugar refinery, estimated to cost about $425,000. To carry out this project and other expansion, the company is disposing of preferred stock for $1,767,000. H. B. Young is secretary.

Tennessee

NASHVILLE—The Bon Air Chemical Co., recently organized with a capital of $1,000,000, has tentative plans under way for the erection of a new plant on local site. M. P. O'Connor heads the company.

CHATTANOOGA—The Chattanooga-Burdett Oxygen Co., 1270 Market St., manufacturer of industrial oxygen products, has plans in progress for the erection of an addition to its plant in the Alton Park section to double, approximately, the present output. It is estimated to cost $100,000. W. K. Hendricks is general manager.

KNOXVILLE—W. G. Lowe & Co., manufacturer of leather products are planning for the erection of a new 2-story plant, 35 x 125 ft., to cost about $30,000.

Texas

FORT WORTH—The Southwestern Portland Cement Co., El Paso, has acquired a tract of land on Sycamore Creek, near Fort Worth, as a site for a new cement mill. The initial plant will have a capacity of approximately 3,000 bbl. per day, and is estimated to cost close to $500,000.

HOUSTON—The Texas Co., Houston, and 17 Battery Pl., New York, has preliminary plans in progress for the construction of new units at its refining plants at Port Arthur and Port Neches, Tex., for large increase in production. The project will be carried out in conjunction with similar expansion at other refineries of the company at West Tulsa, Okla.; Casper, Wyo.; and Lockport, Ill., during the coming months. A fund of $10,000,000 has been arranged for the entire expansion.

ACME—The Certain-teed Products Corp., St. Louis, Mo., is planning for extensions in the local plant of the Acme Cement Plaster Co., utilizing gypsum deposits in this district. The Acme company was recently acquired for a consideration said to be in excess of $2,000,000, including mills in other parts of the country. It is purposed to increase the output of the local plant with the installation of considerable machinery.

MANCHESTER—The Texas Portland Cement Co., Dallas, has commenced the erection of additions to its local mill to increase the annual output to an 800,000-bbl. rating. Considerable additional machinery will be installed. The work will cost in excess of $150,000.

CADDO—The Mid-Kansas Oil Co., has plans for the rebuilding of the portion of its gasoline-refining plant, recently destroyed by fire with loss estimated at $50,000.

Vermont

RUTLAND—The Rutland Evaporator Co. has tentative plans for the rebuilding of the portion of its plant, destroyed by fire, April 1, with loss estimated at $40,000.

Washington

VANCOUVER—The Columbia River Paper Mills Corp., will break ground at once for the first unit of its proposed local mill. The entire plant, with machinery, is estimated to cost in excess of $1,000,000.

West Virginia

FAIRMONT—The Dixie Co., has commenced the construction of a new 2-story oil refining plant, 50x100 ft. A laboratory will be installed.

KENOVA—The Basic Products Co., has perfected plans for the erection of a new plant addition to be equipped for the production of lime for construction service. It is planned to have the unit ready for use early in the summer.

Canada

MONTREAL, QUE.—The National Cement Co., recently organized with a capital of $4,000,000, has plans in progress for the construction of a new cement mill on site purchased near the St. Lawrence River, to consist of a number of units, estimated to cost in excess of $1,000,000. Work will be commenced in about 60 days. Isaie Laplante, Fall River, Mass., is president, and Edmond Cote, of the same city, treasurer and general manager.

New Companies

HERMAN CHEMICAL CO OF NEW JERSEY, Jersey City, chemicals and chemical byproducts; $23,000. Incorporators: C. F. Reynolds, M. Goodman and S. Wormser. Representative: Frank J. Higgins, 15 Exchange Place, Jersey City.

MODERN DYE & CHEMICAL CO., 212 Union St., Providence, R. I., organized; chemicals and dyestuffs. George Decker heads the company.

CITIES SERVICE OIL CO., 208 South La Salle St., Chicago, Ill.; refined oils; $250,000. Incorporators: Austin H. Smith, A. Karvatt and L. K. Edmondson.

TOLU FLUORSPAR CO., Evansville, Ind.; fluorspar and kindred products, capital, $50,000. Incorporators: James F. Engle, Charles H. Parsons and Mark N. Foley, all of Evansville.

CATO TIRE & RUBBER CO., Anniston, Ala.; rubber products; $95,000. J. W. Cato, president, and W. W. Stansell, secretary-treasurer, both of Anniston.

SCHAFFER-ALLESS CHEMICAL CO., Pittsburgh, Pa.; chemicals and chemical byproducts; $100,000. Incorporators: John C. Schaffer, A. F. Cooke and Albert H. Alless, Jr., Pittsburgh. Representative: Capital Trust Co. of Delaware, Dover, Del.

WEST DISINFECTING CO., Dallas, Tex.; chemicals; $10,000. Incorporators: M. B. and I. J. Marcuse, both of Dallas.

WALSH CHEMICAL CO., St. Louis, Mo.; chemicals and chemical byproducts; $100,000. Incorporators: J. D. Poe, M. Walsh and A. G. Kirschbaum, all of St. Louis.

PONTIAC CEMENT PRODUCTS CO., Pontiac, Mich.; cement, $50,000. Incorporators: W. J. Hogan, M. A. Benson and H. A. Freeman, 22 Lexington Place, Pontiac.

EL TEJANO OIL CO., Boston, Mass.; refined petroleum products; $500,000. John A. Sullivan, president; and Arthur J. Lawrence, treasurer, 265 Newbury St., Boston.

REINEAU PROCESS CO., INC., Essex and Middlesex Turnpike, Elizabeth, N. J.; fertilizers and chemicals. Incorporators: Francis T. White, H. H. A. Meyn and Thomas McEerlean.

FLYNT PAINT & VARNISH CO., Cleveland, O.; paints, varnish, oils, etc.; $10,000. Incorporators: Wilton B. Flynt, Jr., and W. H. Kasson, both of Cleveland.

MARTIN CHEMICAL CO., INC., Brooklyn, N. Y.; chemicals and chemical byproducts; $10,000. Incorporators: M. and J. Mariella, and G. Disalvo. Representative: H. Lee, 36 West 44th St.

W. H. METZGER CO., INC., 914 South Main St., Bloomington, Ill.; insecticides and chemical compositions; $19,000. Incorporators: W. H. Metzger, Thomas S. Weldon and W. D. Alexander.

WALLACE & TIERNAN PANDO CO., Belleville, N. J.; chemicals and chemical byproducts; $25,000. Incorporators: J. C. Baker, Gerald D. Peet and William J. Orchard, 11 Mill St.

ROSS SEGUNDA OIL CO., Laredo, Tex.; petroleum products; $150,000. Incorporators: W. C. Bobb, J. F. Ross and T. C. Mann, all of Laredo.

UNITED STATES LIQUID RUBBER PAINT CO., New York, N. Y.; special paints and varnishes; $1,000,000. Incorporators: Samuel Waxman, J. A. Lehman and Sidney B. Klee. Representative: Arley B. Magee, Dover, Del.

LEATHER DYES MFG. CO., 408-10 Adams St., Newark, N. J., organized; dyes and chemicals. John O. Pilar heads the company.

NEW ENGLAND OIL, PAINT & VARNISH CO., Boston, Mass.; paints, varnishes, etc.; 1,000 shares of stock, no par value. Lyford A. Merrow, president; Herbert O. Brackett, Reading, Mass., treasurer and representative.

SPARKS RUBBER CO., Philadelphia, Pa.; rubber products; $25,000. H. L. Jenkins, Devon, Pa., treasurer and representative.

N. S. M. RESEARCH CORP., New York, N. Y.; chemicals; $10,000. Incorporators:

F. K. Fairchild, W. H. Smith and H. G. Samson. Representative: Kelly & Blinn, 200 Broadway.

SOUTHERN PORTLAND CEMENT Co., Wilmington, Del.; cement, $6,000,000. Representative: Corporation Trust Co. of America, du Pont Bldg., Wilmington.

DAVID H. TIFFANY CORP., Rochester, N. Y.; tires and other rubber products; $50,000. Incorporators: D. H. and H. R. Tiffany, and G. A. Fritsche. Representative: E. C. Redfern, Insurance Bldg., Rochester.

HUGHES & CO., INC., 910 South Michigan Ave., Chicago, Ill.; petroleum products; $50,000. Incorporators: Ernest L. Hughes, J. E. Hauronic and F. P. Page.

HOME PAINT CO., INC., Birmingham, Ala.; paints and varnishes; $25,000. Incorporators: C. R. Barrett, Howe C. Benson and K. G. Smith, all of Birmingham.

PRATT-HEWITT OIL CORP., Beeville, Tex.; petroleum products; $5,000,000. Incorporators: R. H. Hawn, Refugio, Tex.; J. W. Kubuk and Lamar Folda, Beeville. Representative: Corporation Trust Co. of America, du Pont Bldg., Wilmington, Del.

PANAMA CITY TAR & TURPENTINE CO., Panama City, Fla.; turpentine and affiliated products; $10,000. A. M. Lewis, Panama City, heads the company.

ATHOL RUBBER CO., Detroit, Mich., rubber products; $500,000. Incorporators: Hugo Miller, Clemens H. Davis, and Hugo Scherer, Grosse Pointe Farms, Mich.

STEPHENSON-MILLER LEATHER CO., New York, N. Y.; leather, $25,000. Incorporators: C. R. Stephenson, Sr. and Jr., and W. D. Millar. Representative: Woodward, Dennis & Buehler, 261 Broadway, New York.

FLORMAN PAINT CO., Amarillo, Tex., paints and varnishes, $25,000. Incorporators: H., M. S., and L. Florman, all of Amarillo.

ROOT OIL CO., South Bend, Ind.; petroleum products; $300,000. Incorporators: Louis J. and H. J. Root, and Daniel S. Brooks, all of South Bend.

Industrial Finances

WOLF OIL CORP., Bristow, Pa., increased capital from $1,000,000 to $3,000,000 for general expansion.

NEWAYGO PORTLAND CEMENT CO., Newaygo, Mich., increased capital from $945,000 to $1,695,000 for expansion.

EUREKA GLASS WORKS, INC., 85 Hope St., Brooklyn, N. Y., increased capital from $15,000 to $150,000 for expansion.

MONTGOMERY CHEMICAL WORKS, INC., Hamtramck, Mich., has filed notice of dissolution.

LIBERTY COTTON OIL MILL, INC., Clayton, N. C., increased capital from $120,000 to $300,000 for plant extensions and general financing.

STOLL OIL REFINING CO., Louisville, Ky., increased capital from $500,000 to $650,000 for proposed expansion.

EMKEN CHEMICAL CO., 14th St., Long Island City, N. Y., has filed notice of dissolution.

Receivers for the EASTERN POTASH CO., New York, N. Y., with plant in Raritan Township, near New Brunswick, N. J., are arranging for a reorganization of the company and payment in full to creditors. It is purposed to place the plant in operation.

KENNECOTT COPPER CORP., 120 Broadway, New York, N. Y., increased capital from $15,000,000 to $25,000,000, a portion of the proceeds to be used for securing a controlling interest in the Utah Copper Co., Salt Lake City, Utah.

PHILLIPS PETROLEUM CO., Bartlesville, Okla., increased capital from 1,000,000 to 2,000,000 shares of stock, no par value, for general extensions.

H. H. Taylor, First National Bank, Kinston, N. C., and A. L. Cavenaugh, Beulahville, N. C., have been appointed receivers for the SEMINOLE PHOSPHATE CO., Goldsboro, N. C., manufacturer of fertilizers.

DEVOE & REYNOLDS CO., INC., 101 Fulton St., New York, N. Y., manufacturer of paints, varnishes, etc., increased capital from $5,000,000 to $7,000,000 for general expansion.

WATERPROOFED PRODUCTS CO., Oakland, Cal., manufacturer of waterproofing compounds, metal-preversing paints, etc., has disposed of stock for $115,000 for plant expansion.

Receivers have been appointed for the CONSTANTIN REFINING CO., Tulsa, Okla. The local oil refinery will be continued in operation.

Industrial Notes

THE OILGEAR CO., of Milwaukee, Wis., manufacturer of hydraulic presses, broaching machines, variable delivery pumps and variable speed drives, has appointed the Cleveland Duplex Machinery Co., Inc., 1224 West 6th St., Cleveland, as its representative in the northern Ohio territory.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING CO., East Pittsburgh, Pa., announces that Ray P. Jackson, manager of the materials and process engineering department, and Marsden H. Hunt, ceramic engineer, will have charge of the new high-voltage insulator plant of the Westinghouse Co. at Emeryville, Calif., near San Francisco, which will be completed and operated in several months. Mr. Jackson will be manager of the new porcelain plant and Mr. Hunt will be superintendent.

THE EUREKA STEEL PRODUCTS CO., with temporary offices at 205 New England Life Bldg., Kansas City, Mo., has been organized by A. A. Kramer, John P. Harris and F. C. Buchanan, to manufacture a new acid- and corrosion-proof alloy "Akramium."

WILLIAM A. ROGERS has been elected chairman of the board of Rogers, Brown & Co., Buffalo, N. Y., manufacturers of pig iron, ferro-alloys, etc. Other officers elected were: William S. Rogers, president; Hugh Kennedy and C. R. Holzworth, vice-presidents; David G. Williams, treasurer, and Charles H. Byron, secretary. Mr. Holzworth was formerly general manager at the plant of the St. Louis Coke & Chemical Co., Granite City, Ill.

THE CHAIN BELT CO., Milwaukee, Wis., announces that Clifford F. Messinger, for the past 3 years general sales manager, has been elected second vice-president.

THE METAL & THERMIT CORP., New York, N. Y., has appointed Charles F. Lederer general supervisor of rail welding, to assume entire charge of all technical work in the field. This company also announces that the Pittsburgh branch will move May 1 to 1514 Fayette St., N. S. In order to take care of business a modern welding shop is now being constructed at the new quarters and will be equipped with facilities for making Thermit welding repairs and relining crucibles. A large stock of Thermit equipment and materials will be carried at all times.

THE LION OIL & REFINING CO., Kansas City, Mo., moved its traffic and car accounting departments on April 1 to its El Dorado, Ark., office and all work connected with these departments will be handled directly from El Dorado.

THE CHASE METAL WORKS, Waterbury, Conn., has added an Atlanta, Ga., office to its other sales offices. J. G. Weddington will have charge of the office, which is located at 304 Rhodes Bldg., Atlanta, Ga.

PERRY & WEBSTER, INC., New York, announces a reorganization. Robert S. Perry has acquired majority stock ownership together with direction of the management and control of the methods of doing business. A. W. Karnopp has succeeded as vice-president and chief engineer in place of P. W. Webster, who no longer has any executive connection with the business activities of the company.

THE LABOUR CO. is closing its office at 8 South Dearborn St., Chicago, and is moving to its own plant at Chicago Heights, Ill.

THE WALTER A. ZELNICKER SUPPLY CO., of St. Louis, Mo., which has been located for 20 years at 325 Locust St., has moved to the Chamber of Commerce Bldg., 511 Locust St.

RICHARDS & GEIER, of New York, patent and trademark attorneys, announce the following additions to their staff: Joseph Farley, formerly an assistant examiner in the U. S. Patent Office; Henry Ruhl, trademark specialist, and Fritz Zeigler, Jr., attorney and counselor-at-law.

THE MECHANICAL APPLIANCE CO., Milwaukee, Wis., has changed its name to the Louis Allis Co.

THE CUTLER-HAMMER MFG. CO., Milkaukee, Wis., announces that the Pittsburgh office of the central district will move May 1 from the Farmers Bank Bldg., to Rooms 950 to 953 Century Building. A. G. Pierce is manager.

Coming Meetings and Events

AMERICAN ASSOCIATION OF CEREAL CHEMISTS will hold its ninth annual convention at Hotel Sherman, Chicago, June 4 to 9.

AMERICAN ASSOCIATION OF ENGINEERS will hold its annual convention in Norfolk, Va., May 7 to 9.

AMERICAN ELECTROCHEMICAL SOCIETY will hold its spring meeting May 3, 4 and 5, 1923, at the Commodore Hotel, New York.

AMERICAN ELECTROPLATERS SOCIETY will hold its eleventh annual meeting at Providence, R. I., July 2 to 5.

AMERICAN FOUNDRYMEN'S ASSOCIATION will hold a meeting in Cleveland, O., April 30 to May 3. The Institute of Metals will hold several joint sessions during this time.

AMERICAN GAS ASSOCIATION will hold its annual convention the week of Oct. 15 at Atlantic City. An elaborate exhibition of gas-making and gas-utilization equipment is planned.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS will hold its summer meeting June 20-23 at Wilmington, Del.

AMERICAN LEATHER CHEMISTS ASSOCIATION will hold its twentieth annual convention at the Greenbrier, White Sulphur Springs, W. Va., June 7, 8 and 9.

AMERICAN OIL CHEMISTS' SOCIETY will hold its annual meeting at the Eastman Hotel, Hot Springs, Ark., April 30 and May 1.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS will hold its spring meeting May 28 to 31 in Montreal, Canada.

AMERICAN SOCIETY FOR TESTING MATERIALS will hold its twenty-sixth annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, beginning Monday, June 25, 1923, and ending either Friday or Saturday of that week.

AMERICAN WELDING SOCIETY will hold its annual meeting April 25 to 27 at the Engineering Societies Building, New York.

AMERICAN ZINC INSTITUTE, INC., will hold its fifth annual meeting at the Hotel Chase, St. Louis, May 7 and 8.

CANADIAN INSTITUTE OF CHEMISTRY will hold its annual meeting in Toronto, May 29 to 31.

CHAMBER OF COMMERCE OF THE UNITED STATES will hold its eleventh annual meeting in New York May 7 to 11.

INTERSTATE COTTON SEED CRUSHERS ASSOCIATION will hold its annual convention at Hot Springs, Ark., May 2 to 4.

IRON AND STEEL INSTITUTE (London) will hold its annual meeting May 10 and 11 at the House of the Institution of Civil Engineers, London, S. W. 1.

NATIONAL ASSOCIATION OF MANUFACTURERS OF THE UNITED STATES OF AMERICA will meet in annual conference May 14 to 16, inclusive, at the Waldorf-Astoria, New York City.

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (NINTH) will be held in New York Sept. 17-22.

NATIONAL FERTILIZER ASSOCIATION will hold its thirtieth annual convention at White Sulphur Springs, W. Va., the week of June 11.

NATIONAL FOREIGN TRADE COUNCIL has postponed its annual conference from April 25, 26 and 27, to May 2, 3 and 4. It will be held in New Orleans, La.

NATIONAL LIME ASSOCIATION will hold its fifth annual convention at the Hotel Commodore, New York City, June 13 to 15.

NATIONAL SYMPOSIUM ON COLLOID CHEMISTRY will be held at the University of Wisconsin, June 12 to 15.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stetters Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month.

PACIFIC DIVISION, American Association for the advancement of Science, will hold its seventh annual meeting at the University of Southern California, Los Angeles, Sept. 17 to 20, in conjunction with the summer session of the national association and a meeting of the Southwestern Division of the National Association.

SOCIETY OF CHEMICAL INDUSTRY, Canadian Section, will meet in Toronto, May 29 to 31.

SOCIETY FOR STEEL TREATING — Eastern sectional meeting will be held June 14 and 15, in Bethlehem, Pa.

The following meetings are scheduled to be held in Rumford Hall, Chemists' Club, East 41st St., New York City: May 4—American Chemical Society, regular meeting, May 11—Société de Chimie Industrielle (in charge) American Chemical Society, American Electrochemical Society, Society of Chemical Industry, joint meeting, May 18—Society of Chemical Industry, regular meeting, June 8 — American Chemical Society, regular meeting.

CHEMICAL & METALLURGICAL ENGINEERING

A consolidation of
ELECTROCHEMICAL & METALLURGICAL INDUSTRY *and* IRON & STEEL MAGAZINE

H. C. PARMELEE, Editor

Volume 28 — New York, April 30, 1923 — *Number* 17

George K. Burgess, Director Bureau of Standards

OUR industries will welcome the appointment of GEORGE K. BURGESS as director of the United States Bureau of Standards. To them this will be a well-deserved recognition of a man who has long been associated with fundamental problems in the metallurgical field, to which he has made contributions of great importance. These industries will, to be sure, regret that they must share so eminent an investigator with other industries, for, as a result of his appointment to the directorship, Dr. BURGESS will doubtless find it necessary to turn over to others many of the important metallurgical investigations he has so ably directed. But the promotion to the directorship is so eminently fitting and so well deserved that all will rejoice in his selection.

Any position of as great importance as the directorship of the Bureau of Standards is a matter of deep concern to the industries; all want to know what policy will be followed. In this case there is no cause for apprehension, for the new director has been associated with the bureau for 20 years and has been largely responsible for the development of some of its most successful work and policies. Industry can therefore feel full confidence in the continuation and enlargement of the service this institution has so splendidly given to all branches of business.

In this appointment, too, there is a recognition of the importance of fundamental research. The work done by the Division of Metallurgy under Dr. BURGESS' direction has invariably been of the type that industry welcomes. It has been planned only after conference with industrial representatives in order that it will be of maximum usefulness to industry. Yet it has always been guided by the thought that the bureau should deal with fundamentals and not with those problems of industrial research that can be managed quite as well or even better in industrial laboratories or by consulting engineers. Some of the other sections of the bureau have not been so fortunate in their plans and other branches of industry may have had some feeling that the bureau has unduly encroached upon the field of industry. It will perhaps be impossible to correct all such cases immediately, but we can look forward with confidence to the new director's judgment and his unswerving devotion to the general good. He first of all is a good scientist, but secondly is a man of sound business judgment, admired and liked by all who know him.

Chem. & Met., speaking for the industries it serves, welcomes Dr. BURGESS to his new position and assures him of unstinted co-operation and support in his new and larger responsibilities.

Selling Short On Arsenic

A REPRESENTATIVE of the Chamber of Commerce of the United States, speaking before the American Paper and Pulp Association, has emphasized the important service problems of a trade association. He emphasizes two important aspects of such association work that are particularly essential to successful progress of any trade body. The first relates to defensive efforts and the second to constructive effort for the advancement of the industry as a whole.

There is little need to discuss both the desirability and the propriety of joint action for defensive purposes in opposing unreasonable legislation or unjust practices of those within or without an industry. The chemical industries will recognize the importance of these problems, for they have been all too conspicuous recently in tariff legislation, in the regulation of industrial alcohol and in similar federal, state and municipal affairs. But there is too little emphasis placed upon the more constructive efforts of trade associations.

Representatives of the chemical industries were called together almost 2 years ago by the Department of Commerce in the hope that some satisfactory basis of co-operation might be arranged for rendering to the industry, to the government, and to the public at large, adequate statistical service. This was a constructive effort from which much was hoped, but due to the opposition of certain individuals, or the companies which they represented, the several plans proposed did not prove to be acceptable and very little progress has been made, especially in the field of heavy chemicals.

At the time the original proposals were made, it was argued that the industry would gain quite as much as the public from this statistical service, but some rather shortsighted companies failed to appreciate this point. Now we have a most conspicuous example in the arsenic situation of this erroneous view.

It seems to be well established that certain makers of calcium arsenate have contracted for deliveries which they are not in a position to make without additional purchases of white arsenic. And this is one commodity that certainly is not readily available at a reasonable price, if it be available at all. This unfortunate result might have been avoided if these companies had been advised of the current stocks, sales and production of arsenic. As it now stands, some are bold enough to forecast large losses for these manufacturers before they are able to gather together from limited supplies the necessary arsenic to complete deliveries under the contracts to which they are committed.

It would be an unusual example of the irony of fate

if it should prove that some of those companies that have opposed Secretary HOOVER'S statistical work for the chemical industry should be the very ones to suffer these losses. We sincerely hope that the rumor of losses has been greatly exaggerated and that some satisfactory commercial solution will be found. But whatever may be the outcome of this particular shortage, no one can deny that it is a convincing and conspicuous demonstration of the necessity of more regular, prompt and accurate statistics for the chemical industry compiled either by the government or by some appropriate trade association.

The Chemistry-Commerce Course At the University of Wisconsin

OUR news pages, in this issue, contain an announcement of a new course at the University of Wisconsin. The course is a courageous and progressive experiment. It is to be called the "Chemistry-Commerce Course," and is designed to give the student both a fundamental knowledge of chemistry and an acquaintance with business procedure and economics. The conception of this course is that it will train men to become purchasing agents, salesmen and executives in the chemical industry, with enough chemistry to deal intelligently with the technical problems as they come up, and yet be essentially business men.

Naturally, the graduate of such a course will not be a competent chemist and it will be incumbent on the educators in charge to make sure that these graduates understand this limitation. On the other hand, there is no doubt that the industry will benefit greatly by the induction of such men into the non-technical positions, for a sympathetic grasp of technical problems is something that is greatly needed.

There is still another phase of the question. There is no doubt that the technical man in industry, at the present time, is ill equipped for other than technical work. This is substantially proved by the very large number of men who are mired in operating routine and who will never rise above it. It is, of course, quite impossible in a 4-year technical course to take up business training as well. Yet it does seem as though the student could be given some conception of the necessity of such training, so that he might familiarize himself with it after he has completed his technical course. The technically trained man who had, in addition to his engineering, a thorough grounding in business would be superior in ability and background to the graduate of this Chemistry-Commerce Course. Yet, this new course will turn out men better equipped to deal with the problems of industry and better equipped to become executives than the technical man of today.

Therefore it is our pleasure to congratulate the department of chemistry of the University of Wisconsin, from which this new course emanates, upon the really progressive idea. It will be our prediction that graduates of this course will find themselves well equipped to fill prominent positions in chemical manufacturing industries. But it will be our mission and effort more strenuously than ever to urge upon the *technical* man the necessity of acquainting himself with the commercial and business side of industry. The two efforts go more or less hand in hand, for one can hardly doubt that future chemists and chemical engineers studying at the University of Wisconsin will have their attention more definitely focussed on business subjects simply because of the existence of this Chemistry-Commerce Course. The chances are that their curriculum may be too full to undertake such studies, but many will supply the lack that has been made apparent to them after they have completed their technical course. Therefore it will have a twofold benefit, both direct and indirect, and it remains to be seen which will be of the greater significance.

Dean's Law of Increasing Returns

WE CONFESS to leanings mathematical. Only when we got as far as differential equations did our interest lag, for then the methods appeared to become empirical, solutions were discovered by a happy chance, rather than by the logical progression of ideas. But these differentials were bread and butter to our professor in thermodynamics, who appeared to be able to start with two simple laws—he said they were simple—and prove anything in the heavens above, the earth beneath or the waters under the earth. Especially the Second Law appealed to him. He would hold it up before our wondering eyes as did the serpent the apple in the Garden of Eden. It almost sprouted a third law, which, however, we were assured was somewhat apocryphal. And then there was the principle of LE CHATELIER—"clearly comprehended in the Second Law." Wonderful; astounding; stupefying!

That principle of LE CHATELIER really is a strange thing. Our lecture notes record that "no proof, in the ordinary sense, can be given of it; it is a generalization based on experience." (Thus it is much like many beliefs, religious and spiritual, and can readily be accepted by the lay reader.) It states that every system in equilibrium tends to remain unchanged. In other words, a balanced system remains balanced. So simple it sounds foolish!

Like $\frac{dx^2}{d^2y}$, it doesn't mean much until some particular examples are cited. Suppose a certain volume of gas is compressed; its temperature forthwith increases. Q.E.D. (Figure it out for yourself.) But the mysterious and amazing part of it is that the law holds for the workings of an entire manufacturing process. And that's what we started to talk about.

During the war when potash was precious, a good friend, J. G. DEAN, was showing the Southwestern Portland Cement Co. how to make expenses from potash and sell cement as an incidental byproduct. He revised their burner settings, adjusted the zone of maximum temperature and the rate of charging so as to volatilize the maximum amount of potash from the slurry. With an eye single on potash, he found that a greater tonnage of clinker was produced, it was better burned, and yielded a sounder cement. "Come to think of it," said DEAN, "I was not so surprised as the manager. I have found that whatever you do which really improves the quality of cement will recompense you doubly—it also increases output and decreases cost."

This idea has almost been enshrined as "Dean's Law." It fits in closely with LE CHATELIER'S—and in turn is solidly founded on the ultimate authority of the second law of thermodynamics. What more could be asked? We can phrase the law in many ways, but it comes down to this: That money wisely put into a process is always returned; or that the way to do a thing best will always be found to be cheapest.

JOHN J. COYLE once showed us an electric furnace near Pittsburgh. At first it operated quite intermittently, it produced about 6,000 lb. of steel a turn, of

which 55 per cent eventually was marketed as A1 bars. After devising ways and means to operate continuously, the life of the furnace roof was increased 150 per cent; production rose to 10,000 lb. per turn, and 70 per cent of it was sound! The best way is evidently the cheapest.

You will probably remember that an enormous amount of smoke litigation has been launched against Western smelters under the belief that the solid fume in smelter smoke was damaging land, crops and live stock. Large dust chambers were forthwith constructed to settle the fume. In order to drag the gases through, more draft was needed, and the easiest way to get this was to build a higher chimney. Higher chimneys in turn gave more draft at the furnaces, which enabled the operators to build hotter fires (still more draft!), bigger furnaces and far greater output per ton of coal and per furnace. Isn't this another manifestation of Dean's law?

A last citation from the automobile industry: H. T. CHANDLER, when studying some unsatisfactory drop forgings, discovered that failure was usually located by kinked "flow lines" in the macrostructure. On redesigning the dies, solely to smooth out the flow lines, he found that the new forgings were far more reliable, and strangely enough (or was it strange?), the life of the dies had increased from 3,000 to 10,000 pieces.

There is no one way of doing things right. The way constantly shifts as circumstances change. But the right way will always be found to be an economical way. If the practice is continually revised so that the product approaches perfection, the results will return the expense and then some. This is Dean's law.

An Amazing Opportunity —Just Missed

A CORRESPONDENT has sent us a clipping from the New York *American* of April 8, 1923, which announces the vacancy in a post as chemist in the Department of Health of New York City. The requirements are that the applicant be a citizen of the United States, and that he be able to analyze accurately all food products, to detect and identify coal-tar dyes, preservatives, metallic and alkaloidal poisons, to conduct research ("perform research work" the announcement reads) in connection with the analysis of foods, and to qualify in court as an expert when prosecutions are brought for food-law violations. The candidate must have a degree from a college of recognized standing "or a certificate from such institution that the applicant has pursued for 2 years a course of study tending to qualify him for the position." The salary is $1,244 a year. Following this is the cheerful statement that "other vacancies at higher salaries occur from time to time." Now, $1,244 a year means almost $23.85 a week. Resolved into mills, it is about a million and a quarter per annum.

Alas and alack, applications closed at 4 p.m. on April 18 and we cannot tell the good news to the world in time to be of service. But there is hope for other vacancies! We should think these would occur frequently, even at the "higher salaries," because men with families are likely to starve out fast enough to provide plenty of places. Plenty of "opportunities."

A few years ago the chemists of this department joined a union under the auspices of the American Federation of Labor. We criticised such preparations to strike as unprofessional conduct. We still hold to the opinion, but we appreciate the fact that a salary of $23.85 a week might wither the sense of professional obligation in a chemist who had prepared himself to meet the requirements.

All this merely shows the confusion that is bound to follow dunderheaded ignorance in administration. No field of this world's work is more democratic than the field of science; but the theory that one man is as good as another will not work in chemistry. To expect a trained man of science to work efficiently for less than a hod-carrier's pay may be sound according to present-day Russian philosophy, but it doesn't fit in the United States. It accords with the theory of Dictatorship by the Proletariat, but it does not accord with the encouragement of education.

Sir Joseph Conquers

TO THE student of physical science the name of Sir J. J. THOMSON will always be one with which to conjure. His experimental wizardry has been both the inspiration and the despair of his followers. And so, for those who had the good fortune to hear his address at the dedication of the Sterling Chemistry Laboratory in New Haven, it was a rare treat to come into contact with his personality.

Just what Sir JOSEPH thought is another matter. Probably the enthusiasm of a thousand listeners does gratify no matter how inured to it one may be. Usually it is apparent from a speaker's general attitude that he is enjoying himself or that he isn't, that he likes his auditors or that he is out of sympathy with them, that he is instructing them or making fun of them. Sir JOSEPH'S auditors came away puzzled. On the whole he seemed to like us, but he could not help chiding us as Americans for not appreciating WILLARD GIBBS, whereas British scientists conferred on GIBBS their highest honor. Parenthetically it may be remarked that this appreciation, though sincere, was entirely academic; furthermore, the honor of really discovering WILLARD GIBBS must still rest with the great Hollander ROOZEBOOM.

Later on Sir JOSEPH gently admonished the chemists because of their lack of facility with mathematics, although it was all done with the air of a kindly and somewhat lenient parent. Throughout his all too short talk the progress in physical research was recorded in such an impersonal way that an uninformed auditor might easily have thought that the distinct pioneer and recognized leader was only a well-informed historian. Never an "I" crossed his lips.

Still another glimpse showed him to be somewhat gleefully group-satisfied because the physicist had bested the chemist in isolating and measuring the units of matter. In that connection his figure of speech is worthy of repetition, although naturally we make no effort to defend it: "Assuming that the chemist's test for a penny is no more sensitive than his test for a single molecule, the chemist would not be able to tell whether a man who possessed a million million dollars and had changed it all into pennies was really a millionaire or a pauper, so crude are even his most delicate methods of detection." Yet in almost the same breath Sir JOSEPH wondered whether physical chemistry should not really be called chemical physics, so closely do the two fields merge.

These are but a few random impressions of a great scientist, who has come to our shores, has seen our universities and scientific organizations, and has conquered our respect and admiration.

Lime and Colloid Chemistry

To the Editor of Chemical & Metallurgical Engineering

SIR:—The want of complete knowledge in regard to lime was emphasized by Oliver Bowles in the issue of March 7, the article being supplemented by an editorial query, "What Causes the Variations in Lime?"

Having been engaged on colloid research, particularly in regard to the successful removal of combined sulphur from vulcanized rubber, by the addition of a substitute adsorption medium composed of an emulsoid colloid solution, it occurred to me that the problem in regard to lime could be solved by methods peculiar to colloid chemistry.

A lime from Shenandoah Valley, Va., was found to be too "short," as the plasterers termed it, when used as a finishing coat; it would not spread easily, the particles would not slide and roll under the plasterer's trowel, but seemed to hang back, as if they possessed the sharp edges of the calcite in a highly crystalline and pure limestone. Particles of lime, if crystalline, would tend to retain their form, even after calcining and hydration.

In "Applied Colloid Chemistry," Bancroft gives some interesting examples of adsorption of solid by solid. To apply this idea, we took ordinary hydrated lime, about 60 mesh, and by adding various powdered substances (covered by patent application) of about 200 mesh, a product resulted from which it was possible to make a plaster which, when dry, was firm and hard, tough and elastic. This was improved by adding another fine powder of an organic nature, as I realized that something of this kind would be present in small quantity in sea water when the lime was deposited.

The question then arose as to whether it would be possible to coat the sharp edges of unburned crystalline lime particles in the same manner. This was done. The ground waste from the Veruga marble quarry of San Diego County, Calif., which is a highly crystalline limestone and contains 97½ per cent $CaCO_3$ was ground in a Hardinge mill with a few finely powdered substances, which cost about $1.50 per ton; the product was 97 per cent lime of a quality which was equal, it is believed, to that which is being sold, according to Mr. Bowles, for $200 per ton.

To the prepared limestone is added water in sufficient quantity and in the same manner as one would with hydrated lime. It takes from 24 to 36 hours to dry, and forms a plaster that is superior to the best on the market. This adheres to planed wood, to oily, corrugated or other kind of paper; it will not crack or check.

Rooms have been plastered with the composition, which has also been applied as a rough coat with sand, in the proportion of 5 of sand to 1 of the composition. The composition plaster was then used as a finished lime, making an unusually hard and firm coat. It becomes so hard when dry that it can be polished with an agate burnisher. The composition plaster was also applied to boards outdoors in California; it has remained unaffected by 2 months' winter rains.

It seems proper to answer your editorial question, "What causes variations in lime?" by explaining that these are due to the variations in the elements present in the sea water when the deposition or sedimentation of the lime occurred. Research on lime must be carried on with recent advances in colloid chemistry in mind.

C. F. WILLARD.

San Diego, Calif.

Winged Errors In Chemical Literature

To the Editor of Chemical & Metallurgical Engineering

SIR:—Your Homeric phrase in the Feb. 21 issue, just received, επεα πτερεοντα, reminds me of the case of silver alum, so useful in chemical philosophy according to the old periodic law in representing silver as like to the alkali metals. Some years ago, when the late Vernon Harcourt was Lees reader, some workers in the Christ Church laboratory attempted to make this in the textbook manner by using strong sulphuric acid in a sealed tube. When the attempt had failed Harcourt remembered that the discoverer had corrected his mistake within a few months of the announcement at a meeting of the chemical society at which he (Harcourt) had been present. The alum was formed from alkali in the glass of the tube. In chemistry the acceptance of observations as true may depend more on the prejudice of authority rather than on evidence.

E. F. MORRIS.

Manchester, England

Magnesia as A Polishing Agent

To the Editor of Chemical & Metallurgical Engineering

SIR:—In reference to your article on "Magnesia as a Polishing Agent," page 441, March 7, 1923, and the letter of E. H. Dix in your issue of March 28 I am in a position to confirm the fact that Dr. Walter Rosenhain was the first to use such materials for polishing metals, and more specifically aluminum alloys.

I distinctly recall preparing both alumina and magnesia powders by elutriation for polishing purposes as far back as 1901, at which time I was Dr. Rosenhain's assistant. These materials were used for polishing aluminum alloys.

C. J. BROCKBANK.

Buffalo, N. Y.

Sponge Iron by New Method

Successful production of sponge iron on a commercial scale has been achieved in a direct-fired rotary kiln at Silver City, Utah. This is the outcome of extended experimentation on the part of metallurgists in the employ of the Interior Department. The furnace was that of the Tintic Milling Co.

If cheaper sponge iron can be obtained, it is believed that it will find large use as a precipitant for copper.

George K. Burgess, Director, Bureau of Standards

MANY friends of Dr. Burgess are congratulating him on his appointment as director of the Bureau of Standards, made by President Harding, April 23. Ever since the resignation of Dr. Stratton—who became president of Massachusetts Institute of Technology on Jan. 1—Secretary Hoover has been considering the qualifications of several men who might be available for the post.

A proper selection is no mean task. From the point of view of the manufacturing industries, the directorship of the Bureau of Standards is the most important technical position in the government service. The director must understand their problems and plan broad investigations that will shed the most light on manufacturing difficulties. On the other hand, he must be a successful leader of men whose life work is scientific research of the utmost accuracy and precision. Beyond all this he must be able to administer the affairs of a series of great laboratories, having a budget of $1\frac{3}{4}$ million dollars annually.

That the choice finally rested upon Dr. Burgess is therefore of far more significance than a mere promotion on the staff. It is a recognition of the fact that the erstwhile chief of the Metallurgical Division is a man highly regarded by the men in industry, a leader among his fellow scientists, and an administrator of ability. The choice is a happy one. It cannot help but react favorably upon the bureau's esprit de corps, as a well won recognition of proved merit.

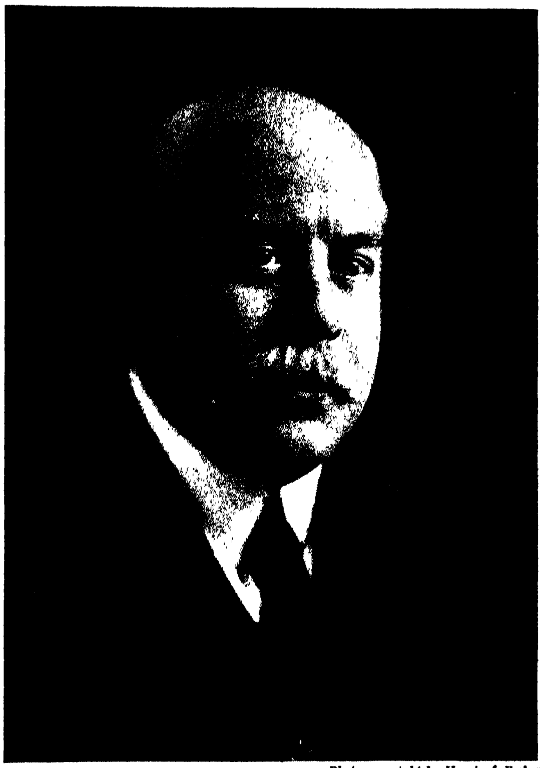

Photo copyright by Harris & Ewing

DR. GEORGE K. BURGESS

It is hardly necessary to say much about Dr. Burgess to our readers. They have often seen him in action at various society and committee meetings—indeed, his appetite for travel and variety of work seems insatiable. He has been with the bureau for 20 years, and during half that time has been directing the Metallurgical Division. As befits that position, he entered largely into the work of the American Society for Testing Materials, serving on committees and directing many investigations into the properties of commercial metal. These activities the society has recognized by making him its president, a position he now holds.

Dr. Burgess is also very much interested in the Iron and Steel Division and the Institute of Metals Division of the American Institute of Mining and Metallurgical Engineers. The young American Society for Steel Treating has also enlisted his support. At home, he is active in various committees on the National Research Council, American Physical Society, Washington Academy of Science and the Philosophical Society of Washington (of which he is past president). Abroad, he is a member of the British Institute of Metals and the Société de Physique.

Descended from Puritan ancestry, he was born at Newton, Mass., Jan. 4, 1874. He studied at Boston Tech. (S.B., 1896) and in Paris (D.Sc., 1901). He taught physics at Tech., Michigan and California from 1896 to 1903; in the latter year he entered government service. On Jan. 5, 1901, he married Mlle. Suzanne Babut.

Dr. Burgess' acquaintance with the French language has borne fruit in the translation of Duheim's "Thermodynamics and Chemistry," and the publication of "Reserches sur la Constante de Gravitation." His best known book is the translation of LeChatelier's classic on "Measurement of High Temperature": indeed a later edition, enlarged and modernized by the translator, has become the standard English work on pyrometry. Temperature measurement is not included in the Metallurgical Division at the bureau—nevertheless Dr. Burgess has never permitted his interest in pyrometry to lag, nor missed a timely opportunity to emphasize the necessity of accurate heat control to modern metallurgical operations.

His contributions to the learned and professional societies and technical press are too numerous to list here. Several important monographs and professional papers from his pen have been printed by the Bureau of Standards. Beyond this, many similar publications by members of his staff undoubtedly owe their inception to Dr. Burgess, and their successful conclusion to his encouragement and seasoned advice.

His early publications naturally are concerned with methods of measuring very high temperatures. This requires a knowledge of the amount of energy radiated from a hot body, and the development of instruments to measure this radiation. Dr. Burgess bent his energies to these two great problems, and in conjunction with Messrs. Waidner, Waltenburg and Foote, issued a number of publications containing many essential data. With Messrs. Crowe and Scott he did some extraordinary work on the nature of the so-called magnetic transformation A_2 in pure iron. That his mind does not run along strictly academic and scientific lines may be inferred from his publications on open-hearth practice, sound ingots, and on rail manufacture. Recently he has acted as chairman of the joint committee investigating the effect of sulphur and phosphorus in steel.

What Must a Corporation Do To Borrow Money From a Bank?

A Brief Survey of the Procedure Followed in an Average Bank When a Prospective Borrower Is Investigated as a Credit Risk—What Does the Banker Want to Know and How Does He Go About It?

BY CHARLES WADSWORTH, 3D.
Assistant Editor of *Chemical & Metallurgical Engineering*

IN THE first article on this subject, an interview with William Post,[1] the field of operation of the commercial banker was defined. Mr. Post pointed out that the commercial banker must confine himself to liquid business. He must not tie up his depositors' money in either long-term loans or in permanent improvements, so called "fixed assets."

So, with the field defined, an analysis is in order that we may better understand the banker's relation to industrial or commercial organizations. We must study the inside workings of the machinery for granting bank credit, which means, in other words, what must you do to borrow money. Perhaps the best procedure would be to go through the process with John Smith & Co.

Before we go with Mr. Smith to the bank it will help considerably to understand two points of view. The first point is to recall that a banker is in a sense a trustee for his depositors. They intrust their money to him. It is payable on demand, and therefore a certain percentage of the deposits must be retained by the bank for such needs. The other point of view is that the banker is anxious to make reliable loans, since that is the way he makes a profit for the bank. He is a salesman with a peculiar commodity to sell. His customers often must be solicited and sold, much as those of any salesman; yet he can never lose sight of the fact that he is a trustee. This interesting dualism is frequently not recognized. Even many bankers, because of a consistent demand for bank credit, forget that they are half salesmen and adopt toward industry an attitude of self-conscious benevolence that is irksome and unjustified. Throughout the discussion you will find many points at which these two selves of the banker would be antagonistic in their desires and in some cases an obvious convention has been created to solve the problem.

HOW TO SELECT A BANK OF DEPOSIT

To return to Mr. Smith and his bank, it is first of all essential that he should have exercised considerable care in the selection of a bank. A bank is not just a bank, but it has what might be termed a personality that depends upon the policies of its directors and executives. A bank should be large enough to take care of the expanding needs of a business and yet not so large that the client's business would come to be handled in a routine manner. These limitations are not obvious ones and a business may be embarrassed if either condition arises.

Beyond the question of actual size is the question of the temper or personality of the bank. Do they handle business similar to that of Smith & Co.? Are they familiar with the credit requirements of the business and are they well disposed toward and sympathetic with that type of credit risk? Perhaps a disproportionate percentage of the bank's clientèle is in the same field. This might not be desirable, either. These questions are of less consequence to the large corporation borrowing from many banks and regarded as a good client, but they vitally concern the smaller unit. The bank of deposit is of unusual significance, because loans are supposedly confined solely to the bank's depositors. This is frequently stated as an ironclad rule, although there is an easy way out the side door which may be shown concretely as follows: It is a convention that 20 per cent of the loan shall be left as deposit in the bank (a convention not universally prac-

ticed, but nevertheless in wide observance). Thus a borrower would automatically become a depositor if he were not one already. But to return to our previous point, it can be said that in general a bank loans to its depositors and thus the bank of deposit will be in a position to exercise an important and occasionally a vital veto on the financial resources of an industrial organization. That is why the bank of deposit must be selected with care.

DON'T PLAY OSTRICH WITH THE BANK

With this background let us go with our friend Smith to negotiate a loan, his first, with his bank of deposit. If Smith is wise, he will lay all his cards on the table. More than anything else this predisposes the banker in his favor. Complete and frank answers to necessarily searching questions will often swing a borderline decision in his favor. It is a frequently occurring experience of the banker to see a marked resentment on the part of a prospective borrower at the "unreasonable inquisitiveness" of the bank's inquiry. Very frequently, too, this resentment is due to the fact that all is not wholesome with the borrower and he does not want to reveal a weakness

The first set of questions that the banker asks are those that deal with the nature of the business. This is frequently embodied in a notaried statement, a sample of which is given herewith. The questions are largely self-explanatory, but several points are worth noting. For example, there is a widespread misconception that treasury stock is the same as authorized but unissued stock. The unscrupulous promoter is responsible for this point of view. Treasury stock is actually fully paid stock bought in by the corporation. Again, the method of evaluating property is important, as considerable water can be pumped into a financial statement by overvaluation of property. This point will doubtless be the subject of some investigation by the banker. He may not be vitally interested in the actual figure but rather in the spirit of the estimate. Frequently it would be very difficult to determine the true value of real estate, for example, as this might depend on a possible purchaser in the event of sale or on an estimate of increased value, which would always be precarious.

In addition to the above questions it is desirable to know the executive personnel and that of the board of directors as well as the amounts of their individual financial interest in the venture.

All of the foregoing might be classed as preliminary investigation. Following this the banker will ask Mr. Smith to fill out a form which will be discussed later and will then commence an investigation of John Smith & Co. from the outside.

WHY THE BANKER DOES NOT KNOW THE DEPOSITOR

It may cause some surprise to realize that a banker knows as little about his depositors as would be inferred from the foregoing and following discussion. However, it is none the less a fact that, granting exceptions, he does not. It is a physical impossibility in the first place and in the second place, as one banker said, a bank will take a deposit from anyone, but lending its money to someone is a very different thing. In other words, so long as a depositor keeps out of the red, he needs little attention. In fact a firm may keep a large deposit in the bank and unless it writes checks of large denomination that have to be O.K.'d by an officer of the bank, the bank may know nothing of the deposit. Thus it comes about that a large depositor of some years' standing may ask for a loan and be amazed at the complete ignorance which the bank has with respect to its affairs.

INVESTIGATING A CREDIT RISK FROM THE OUTSIDE

Of course the first step in the outside investigation of a client is a study of the agency rating in both Bradstreet's and Dun's. This gives very little idea of anything except the order of magnitude of the business. Only a very approximate idea of the client as a credit risk can be obtained. Then follows a widespread inquiry through the bank's business connections and associates as to the character of John Smith & Co. Suppose they manufacture hardware. The people from whom they buy steel, machinery and supplies will tell the bank whether they discount their bills or whether they are slow pay. These trade estimates from firms of known reputation, together with the reports from banks that know the firm, are the most important forces in molding the banker's opinion of a credit risk.

As William Post pointed out about 15 years ago, credit reliability is based on character, capacity, capital and collateral. It is significant that character is placed first, capacity second and capital third. All information on character is obtained from outside sources, as is much of the information on capacity. The latter is also inferred from the consecutive financial statements, but it is primarily on these outside estimates that the banker will rely. From another angle it will be seen that it is logical for the banker to depend on them. They show exactly how the firm behaves in practice. It is not theory or deduction. "As a man or firm does, so he is," at least so far as the banker is concerned.

Perhaps the greatest banking genius in our generation, the late J. P. Morgan, said that he would lend some men a million on their word whereas he would not lend others 5 cents on government bonds. You cannot get data on the reliability of a man's word (which includes character and capacity) from statistics. You can and do get it from banks, business associates, from the companies with which he deals. That is the *quod erat demonstrandum*.

In addition to those sources already mentioned there is the splendid machinery of the National Association of Credit Men. Its interchange bureaus give accurate information and are invaluable in aiding bankers to obtain information on so-called foreign paper—that is, commercial paper offered for sale originating in other communities. Although this is perhaps the most useful part of the interchange bureau's work, the commercial banker does use it often to confirm opinions on local corporations and individuals.

INVESTIGATING A CREDIT RISK FROM THE INSIDE

Let us consider now the form which John Smith & Co. must fill out for the banker. Each bank has a standard form to fill out—one for individuals or partnerships and one for corporations. Herewith is reproduced a facsimile of a typical form for corporations. A somewhat detailed comment is in order, though the financial statements will not be analyzed until a later article.

The first page contains, of course, the formal application for credit, and under it the two most important sets of data—the balance sheet and profit and loss

Type of Statement to Be Filled Out by Corporation Applying for Credit

Business .... Address ....

Name (Corporate style under charter) .... Laws of state of ....

For the purpose of procuring credit from time to time from you for our negotiable paper or otherwise, we furnish you with the following statement and information which fully and truly sets forth our financial condition on the .... day of .... 19 ... which you can consider as continuing to be full and accurate unless notice of change is given you. We agree to notify you promptly of any change that materially reduces our pecuniary responsibility.

n consideration of the granting of such credit, we agree that if we at any time stop payment or become insolvent, or commit an act of bankruptcy, or if any of the representations made below prove to be untrue, or if we fail to notify you of any material change as above agreed, or if we assign any accounts or transfer or encumber any of our assets in such way as, in your opinion, to materially affect our business or financial condition, or if execution be issued on any judgment obtained against us, then all our obligations held by you shall immediately become due and payable without demand or notice, and the same may be charged against the balance of any deposit account kept by us with you, we hereby giving a continuing lien upon such balance or deposit given from time to time existing to secure all our obligations held by you.

account. These two topics will be elaborated in a later article. What we are trying to do now is to get a general impression of the kind of information which the banker seeks. Below the financial statement, the client is asked to list his depository banks and the amount of credit extended by each. Such information can, of course, be easily checked, and if any attempt is made to conceal other loans it will show up in a discrepancy between cash reported in the balance sheet and the amount accounted for on the books of the bank itself.

Contingent Liabilities a Bad Sign

At the top of the reverse sheet the contingent liabilities must be listed. The existence of contingent liabilities is a most unhealthy sign from the banker's standpoint. This is easy to understand, since contingent liabilities may tie up assets as effectively as current liabilities. The term is somewhat elastic and frequently item 4, "materials purchased for future delivery," is not included. Usually the term applies to items 1 and 2. Accommodation indorsements are particularly obnoxious to the banker, for there is no way of evaluating the risk involved. In fact this item is sometimes estimated in with current liabilities in analyzing the statement.

There follows a series of questions all of which have a distinct bearing on the desirability of the credit risk. Losses by bad debts, for example, should be a relatively small percentage of the total sales. If it is higher than usual, the credit department of the company is not on the job. What portion of the assets listed in the balance sheet have been pledged as collateral. A $10,000 house with a $6,000 mortgage is not a good credit risk. Neither is a mortgaged business, whether its fixed assets are pledged for a bond issue or its receivables discounted for cash. Insurance is obviously important, for the bank cannot gamble that there will not be a fire within 90 days to impair the company's credit.

"Do you exchange paper or indorse for anybody?" Contingent liabilities again! They may not be on the books now, but day after tomorrow maybe they will. As to the next question, overdue accounts mean potential bad debts, a further check on the credit department.

"Are you in any other business?" asks the banker and with cause. John Smith & Co. may be liquid, even molten, but Jones & Brown may be on the verge of insolvency, and if John Smith & Co. have a large interest in Jones & Brown it is obvious that they are going to be much less well off than they are now. At any rate it is a wise thing for the bank to know the whole story.

Yet again Smith may have been giving his commercial paper to a broker to sell and if so the bank would like to know what broker. This will give him an additional line on the client. Commercial paper, by the way, usually refers to the promissory notes which a firm sells in the open market.

The final question, except for a listing of real estate is, "Have the books been audited by a certified public accountant?" There are two kinds of audits; the one is a simple certification that the arithmetic of the financial statement is correct and the other, based on a thorough inventory analysis and a complete study of the accounting system, means much more.

This covers in a general way the kind of information that a bank demands from prospective borrowers. I have attempted to give the various items a proper perspective in the general plan. In a subsequent article a study and analysis of the financial statements will be undertaken. Then credit can be discussed in terms of mathematics, but one must never lose sight of the fact that it is not either primarily or essentially a mathematical problem.

Some Notes on Talc

The Bureau of Mines reports that the United States is at present producing approximately two-thirds of the world's supply of talc, a mineral the uses of which are many and varied.

The widest use of talc is in the powdered form. The value of ground talc depends upon color (whiteness), uniformity, fineness of grain, freedom from grit, "slip" and sometimes freedom from lime. White talc, free from grit and iron and low in lime, ground to about 200 mesh, is used largely as a filler for paper, rubber and paint. Ground talc and soapstone are used for foundry facings, either alone or mixed with graphite. A coarser grade of talc is used in the manufacture of asphalt-coated roofing felts and paper, both as a filler and as a surfacing.

The highest grade of ground talc is used as toilet powder, whiteness, fineness of grain, freedom from grit and lime and a good "slip" being essential. Ground talc is also used in dressing and coating cloth, in making soap, rope, twine, pipe-covering compounds, heavy lubricants and polishes. Massive varieties of talc, pyrophyllite and high grades of soapstone are cut into slate pencils and steel-workers' crayons. French chalk or tailors' chalk is a soft, massive variety of talc. In China, Japan and India, massive talc is carved into grotesque images and other forms and is often sold as imitation jade.

Talc is a hydrous magnesium silicate; it is often called steatite, soapstone or potstone, and by the trade names talc clay, agalite, asbestine and verdolite. The term talc may be used to include all forms of the pure mineral, whereas steatite denotes particularly the massive, compact variety, and soapstone the impure, massive form that often contains only 50 per cent of talc. Talc ranges in color from pure white and silvery white through gray, green, apple green, gray green to dark green, also yellow, brown or reddish when impure.

As talc is a relatively low-priced commodity and its distribution throughout the world is general, the location of new plants has been materially influenced by transportation and distance from markets. Most of the paper mills in the United States are in New York and New England, and the talc deposits of New York and Vermont have therefore been most fully developed, as they can easily compete with imported English clay. There are also important deposits in California, Washington, North Carolina and Georgia.

The Search for Potash

In the search for potash supplies within the United States, the State of Utah seems to be the favorite hunting ground for mineral prospectors. Of 237 prospecting permits for potash issued up to March 1 by the Department of the Interior, 184 were in Utah. Twenty-five permits for potash prospecting in Nevada, 14 in California, 8 in New Mexico, 3 in Arizona and 1 each in Colorado, Montana and Nebraska had been issued. Technical supervision over potash mining operations is intrusted to the Bureau of Mines.

Anti-Dimming Preparations for Glass Surfaces

By H. A. Kuhn

First Lieut., C. W. S., U. S. A., Edgewood Arsenal, Edgewood, Md.

During the World War considerable research work was conducted by the Chemical Warfare Service on anti-dimming preparations for gas mask eyepieces. The essentials laid down for these anti-dimming preparations were: That they lower the surface tension of the droplets of water condensing on the eyepieces, causing them to spread into a thin film; that the preparation, spread to a thin film on the eyepiece, should be optically clear when dry, and that the film of material should not dissolve too rapidly.

An anti-dimming preparation satisfying these requirements was finally developed and adopted as the official anti-dimming material. This consisted essentially of sulphonated castor oil, sodium hydroxide, water glass and paraffin oil. Over eight million sticks, each containing about 25 grams of this material, were manufactured by various soap companies for the army during the war.

The base of this anti-dim was castor oil, which, owing to its use as a lubricant for airplane motors, was scarce and expensive. When the Chemical Research Division of the Chemical Warfare Service was reorganized in 1920, one of the problems taken up was the development of a material that would be as good as or better than the official anti-dim and that would not require castor oil as an ingredient. In addition, this new anti-dim was to be impregnated in a cloth in order to simplify the gas mask equipment. Considerable fundamental work along this line was done in the latter part of 1918 and several substitutes were suggested.

As a result of previous investigations, it was decided that an anti-dimming preparation made from sulphonated fat should be the proper mode of attack. Work was conducted along this line, using as a base rapeseed oil, cottonseed oil, corn oil, castor oil, coconut oil, peanut oil, raw linseed oil, cod oil and fish oil. Preparations were made using the sodium salt of the sulphonated oil with varying excesses of caustics and various binders, emulsifiers and restrainers to prevent drying of the preparation.

Previous investigators had developed various rapid tests for eliminating poor preparations. Several of these were based on the measurement of the lowering of the surface tension of water droplets, permitting them to spread to a film. The measurement of the spread of a drop of water, dropping a certain distance to a glass plate treated with the preparation to be tested, is typical of this type of test. Other investigators marked out squares on the laboratory windows, and by blowing steam against the treated windows and reading a chart placed some distance outside the windows, were able to secure a rough comparison between the anti-dimming power of various preparations. Other tests were carried out by testing the preparations on the eyepieces of the gas masks in use. All of these tests were limited in speed and accuracy.

TYPICAL COMPARISON OF ANTI-DIM COMPOUNDS

Note. In this test all the preparations except the Official A. D. were applied to the lenses with impregnated cloth

ANTI-DIM TESTING MACHINE

To obtain more reliable comparisons the apparatus shown by the accompanying diagram and photograph was developed to test anti-dimming preparations under conditions simulating the most rigid field conditions. With this apparatus, conditions could be controlled, the factors varied, and tests readily duplicated.

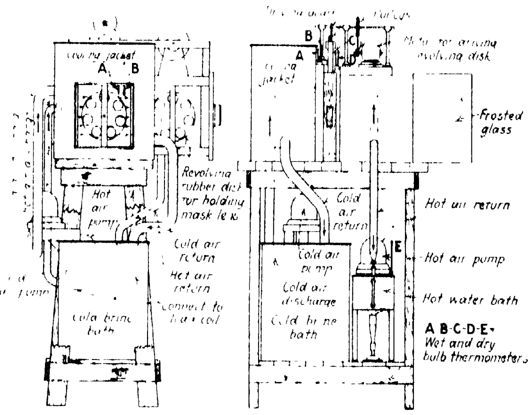
The machine for testing the anti-dimming compounds consists essentially of three parts: A chamber into which a current of warm, humid air is blown; a chamber containing cold air; and between these a revolving disk of rubber with perforations over which is clamped a 3-in. glass lens on which the anti-dim is to be tested. The disk is so placed that one side of the lens is exposed to the warm moist air while the other side is exposed to the cooler air. The back of the warm air chamber is made of frosted glass, while the front is covered by the disk holding the glass lenses. The cool air chamber is open at both ends so that a light placed behind the frosted glass plate at the back of the warm

air chamber can be seen through the lenses in the disk from the front of the cold air chamber. In this way the clearness of the lenses could be observed throughout the experiment.

As a result of a series of tests conducted in this manner, two anti-dimming preparations consisting of the sodium salt or either sulphonated rapeseed or cottonseed oil, sodium hydroxide, glycerine, sodium silicate and engine oil "F" were finally selected as superior to all others tested. Both of these proved superior to the sulphonated castor oil preparation used during the war.

A typical comparative test of several sulphonated rapeseed oil preparations, the best cottonseed oil preparation and the official anti-dim stick under unusually severe conditions is given in the tabulation.

A preparation consisting of the sodium salt of sulphonated rape oil with an excess of sodium hydroxide and a small amount of sodium silicate, glycerine and engine oil "F" was selected for final tests. The material was applied in both stick form and impregnated in a loosely knit cotton cloth. It was found that for most



SIDE OF TESTING MACHINE, SHOWING HOT AND COLD AIR CIRCULATING PUMP AND MOTOR FOR REVOLVING DISK

purposes the cloth gave a more even and permanent film.

After tests on gas masks in use under field conditions the preparation was tried on the windshields of automobiles. A shield remained practically clear after running through a dense fog for 30 minutes. One application of the material was tested by driving through a fog for about 30 minutes. Several days later it still proved effective during a light rain.

The Navy Department has tested the preparation on the pilot houses, port holes and glass bridge screens of cruisers during rains and against sea spray. It was found that the windows remained clear during the rain, although it was necessary to renew the application after each rain. When under full speed the pilot house and bridge screens are continually dashed by salt spray. Although the anti-dim at first increased visibility, the thin film of salt water dried by the sun left a deposit of salt, which after a time considerably decreased visibility through the windows and necessitated their being washed. Tests are being carried out on the lenses of range finders and other optical instruments which must be kept clear at all times. To date the tests have been very satisfactory in so far as the elimination of drops of water is concerned. Further, there has been no evidence of scratching or other injurious effects on the lens. Preliminary tests on submarine periscope lenses have been so satisfactory that 150 sticks of 100 grams each were made and will be distributed to the submarines for further tests. In its tests, the navy has used both the preparation in sticks and those impregnated on cloth. The stick form has been selected owing to the small amount of material in the cloth as compared to the large surfaces to be treated.

Improved Glass for Industrial Goggles

New Glass of Special Composition Will Stand Much Greater Impact Than Ordinary Laminated or Hardened Lenses

AT PRESENT there are two common types of goggle glass. The first is composed of two layers of glass with a film of celluloid or similar material between. The strength of the glass is not improved, but the laminated structure retards penetration of a missile after the glass is broken. However, the thickness of the double lens and the color of the celluloid reduces the light transmission of the glass, and this is objectionable.

The second method is to use the ordinary glass and harden it by a sudden uniform cooling which introduces a uniform strain. This makes it very tough. This treatment actually increases the resistance of the glass to impact or stress and has been used in the manufacture of lamp chimneys, high-pressure gage tubes and industrial goggles.

TESTS ON IMPROVED GLASS

The Bausch & Lomb Optical Co. has now developed a new glass of special composition and improved physical properties which, when properly treated, will stand much more than the ordinary laminated or hardened glass. Lenses for industrial goggles made from this special glass have stood 125 and more blows on each side from a steel ball 1.59 cm. (⅝ in.) in diameter dropped from a height of 54 cm. (21 in.). A glass which will stand ten blows on one side is considered to be satisfactory by the Bureau of Standards.

In making a comparative test, the Bureau of Standards found its regular test was not severe enough. A summary of the bureau's results is given in the accompanying table. Steel balls 1 and 1⅜ in. in diameter were dropped from increasing heights on the same side.

STRENGTH TESTS OF GOGGLE LENSES

Kind of Lens	Diameter Of Ball, In	Height, In	Average Impact, Ft.-Lb
Laminated	1	14.5	0.18
Regular or hardened	1	13 to 21.5	0.16 to 0.26
Special goggle			
Group 1	1 and 1⅜	36 to 96	1.36
Group 2	1 and 1⅜	36 to 96	1.30
Group 3	1⅜	96 and not broken	2.95

Groups 1 and 2 of the special goggle lenses were finished in a way which reduced their possible strength. In group 1 three lenses out of a group of 17 were not broken under a blow of 2.95 ft.-lb., while in group 2 one lens was not broken with this maximum blow. Group 3 shows what strength may be developed by proper handling. Only one lens was broken under an impact of 2.95 ft.-lb. which was delivered by a 1⅜-in. steel ball falling 8 ft. This is at least ten times the blow the ordinary goggle glasses will stand.

Production of Hydrogen By the Thermal Decomposition of Oil

The First of Three Articles Describing Exhaustive Experiments in Producing the Pure Gas Required by Governmental Air Services—Design, Construction and Operation of Modified Water-Gas Plant and Its Accessories

By E. R. Weaver
Chemist, Bureau of Standards

The experiments described in this article and those that will follow it were made for the purpose of determining the practicability of making hydrogen of sufficiently high purity for use in airships by the thermal decomposition of a hydrocarbon oil. The experiments were financed jointly by the Air Services of the army and the navy and were carried out at the plant of the Gas Engineering Co., of Trenton, N. J., with an existing water-gas plant which was suitably modified for the purpose of the experiments.

The method employed was essentially that of the Berlin Anhaltische Maschinenbau Aktien-Gesellschaft[1] and the good results reported by Leslie Vicroy, of the Goodyear Tire & Rubber Co., who experimented with the method during the summer of 1920, were the immediate incentive to a more complete study of the method.

General Principles of Process

This method of manufacturing hydrogen by the thermal decomposition of oil is very simple in principle. Essentially it consists merely in vaporizing a hydrocarbon oil and passing the vapors over surfaces sufficiently hot completely to decompose the hydrocarbon into its elements. The simplest way of accomplishing this, and the method employed in most of the experiments here described, is to blow air through a bed of coke, burning the resulting "blast gas" in a tower filled with checker brick, which will usually be called the vaporizer. When both coke and brick have reached the desired temperature, oil is run onto the heated brick, and the vapors pass through the column of brick and thence through the hot coke. The carbon deposited in both chambers is burned out during the next "blow" and provides a part of the fuel necessary for maintaining the required temperature.

The reactions involved in the process are almost independent of the nature of the hydrocarbon used. If any hydrocarbon is heated to a sufficiently high temperature it breaks down into simpler substances, eventually yielding hydrogen and carbon. During the decomposition methane is always produced, and it is this compound which is most difficult to decompose. The equilibrium between methane and hydrogen in contact with carbon can be represented by a curve of the general character shown in Fig. 1.

Unfortunately methane does not decompose to any considerable extent in the gas phase. This is shown by the non-luminous character of the methane flame. It is stated by Bone and Coward[2] that the decomposition of methane is a surface phenomenon exclusively, even at temperatures as high as 1,500 deg. C. Decomposition and separation of carbon take place throughout the mass of almost any other hydrocarbon, but these observers found that the carbon of methane would separate only by deposition upon a solid surface. Even under favorable conditions the rate of decomposition of methane is extremely slow. J. N. Privy[3] found it necessary to heat 22 hours at 1,200 deg. C. to approach equilibrium, and 2 hours at 1,500 deg. C. It is obviously impossible to make hydrogen commercially and to allow it hours of contact with heating surfaces. The time of contact must be reduced to a few seconds and this means that the temperature must be several hundred degrees above the equilibrium temperature corresponding to the gas composition desired. If the decomposition of methane is exclusively a reaction between solid and gas phases, its rate should be directly proportional to the area of the solid surface. The elimination of methane from hydrogen produced upon a commercial scale therefore depends upon decomposing the oil in contact with a very large surface at a very high tem-

perature; but of the three factors—temperature, surface and time of contact—temperature is by far the most important.

The excessive temperature required is the source of most of the difficulties encountered in the practical application of the method, and leads at once to something of a dilemma. On the one hand, about the only solid available at a reasonable price which will stand the necessary temperature without crumbling, sintering or taking part in undesirable reactions with oxygen, hydrogen or carbon is carbon itself. On the other hand, carbon is the one substance that might be used which it is difficult to heat to a high temperature. An inert refractory is easily heated by an oil or gas flame to a temperature of 1,600 to 2,000 deg. C. What happens in the case of carbon can be readily seen by considering a bed of coke heated by an air blast.

No matter whether carbon burns first to carbon monoxide or to carbon dioxide, the reaction between carbon monoxide and oxygen is so much more rapid than the reaction between oxygen and solid carbon that carbon dioxide is the only gas formed in large quantity so long as an appreciable amount of oxygen is present. At temperatures above 1,000 deg. C., however, the carbon dioxide reacts very rapidly and practically completely with carbon to form carbon monoxide again. The amount of heat produced in burning carbon to carbon monoxide is sufficient to raise the temperature of the products of combustion to only about 1,400 deg. C. if no heat losses occur, while the heat liberated

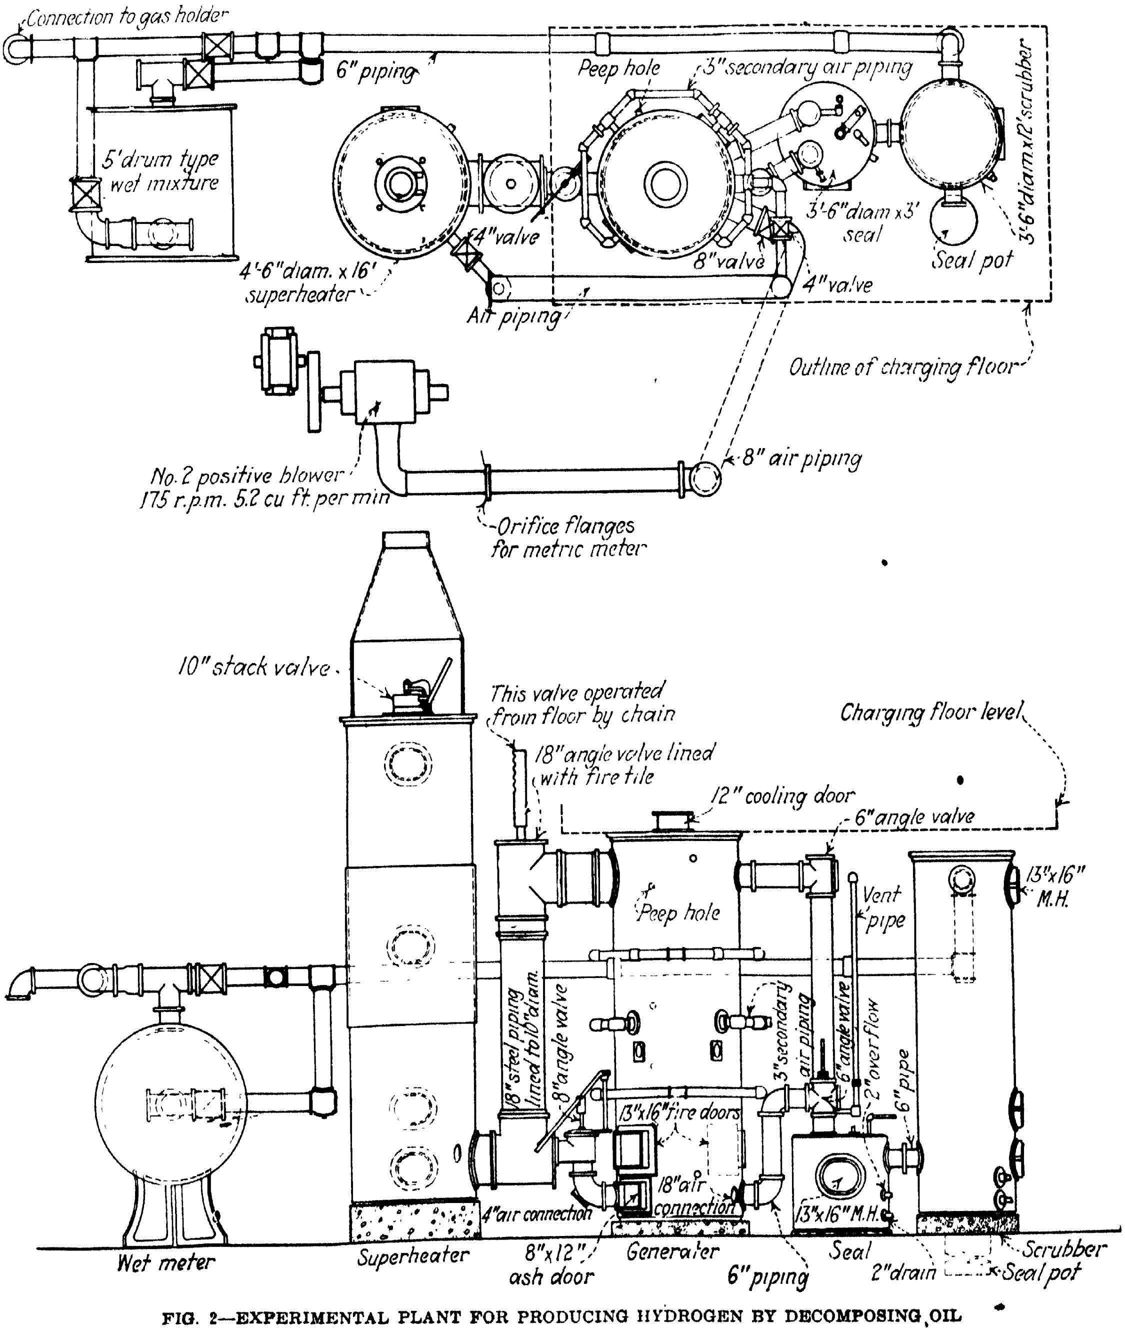

FIG. 2—EXPERIMENTAL PLANT FOR PRODUCING HYDROGEN BY DECOMPOSING OIL

in the formation of carbon dioxide is sufficient to raise the temperature of the products of combustion to about 2,500 deg. C. When air is introduced into the fuel bed at only one level, there is always a zone of increasing temperature corresponding to decreasing oxygen content in the gas stream. The maximum temperature is reached where all the oxygen is combined as carbon dioxide. Beyond that point, the temperature decreases because of the formation of carbon monoxide. It is, therefore, not merely wasteful of heat to permit unburned carbon monoxide to escape, but, in order to obtain a temperature in any region sufficiently high to decompose oil successfully, it is absolutely necessary to produce carbon dioxide in that region.

As blasting is continued from a single level and the temperature in the hottest zone increases, combustion becomes more rapid, and the width of the zone decreases to such an extent that the total heat in the coke bed available for decomposing oil may actually decrease. In order to have a sufficient depth of hot coke it is therefore necessary to introduce air at several levels at each of which the carbon monoxide formed below will be burned to dioxide. The ideal condition would, of course, be one in which air was supplied at all points in just sufficient quantity to oxidize all the carbon monoxide formed at lower levels.

The need for the checker-brick tower is also apparent. If carbon were the only solid used for heat transfer, as in the Rincker-Wolter process, it would be impossible to prevent the fuel from burning only to carbon monoxide or to prevent the blast gases leaving the plant at a very high temperature. By using the checker-brick tower it is possible to burn the blast gas completely and make it give up its heat to the brick where it is available for use.

Construction of Plant

The plant employed in the experiments consisted of a 4.5-ft. water-gas generator and two shells of about the same size as the generator, each filled with checker brick, together with blower, scrubber, meter and other accessories. The general arrangement of the plant is shown in Fig. 2. Particular attention should be called to the three sets of "secondary" inlets, by means of which air could be introduced into the generator at three levels above the grate. These inlets proved to be of the utmost importance. Without them it is practically certain that no satisfactory results could have been obtained.

It was possible to use this plant in several different ways; for example, the oil could be vaporized on either coke or checker brick and the hydrogen could be withdrawn after passage through the coke only, the checker brick only, or the coke in series with one or both of the checker-brick towers. Unfortunately, the connections were not such as to permit the sequence of operations which is later described and recommended for a large plant and which is believed to be the most efficient thermally. Several of the possible procedures were tried and the results obtained in certain unusual cases will be mentioned later; but only the method of operation described in the following paragraph gave satisfactory results, and this was the method employed in nearly all of the experiments described.

Only one checker-brick tower was employed. Air was blown upward through the generator, entered the bottom of the checker-brick tower where air was added to burn the combustible gas present, and the blast escaped through the stack valve at the top of the tower. The oil was introduced at the top of the checker brick and traversed the two shells in the direction opposite to that of the blast, the hydrogen leaving the generator at the bottom. When hydrogen of sufficient purity was no longer produced or when the generator became choked with carbon, the introduction of oil was stopped, the carbon was burned from the checker brick with air, and the cycle repeated.

Refractories. The inner linings of both generator and checker-brick tower were of fireclay blocks of good quality. The lower 3 or 4 ft. of the tower lining was protected by a layer of split carborundum brick 1¼ in. thick. At the end of the experiments, the generator lining had fused to such an extent that it would have had to be replaced if the experiments had continued. Indeed, it was the blocking of the grate by fused material from the wall of the generator lining that caused the experiments to be discontinued just when they were; but the lining of the vaporizer remained in good condition until the end of the experiments. Only the surface was glazed to a depth of a few millimeters The grate was made of 4x8-in. fireclay bars; these also remained in good condition throughout the experiments.

During the first experiments a good grade of fireclay brick was used for checkerwork. It was found that these brick had too low a melting point to permit satisfactory operation, and they were replaced, principally by silica brick. As an experiment a few special brick of several different kinds were included in the checkerwork, but all of them were less satisfactory than the silica brick.

Facilities for Observation and Control. Orifice meters were installed for measuring the flow of air to each of the four levels of the generator and to each checker-brick tower. The distribution of air to the various points was under fairly accurate control by means of these meters and throttle valves.

The oil used had to be forced into the shells, from a tank located at floor level, by means of compressed air. It was measured both by a friction-tube flow meter and by direct measurement of the oil in the supply tank by means of a glass gage and calibrated scale.

The rate of flow was governed as carefully as possible by observing the flow meter, but was necessarily subject to considerable fluctuations the effects of which are very apparent upon the curves showing the rate at which hydrogen was produced and also upon those showing the purity of the gas. The hydrogen produced was measured through a revolving-drum wet meter.

The composition of the hydrogen was recorded continuously by the thermal conductivity method, except when trouble with the sampling prevented. Analyses were also made frequently with an accurate volumetric apparatus of the Orsat type. The combustion method was generally used to determine carbon monoxide, methane and hydrogen. The carbon monoxide was occasionally determined also by absorption in cuprous chloride. All methods checked closely, and there appears to be no reason to doubt the substantial accuracy of all the important analyses.

Pyrometric Measurements. All temperature measurements of any significance in the generator and vaporizer were made with an optical pyrometer. Sight holes and

openings in the checkerwork were provided at heights of 3, 6, 9, and 12 ft. above the bottom.

Sight holes into the generator were provided at heights of about 2, 4, 6, 8 ft. above the grate. Because of obstacles which interfered with the use of the optical pyrometer, however, the holes at heights of 2 and 8 ft. were but little used. The opening 4 ft. above the grate was fitted with a stuffing box through which a 1-in. pipe with a sight cock and glass on the outer end could be rammed into the fire and the temperature of the fuel bed determined at a point at least 6 or 8 in. inside the lining. This arrangement was particularly satisfactory and it is regretted that space did not permit the use of the same device at the other sight holes.

It was the general rule, in making temperature measurements, to focus upon the hottest surface visible, since the surfaces near the shells were always cooled to some extent by radiation, and the hottest visible surface was probably never hotter than the average temperature at that level. Unfortunately, on account of smoke, no temperature readings could be made while oil was being introduced nor for a considerable time after the run. Even when the smoke had been cleared away by the air blast, the temperature observed had little significance until the porous deposit of finely divided carbon had been burned away. For that reason the frequent temperature readings taken in the earlier runs were later dispensed with and temperatures were taken for only a short time before a run.

Fuels. Two grades of oil were used, kerosene and a refined fuel oil of considerably greater density, both purchased without specification or test from the regular stock of a local dealer. As will be shown later, the composition of the oil has but little influence upon the results obtainable. Neither oil contained an important amount of sulphur. Any sulphur present is converted quantitatively to hydrogen sulphide during the reaction and is easily removed from the gas in contrast to the organic compounds of sulphur formed at the low temperatures of carburetion of ordinary water gas. Three solid fuels were tried—an ordinary gas coke, petroleum coke and retort carbon. The apparent densities of the three solid fuels in loose piles were respectively about 27, 17 and 40 lb. per cu.ft. The gas coke was used for only a few runs until it became apparent that temperatures high enough to decompose oil could not be attained without fusing the ash to a clinker almost impossible to deal with. Petroleum coke was used during most of the experiments, the retort carbon, of which only a small supply was available, being reserved for a few runs at the end.

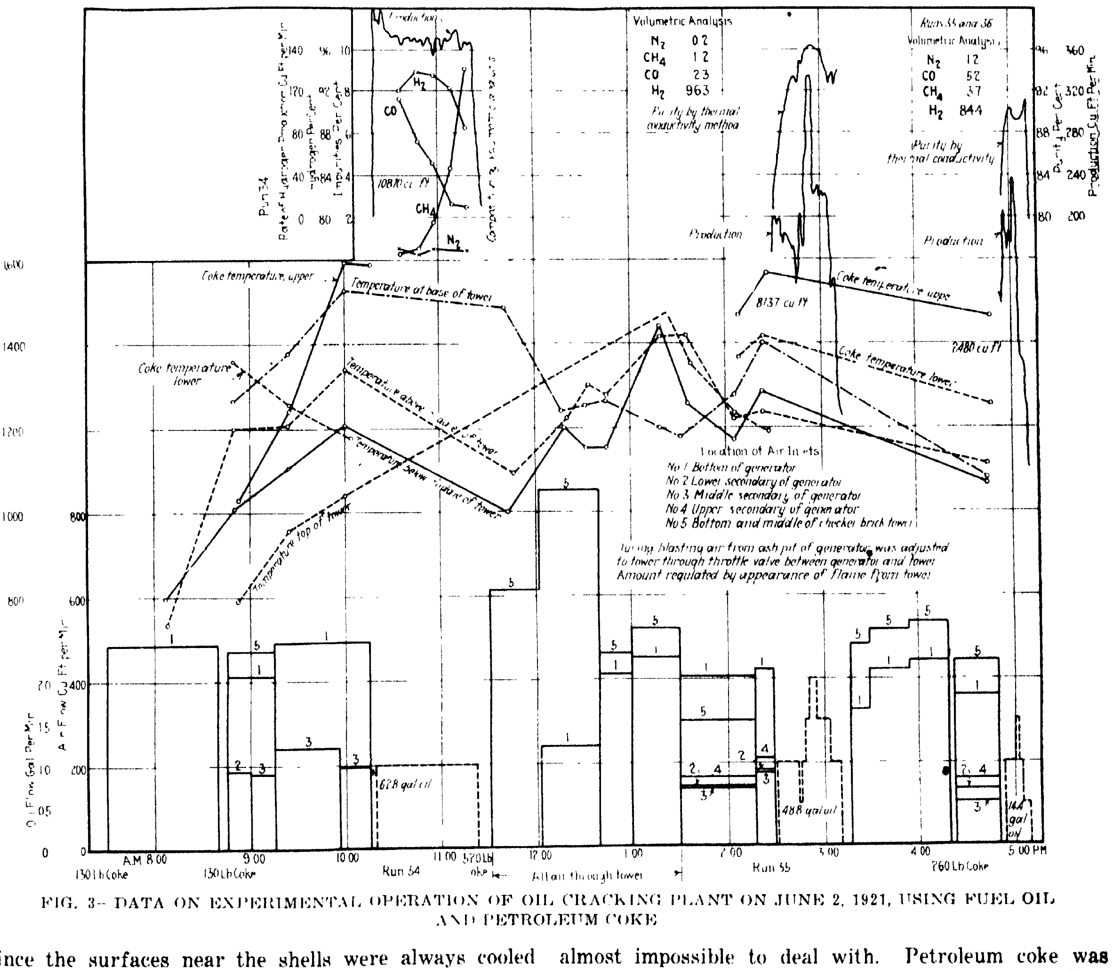

FIG. 3—DATA ON EXPERIMENTAL OPERATION OF OIL CRACKING PLANT ON JUNE 2, 1921, USING FUEL OIL AND PETROLEUM COKE

Record of Observations. The observations and all essential data taken during each experiment were plotted in colored inks on 40x50-cm. cross-section paper. A reproduction of one such sheet is shown in Fig. 3, which records the operation of the plant on June 2. The solid rectangular figures at the bottom of the sheet represent air blown into the various inlets of the generator and vaporizer; the height above the origin of the upper boundary of each rectangle represents the rate of air flow, and the area of the rectangle represents the total quantity of air delivered. Similarly the dotted

rectangles represent the rate and quantity of oil introduced into the vaporizer. The small circles connected by straight lines in the middle of the page represent observations of temperature made with the optical pyrometer. The irregular curves near the top of the sheet represent the rate of production and composition of the hydrogen made.

Details of Plant Performance

The operation of the plant as shown by the data sheet will be followed descriptively for the purpose of illustrating the methods of experimentation and control, a knowledge of which is essential to an understanding of the discussion of plant performance which follows:

On the morning of June 2, 130 lb. of petroleum coke was charged into the generator and at 7:30 the blast was started, 485 cu.ft. per minute entering the bottom of the generator, from which enough was diverted to give practically complete combustion inside the checker-brick tower (as shown by the flame at the top of the tower). At 8:40 the blast was stopped for 5 minutes while an additional 130 lb. of coke was shoveled into the generator. From 8:45 until 9 air was blown into the bottom of the generator at the rate of 408 cu.ft. per minute, into the lower secondary air inlets at the rate of 182 cu.ft. per minute, and directly into the checker-brick tower at the rate of 476 cu.ft. per minute. At about 8:50 the temperature of the lower half of the coke bed was observed to be about 350 deg. hotter than the upper, consequently the lower secondary to the generator was closed and the middle one opened to pass air at approximately the same rate. At 9:15 the direct air line to the checker-brick tower was closed to permit mixing of the blast gas and secondary air before entering the tower, and the secondary air for the checker brick was taken by bypassing a portion of that entering the bottom of the generator, the amount taken being regulated as before to give a small pale flame at the stack. This permitted 240 cu.ft. per minute to be taken into the middle of the generator. At 9:45 the secondary air to the generator was cut down to about 200 cu.ft. per minute. Observation then showed temperatures in both generator and vaporizer well above 1,500 deg. C. At 10:15 the blast was stopped, and at 10:19 kerosene was introduced into the vaporizer at the rate of 1 gal. per minute. The rate at which gas was produced is shown by the wavy line at the top of Fig. 3.

At 11:21, 62 minutes after starting, 62.8 gal. of kerosene had been used and 10,870 cu.ft. of hydrogen produced. The composition of the gas produced, as shown by volumetric analysis, is given by the four curves under the rate curve. The maximum purity obtained was 93.8 per cent 27 minutes after the beginning of the run, the impurities at that time being 5.5 per cent of carbon monoxide, 0.4 per cent of methane and 0.3 per cent of nitrogen.

The generator was then charged with 520 lb. of petroleum coke and the blast started through the checker-brick tower only, in order to burn out the deposited carbon.

The upward movement of the hot zone of carbon-dioxide formation and the sharp fall of temperature after this hot zone has passed a given level can be seen quite clearly even from the small number of temperature observations made in this case. Blowing through the vaporizer alone continued until 1:30, when the carbon appeared to be practically burned out. The blast was directed into the generator at all four levels from 1:30 to 2:29 with a change in the secondary air to the checker-brick tower at 2:17. At 2:32 oil was again turned into the machine at the rate of approximately 1 gal. per minute. The lower irregular curve at the top of Fig. 3 shows the rate at which hydrogen was produced during the run, and the upper irregular curve is the record of the purity recorder. At 2:46 the gas had attained a purity of 92.8 per cent.

Effects on Purity of Gas

If, as suspected, the principal impurity were now carbon monoxide produced at a rate independent of the rate of hydrogen production, the purity should be decreased by decreasing the rate of production. If the impurity were methane which had not been decomposed because of insufficient contact with a surface at high temperature, the purity should be improved by decreasing the rate of production. To test this point the rate of oil flow was cut to half a gallon per minute. The purity immediately dropped about half of 1 per cent, indicating carbon monoxide as the principal impurity. Without waiting to see how far this decline would go, the rate of oil flow was restored to 1 gal. per minute. The purity increased at once to 94.7 per cent. The rate was again increased to 1.5 gal. per minute. The purity again increased sharply. The rate of oil flow was increased to 2 gal. per minute, but without noticeable effect on the purity, indicating that conditions had been reached under which the effect of a further increase in rate upon methane production would more than offset its effect in diluting carbon monoxide. A sample taken at this time for volumetric analysis showed N_2 0.2, CO 2.3, CH_4 1.2 and H_2 96.3 per cent. In about 5 minutes the purity of the gas at this rate had begun to fall off appreciably, unquestionably because of the formation of more methane as the machine cooled. The rate of oil flow was cut down to 1.5 gal. per minute to check this tendency. The effort was partly successful, a decided break toward horizontal occurring in the downward purity curve. The purity continued to drop off, however, and after running 1.5 gal. for 9 minutes the rate of oil flow was reduced to 1 gal. per minute. This resulted in an immediate increase in purity of a little more than 1 per cent, followed by a gradual decline. In about 5 minutes the impurity was as great as before the change in rate. The oil was then shut off entirely, but the production of hydrogen continued for some time, the purity at first increasing as the rate of production fell off and greater time of contact cut down the amount of methane, and then decreasing as the rate fell to so low a figure that the carbon monoxide again became the dominant impurity. The decomposition of 48.8 gal. of oil in 39.5 minutes had resulted in the production of 8,137 cu.ft. of hydrogen of an average purity of about 93 per cent. Burning out the carbon from the checker brick occupied the time from 3:18 to 4:20. At 4:20, 260 lb. of coke was put into the generator, and the coke bed was then blown for 28 minutes at all levels. Observation now showed the temperatures at various places to be about 100 deg. C. lower than at the beginning of the previous run. A run was made, nevertheless, primarily to test the effect of this difference of temperature. The effect is quite apparent from the purity curve, which reached at the maximum only 91 per cent. As was to be expected from the low purities, the effect of changing rate was just the opposite of that at the beginning of the preceding run. Volumetric analysis at once confirmed the conclusion that methane was largely the cause of the low purity of the gas.

The preceding description is merely illustrative of the results obtained during 15 days' operation of the plant under many conditions. It would require too much space to give the results of all these operations in greater detail. Consequently in the articles to follow this one only the more interesting data will be presented, mostly in the form of curves showing the variations from moment to moment in the compositon of the gas produced during the runs.

Forest Products Research Carried On by Canada

The progress which has been made in forest products research in Canada is outlined in a recent bulletin issued by the Federal Department of Interior. This research work is being carried on at the Forest Products Laboratories at Montreal, and in addition special work is being conducted in a timber testing laboratory at Vancouver.

The work of the Montreal laboratories is divided into four main divisions—namely, pulp and paper, timber physics, timber tests and wood preservation.

The pulp and paper division has made detailed studies of the chemistry of Canadian woods in relation to pulp manufacture. Technical processes in the heating of pulp have been investigated. In the manufacture of sulphite pulp, experiments have been made in the penetration of cooking liquor in relation to moisture content, chips, etc. The utilization of waste sulphite liquor has been studied, also chipping, drying and baling of pulp for shipment. Other studies cover the efficiency of various newsprint splices, and the relation of humidity and temperature to moisture content of woods. Blotting paper has also been manufactured at the laboratories for the first time in Canada.

Corrosion of Rustproofed Iron and Steel

Galvanizing Is the Best Method of Protecting Against Rusting When Immersed in Fresh Water Saturated With Oxygen—Uncoated Iron and Low-Carbon Steel Corrode at About Equal Rates Under Those Conditions

By W. P. Wood
Assistant Professor of Metallurgical Engineering, University of Michigan

THE experiments and results set forth in this article are presented with the idea of supplying some further data upon the corrosion rates of some common ferrous metals when unprotected and when protected by some of the well-known rustproofing processes. This work was carried out at the instigation and with the co-operation of one of the large central power stations of the Middle West.

The main interest in this investigation was centered upon the behavior of the samples when immersed in various waters. Nothing that is stated here is calculated to have any direct bearing upon the subject of corrosion of iron and steel when subjected to atmospheric conditions. The writer believes the two types of corrosion are somewhat different and should be approached separately.

A study of the recent work upon corrosion of iron and steel reveals the fact that it is felt by most authorities upon the subject that the rôle of oxygen in producing and accelerating corrosion is an exceedingly important one. This is particularly emphasized by W. D. Richardson[1] in his exhaustive and instructive series of experiments. While studying Mr. Richardson's work, the idea occurred to the writer that it might be feasible to use pure oxygen as a constant accelerator in corrosion tests, thus accomplishing, perhaps, the results which it has been hoped by some might be reached through use of the acid tests. It is quite well recognized that an indiscriminate use of acid tests in determining relative corrosion rates often leads to erroneous conclusions. It is also appreciated that some sort of reliable accelerated test would be very useful. In all the tests hereinafter reported the waters were kept saturated with oxygen, as nearly as possible, and determinations made upon the water showed the presence of considerable entrained oxygen.

It is felt that in order to have any comparative value corrosion tests should be carried out under as rigidly controlled and uniform conditions as possible. It is also believed that too wide an application of results obtained under one set of conditions should not be made. It is just this which has led to the great confusion in corrosion work which is apparent to any one interested. For instance, data which may be entirely applicable to corrosion by immersion in slowly moving waters will not be applicable when the water is moving with a high velocity or when quiet. The results of this work are felt to be applicable in waters that are slightly agitated by a slow motion. It is not proposed that the results of this investigation will have unlimited application over a wide range of conditions.

The metals used were pure open-hearth iron, wrought iron, open-hearth steel and a steel containing about 0.21 per cent copper. Analyses of these metals are given in Table I. Each metal, uncoated, was tested in two conditions, "as received" and after receiving a rough polish upon a 200 M wheel. Most of the metal "as received" was coated with a more or less uniform amount of mill scale. The pure open-hearth iron did not possess this covering of mill scale to as marked a degree as the other metals.

The protective coatings that were investigated were those obtained by calorizing, parkerizing, sherardizing, galvanizing and an electrolytic zinc process. It was realized that calorizing is not recommended as a protection against under-water corrosion, but it was thought that it would be of interest to include this process, as aluminum is electropositive to iron and should offer much the same advantages as a rustproofing material as does zinc. The physical condition of the aluminum coating and its method of application would be important factors. Previous to coating, each sample was polished upon a 200 M wheel in order to produce uniform surface conditions for the application of the coating.

Three waters were used as corroding mediums. These were distilled water, tap water and a special boiler-feed water. Analyses of the last two waters are presented in Table II. Particular interest was attached to the behavior of the tap water, since it was obtained from a system which makes use of liquid chlorine as a purifying agent.

It was not believed that any striking differences would develop between metals coated by the same process, and therefore it was not deemed necessary to run samples of all rustproofing processes upon all the metals. The samples which were actually run may be ascertained from Table III.

The dimensions of the samples were approximately

as follows: 2 in. long, 1 in. wide and ⅛ in. thick. Each test was carried out in triplicate in order to obtain reliable results and the average value of the three used in making computations. It might be stated at this point that in no case was there any wide variation among the three check samples. Each type of sample was exposed for four different lengths of time—1 month, 4 months, 8 months and 1 year. The total number of samples in each test was therefore twelve.

The dimensions of each sample were taken by means of micrometer and steel scale, after which the total area was computed. The samples were all washed in distilled water and 95 per cent alcohol and dried for one hour at 105 deg. C. in an electric oven, being subsequently stored in a dessicator until convenient to weigh them. Weighings were made correct to fourth decimal place. After weighing, the samples were placed in the water for the designated length of time, at the expiration of which they were removed and again washed, dried and weighed as before. Rust was nearly always flocculent, non-adherent and washed off very easily. In preparing the samples for immersion the idea in mind at all times was to maintain as nearly as possible uniform surface conditions.

Some exception might be taken to the statement that weighings were correct to the fourth decimal place. This criticism might be particularly applicable to the weighings made subsequent to immersion, as it was not always possible to wash off the last trace of adherent rust from the samples. Some experiments were made to determine the relative error introduced from this source and it was found that these last traces of rust, which in many cases were mere discolorations, weighed only a few tenths of a milligram, even though they appeared quite bulky at times.

In all, about seven hundred samples were run in this series of tests. The great difficulty involved was in keeping track of each sample during the entire process. Each sample was stamped with a number as soon as it was cut from the original stock. "As received" samples were stamped lightly, in order to avoid a tendency for corrosion at that point. Polished and coated samples were stamped more deeply, as the marks were subsequently nearly obliterated by the polishing and rustproofing operations. It was observed that in only a few instances did this number cause excessive local corrosion and even then the difference in weight was very slight when these samples were compared with their checks which had not exhibited the excessive corrosion around the number. Such facts all

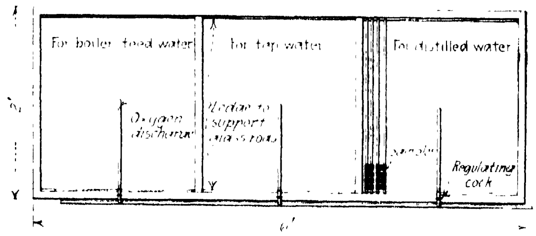

FIG. 1—SKETCH OF TANK USED IN CORROSION EXPERIMENTS

demonstrate the great importance of uniform surface conditions in corrosion phenomena.

APPARATUS

Before describing the apparatus by means of which the corrosion tests were carried out, it will probably be advisable to review some of the conditions which are known to effect corrosion and which must be taken into account in carrying out corrosion tests. These conditions were obtained from a study of the work of other investigators, more particularly the work of Heyn and Bauer.[2] In all there are about twenty-one factors[3] that influence corrosion, but the five enumerated below were considered of the most importance. They are:

1. Rise in temperature of the corroding liquid usually increases rate of corrosion.

2. An increase in depth of immersion decreases corrosion.

3. An increase in the exposed surface of the liquid increases corrosion.

4. Chemical impurities in the liquid increase the action.

5. The corrosion is usually in direct ratio to the amount of liquid present.

Most of the variables may be partly eliminated in the following manner: (1) Use same amount of liquid, (2) run tests at same temperature, (3) use same depth of immersion, (4) use pieces of metal from same stock piece. In building and locating the immersion tank the conditions enumerated were kept in mind.

A diagram of the tank used will be found in Fig. 1. As will be seen it is a three-compartment tank, 6 in. deep, built of 1-in. lumber. A narrow strip of wood was fastened around the inside of each compartment 4 in. from the bottom to support the glass rods, which

[3] A. F. Wendler. An unpublished manuscript on corrosion.

in turn supported the samples. Commercial oxygen was supplied by tanks and was brought into each compartment through a steel pipe manifold and glass delivery tubes; its flow was regulated by a rubber hose connection and a stock cock. Oxygen was regulated in such a manner that about one bubble per second rose from each delivery tube. This bubbling produced a slight but constant agitation of the water in the tank. A space about 6 in. square was left in the center in which no samples were placed.

Since it has been shown that light has an effect upon rate of corrosion, each compartment of the tank was supplied with a tight-fitting wooden cover. These covers also prevented objects from falling upon the samples and, most important of all, maintained the atmosphere over the surface of the water much richer in oxygen than normal, a condition maintaining a more uniform and larger concentration of oxygen in the water. Table II gives data on the amount of oxygen carried in one test. No doubt the concentration varied largely at times.

Samples were laid flat in order to eliminate the variations in corrosion rate by varying depths of immersion. A depth of 2 cm. of water was maintained over the upper surface of the samples. Evaporation losses were made up by occasional additions of pure distilled water. In placing samples in the tank care was taken to make a uniform distribution in order to offset any local conditions obtaining in various parts of the tank.

The tank was placed in a room where the average yearly temperature variation was not over 15 deg. F. from the average yearly temperature of 70 deg. F. The tank never received the direct rays of the sun; moreover, the sun shone in the room only a short time during each day.

The flow of oxygen was kept practically constant over the entire year. There were, of course, some unavoidable breaks occasioned by leaks in the delivery system or in the valves on the oxygen tanks. On the average one tank of oxygen would last about 3 weeks.

Results for Uncoated Metals

Results are presented in Table III, which give total losses for the periods noted. Rate of corrosion may be had by dividing those figures by 30, 120, 240 and 360 respectively.

During the first few months of the test nearly all of the samples were corroding at a more rapid rate than they were during the last months of the year. This is probably due to the accelerating effect of the oxygen being gradually overcome by the formation of a protective coating of flocculent rust which does not entirely inhibit corrosion but regulates its rate. There seems to be no evidence that the composition of the water has any general effect in bringing about this primary acceleration.

It is seen that all four metals are corroding at not widely varying rates at the end of the year, the point of interest lying in the fact that the open-hearth iron is corroding more rapidly than any of the others about 80 per cent of the time. This is in accordance with the observations of Richardson, and is due to the large amount of oxygen present.

Wrought iron and steel corrode at about the same rate under the circumstances here present. The writer feels that this is about the situation which will be found generally where these two metals are concerned.

There is some difference in the corrosion phenomena between the polished and unpolished samples. The majority of the "as received" samples corrode more slowly at first than the polished samples, probably due to the protective skin of oxide. This effect is transient and at the end of a year the samples are all corroding at about the same rate and have similar surface conditions.

Samples in tap water were watched with interest on account of the chlorine content of the water, but the effect of the chlorine is apparently not very pronounced. It seems to accelerate corrosion of wrought iron, but it is believed that the increased corrosion would not be large.

Whether the introduction of a few tenths of 1 per cent of copper will suppress corrosion of iron and steel when immersed in water is still being debated in some quarters. As far as results of these tests are concerned the copper does not appear to affect the corrosion in any way. In general, small variations in the composition of iron and steel are practically without effect as influencing corrosion by immersion.

Probably the most vital thing to be observed in corrosion experiments is the tendency toward pitting. Loss in weight provides a means for comparative study, but the pitting tendencies of a metal are what determine its actual value. This point is stressed by most authorities upon the subject. An examination of the uncoated samples in this investigation failed to establish any notable differences in this respect among the four metals tested. The only statement which can be made is that the samples immersed in tap water (which, it is remembered, carries dissolved chlorine) showed slightly more tendency to form pits than the samples immersed in the other waters.

Rustproofed Samples

Calorized Samples.—Calorized samples acted in a very erratic and unexpected manner. All the samples with the exception of those in boiler feed water showed a gain in weight for 4 months. After that an appreciable loss in weight began. The preliminary gain was probably due to the oxidation of aluminum upon the surface of the samples.

After 8 to 12 months' immersion the samples showed very noticeable evidence of corrosion, the weight in most cases approaching or becoming less than the weight of the original sample. Great variations in this respect were noted. The most serious aspect of this corrosion was a very pronounced tendency toward pitting. This is no doubt due to the uneven surface of the calorized metal.

While the results of this investigation did not indicate a very desirable behavior of calorized metal when immersed in water, there were certain aspects which would lead to the conclusion that if the aluminum coating could be smoothly and evenly applied, it would furnish an excellent corrosion-resisting surface.

Sherardized Samples.—Sherardized samples all showed a more or less steady increase in the rate of corrosion, but the corrosion was less marked in distilled water. Corrosion was extremely localized—not one sample showed an even corrosion all over its surface. Rust would soon perforate the sheet or pipe which had been thus "protected."

Galvanized Samples.—These samples showed much the best resistance to corrosion. At first they lost weight as rapidly as the other rustproofed samples, but

afterward the rate of corrosion became constant and very slow. The most important thing in connection with these samples was this: Careful examination failed to reveal any evidence of local action or pitting. In fact the samples which were immersed for a year did not give any visible evidence of the long immersion.

Electrolytic Zinc Process.—Next to the galvanized samples, these exhibited the best average results. At first corrosion was not very marked, but about half the samples speeded up after the first 6 months. At the end of a year some of the samples were corroding very rapidly and the protective coating had disappeared over large areas. Corrosion appeared to start over much broader areas than in sherardized samples. No serious tendency toward pitting was observed.

The Parkerized samples exhibited erratic behavior similar to that evidenced by the calorized samples. Some samples showed steadily increasing and very decided corrosion. Others were nearly as good as galvanized metal. In some the dark-colored coating had entirely disappeared. However, there was no tendency toward pitting.

It was very evident that large variations were present in the thickness and character of the coating. If these conditions were investigated and uniformity established, it is possible that this coating might have a distinct value, under some circumstances, as a protective coating for iron and steel articles when immersed in water.

SUMMARY

1. The presence of oxygen apparently causes an exaggerated initial corrosion in iron and low-carbon steel.

2. The presence of a small amount of chlorine in tap water causes a slight but not serious increase in corrosion rates of immersed metals.

3. The composition of iron and steel does not affect noticeably the corrosion rate when metal is immersed in water. This applies particularly to the presence of copper.

4. Different surface conditions of a metal tend to become equalized over a period of time and the corrosion rate to become steady and uniform when the metal is in the presence of large amounts of oxygen.

5. The presence of large amounts of oxygen does not appear to increase the tendency toward pitting in a corroding piece of iron or steel.

6. Galvanizing seems to offer the best means of preventing the corrosion by immersion of iron and steel.

New Type Vertical Retort

A new style construction of the Glover-West vertical retort has been prepared in the course of the reconstruction of eighty vertical retorts at the Belfast, Ireland, plant. The *Gas Journal* (London), of March 28, page 821, describes the modified form as follows: "The retorts will be increased in length by the addition of a steaming chamber at the base. In this chamber, which takes the form of an enlargement of the retort section, the steam, introduced for the purpose of water-gas generation in the retort, is raised in temperature, at the expense of the residual heat of the coke, to that necessary for the water-gas reaction. By the adoption of the new principle, the yield of gas in this installation will be increased by 2 million cu.ft., and the labor cost per setting, remaining constant, will be correspondingly less per 1,000 cu.ft. of gas made."

Of the Chicago Bar

Demurrage Charges Held to Be Taxable

Are Part of Payment for Transportation, Though Made Primarily to Discourage Detention of Cars

In two cases, the Procter & Gamble Co. versus United States and the Buckeye Cotton Oil Co. versus United States, the Federal District Court held that demurrage charges for failure to load and unload cars within the "free time" permitted by the rules of railroad companies were taxable as a part of the charge for transportation, under the revenue acts of 1917 and 1918 imposing a tax on the amount paid for transportation, since "demurrage" is a terminal charge, a part of the charge for transportation, even if the purpose of demurrage is primarily to prevent the detention of cars.

The cases arose under the revenue acts, title 5, sections 500-503, of the act of 1917, and title 5, sections 500 to 502, of the revenue act of 1918, imposing a tax on the amount paid for transportation, and involved the question of whether demurrage charges to load and unload cars within the "free time" permitted by the rules should be included as part of the cost of transportation and thereby subject to tax. Article 2 of regulation 49 provided that the word "transportation," as used in title 5 of the revenue acts mentioned, included "receipt, delivery, elevation, transfer in transit, ventilation, refrigeration, icing, storage, demurrage, towing, lighterage, trimming of cargo in vessels, wharfage, handling of property transported, feeding and watering live stock, and other incidental services and facilities." Plaintiffs contended that a charge for demurrage was not taxable as a part of the charge for transportation. (281 Federal 1014.)

Insufficient Memorandum of Sale

Rules Set Forth Relating to Correspondence and Oral Evidence Under Statute of Frauds

Controversy over a sales contract between the Western Metals Co., of Cleveland, Ohio, and the Hartman Ingot Metal Co., of Chicago, emphasizes some valuable information to buyers and sellers. The former brought suit against the latter and obtained judgment, but this has been reversed by the Appellate Court and then affirmed by the Supreme Court of Illinois, 303 Ill. 479.

On Nov. 2, 1918, the presidents of the two corporations met by chance in Cleveland in the office of a mutual acquaintance. There was some talk then regarding a sale by the former to the latter of a quantity of scrap brass. Following this conversation the former sent the latter a confirmation of a sale upon a printed blank for 25 tons of red brass borings at 20c. per lb. and 25 tons of clean light brass at 13c. per lb., calling for shipment within 3 months with regular terms. In response to this the Ingot Metal Co. sent a letter refusing to accept any shipments of metal until such time as notice was given, owing to a badly congested condition at the plant. On Nov. 11 the Western Metals Co. asked the alleged buyer to notify it when conditions would make a ship-

ment possible. No reply was made to this letter. On Dec. 4 the claimed seller again wrote the alleged buyer advising that it was shipping 50 tons scrap covered by the contract. The buyer wired that it would refuse to accept the shipment. On the same day it notified the seller by letter that it would under no circumstances receive any materials until it had notified seller to make shipment.

On Dec. 9 the seller replied by saying it would comply with the request for a short time, but would not withhold shipment much beyond Jan. 1. On receipt of this letter the alleged buyer replied that no shipments were to be made until specific instructions were sent to that effect. On Jan. 3 the seller requested shipping instructions at once. Four days later the alleged buyer replied as follows:

"On account of the government canceling orders on all purchases they have made, we are likewise canceling all written orders we have given our trade. We might have given you a verbal order, and this would be under the same ruling as all written orders we have given others."

Following receipt of this letter the Western Metals Co. began suit in Chicago for breach of contract. The Hartman Ingot Metals Co., defendant, pleaded the statute of frauds of both Ohio and Illinois and denied liability generally. A jury returned a verdict for $4,500 in favor of the seller and judgment was rendered thereon. The higher courts have now reversed this judgment.

Statute Requiring a Writing

That an oral contract of sale was made in Cleveland by the presidents of the opposing corporations was established by the jury and the judgment of the trial court. But the appellate courts found that the action was barred because of the provisions of section 4 of the uniform sales act, commonly called the statute of frauds. This section provides:

"A contract to sell or a sale of any goods . . . of the value of $500 or upward shall not be enforceable by action . . . unless some note or memorandum in writing of the contract or sale be signed by the party to be charged or his agent in that behalf." Hurd's Rev. Statutes, 1921, page 2855.

The seller contended that this sale of brass was not within the statute and therefore the law applied was erroneous. The court said it was not necessary, in order to take the contract of sale out of the statute, that there be a formal written contract, nor is it necessary that the written memorandum be complete in one writing. It is now established that a complete contract, binding under the statute of frauds, may be gathered from letters, writings and telegrams between the parties relating to the subject matter of the contract and so connected with each other that they may be fairly said to constitute one paper relating to the contract, though only one of the writings may be signed by the party to be charged.

No particular form of language is necessary to constitute the memorandum requisite to satisfy the requirements of the statute. Any kind of a writing, from a solemn deed down to mere hasty notes or memoranda, from which the intention of the parties may be gathered, as in other contracts, will be sufficient.

It is equally well established, says the court, that the signed writing or writings must refer expressly to the other writing, or the several writings must be so connected, either physically or otherwise, as to show by internal evidence that they relate to the same contract. (32 L. R. A. 127.) A paper signed by the party to be charged cannot be incorporated in a paper not signed by him by a reference in the latter. The signed paper must refer to the unsigned paper in clear and distinct terms. (27 Corpus Juris, 263.)

Oral evidence is inadmissible to connect the several papers or show that they relate to the same transaction. Oral evidence can only bring together the different writings, it cannot connect them. They must show their connection by their own contents. The connection must be apparent from a comparison of the writings themselves. (25 Ruling Case Law 680.)

What Oral Evidence May Show

After the several writings connect themselves together into one complete memorandum, parol proof is proper to show that the several writings apply to the subject matter of the suit, and not to some other sale. This is equally so in case the complete memorandum is contained in one writing. The rule with respect to the admission of parol proof is the same, whether the memorandum is to be found on one paper or on several papers which connect themselves together. The wisdom of the rule forbidding the use of oral evidence to show the connection between the several papers is apparent, says the court.

On this point it says: "If it is necessary to use oral evidence to show that the papers are parts of one contract of sale, then the contract becomes partly oral and partly written and we have then introduced all the mischiefs which the statute of frauds and perjuries was intended to prevent. The line must be established somewhere, and that line has been wisely established at a definite point. If we break across this line and permit the use of some oral evidence to connect the writings, then we introduce into the law confusion and uncertainty, because no one will know how much oral evidence will be permitted to join the several writings in a given case."

Going over the correspondence in the case at bar, the court said such admitted the existence of a contract of the sale. That this sale was made was not questioned in the Supreme Court. The question presented was whether this correspondence makes out a memorandum of this contract of sale, complete in all its terms, and signed by the buyer. The court found that the letters nowhere made the slightest reference to the confirmation, nor did the buyer ever admit the confirmation correctly stated the terms of the contract. Conceding that its letters admit the existence of the oral contract sale, there was nothing in the letters, nor in any paper to which the letters refer, that states any of the terms of the contract, says the court.

Finally, it is unquestionably the law that the memorandum upon which it is sought to charge a party to a contract must state the contract with such certainty that its essentials can be known from the signed writing, or by some reference to parol proof to supply the essential elements of the contract or to supply the connecting links between the signed writing and some other writing or writings.

In this case the correspondence offered in evidence did not meet these requirements, and the court so found, affirming the Appellate Court judgment which had reversed the trial court judgment for the seller.

Materials and Accessories for Chemical Industries

Gasoline Shovel

The Pawling & Harnischfeger Co. of Milwaukee has brought out a 1-yd. gasoline shovel mounted on corduroy traction, which should have a wide application in shovel work. Shovel users will be interested in this new machine, because it is one-man operated, does away with fuel and water hauling and starts and stops instantly without requiring overtime work for firing.

This shovel is similar in design to ¾-yd. machine that was brought some

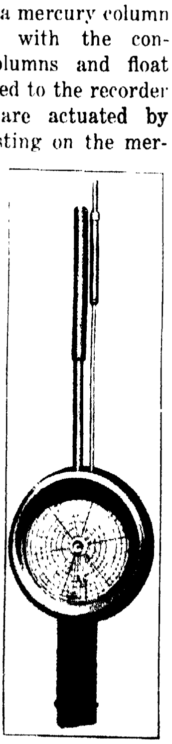
NEW 1-YD. SHOVEL

years ago by the Pawling & Harnischfeger Co. and that is in use all over the United States. One of the principal features of the gasoline shovel is its crowding motion, which has proved successful on the ¾-yd. machine. The pinion on the shipper shaft is driven by a heavy steel chain from a set of planetary gears mounted in the forward drum of the machine. This mechanism can shake the dipper very rapidly, which is extremely necessary when operating in clay. It also can force the dipper into the toughest soil.

This machine can be used with dragline bucket, clamshell, pile-driving rig or crane hook. The Aluminum Co. of America, American Agricultural Chemical Co., Lincoln Clay Products Co., American Brass Co. and many industrial companies are using these machines with good success. Like the smaller machines, it is built throughout in a thorough manner, being made principally of steel; forged alloy shafts being used for heavy duty parts. Gears are all of steel with cut teeth. The traction is one of the most important parts of the machine and is of heavy construction. The track links are of single piece special steel castings joined by alloy steel pins. There are two pair of driving and idler sprockets on each machine and the corduroys are non-cloggable even in the heaviest going.

Economy Recorder

The Uehling Instrument Co., Paterson, N. J., has developed and placed on the market a new combined barometer and vacuum recorder primarily for determining (1) the absolute back pressure in steam turbine and condensing plants, (2) the barometric pressure, (3) the condenser vacuum, (4) the existence of air leakage into the condenser, etc., and (5) the ability of the condenser to handle the load. This combined recorder consists merely of two float chambers, one of which is connected with a barometric mercury column and the other with a mercury column in communication with the condenser. These columns and float chambers are secured to the recorder case. The pens are actuated by means of floats resting on the mercury in the two chambers. The movements of the floats correspond exactly to the changes in barometric pressure and in vacuum



The measurement of barometric pressure and vacuum by means of mercury columns is standard for power plant testing, and therefore the readings of the combined barometer and vacuum recorder are at all times accurate and reliable. There is no necessity for calibrating the recorder against mercury column testers as is customary with instruments utilizing diaphragms, tube springs and multiplying lever mechanisms.

The recorder draws automatically and continuously the barometer and vacuum records on the same chart. The barometer record is used as a base line for reading the absolute back pressure directly off the chart. As long as the two curves, barometer and vacuum, vary simultaneously and proportionately, everything is as it should be. However, should the vacuum fall when the barometer remains constant, either considerable air is leaking into the condenser or the condenser is not able to handle the load.

By means of the recorder chart the operator is at all times able to ascertain whether his turbine or condenser is operating as efficiently as it should, and to know whenever air is leaking into the system, thereby impairing the vacuum and causing an unnecessarily high turbine steam consumption. The existence of air leakage is instantly revealed, and thus can be located and eliminated by the operator before an appreciable waste or heat loss is incurred. The instrument records any part of the total range of 0 to 31 in. Vacuums from 25 to 31 in. and the corresponding absolute back pressures, or vacuums from 20 to 31 in., etc., may be recorded with great accuracy over nearly the full face of the chart, the remainder of the chart being used for recording, on a contracted scale, the lower vacuums down to atmospheric pressure.

Catalogs Received

STURTEVANT MILL Co., Boston, Mass.—Catalog 77H, descriptive of the Sturtevant Moto-Vibro Screen, an inclined vibratory screen, featuring the different ways which this can be installed.

STURTEVANT MILL Co., Boston, Mass.—Booklet. Description of the Sturtevant Acidulating Unit installed at the Armour Fertilizer Works, Columbus, Ga.

LOUIS ALLIS Co., Milwaukee, Wis.—Catalog on the Watson Multi-Speed Motor, a motor which operates on a polyphase alternating current having adjustable speed through field control over a range of from two to four speeds.

Book Reviews

Books on Mineral Resources

Two excellent booklets have recently been published by our English cousins, books that will prove welcome to all who have interest in the sources and statistics of metal and mineral production. One is printed by the Imperial Mineral Resources Bureau (H. M. Stationery Office, London, 218 pages, price 4s. 3½d.), and presents a digest of statistical and technical information relative to the production of silver, especially during the war period (1913-1919). It is one of a long series of such tracts recently published. Turning its pages one is struck with the evident care used in its compilation and the comprehensiveness and conciseness of the volume.

No less valuable should be the monograph on Copper Ores, written by Robert Allen and published by the Imperial Institute (published by John Murray, Albemarle St., W., London; 220 pages, price 7s. 6d.). This is one of a series published by the Institute giving a general account of the occurrences and commercial utilization of the more important minerals.

EL ARTE DE LOS METALES. Translated, from the Spanish of *Alvaro Alonzo Barba*, by *Ross E. Douglass* and *E. P. Mathewson*. New York: John Wiley & Sons, Inc. 288 pp. illus. Price $3.50.

The eminence of Dr. Mathewson in the profession of metallurgy will tend to enhance the popularity of this translation, made in collaboration with Ross E. Douglass, of what is recognized as the oldest published treatise on American metallurgy. Barba, the author, was at one time an ecclesiastic at Potosí, Bolivia—noted during many centuries for its fabulously rich silver mines; the book was first published in Spain in 1640. Translations, into English, French and German, have been made at various dates, but these are incorrect, inaccessible and lacking in a proper interpretation of the technology of Barba's day. Students of metallurgy, particularly those who have followed the history of mining in South America, should be grateful to the translators, both of whom are unusually well qualified to present an English version without mutilation of the original sense.

Book I discusses "The Manner in Which Ores Are Begotten, and the Things That Accompany Them." In it are described such considerations as the smell and taste of earths, and their recognition thereby, a defence of the opinion that sulphur and mercury are the components of metals, and sundry other quaint arguments and views. Book II deals with the amalgamation of silver and gold ores; Book III, the treatment by cooking (pan amalgamation); Book IV, the reduction of ores by smelting, and Book V describes the practice of refining and parting. The greater part of the treatise, therefore, forms a thesis on a subject in which the author had gained much experience and formed sundry basic conclusions, many of which were in error and not a few were influenced by religious views. The translators have peppered the English version with comments, in brackets, which will prevent the metallurgically uninitiated from accepting too readily many of the conclusions. The volume is illustrated by several informative cuts that show the equipment used by metallurgists in the seventeenth century and thereabouts. It should find a place in every library of mining and metallurgical works of reference, as a record of what was being done and the standard and practices of technology in those far-off times.

A. W. ALLEN.

TECHNICAL ANALYSIS OF STEEL AND STEEL WORKS MATERIALS. By *Frank T. Sisco*. McGraw-Hill Book Co., Inc., New York. 6x9¼ in., 543 pp., with 28 illustrations in the text and 26 tables. Price $5.

Of all the branches of analytical chemistry, the analysis of steel undoubtedly has received the greatest amount of attention, judging from the large number of books already published. To write a book of any considerable novelty is a matter of some difficulty. However, the author has produced a book which marks a distinct departure from the manuals of steel analysis previously published.

This book is written from the standpoint of the rapid and accurate analysis of steel and steel works materials for commercial purposes.

The first quarter of the book, Part 1, is devoted to the design, equipment and operation of the laboratory. It is the first adequate discussion of these topics from a practical standpoint that has come to the attention of the reviewer and is a distinct contribution to the literature of the subject. The chapters on "The Qualifications and Selection of Laboratory Employees," "The Organization and Efficient Operation of the Steel Works Laboratory," and "Errors in Routine Analysis and Their Control" will be of considerable interest to those who have charge of laboratories, and valuable to beginners in such positions. The chapter on "Record Keeping and Costs for Steel Works Laboratory" will prove of considerable assistance in those laboratories where such matters are too frequently neglected.

Part 2 deals with "The Analysis of Plain and Alloy Steels." The methods as a whole are well selected and carefully worked out in detail. The chapter on "The Determination of Carbon in Plain and Alloy Steels" is excellent.

Part 3 is devoted to "The Analysis of Steel Works Materials" and includes the analysis of pig iron, cast iron, the ferro-alloys, ores, fluxes, refractories and slags.

The English in a few places is a little "sloppy," as "a new 5-gal. bottle syphoned from a carboy of solution." In standard works previously published, Ehrlenmeyer is invariably capitalized, likewise Meyer and Gooch. The author always uses the above terms uncapitalized, and yet capitalizes Nesbitt. It would be preferable to adhere to the standard practice in such matters.

This book is commended to the attention of university and college professors teaching analytical chemistry. Students who contemplate entering the field of metallurgical work should read this book. The rapidity and accuracy with which work is done in a steel laboratory will be quite a revelation to them.

Superintendents and managers in steel works would be considerably enlightened, doubtless, by reading Part 1.

G. W. WALKER.

Metallurgical Transactions

JOURNAL OF THE INSTITUTE OF METALS, vol. 28. Edited by *G. Shaw Scott*. The Institute, 36 Victoria St., London, S. W. 1; 1,008 pages. Price to non-members, 31s 6d.

JOURNAL OF THE IRON AND STEEL INSTITUTE, vol. 106. Edited by *George C. Lloyd*. The Institute; and Spon & Chamberlain, 123 Liberty St., New York, 457 pages. Price, $9.50.

These publications are much alike in general plan. Each gives over about half its space to abstracts of current technical literature in its respective field. The first half of each book is occupied with the papers read before the fall meeting, together with contributed discussion. Both institutes are now paying a great deal of attention to the advanced phases of physical metallurgy, metallography and the properties of heat-treated alloys—the Institute of Metals even more than the older association. It is an interesting speculation whether this is a true reflection of the weight of importance which the "practical" and "theoretical" aspects of the art are held by the members of societies, or whether it is only an evidence that the advanced students find more time and urge to write about their doings than the ambitious operator.

At any rate, either type of man will find great stimulation in many articles in both books. By that same token the books will not be overly interesting to the rule-of-thumb operator. But even the chemical engineer can find much to interest him. Thus, the May Lecture of the Institute of Metals was by Sir Ernest Rutherford, on "The Relation of the Elements," which dips even as deep as the structure of the atomic nucleus.

The other volume contains a paper by J. H. S. Dickenson with this imposing title: "Some Experiments on the Flow of Steels at a Low Red Heat, With a Note on the Scaling of Heated Steels." In it, and its appended discussion, will be found some very interesting history of the Claude synthetic ammonia process—how they tried first one metal, then another, each catalyzing tube following the other out through the roof in fragments until the proper alloy was finally discovered.

E. E. THUM.

Synopsis of Recent Literature

Solder for Aluminum*

Most of the metals commonly used in solders, except magnesium, are electropositive to aluminum, so that any metals used in making a soldered joint of aluminum act electrolytically in the presence of moisture as positive galvanic poles, accelerating the corrosion of the aluminum. Magnesium cannot be utilized advantageously even though it is electronegative to aluminum, because the metal disintegrates rapidly in the presence of moisture. Soldered joints of aluminum which are to be exposed to moisture should be protected against corrosion by a paint or varnish.

Various compositions of zinc-tin and zinc-tin-aluminum solders give the best results. The tensile strength of a good aluminum solder is about 7,000 lb. per sq.in., for those with higher tensile strength have, in general, their temperature of complete liquation too high for soldering purposes. As a rule the strength of an aluminum-soldered joint depends upon the type and upon the workmanship.

*Abstract of circular of Bureau of Standards, No. 78. The complete paper may be purchased from the Superintendent of Documents, Government Printing Office, Washington, D. C. Price, 5 cents.

Pulsations in Gas Flow

For the purpose of studying the nature of pulsation and to discover some practical means of reducing or eliminating it or of compensating for its effects on the devices used for measuring fluid flow, a joint investigation was undertaken by Ohio State University and the A.S.M.E. The results are reported in a paper in *Mechanical Engineering* for April, 1923, by Horace Judd and Donal B. Pheley.

The investigation was confined to the venturi meter, the orifice, the flange nozzle meter and the pitot meter, using air flow from a small compressor discharging into a 3-in. line.

The apparatus used for this investigation was chosen with great care and the experiments were conducted so carefully that the authors regard it as highly probable that the basic principles established would be fundamental for gas, steam and water as well as air and also for other sizes and kinds of installations.

The conclusions reached as a result of the investigation may be summarized as follows:

NATURE OF PULSATIONS

a. Pulsations in a pipe line, originating from a reciprocating system, or a similarly disturbing system, consist of sudden changes both in the velocity and in the pressure of the fluid.

b. The pressure change is the most apparent and is probably the greatest factor in producing errors in metering devices.

c. The pressure change is in the form of a wave front resembling a traveling sound wave of low frequency.

d. The pressure wave travels in the pipe with the velocity of sound.

e. The velocity of the pulsation is independent of the velocity or quantity of fluid flowing.

f. Pulsations in air flow are similar to the compression waves set up by water hammer. Both travel at the velocity of sound in the fluid and are independent of the velocity of flow.

g. The effect of this pulsation on a flow meter is to increase its reading, often causing an error of great magnitude. The magnitude of this error depends upon the frequency of pulsation, nominal static pressure of the fluid, type of meter used and adjacent fixtures in the pipe line.

h. With orifice meters and flange nozzle meters the pulsating error increases as the diameter of the orifice, or nozzle, approaches the diameter of the pipe.

i. The throttling or modification of the manometer connections to the meter does not appreciably reduce the error.

j. The point of attachment of manometer connection has no great effect on the error due to pulsating flow.

k. The pulsation error at the center of the pipe is 35 per cent less than that at the wall of the pipe.

l. A meter on a "dead-end" connection will usually show a positive error of considerable magnitude.

m. The pulsation must be eliminated or greatly reduced in order to have the meter read without objectionable error.

PRACTICAL ELIMINATION OF PULSATIONS

n. Because of the high velocity of the pulsation, an excessive length of pipe line would be necessary to destroy the pulsation.

o. Throttling is effective but requires a pressure drop of 6 in. of mercury to reduce the error to 5 per cent.

p. Abrupt volume enlargements in the pipe line will eliminate the error, if of sufficient capacity. A volume capacity of 20 cu.ft. is required for an error within 2 per cent.

q. Generally speaking, for the same capacity, a volume of relatively large diameter is more effective than one of small diameter.

r. No relation was found between the compressor displacement and the capacity of the volume chambers.

s. The combination of throttling with volumes forming the "muffler" device probably is the most effective device for the mechanical elimination of pulsations.

t. The pulsating bag, or diaphragm, and the fan, or revolving baffles, are partly successful in eliminating the pulsations, but their installation is thought to offer serious practical objections.

u. The effectiveness of any of these quieting devices seems to depend upon their ability to dissipate or change the energy of pulsation, which is effected chiefly through a drop in pressure.

v. The device that will destroy the pulsating energy with the least obstruction to the flow of the fluid is the most desirable.

w. The effectiveness of the meter element itself in quieting the pulsation depends upon the degree of restoration of the pressure beyond the meter. The greater the percentage of restoration the higher the percentage of error shown for any given type of meter.

ADJUSTMENT OF ERROR OF PULSATION

x. It is probably not feasible to correct any meter by means of a correction factor owing to the disturbing effects which may arise from slight changes in the installation and running conditions.

y. The experimental establishment of a pulsating correction factor and its relation as shown in the formula proposed in the complete paper is not considered feasible with our present experimental knowledge of the laws of pulsating flow.

z. It seems probable that each installation where pulsating flow is pres-

Important Articles In Current Literature

More than fifty industrial, technical or scientific periodicals and trade papers are reviewed regularly by the staff of *Chem. & Met.* The articles listed below have been selected from these publications because they represent the most conspicuous themes in contemporary literature, and consequently should be of considerable interest to our readers. Those that are of unusual interest will be published later in abstract in this department; but since it is frequently impossible to prepare a satisfactory abstract of an article, this list will enable our readers to keep abreast of current literature and direct their reading to advantage. The magazines reviewed have all been received within a fortnight of our publication date.

MAKING ALCOHOL FROM WASTE MOLASSES. D. Jessurun. *Sugar*, April, 1923, p. 173.

USE OF CALCIUM CHLORIDE AS A PROTECTION AGAINST FREEZING CONCRETE. P. Cottringer and H. S. Kindel. *Concrete*, April 1923, pp. 150-156.

LA VISCOSE. SA PRÉPARATION ET SES PROPRIÉTÉS. André Graire. *Chimie et Industrie*, March, 1923, pp. 454-162.

LA THEORIE THERMIQUE DE LA DISTILLATION ET DE LA RECTIFICATION DE L'AIR. P. Mion. L. Gay. *Chimie et Industrie*, March, 1923, pp. 463-468.

TESTING THE QUALITY OF LUBRICATING OILS. Winslow H. Herschel. *Proc. of the Eng. Soc. of Western Penn.*, vol. 38, No. 10, pp. 503-41.

THE FUNDAMENTALS OF COLLOIDS AS APPLIED TO PAINTS AND VARNISHES. E. W. Fasig. *Can. Chem. & Met.*, pp. 90-92, April 1923.

OXIDATION OF HYDROCARBONS, WITH SPECIAL REFERENCE TO THE PRODUCTION OF FORMALDEHYDE. T. S. Wheeler and E. W. Blair. Part II. Action of Oxygen on Methane. *J. Soc. Chem. Ind.*, vol. 88, p. 92T, March 16, 1923.

COMPARATIVE EFFICIENCY OF FISH MEAL. D. B. Dill. *Am. Fertilizer*, vol. 58, No. 7, April 7, 1923.

SOIL CHEMISTRY—RELATIONS BETWEEN THE ACTIVE ACIDITY AND THE LIME REQUIREMENT OF SOILS. E. T. Wherry. *J. Wash. Acad. Sci.*, vol. 13, No. 6, March, 1923.

FERROCONCRETE AND ITS APPLICATIONS TO GAS-WORKS CONSTRUCTION. J. Twist. *Gas Journal* (London), April 11, p. 105.

ent would present its own peculiar problem for which an individual study and consideration of the existing conditions would be necessary for a satisfactory solution.

The complete paper contains illustrations of apparatus, indicator and photo-pulsometer diagrams, tables giving the data obtained in the investigation, and a bibliography of the subject. It also discusses the possibility of adjustment of errors at considerable length.

Recording Gas Calorimeter

The research sub-committee of the British Institution of Gas Engineers has reported on the Fairweather recording calorimeter. This investigation has gone into great detail regarding this instrument and its possibilities. The *Gas Journal* (London) is presenting this report serially beginning with its issue of Feb. 21.

Executive Control of Steam Costs

The efficient production and utilization of the steam in the paper mill is a problem of primary importance. Rising costs of coal, labor and power equipment make the elimination of waste absolutely essential. F. H. Childs, in the *Paper Trade Journal* of March 29, 1923, clearly shows where losses occur, and also demonstrates their possible prevention. The lack of co-operation between engineer and executive is apparently the chief cause of neglect to remedy the conditions, which are in many cases extremely bad. Dollars and cents furnish the only possible yardstick whereby the executive may appreciate the significance of the engineer's data.

In facing the problem there are three phases to be considered: First, to find out where one stands in relation to the results that others are getting; second, to find out quickly and economically what is wrong if results are unsatisfactory; and third, to devise, at reasonable expense, methods for controlling costs in the future. The degree of efficiency of generation and distribution is determined with comparative ease. Assuming a reasonable boiler efficiency and knowing the amount of coal burned in the year, it is possible to calculate what the probable steam production for the year is. The steam required in various operations is next figured. To estimate consumption of various units it is agreed that none can vary greatly if reasonably good practice is assumed. Such items as steam for power can be calculated very closely, while such operations as that of drying can be approximated with reasonable accuracy. Cooking stock or heating process water are more difficult to approximate, but still it is possible to make a close estimate. Once located, losses may be largely eliminated.

As an example of efficient management it is shown that with a mill producing 10,000 tons of paper per year, the possible saving amounts to upward of $70,000 if conditions are changed from those of ordinary mill practice to those of most modern and efficient practice. With coal costing $6.50 per ton, it is shown that $70,000 would be saved in a mill that had an actual boiler efficiency of 50 per cent but a possible efficiency of 80 per cent and whose actual drying efficiency was 50 per cent, whereas the theoretical efficiency was 90 to 100 per cent. **Careful control of the drying operation by maintenance of conditions found to be most satisfactory after experiments at wet and dry ends, and operatior of the** boiler plant at the most efficient load and with the best possible utilization of fuel, are the only measures that must be taken in this particular case to effect the savings named.

Review of Recent Patents

American Patents Issued April 17, 1923

The following numbers have been selected from the latest available issue of the *Official Gazette* of the United States Patent Office because they appear to have pertinent interest for *Chem. & Met.* readers. They will be studied later by *Chem. & Met.'s* staff, and those which, in our judgment, are most worthy will be published in abstract. It is recognized that we cannot always anticipate our readers' interests and accordingly this advance list is published for the benefit of those who may not care to await our judgment and synopsis.

1,451,711—Vulcanized Rubber Solution. W. B Pratt, Wellsley, Mass., assignor to E. H. Clapp Rubber Co., Boston, Mass.

1,451,734—Leaching of Copper Ores and Recovery of Copper. Joseph Irving, Bisbee, Ariz.

1,451,739—Apparatus for Refining Crude Oil. John Mayes, Wichita, Kan.

1,451,755—Method of Producing a Protective Coating on Objects of Magnesium or of Magnesium Alloys. C. B. Backer, Bergen, Norway.

1,451,786—Process for the Purification of Phosphoric Acid by Crystallization. W H Ross, C. B Durgin and R M Jones, Washington, D. C., assignors to the people of the United States.

1,451,839—Evaporating Apparatus. H S. Mellott, Morenci, Mich., assignor to By-Products Recovery Co., Toledo, Ohio.

1,451,843—Manufacture of Resinous Condensation Products. H Plauson, Hamburg, Germany.

1,451,847—Electrically Heated and Controlled Steam Boiler. W. H Rowe, Jacksonville, Fla.

1,451,850—Mercurial Composition. H McC Spencer, Newark, N. J., assignor to Seydel Chemical Co., New York.

1,451,883—Means for Ventilating Drying Ovens. A Maehler, Chicago, Ill.

1,452,009—Process for Utilization of Ammonia. J. F Wait, New York City.

1,452,016—Slime Pulp Thickener. C. Allen, El Paso, Tex.

1,452,024—Rotary Compressor. H A Campbell, Oakland, Calif.

1,452,027—Catalyzer for the Synthetic Manufacture of Ammonia and Manner of Producing Same. I W Cederberg, Stockholm, Sweden, assignor to Norsk Hydro-Elektrisk Kvaelstofaktieselskab, Christiania, Norway.

1,452,061—Gas Expansion and Absorption Process. J C. Bertsch, Tulsa, Okla.

1,452,083—Black Azo Dyestuffs. A. L. Laska and A Zitscher, Offenbach-on-the-Main, Germany, assignors to Chemische Fabrik Griesheim-Elektron, Frankfort, Germany.

1,452,086—Process for the Manufacture of Solid Plastic Material From Casein. F. G Maries, Kingston, England.

1,452,129—Dyeing Machine. F. C. W Stelter, Astoria, N. Y.

1,452,145—Apparatus and Method for Carrying Out Catalytic Oxidization of Ammonia With Oxygen. I. W. Cederberg, Berlin, Germany.

1,452,151—Continuous Thickening Process. A. L. Genter and G. C. Jones, Salt Lake City, Utah, assignors to the General Engineering Co., Salt Lake City and to A. L. Genter.

1,452,166—Apparatus for Drying Char. H E Niese, Morristown, N J., assignor to the American Sugar Refining Co., New York City.

1,452,185—Alkali-Metal Product and Process of Producing the Same. H. W. Charlton and R. N. Shreve, New York City, assignors to American Potash Corp. of New York City.

1,452,186—Accelerating Agent in Potash Recovery. Same inventors and assignees as 1,452,185.

1,452,206—Means for Dehydrating Alcoholic Liquids. M. D Mann, Roselle, N. J., assignor to S B. Hunt, Mount Kisco, N Y.

1,452,218—Pulverizing Mill. R. E. H. Pomeroy, Canton, Ohio.

1,452,226—Boll Weevil Destroyer. M. A Spencer, Yonkers, N Y., assignor of one-half to B E. Nussbaum, Muskogee, Okla.

1,452,253—Liquid and Vapor Separator. H G Nevitt, Tampico, Mexico.

1,452,288—Water-Softening Apparatus. J E Caps, Wilmette, Ill.

1,452,309-310—Asphalt Structure and Composition. Gustav Monrath, New York City, assignor to Barber Asphalt Paving Co., Philadelphia Pa.

1,452,315—Process for Bleaching Barytes. J. B Scheuer, Lanett, Ala.

1,452,322—Method of Segregating Olefines. L. C Stewart, Midland, Mich., assignor to the Dow Chemical Co., Midland, Mich.

1,452,380—Liquid Fuel Furnace. C. G. Hawley, Chicago, Ill.

1,452,388—Process and Apparatus for Centrifugal Separation. C. A. Porter and O C. Brewster, Casper, Wyo., assignors of one-half to P. Sullivan and G R Hagens, both of Casper, Wyo.

1,452,389—Paper Waxing and Sizing Composition. F L Pullen, Oldtown, Me.

1,452,445—Silicate Composition. Léon Seidman, New York City.

1,452,450—Burner for Metaldehyde. C. Tommasi H. Dannell and A. Busch, Basel, Switzerland, assignors to Elektrizitatswerk Lonza, Gampel, Switzerland.

1,452,478—Process of Making Nickel Formate. C. Ellis, Montclair, N J.

1,452,481—Manufacture of 1.4 Naphthol Sulphonic Acid. J. Baddiley, J. B. Payman and E G. Bainbridge, Manchester, England, assignors to British Dyestuffs, Ltd., Manchester, England.

Complete specifications of any United States patent may be obtained by remitting 10c to the Commissioner of Patents, Washington, D. C.

Rubber Accelerator—Patents have been issued to Sidney M. Cadwell, assignor to the Naugatuck Chemical Co., for a process of vulcanizing rubber by means of an accelerator comprising certain derivatives of thiuramdisulphide containing substituted alkyl and aryl groups. One of the most satisfactory derivatives, dimethyldiphenylthiuramdisulphide, is prepared from monomethylaniline (480 parts), carbon disulphide (170 parts) and iodine (285 parts), dissolved in alcohol and allowed to stand. The product which is formed crystallizes out after standing about 2 hours and is filtered, washed with a

little alcohol and dried. In carrying out the invention described in this patent, 100 parts of rubber, 10 parts of zinc oxide, 3 parts of sulphur and 1 part of dimethyldiphenylthiuramdisulphide are mixed in the mill at the ordinary temperature and for the usual time. After the mixing is accomplished, the material is vulcanized for 10 minutes or longer under 40 lb. steam pressure. (1,445,621. Feb. 20, 1923.)

Preparing Oxalic Acid—A catalytic process for the oxidation of carbohydrate material to oxalic acid by means of nitric acid in the presence of phosphoric acid and a vanadium catalyst has been described by George Kolsky, of Mamaroneck, N. Y. According to the procedure he outlines, an aqueous solution of phosphoric acid in about 50 per cent concentration is introduced into the carbohydrate material (sugar, glucose, starch, dextrine, etc.), together with an appropriate amount of nitric acid. It is said that a satisfactory reaction mixture might contain equal amounts by weight of water, nitric anhydride and phosphoric anhydride. The reaction is carried out preferably in the presence of vanadium pentoxide or other similar catalyst at a temperature range of 30 to 70 deg. C. After cooling the resulting mixture of oxalic acid and spent liquor, the crystallized acid is removed by centrifugal action or filtration and the spent liquor is denitrated by raising its temperature and blowing air through it. The denitrated spent liquor is then brought into absorptive contact with the fumes evolved during the oxidizing step and the fumes and the air from the denitration, to form a mixture of phosphoric and nitric acid suitable for re-use in the process. (1,446,012. Feb. 20, 1923.)

Chlorhydrins of Organic Liquids—Benjamin T. Brooks, assignor to the Chadeloid Chemical Co., describes a process for the manufacture of chlorhydrins of various liquid or solid organic substances, preferably oils containing one or more chemically unsaturated groups, such as the olefine group or ring structures which behave similarly to the olefine group. By this process, unsaturated petroleum oils (either the lighter or heavier distillates), unsaturated hydrocarbons of the terpene type and unsaturated fatty acids or their esters (such as those of oleic or linoleic acid) are converted into the corresponding chlorhydrins. Of the terpene compounds, the commonest and cheapest is ordinary spirits of turpentine. Apparently the presence of other substances which are chemically inert, such, for example, as saturated petroleum hydrocarbons, benzol, carbon tetrachloride, etc., do not interfere with the reaction—in fact, they may be of advantage in some cases. Thus certain solid or semi-solid fatty oils or other organic substances, such as cinnamic acid, stilbene, etc., may be successfully treated by dissolving the substance in an inert solution, such as gasoline, kerosene, benzene or carbon tetrachloride. These organic substances are treated with an aqueous solution of hypochlorous acid, but not in the high concentration which has been described in previous published work. It is difficult or impossible to carry out the process economically on a large scale when the solutions contain more than about 3 per cent of hypochlorous acid. In the present invention, the unsaturated organic liquid is continuously subjected to the action of a cold dilute aqueous solution of hypochlorous acid in an exceedingly dilute solution. It is possible to carry out the reaction smoothly and with sufficient rapidity to meet the requirements of commercial large-scale operation even when aqueous solutions containing 0.25 per cent of hypochlorous acid are employed. In the preparation of the aqueous solution of hypochlorous acid, the chlorine is passed into a dilute solution of an alkali carbonate or bicarbonate. Since it is well known that carbonic acid is a stronger acid than hypochlorous acid, in fact will displace the latter from its salts, the hypochlorous acid does not become fixed in the form of hypochlorite salts, but remains in a free or uncombined state and is therefore available for direct combination with the unsaturated substances to form the desired chlorhydrins. (1,446,873. Feb. 27, 1923.)

Effect of Alkalinity on Lithopone—One of the most baffling sets of facts that the paint technologist has to face is the great variation in consistency obtained when equal volumes of different pigments are incorporated in equal volumes of the same vehicle, such as oil or varnish. But even more baffling to the paint technologist is the fact that often when equal volumes of different lots of lithopone are incorporated in equal volumes of the same vehicle, mixtures are obtained which vary widely from one another in consistency. The consistency of a mixture of a pigment with an appropriate vehicle, such as oil or varnish, is dependent upon the ease with which the pigment is wet by the vehicle. Different brands or lots of lithopone have often been found in practice to differ widely in the ease with which the pigment is wetted by a particular vehicle. Many of the commercial brands of lithopone are difficultly wetted by many desirable oils and varnishes, or, as the paint mixer says, lithopone "fights" these vehicles during the mixing operation. On the other hand, occasionally a highly alkaline lithopone is found which is wetted by the vehicle with reasonable ease, but then thickening or livering reactions of the resulting mixture are generally encountered.

Frank G. Breyer and Clayton W. Farber, assignors to the New Jersey Zinc Co., have discovered that the ease with which lithopone incorporates with a vehicle or is wetted by it is largely proportional to the degree of alkalinity manifested by the lithopone. Most commercial lithopone at the present time will give a neutral or slightly acid water solution. It is believed that this property accounts for the difficulty experienced in incorporating it with the vehicle. However, there are certain brands of lithopone which give a strongly alkaline water solution; particularly is this true of those lithopones in which magnesium oxide has been added with a view of improving the light resistance. Such strongly alkaline lithopones exhibit marked tendencies to liver and thicken on standing or aging and are objectionable on this account. It has been found that the alkalinity of the lithopone therefore must vary over a relatively narrow range. The most desirable range of alkalinity and that covered by this patent is a product which when subjected to a precision alkalinity test with methyl orange as an indicator requires between 2 and 4 cc. of $N/50$ sulphuric acid for titration to a faint pink color of 100 cc. of a clear filtrate obtained from a mixture of a 50-gram sample of the product with 250 cc. of distilled water agitated for 5 minutes at a temperature between 65 and 75 deg. F. (1,446,637. Feb. 27, 1923.)

Manufacture of Arsenic Acid and Arsenical Compounds—In the manufacture of arsenic acid it is usually the custom to heat arsenic trioxide in nitric acid. Oxidation by means of chlorine in an acid aqueous medium is proposed by Carleton Ellis and Vernon T. Stewart, of Montclair, N. J. For example, 1 part of a commercial grade of white arsenic is mixed with 7 parts by weight of water and the mixture is heated to boiling. Chlorine gas is bubbled through until a sample shows permanently blue with starch and potassium iodine in the presence of sodium bicarbonate. Iron may be removed by treating with sodium acetate and filtering off the basic acetate formed. The resulting solution of arsenic acid may be treated directly with milk of lime to form tricalcium arsenate or with lead oxide or hydroxide to form lead arsenate. (1,447,203. March 6, 1923.)

Soluble Arsenic Compound—The effective poisoning ingredient in an arsenic compound designed for use in sprays, dips, poison baits, etc., is the arsenious oxide and it is therefore important that a maximum amount of this ingredient be obtained in solution. Heretofore, according to the patent of Joseph F. Cullen, assignor to the United States Smelting, Refining & Mining Co., the maximum amount of available arsenious oxide has been about 30 per cent by weight, and to secure this amount at least equal molecular proportions of alkali to white arsenic have been required. In the process described in this patent 2,500 lb of caustic soda is added to 7,500 lb. of water, in a suitable container, and immediately thereafter 10,000 lb. of a good grade of white arsenic is added. On agitation, the heat of reaction is sufficient to dissolve all of the arsenious oxide. Using these quantities of ingredients, approximately 1,250 gal. of concentrated solution containing 50 per

cent of arsenious oxide, 37½ per cent of water and 12½ per cent of alkali expressed as caustic soda is obtained. This solution contains approximately 8 lb. of arsenious oxide to the gallon, whereas most concentrated solutions now on the market contain not over 4 lb. of arsenious oxide to the gallon. Usually the concentrated solution will be shipped directly to the place of use, where it may be further diluted to meet the needs of the particular requirement. Or a solid compound can be obtained by evaporation of this concentrated solution. The compound thus obtained is said to be completely soluble in water. (1,446,160. Feb. 20, 1923.)

Production of Diarylguanidines—If an alcoholic ammoniacal solution of diarythiourea is mixed with finely comminuted lead oxide at a temperature below boiling point of the solution, diarylguanidine is produced. In order to remove the latter substance from the solution it must be treated with acid, filtered and precipitated with caustic alkali. The method in general applies to all di-substituted guanidines. Excellent yield and purity of product are claimed to have been effected by this method invented and patented by Y. Young, of Caldwell, N. J., and E. G. Croakman, of Buffalo, N. Y. They have assigned the rights to the National Aniline & Chemical Co., of New York. (1,446,818. Feb. 27, 1923.)

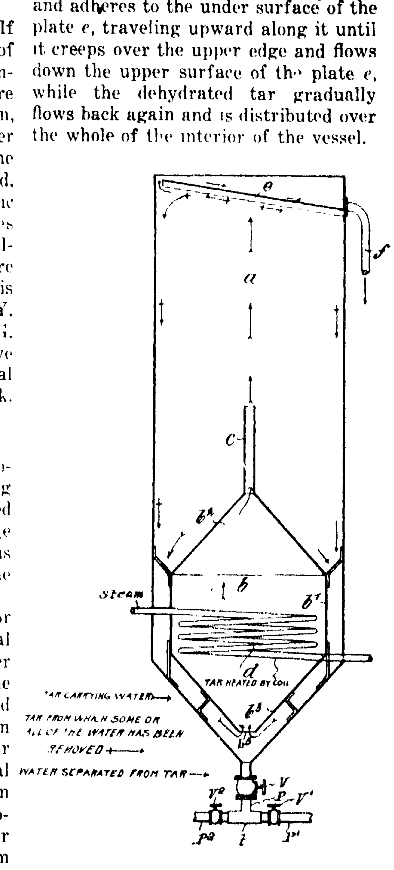
Dehydrating Coal Tar—In this invention, for the purpose of separating water from coal tar, the tar is projected upward in a stream so as to impinge against a separating surface. This separates out the water carried in the tar mechanically.

The apparatus comprises a separator a, cylindrical and formed with a conical bottom, the vessel being of greater height than transverse dimensions. The height of the vessel may be two and one-half to three times its diameter. In the lower end of the vessel is fitted a tar heater b, which comprises a cylindrical portion b' and a conical upper portion b^2 with or without an upwardly projecting outlet tube c. The tar container b is also formed with a conical bottom b^3 to correspond with the conical bottom of the vessel a.

The conical bottom b^3 is open at its lower end at b^5 and the upper conical portion b^2 or outlet tube c is open at its top so that, when the vessel a is filled to or just above the top of baffle e, the contents of the tar container b communicate with the contents of the vessel a. The container b is fitted with a heating coil d for heating the container and the upper end of the vessel a is fitted with an inclined transverse separating plate e which is spaced at its upper edge as shown from the vessel a. Above the lower end of the transverse plate e, the vessel a may be provided with a drain pipe f.

In operating this apparatus the tar to be dehydrated can be run in through the valved pipe p', valve v and v' being open, and valve v^2 being closed. The pipe p at the bottom of the tapered part at the bottom of tank a has a valve v. This pipe may be connected to a T-pipe t, to the two ends of which are connected a supply pipe p' and an exit pipe p^2 or a wholly separate pipe may enter the tank a at any suitable point for admitting the tar to be treated.

The tar contained in the tar container b is heated by means of the heating coil d and thus given a considerable upward tendency so that a stream of tar is projected upwardly through the tube c with a sufficient velocity to impinge against the separating plate e, whereupon the water carried with the tar is separated therefrom as liquid water and adheres to the under surface of the plate e, traveling upward along it until it creeps over the upper edge and flows down the upper surface of the plate e, while the dehydrated tar gradually flows back again and is distributed over the whole of the interior of the vessel.



Practical experience has shown that satisfactory results are obtained when the tar is heated to a temperature of 50 to 65 deg. C. In the course of 20 to 24 hours the water contained in the tar was, in a particular run of the process, reduced to about 3 to 4 per cent, which is generally admitted to be sufficient for all practical purposes.

When sufficiently dehydrated the tar can be run out by opening valves v and v^2. The pipe p^2 will conduct the treated tar to a storage vessel or elsewhere. (1,448,593. Paul Jaworski, Bismarckhutte, Germany. March 13, 1923.)

Liquid Fuel—This combustible is obtained by mixing in appropriate apparatus, at the convenient pressure and temperature, the following three ingredients: nitro-benzol, alcohol, preferably ethyl alcohol, and nitrous ether. These are mixed in such proportions as to form a homogeneous mixture. The proper proportions are as follows: Nitrobenzol, 0.75 per cent; ethyl alcohol, 99 per cent; nitrous ether, 0.25 per cent. To this mixture is added a dye soluble in alcohol, such as the rosaniline or fuchsine hydrochlorate, the result being a liquid of greasy nature, scarlet red color, intense, penetrating and persistent odor similar to that of the bitter almonds, boiling at 80 deg. C., and having a specific gravity of 0.80.

It is claimed for this fuel that its heating and dynamical efficiency is greater than that of the fuels used now and that it produces in the explosion a high temperature and pressure which are maintained until the combustion is completed. It is also claimed that it has the advantages of producing light and aromatic residues free from acetic acid; of not promoting the formation of carbon in the cylinders; of being a high rust protective and lubricant on account of its oleaginous and ethylic nature, thus tending to protect the engine organs; of being more economical than any of the other combustibles now used, and of not being dangerous, for it is not flammable at the usual temperature. (1,448,245. Miguel Llomparty Valdés and Vicente Baullaoy Villar, Havana, Cuba. March 13, 1923).

Composition for Rendering Paper Greaseproof—Casein and emulsified coconut oil form the basis of a greaseproofing composition patented by Wilbur L. Wright, of Fulton, N. Y., the proportions being as follows: Casein, 100 parts; emulsified coconut oil, 100; water, 1,000; ammonia, 10 parts. The casein is dissolved in the ammonia diluted with part of the water, the oil and remainder of the water are added, and the resulting mixture is heated to 175 deg. F. until a homogeneous product is obtained. (1,449,718. March 27, 1923.)

Reactivating Spent Catalyzers—It has been found that finely divided spent nickel or other catalyzers may be regenerated by subjecting them to a resurfacing treatment -for example, by grinding or abrading the spent catalyzer, admixed with oil, in a ball mill whereby the particles are freed from their inert or inactive surfaces. The present invention covers an additional treatment, the resurfacing being described in a co-pending application, Serial No. 222,007. The resurfaced catalyzer particles are heated to 200 to 250 deg. C. in admixture with a relatively small amount of oil and a stream of hydrogen is passed through until the maximum increase in activity, as determined by test, is obtained. Due to the large amount of catalyzer in proportion to the oil present, it seems probable that the activation is due to the replacement of absorbed gases on the catalyzer by hydrogen. (1,447,689. William D. Richardson, of Chicago, assignor to Swift & Co. March 6, 1923.)

Men in the Profession

A. W. AMBROSE, assistant director of the Bureau of Mines, resigned recently to become associated in an executive capacity with the Empire Companies, with headquarters at Bartlesville, Okla. Mr. Ambrose was superintendent of the government experiment station there until 1920, when he went to Washington as chief petroleum technologist. From 1914 to 1919 he was associated with California, Texas and Louisiana oil companies.

G. A. BOLE, superintendent of the Ceramic Experiment Station of the Bureau of Mines at Columbus, Ohio, was in Washington last week to discuss the refractories program with bureau officials.

JOHN DAVIS, a member of the Bureau of Mines staff, who has been stationed in Washington, has been selected to take charge of the helium production plant at Fort Worth, Tex.

M. D. HERSEY, of the Pittsburgh Station of the Bureau of Mines, is in Washington in connection with the bureau's work on oxygen-oil explosive mixtures.

Dr. IRA N. HOLLIS, who for the past 10 years has been president of Worcester Polytechnic Institute, has tendered his resignation to the board of trustees of the Institute, to take effect some time within the next 3 years, or as soon as his successor is chosen. Dr. Hollis plans to retire from teaching in order that he may devote some time to literary work.

E. J. McCONE, general manager of the Buffalo *Commercial*, was the principal speaker at the banquet held during the convention of the Electric Steel Founders' Research Group at East Aurora, N. Y., on April 13 and 14, at which were present representatives and executives of the five electric steel foundries forming the group. Mr. McCone spoke on the subject of "Americanization of the Employer."

R. A. MILLIKAN addressed the Physics Club of the Bureau of Standards, April 18, on "The Penetrating Radiations of the Upper Air."

GEORGE C. MITCHELL, an official of the Pope-Gosser China Co., Coshocton, Ohio, has been elected president of the United States Potters' Association, succeeding Frank P. Judge, Jr., Salineville, Ohio. Other officers elected were: B. E. Salisbury, Onondaga Pottery Co. Syracuse, N. Y., first vice-president; D. William Scammel, Maddock Pottery Co., Trenton, N. J., second vice-president; Guy C. Crooks, Crooksville China Co., Crooksville, Ohio, third vice-president, and Charles F. Goodwin, East Liverpool, Ohio, re-elected secretary-treasurer.

LANDON C. MOORE, a consulting chemist of Dallas, was in Washington last week.

R. B. MOORE, chief chemist of the Bureau of Mines, has been made a member of the American Philosophical Society of Philadelphia in recognition of his services in "promoting useful knowledge."

MAX PHILLIPS, of the Color Laboratory of the Bureau of Chemistry, presented as an informal communication before the Washington Chemical Society, April 12, a brief outline of the indirect method that he has developed for making thymol from cymeme. The first method usually employed for making hydroxyl derivatives from hydrocarbons gives an isomer in this case, and therefore is not applicable. Phillips' method involves the following steps: Nitration, reduction to an amine, sulphonation, preparation of the azide, removal of this group, and then substitution of the hydroxyl for the sulphonic acid group, giving thymol as the product.

WILLIAM F. G. SWANN, professor of physics at the University of Minnesota, visited the Cryogenic Laboratory of the Bureau of Mines on April 19. Other visitors to the laboratory included Dr. J. W. MARDEN, of the Westinghouse Lamp Co., and Prof. W. A. NOYES, of the University of Illinois.

CLAUDE F. TEARS, of Star Lake, N. Y., formerly chemical engineer with the Texas Oil Co. in New York City, has recently accepted a similar position with the Universal Oil Production Co. of Chicago, Ill.

Sir JOSEPH JOHN THOMSON was guest of honor at a dinner at the Union League Club in Philadelphia on April 12.

E. G. WILMER, president of the Goodyear Tire & Rubber Co., Akron, Ohio, has been elected chairman of the board of directors and executive committee. G. M. STADELMAN, heretofore vice-president, has been elected president to succeed Mr. Wilmer.

Obituary

JOHN J. HEROLD, late superintendent of the Ohio Pottery Co., died at his home in Zanesville, Ohio, on Wednesday, April 18. He had been in poor health for a number of years, and had not been active in business for several months. Mr. Herold was born 1871 in Carlsbad, Austria.

Dr. S. S. WHEELER, president of the Crocker-Wheeler Co., died suddenly of angina pectoris April 30 at his home in New York City.

Society Calendar

AMERICAN ASSOCIATION OF CEREAL CHEMISTS will hold its ninth annual convention at Hotel Sherman, Chicago, June 4 to 9.

AMERICAN ASSOCIATION OF ENGINEERS will hold its annual convention in Norfolk, Va., May 7 to 9

AMERICAN ELECTROCHEMICAL SOCIETY will hold its spring meeting May 3, 4 and 5, 1923, at the Commodore Hotel, New York.

AMERICAN ELECTROPLATERS SOCIETY will hold its eleventh annual meeting at Providence, R. I., July 2 to 5

AMERICAN GAS ASSOCIATION will hold its annual convention the week of Oct. 15 at Atlantic City An elaborate exhibition of gas-making and gas-utilization equipment is planned.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS will hold its summer meeting June 20-23 at Wilmington, Del

AMERICAN LEATHER CHEMISTS ASSOCIATION will hold its twentieth annual convention at the Greenbrier, White Sulphur Springs, W Va., June 7, 8 and 9.

AMERICAN OIL CHEMISTS' SOCIETY is holding its annual meeting at the Eastman Hotel, Hot Springs, Ark, April 30 and May 1.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS will hold its spring meeting May 28 to 31 in Montreal, Canada.

AMERICAN SOCIETY FOR TESTING MATERIALS will hold its twenty-sixth annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, beginning Monday, June 25, 1923, and ending either Friday or Saturday of that week.

AMERICAN ZINC INSTITUTE, INC., will hold its fifth annual meeting at the Hotel Chase, St. Louis, May 7 and 8.

CANADIAN INSTITUTE OF CHEMISTRY will hold its annual meeting in Toronto, May 29 to 31.

CHAMBER OF COMMERCE OF THE UNITED STATES will hold its eleventh annual meeting in New York May 7 to 11.

INTERSTATE COTTON SEED CRUSHERS ASSOCIATION will hold its annual convention at Hot Springs, Ark., May 2 to 4.

IRON AND STEEL INSTITUTE (London) will hold its annual meeting May 10 and 11 at the House of the Institution of Civil Engineers, London, S. W. 1.

NATIONAL ASSOCIATION OF MANUFACTURERS OF THE UNITED STATES OF AMERICA will meet in annual conference May 11 to 16, inclusive, at the Waldorf-Astoria, New York City.

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (NINTH) will be held in New York Sept. 17-22

NATIONAL FERTILIZER ASSOCIATION will hold its thirtieth annual convention at White Sulphur Springs, W. Va., the week of June 11.

NATIONAL FOREIGN TRADE COUNCIL will hold its annual conference May 2, 3 and 4 in New Orleans, La

NATIONAL LIME ASSOCIATION will hold its fifth annual convention at the Hotel Commodore, New York City, June 13 to 15.

NATIONAL SYMPOSIUM ON COLLOID CHEMISTRY will be held at the University of Wisconsin, June 12 to 15.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stetters Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month.

PACIFIC DIVISION, American Association for the advancement of Science, will hold its seventh annual meeting at the University of Southern California, Los Angeles, Sept. 17 to 20, in conjunction with the summer session of the national association and a meeting of the Southwestern Division of the National Association

SOCIETY OF CHEMICAL INDUSTRY, Canadian Section, will meet in Toronto, May 29 to 31.

SOCIETY FOR STEEL TREATING — Eastern sectional meeting will be held June 14 and 15, in Bethlehem, Pa.

The following meetings are scheduled to be held in Rumford Hall, Chemists' Club, East 41st St, New York City: May 4—American Chemical Society, regular meeting, May 11—Société de Chimie Industrielle (in charge) American Chemical Society, American Electrochemical Society, Society of Chemical Industry, joint meeting, May 18—Society of Chemical Industry, regular meeting. June 8 — American Chemical Society, regular meeting.

CHEMICAL & METALLURGICAL ENGINEERING

Tenth Avenue at 36th Street, New York

H. C. PARMELEE, *Editor*

Market Section

The Summary of the Week

Merger of the Archer-Daniels Linseed Co. and the Midland Linseed Products Co., was announced last week. The new company will have a larger linseed crushing ca acity than any other company in the world.

Leading producers of prussiate of soda have announced lower prices for May deliveries, which in turn has weakened the spot market.

Formaldehyde has worked into a stronger position as the result of cleaning up resale lots which had depressed the market.

Declines in the metal markets has been reflected in prices for metal salts and practically all the latter are easier with an open decline of 2c. per lb. in the case of tin oxide.

Reports that phenol production will soon be increased have put a check on buying in speculative circles.

Potash company will conduct an educational campaign to stimulate the consumption of potash in the fertilizer trade.

China wood oil sold on spot at 40c. per lb., which is a new high for the movement and the highest price on record in our markets.

Arsenic continues to be one of the live spots in the chemical market, but prices are too high to interest buyers.

Southern Tariff Association and various farmers' organizations have protested against an investigation by Tariff Commission on duties on vegetable oils as applied for by organization representing soap and paint manufacturers.

The Treasury Department is preparing a list of standards of strength of coal-tar products as imported. prior to 1914. These standards will be used as a basis of assessing duties on present imports.

D. H. Blair, Commissioner of Internal Revenue, announces the names of the committee from the industrial alcohol industry to consult with and advise the Prohibition Unit.

Expansion of English Chemical Industry

THE steady increase in production of chemicals in England is set forth in a report issued by H. B. Allin Smith, Assistant Trade Commissioner, from the office of the Commercial Attaché at London. This report states that English production of some heavy chemicals previously drawn from abroad is now under way and is expanding as plant and staff can be extended or precarious trade at the present time warrants. Calcium carbide plant is established, one by the British Carbide Factories, Ltd., with 2,000 tons capacity per annum, and another by the British Cellulose & Chemical Manufacturing Co., Ltd., at Spondon, capacity 40,000 tons yearly. The latter has an acetic acid plant also, but importations have been cheaper heretofore than local recovery from carbide.

The report further states that ammonium sulphate manufacture is developing through Brunner, Mond & Co. Their new Billingham factory, now under construction, for the recovery of atmospheric nitrogen, is to be fully operating this year, producing 100 tons of 100 per cent ammonia daily, or 150,000 tons of sulphate annually. A gradual extension to 300 tons is planned, equivalent to 450,000 tons of sulphate each year. The March *Chemistry and Industry* states that "in conjunction with a contact nitric acid plant, the Billingham factory goes far to diminish our dependence on Chilean saltpeter. It enables Britain to become an exporter of a bulk product of which we were formerly exporters."

Alkali and bleach are being made by the Greisheim Electron Co. and the United Alkali Co. Among heavy chemicals, the war production by the latter of dinitrophenol expanded its plant to a capacity of 100 tons week.y.

The growing British dyestuffs industry is an outlet for chlorine, made by the firm of Castner-Kellner and the United Alkali Co., Ltd.

A few words may be said about these more specialized branches of the industry, which of course cannot be divorced from the fundamental foundation of heavy chemical supplies. Britain is said to be making good progress in establishing these, through the governmental support provided by the dyestuffs act and the protective measure known as the safeguarding of industries act.

An estimate is made that, of fine chemicals, essences, perfumery and medicines, about 2½ tons is now made in Britain for every ton made before the war. W. & J. Bush & Co., Boots & Co. and others have led in research since protective measures have supported them. Aspirin, salicylic acid, saccharin, chloramine-T, novocaine and ethylenechlorhydrin are now British made.

Especially in dyestuffs have the chemical staffs and research facilities been broadened. It is said that fully 80 per cent of dyestuffs consumed in Britain today are wholly British made, compared with 10 per cent, or about 2,000 tons only, in 1914. Leaders in this business are the British Dyestuffs Corporation (with governmental connections), Read, Holliday & Sons, British Alizarine Co. and Clayton Aniline Co.

Chemical Imports for 1922 Increased 24 Per Cent in Value

Heavy Arrivals of Oxalic Acid in Last Quarter—Imports of Sodium Cyanide More Than Doubled—Falling Off in Coal-Tar Crudes

IMPORTS of chemicals during 1922 show a healthy gain in sympathy with the general trend of increased domestic industrial activity. Aggregate value of imports of chemicals and allied products for the year increased 24 per cent, from $80,763,600 in 1921 to $100,603,700 in 1922.

Owing to the incomparability of the individual commodities included under the main groups, only a very general idea of the trend can be procured from an analysis of the import and export statistics for the years 1921 and 1922. Of the groups for which any comparisons can be made, explosives, the group recording the most important expansion in exports (80 per cent), showed the smallest in imports (11 per cent). On the other hand our foreign shipments of paints, pigments and varnishes actually diminished 5 per cent while our receipts advanced 55 per cent. Fertilizers, another group of the exports having but a small gain (3 per cent), took a big jump in imports (47 per cent). Crude drugs and essential oils exceeded 1921 shipments by 10 per cent in value, while receipts swelled 42 per cent. Foreign sales of perfumery and cosmetics also were greater than foreign purchases of these articles, having gained 33 per cent, and imports, 28 per cent. Imports of medicinal and pharmaceutical preparations increased 23 per cent; exports but 11 per cent. The least change of all the groups was still in general chemicals (which includes coal-tar and heavy chemicals), and although the figures indicate a loss (4 per cent) in exports, they likewise show but a small gain (less than 3 per cent) in imports.

Decrease in Coal Tars

The aggregate value of imports of all coal-tar chemicals decreased slightly, from $11,225,700 in 1921 to $11,012,800 in 1922. The total receipts of coal-tar crudes dropped 11 per cent, from $5,281,400 in 1921 to $4,740,400 in 1922, noticeable declines occurring in all the classes except in tar and pitch. Naphthalene fell 30 per cent in quantity and 60 per cent in value, from 4,495,800 lb ($135,900) to 3,144,300 lb. ($54,000); dead or cresosote oil increased 25 per cent in quantity but decreased 10 per cent in value, figures for which are 33,239,400 gal. ($4,756,600) in 1921 and 41,567,500 gal. ($4,240,400) in 1922. The biggest reduction of this class was in benzene (90 per cent), which fell from 1,722,000 lb. ($42,370) to 172,500 lb. ($1,220); none was received from Sept. 22 to Oct. 31; 57,108 lb. ($381) arrived in November, and but 45 lb. ($8) in December.

Receipts of intermediates in 1922 surpassed those of 1921 by 867,300 lb. ($65,300); total receipts for the year 1922 were 2,136,700 lb. ($422,150). Arrivals of carbolic acid totaled 686,300 lb., valued at $102,300 in 1922. Were it possible to procure comparative figures for finished coal-tar products for the years under discussion it is believed that they would indicate, for the whole group, but a little change in tonnage. While slightly larger quantities of alizarin and derivatives, and colors, dyes, stains and color acids probably came in during the year 1922 than during 1921, on the other hand considerably smaller amounts of indigo, both natural and synthetic, and of coal-tar medicinals, were received. Alizarin and derivatives rose from 375,100 lb. ($510,000) in 1921 to 479,900 lb. ($701,900) in 1922.

General Chemical Comparisons

Although the quantity of oxalic acid received during 1922 was 3 per cent in excess of that of 1921, the value was reduced approximately 30 per cent. It will be observed from a study of the following figures that the majority of the oxalic acid arrived since Sept. 22:

	Lb.	Value
October	324,319	$24,564
November	460,514	44,117
December	488,950	56,723
Total since Sept 22	1,273,783	125,404
Total for year	1,294,236	127,757

There was 1,741,000 lb., $132,600, of arsenious acid or white arsenic; 112,700 lb., $40,450, of citric acid; 629,000 lb., $171,600, of tartaric acid, and 1,260,000 lb., $12,200, of sulphuric acid imported during the period Sept. 22 to Dec. 31, 1922. Imports of arsenic sulphide dropped in value but increased in quantity during 1922, figures for which are 6,686,600 lb., $531,300, in 1921, as compared with 7,630,500 lb., $472,000 in 1922.

Bleaching powder, one of the heavy chemicals recording the biggest advance in exports (123 per cent), showed a noticeable decrease in amounts imported—about 30 per cent. On the other hand, imports of glycerin advanced 30 per cent but exports only 20 per cent. Imports of crude iodine in 1922 failed to reach the 1921 level of 646,000 lb. ($1,430,600) by 294,000 lb. ($406,000) or nearly one-half of the total imports of 1921. Demand for citrate of lime during 1922 jumped over 1,000 per cent until a total of 15,982,000 lb. ($2,223,000) was reached. Receipts of potassium cyanide and potassium nitrate, crude and refined, in 1922, were below 1921, while those of other potassium compounds, carbonate, hydrate, hydroxide, bitartrate, and other potassium compounds, n.e.s., surpassed 1921. Sodium compounds also reflected an expansion, sodium cyanide more than doubling, from 8,708,000 lb., value $913,100, to 15,705,000 lb., value $1,306,000.

A noticeable feature of the trend of the import trade of fertilizers is the high percentages of gains in quantities but the much lower gains in values. The largest increases were in potassium sulphate (418 per cent in quantity and 237 per cent in value), and in manure salts (400 per cent in quantity and 153 per cent in value).

Calendar

The following important technical meetings are scheduled for the immediate future:

INTERSTATE COTTON SEED CRUSHERS ASSN. Hot Springs, Ark, May 2-5

AMERICAN ELECTROCHEMICAL SOCIETY New York City, May 3-5

AMERICAN CHEMICAL SOCIETY Regular meeting, New York, May 4

AMERICAN ZINC INSTITUTE St. Louis, May 7-8

AMERICAN ASSN OF ENGINEERS Norfolk, May 7-9

AMER SOCIETY MECHANICAL ENGRS. Montreal, May 28-31

CANADIAN INSTITUTE OF CHEMISTRY Toronto, May 29-31

SOCIETY OF CHEMICAL INDUSTRY Canadian Section Toronto, May 29-31

AMER. ASSN CEREAL CHEMISTS Chicago, June 4-9

AMER LEATHER CHEMISTS ASSN. White Sulphur Springs, W. Va., June 7-9

NAT'L FERTILIZER ASSOCIATION White Sulphur Springs, W Va, June 11-16

NATIONAL LIME ASSOCIATION New York City, June 13-15

SOCIETY FOR STEEL TREATING Eastern Sectional Meeting Bethlehem, Pa, June 14-15

AMER INST. CHEMICAL ENGRS. Wilmington, Del, June 20-23

AMER SOC FOR TESTING MATERIALS Atlantic City, June 25-29

Begin Nitrate Inquiry Soon

Selection of a chemist to have charge of the investigation of the Department of Commerce into the nitrate situation is expected to be announced soon. This will be part of the general inquiry to be made with regard to a number of products for which the United States is largely dependent upon imports.

The nitrate inquiry will include the advances of chemistry in the production of synthetic nitrate, from the standpoint of the economic results obtained rather than purely from the theoretical chemical point of view. The cost of production in Chile, the relative cost of synthetic production in the United States and actual or possible control of prices by foreign combinations will be looked into. Investigations also will be made in Germany. Possibilities of synthetic production at Muscle Shoals and at other suitable sites, by various methods, will be studied.

Preliminary steps have been taken for an investigation into tanning extracts, while the complete program will include inquiries into iodine, potash, quinine and other commodities.

Washington News

Move to Reconsider Duties on Oils Draws Protest

Vigorous protest has been voiced by the Southern Tariff Association and various farmers' organizations against an investigation by the Tariff Commission of duties on linseed oil, coconut oil, peanut oil, soya bean oil and other vegetable oils regarding which an application for reductions of 50 per cent in duties under the flexible tariff has been filed.

A delegation of ten called on the commission April 23 and a delegation of twenty visited the commission April 24 to register a protest against the application. The commission did not grant a formal hearing to the delegations, as under its rules hearings on applications are to be held only after a preliminary investigation of the application by the commission itself and a formal call for a hearing where all interested parties may appear, but the protestants met the commissioners individually and conferred with members of the commission's staff.

The application for a reduction in the duties was filed by the Bureau of Raw Materials for American vegetable oils and fats industries in the interest of soap and of paint and varnish manufacturers and of large consumers of these commodities.

Representatives of farmers' associations who protested against a formal investigation looking to changes in rates declared that financing of the crops would be made difficult were the duties to be thrown into a condition of uncertainty and that there would be a reduction in acreage.

The application has not passed through the preliminary stages of investigation and the action of the commission will not be determined until after a report is received from its advisory board, which is now considering the case.

To Stimulate Use of Potash in Fertilizers

No stone will be left unturned by the Potash Importing Corporation of America when it begins its operations on May 1 to stimulate the use of potash fertilizers. An effort will be made to increase the percentage of potash in fertilizer mixtures. It is recognized in Germany that American consumption of potash must be restored to its pre-war volume if the industry in that country is to thrive.

The American corporation, which is understood to have been financed entirely in this country, will be the official distributing representative of the German syndicate. The objective of the corporation will be to increase potash consumption in the United States to the point where the potash taken out of the soil by crops is replaced each year. It is realized that this will have to be done gradually and that it carries with it an educational campaign, the object of which will be to convince the American farmer of the value of potash fertilizers.

Strength Standards Adopted for Coal-Tar Imports

List of About 100 Standards Prepared—Will Be Submitted to Trade for Criticism

The Treasury Department is preparing to issue in the immediate future a list of standards of strength of commercial imports of coal-tar dyes, chemical and other products as brought in before July 1, 1914.

A conference on this subject was held April 23 among Ernest W. Camp, director of the Customs Division; Dr. H. C. Knight, in charge of the customs laboratory at New York; Dr. Peter Feberger, dye specialist at the laboratory, and W. N. Watson, color specialist of the Chemical Division of the Tariff Commission.

The 1922 tariff act provides that coal-tar products shall be assessed for duty on the basis of the commercial strength of imports previous to July 1, 1914. Many dyes and other products are now imported in more concentrated form than previous to the outbreak of the war in Europe. In such cases the specific duty of 7 cents per pound will be multiplied in accordance with the increase in strength. The ad valorem duty naturally will not be affected.

Samples have been gathered from various sources by the customs laboratory in its investigations and a list of about 100 standards has been prepared, covering the bulk imports. No effort will be made to list each individual color or product, but the standards will be arranged by types.

The list will be submitted to the trade for criticism for about 10 days before it is officially promulgated.

German Potash Industry Not Dependent on Ruhr Coal

The German potash industry is not dependent upon Ruhr coal. In January of 1922 more than 97 per cent of its fuel requirements were met with brown coal. At the time of the entry of France into the Ruhr, a slightly larger percentage of black coal was being used, but it was less than 5 per cent of total requirements. Such black coal as is needed for operating the railways belonging to the industry and its blacksmith forges can be supplanted easily by imported coal. There is, however, some black coal production on the properties of the potash companies. It happens that brown coal is so distributed in Germany as to be the logical fuel for the potash works.

Alcohol Committee Named

Commissioner Blair Makes Known List of Men Who Will Consult With Internal Revenue Bureau

Appointment of an advisory committee representing various phases of the industrial alcohol industry to consult with officials of the Internal Revenue Bureau and the Prohibition Unit regarding regulations and practices affecting the industry has been announced by D. H. Blair, Commissioner of Internal Revenue.

The organization of this committee is the result of a conference with the commissioner held several weeks ago by representatives of various organizations of producers, distributors and consumers of industrial alcohol, who asked that a special division to handle such matters be created, separate from the Prohibition Unit, or that an advisory committee be named. Attention was called by this delegation to the fact that the legitimate needs of industrial alcohol have been submerged beneath exercise of the police powers to suppress liquor violations, whereas the Volstead act provides for encouragement of the proper use of industrial alcohol.

The committee will consult with Commissioner Blair and with Prohibition Commissioner R. A. Haynes before any regulations affecting industrial alcohol are issued, and will give advice regarding means of facilitating legitimate use of the product.

Members of the committee named by Commissioner Blair are:

Dr. H. E. Howe, Washington, D. C., editor of the *Journal of Industrial and Engineering Chemistry*, representing the American Chemical Society.

William A. Sailor, Baltimore, president of Sharpe & Dohme and president of the American Drug Manufacturers Association.

E. J. Schieffelin, New York City, representing the National Wholesale Druggists Association.

Samuel C. Henry, Chicago, representing the National Association of Retail Druggists.

Prof. J. H. Neal, University of Illinois, Urbana, representing the American Pharmaceutical Association and the faculties of pharmaceutical colleges.

Martin Ittner, chief chemist, Colgate & Co., Jersey City, N. J., representing the American Manufacturers of Toilet Articles.

Frank A. Blair, New York City, president of the Proprietory Association.

M. C. Whitaker, New York City, president of the U. S. Industrial Chemical Co.

R. H. Bond, Baltimore, manager, McCormick & Co., representing the Flavoring Extract Manufacturers' Association.

Charles L. Reese, chemical director, E. I. du Pont de Nemours & Co., president of the Manufacturing Chemists' Association.

U. S. Largest Producer and Consumer Of Rosin and Turpentine

How Consuming Demand Is Divided According to Trades—Exports Below Standards of Pre-War Years

AN investigation into the turpentine and rosin industries has recently been completed by V. E. Grotlisch, of the Bureau of Chemistry. This report states that the United States furnishes between 60 and 65 per cent of the world's supply of turpentine and from 70 to 75 per cent of the world's rosin. The principal reason for the difference between the two is the fact that in Russia, Finland, Sweden, Norway and Poland wood turpentine is produced chiefly by the destructive distillation of wood, in which process no rosin is recovered. In Sweden a so-called turpentine and a so-called liquid rosin are recovered as byproducts in the manufacture of paper pulp. A relatively small quantity of so called spruce turpentine is recovered at several paper mills in this country.

The United States not only produces most of the world's turpentine and rosin but also uses a larger part of it than any other country. Roughly, it consumes between 35 and 40 per cent of the total world supply of turpentine and about 30 per cent of the rosin. As indicated by recent data collected by the Bureau of Chemistry, this consumption is distributed approximately as follows:

	Per Cent
Turpentine	
Paint and varnish industry	15
Shoe, floor and other polishes	6
Automobiles, wagons, cars, etc. (painting)	3
Medicinal and pharmaceutical preparations	2
Other industrial uses	1
For thinning down paint and varnish, and other miscellaneous purposes	10
Rosin	
Soap making	42
Paper and paper sizing	25
Paint and varnish	17
Rosin oil, pitch and printing ink	6
Linoleum and similar coverings	3
All other uses	7

In England, at present the second largest consumer of naval stores, the distribution of consumption is probably similar to that of the United States.

Exports of turpentine have shown decided increases since the war, the average for 1919 and 1920 being more than 10,000,000 gal. On the other hand, the average exports of rosin for 1919 and 1920 were 665,000 round barrels less than they were during the war. For the calendar year 1921 there were exported 9,267,959 gal. of turpentine and 560,864 round barrels of rosin, which, deducted form a total production of approximately 24,751,000 gal. and 1,684,000 round barrels, respectively, left for domestic purposes about 15,483,000 gal. of turpentine and 1,123,000 round barrels of rosin. In 1922 there were exported approximately 9,864,000 gal. of turpentine, including 495,000 gal. of wood turpentine, and 799,000 bbl. of rosin.

The exports of naval stores from the United States to Belgium, Germany, Holland and Italy in 1921 showed a decided increase, which, however, was offset by a decrease in the exports to most of the other countries listed, particularly Great Britain and the South American countries. In 1922, on the other hand, exports of turpentine to Belgium, Germany and Holland again decreased, but there was a corresponding increase in the exports to the rest of the world. Argentina, Australia and Japan were the only important countries importing American rosin which took less in 1922 than in 1921. Exports to the rest of the world showed a decided increase.

The increase since the outbreak of the war in American exports of rosin to the Scandinavian countries is interesting. This is due not only to an increase in their consumption of this commodity but also to a decrease in their importations from Germany, and, to a less extent, from Holland and Belgium. In other words, the Scandinavian countries are buying more of their American-made naval stores in the United States instead of second hand from German dealers in Hamburg and Bremen and Belgian and Dutch dealers in Antwerp and Rotterdam. A large proportion of the naval stores imported from the United States by Belgium and Holland are re-exported into Germany, passing through Rotterdam and Antwerp, whence it is shipped by river and canal to the German manufacturing districts in the Rhine Valley.

Linseed Companies Merge

Announcement was made last week that plans had been completed for the consolidation of the Archer-Daniels Linseed Co. and the Midland Linseed Products Co. J. W. Daniels, president of the Archer-Daniels Linseed Co., will serve as president for the new company and in general the management of the latter will be in the hands of the present officials of the Archer-Daniels Linseed Co. E. C. Warner, president of the Midland Linseed Products Co., will retire.

Bakelite Phenol Production Soon Available

The Bakelite Corporation of New York is erecting a plant for the manufacture of phenol near Cleveland, Ohio, and expects to be in a position to produce a surplus beyond its own needs, which will be available in a short time at as moderate prices as conditions will permit. According to an announcement made last week the phenol enterprise is the direct result of the protection afforded by the new tariff.

Trade Notes

Parsons & Petit, 63 Beaver St., New York, have issued a card on the subject of nitrate of soda. Statistical figures showing production and world's consumption, together with prices for a period of years, make this chart interesting and valuable to the trade.

It is reported that the California Cyanide Co., which is a subsidiary of the Air Reduction Co., will start producing cyanide and hydrocyanic acid in its California plant by Aug. 1.

Dr. Frank J. Monaghan, Health Commissioner of New York City, has set aside the week beginning May 7 as Paint-Up and Clean-Up Week for the city.

Advertising soap as "medicated" or as being made for or by a "medical association" when such statements are not true is declared by the Federal Trade Commission to be an unfair business act. The commission has therefore issued a cease and desist order directed to the Williams Soap Co., of Indianapolis, Ind.

W. D. Schwartz, of the L. H. Butcher Co., New York and San Francisco, accompanied by Mrs. Schwartz, sailed on the S.S. "Majestic," April 21, for England and the Continent. He will visit principals and factories in nine countries, for whom his company acts as sales agent for colors, minerals and chemicals.

Inquiries are being received in this country from German sources for prices on Chilean saltpeter. No explanation has been forthcoming as to why reputable German firms should be interested in making nitrate purchases in this country.

The rate on sulphate of ammonia from Seaboard, N. J., to New York, for export, is not unreasonable or otherwise unlawful, the Interstate Commerce Commission has ruled in connection with a case brought by the Seaboard Byproduct Coke Co. against the Delaware, Lackawanna & Western R.R.

B. H. Handy, assistant sales manager, Semet-Solvay, Syracuse, N. Y., was in New York last week.

C. W. Nichols, president of the Nichols Copper Co., has resigned the office of vice-president of the General Chemical Co.

The Oil Trades Association of New York held an informal luncheon at Angelo's restaurant on Thursday, April 26. Dennis E. Bergen, president, presided.

F. D. Lockwood, dealer in chemicals and oils, 115 Broadway, has been in Baltimore on a business trip.

E. F. Drew & Co., dealers in chemicals, will move their offices on April 30 to the Barrett Building, 40 Rector St.

H. H. Dow, president of the Dow Chemical Co., Midland, Mich., was in New York last week.

George W. Fortmeyer

Vice-president of the National Lead Co., who has served in the white lead industry for sixty-seven years, is honored by his co-workers on his eighty-fourth birthday.

THURSDAY, April 20, was the occasion of a celebration in honor of one of the best known and most highly regarded members of the white lead industry. It was the eighty-fourth birthday of George W. Fortmeyer, vice-president of the National Lead Co. and general manager of the Atlantic branch of the company. During the course of the day Mr. Fortmeyer was called to the office of President Cornish and on his return he found his own office thronged with officials and employees of the company who had assembled to celebrate the day and to honor their associate and leader.

A. C. Saunders, cashier of the company and a veteran of many years in the "National" employ, in a very fitting speech presented Mr. Fortmeyer with an oil painting of himself, done by Frank B. McCarthy, of the sales force of the company. Mr. Fortmeyer was visibly affected by the gift and by the many congratulations which he received from his co-workers. He expressed his thanks in a brief speech in which he took occasion to pay tribute to the spirit of harmony and co-operation that prevails among the workers in the Atlantic branch. Mr. McCarthy also spoke briefly and came in for much praise because of the excellent likeness of Mr. Fortmeyer which he had transferred to canvas.

Mr. Fortmeyer was born in New York and when a very young man he became associated with Colgate & Co. From that time up to the present has been identified with the white lead and linseed oil industries, until he has amassed the enviable record of 67 active years in those lines. As Mr. Saunders said in his presentation speech, Mr. Fortmeyer is more like 48 than 84, since he is very active physically and in addition to the manifold duties of his position, still finds time to devote to outside activities.

In the latter part of last year Mr. Fortmeyer completed his thirteenth year as president of the Linseed Association of New York and was re-elected for the ensuing year. Mr. Fortmeyer was one of the founders of this association and he played a prominent part in bringing it to the high plane of efficiency which it now enjoys. At the last annual meeting of the association, when Mr. Fortmeyer was re-elected to the presidency, a valuable gift was presented to him by the members and on different occasions they have paid tribute to the esteem in which they hold him and to the work he has done to make the association a recognized authority in the markets of the world.

Although he is now an honorary member of the Paint, Oil and Varnish Club of New York, Mr. Fortmeyer's activities for many years made him one of the most prominent members of that organization. He was president of the club in 1895-1896 and served on various important committees in later years.

New Chemistry Course on Commercial Subjects

University of Wisconsin Stresses Economic Phases of Chemical Industry in Studies to Start This Fall

A new course, called the "chemistry-commerce course," is to be launched at the University of Wisconsin this fall. Its purpose is to meet the requirements of men who wish to fit themselves for commercial positions in the chemical and related industries. The growing importance of chemistry in commerce has led to this step. The idea is to combine sound training in various branches of economics with several courses in chemistry. The chemical training is planned mainly to give a man sufficient knowledge to understand the basic technical features of the industries with which he may come in contact.

In the course in commercial chemistry, which runs throughout the junior year, only so much of the technical side will be presented as is necessary for a background. Emphasis is to be placed on the economic or commercial aspect. It is the expressed intention to give a student a wide acquaintance with commercial processes and materials of commerce rather than a detailed technical knowledge of a few. For those who desire more technical treatment, courses in industrial chemistry will be open as electives. Such problems as those of plant location and transportation will be especially studied. Another feature is to be a study of market reports and analysis of the factors causing fluctuations in the price of materials in the chemical markets.

Besides the broad range of economic subjects covered, embracing in all fourteen courses, the curriculum includes several in mathematics, foreign languages and English. In addition, a number of electives have been provided in order that a student may broaden his education in the direction he chooses.

H. D. Ruhm Named to Head New York Paint Club

The committee on nominations, of which H. J. Schnell is chairman, will submit the following names for election at the May meeting of the Paint, Oil & Varnish Club of New York: President, H. D. Ruhm; vice-president, C. J. Roh; secretary, H. G. Sidebottom, and treasurer, G. H. Tomlinson. Executive committee: E. V. Peters, chairman; A. G. Fairweather, R. W. Murray, H. G. Sidford, A. L. Somers and Frank Waldo. The arbitration committee proposed by the committee consists of G. W. Fortmeyer, chairman, D. E. Breinig, J. B. Bouch, Jr., H. Gates and Eugene Merz. R. O. Walker will head the twenty-six delegates that will be chosen to represent the New York organization at the national convention next October.

June A.I.C.E. Meeting to Be Held at Wilmington, Del.

The fifteenth semi-annual meeting of the American Institute of Chemical Engineers is to be held June 20 to 23 at Wilmington, Del. The headquarters for the meeting is to be the Hotel Dupont, where about 150 guests are expected. Each day of the meeting includes in its program the reading of technical papers, plant inspection and some social activity.

The papers to be presented, about twenty-three in number, embrace a wide range of interesting subjects. The papers on decolorizing materials, char, silica gel and fullers earth and those on corrosion promise to be noteworthy.

Among the plants to be visited are those of the Bond Bottle Seal Co., the American Vulcanized Fiber Co., the Bancroft Co. (cotton finishing), the Electric Hose & Rubber Co. and several departments of E. I. du Pont de Nemours & Co. In the latter plant an opportunity is to be afforded to see the Jackson laboratory, probably the most famous color laboratory in the world.

Social activities have not been neglected in the preliminary arrangements. A general social gathering, golf and an automobile trip to Pierre S. du Pont's residence at Longwood have been provided. At Mr. du Pont's home there is to be a garden party, a visit to the conservatories and dinner.

Chemical Trade Commissioner Urged for Germany

The Department of Commerce has under consideration the addition to its staff of trade commissioners in Berlin of an economist especially experienced in chemicals. It has practically been decided to expand in this direction if a man of proper qualifications can be secured. Domestic producers of dyes and chemicals have urged the department recently to secure more reports on conditions in the industry in Germany. If the suggestion is adopted, the agent will operate from Berlin.

Chemicals and Allied Products Show Gains in Export Trade

Statistical Review of Export Movement for 8-Month Period Ended Feb. 28

A GAIN of 19 per cent was made in the exports of chemicals and allied products for the 8 months July 1, 1922, to Feb. 28, 1923, as compared with July 1, 1921, to Feb. 28, 1922. Foreign sales for the months of January and February, 1923, represented expansions of 14 and 19 per cent respectively over the corresponding months of 1922, rising from $9,685,859 in January, 1922, to $10,944,830 in January, 1923, and from $8,692,116 in February, 1922, to $10,374,895 in February, 1923. One noticeable feature in the February trade, 1923, is a loss of 5 per cent from the January trade, although this may be partly accounted for by the difference of 3 days in the length of the months. The aggregate value of the groups and commodities with the percentages of increase or decrease for the 8 months, July 1, 1921, to Feb. 28, 1922, as compared with July 1, 1922, to Feb. 28, 1923, were:

Under the first group, "chemicals and allied products," are included coal-tar products (which expanded 44 per cent in value), medicinal and pharmaceutical preparations (24 per cent in value), acids and heavy chemicals, sodium compounds (26 per cent in value), pigments, paints and varnishes (32 per cent in value), fertilizers (1 per cent increase in quantity, but 8 per cent decrease in value), explosives (55 per cent in quantity and 38 per cent in value), perfumery, cosmetics and toilet preparations (34 per cent in value) and pyroxylin products (62 per cent in value). All future analyses of imports and exports will be based on this grouping. Soaps of all kinds and tanning materials and extracts are excluded.

Decrease occurred in the exports of formaldehyde, glycerin, soda ash, sal soda, ammonium sulphate and phosphate rock except the high-grade hard rock.

	July 1, 1921-Feb 28, 1922	July 1, 1922-Feb 28, 1923	Per Cent of Increase or Decrease
Chemicals and allied products	$51,842,166	$58,305,753	12
Naval stores, gums and resins	9,642,219	14,222,046	48

Total	**$69,300,925**	**$83,340,825**	**19**

Government to Investigate Production Costs Abroad

C. R. DeLong, chief of the Chemical Section of the Tariff Commission; M. G. Donk, a chemical expert of the section, and Eben M. Whitcomb, one of the commission's accountants, will sail for Europe May 3 to investigate costs of production abroad of various chemicals regarding which applications for changes in duties under the flexible tariff section have been docketed.

The party plans to spend 3 weeks in England investigating barium dioxide and potassium chlorate. Their subsequent schedule calls for 2 weeks in Norway investigating sodium nitrite; 6 weeks in Germany investigating various chemicals, and later trips to Holland on oxalic acid and to Switzerland on barbituric acid. This schedule is tentative as to the time in each country.

Mr. DeLong will leave the party in Germany and make a trip of inspection through France and probably other countries on the Continent. He will return after 2 months abroad. Other members of the Chemical Section staff will embark in June and join the original party. The total schedule of work for the chemists in Europe cannot be completed before the middle of August, it is estimated, and may be extended by the addition of other investigations while they are abroad.

Equipment Statistics to Be Gathered Monthly

A new statistics service in the chemical industries has been inaugurated by the Chemical Equipment Association. Data are to be gathered through the co-operative efforts of members of this organization, representing manufacturers of equipment and materials in practically every field. This will embrace industries which are strictly chemical or metallurgical in nature as well as a great many which are related to these.

According to a statement made by P. D. Schenck, president of the association, following a recent consideration of statistical activities by the board of directors, "Chemical equipment is in effect a barometric register of general industrial conditions both at home and abroad. In many ways the absorption of chemical equipment and materials is as reliable and specialized an index to general industrial conditions as the production of pig iron was considered to be before the war, or as the Federal Reserve Bank's discount rates are now regarded.

"It is not yet generally realized that the membership of the Chemical Equipment Association, now recognized by the government and by industry in general as the speaking voice of American chemical equipment and materials manufacture, supplies essential equipment to practically every basic industry in the United States and abroad. There is scarcely an article of common consumption, in diet, in clothing, in transport, in the essentials or semi-essential accessories of life, that is not produced in some degree through the use of standard or special equipment and materials manufactured by the membership of this association."

The collection of comparative statistics on the absorption of chemical equipment and materials by industries and by sections is to be a monthly activity. By industries, the information collected each month discloses the manufacturing fields most active in the absorption of equipment and materials, both as to domestic absorption and as to foreign absorption. By geographical sections of the United States, the information also discloses the principal concentrations of industrial activity in the way of replacements, in factories, new construction operations and expansion projects of various sorts. The information further reveals general trade and business conditions of other sorts than those strictly pertaining to the absorption of chemical equipment.

News Notes

A unique celebration is to be held in France on May 27, to be known as "Laboratory Day." The occasion is that of the centenary of the birth of Pasteur. Research laboratories and research workers are to profit from contributions received on that day.

Reduction of wasteful variety in manufactured goods is being sought with considerable success by the U. S. Chamber of Commerce. Paper, rubber, leather and fabricated iron, as in pipe and agricultural implements, are the industries in which results have been accomplished. For instance, certain paper makers report a cut to 55 per cent of former lines, with consequent increased production at lower cost.

Synthetic camphor production by a new process is to be begun at Feugen, Austria, in the near future. The Chamber of Commerce of Vienna has confirmed a report to this effect. Anton Gawalowski of Feugen is the inventor of the new process.

Desulphurization of coke by steam is one of four important research problems being carried on at Carnegie Institute of Technology. The Bureau of Mines is co-operating in this work, which also includes a study of the correlation of the coal beds of western Pennsylvania through their microscopic constituents. The two other studies involve fundamental research on the corrosion of alloys and an investigation of low-temperature Pennsylvania coal tars

Fertilizer men who are to meet at the convention of the National Fertilizer Association at White Sulphur Springs, W. Va., June 11 to 17 are arranging an extensive program. The subjects covered will include cost accounting systems, chemical and manufacturing problems, sales methods, transportation problems, etc. The officers of the association are now arranging the details and promise a meeting which will be of unusual interest to everyone identified with the fertilizer industry.

Viscosity of cellulose as determined by the cuprammonium method is being investigated by the Cellulose Division of the A.C.S. All firms or individuals having constructive information dealing in any way with the subject are urged to communicate with E. B. Benger, chairman, E. I. du Pont de Nemours & Co., Newburgh, N. Y.

"Dyewood Products" and **"Early Chemical Symbols"** were the two topics discussed at the April 23 meeting of the Stamford Chemical Society. R. H. Wisdom and E. H. Smith were the respective speakers.

Ceramic engineering will be taught at the Georgia School of Technology if the project now under way is consummated. The ceramic industries of the state are interested in the founding of the new course, for which a fund of $26,000 is sought. The idea of the new institution is to develop the clay resources of the state in a comprehensive and intelligent manner.

Five fellowships in the school of mines, University of Alabama, are to be offered during the school year 1923-24. The work, which will be done in conjunction with the U. S. Bureau of Mines, has been divided into two sections. One deals with the beneficiation of various iron ores, the other with problems of coal washing.

American oil chemists meeting at Hot Springs, Ark., April 30 and May 1 have arranged two very busy days. Besides the usual committee reports, seven technical papers are slated for the occasion.

Ethylene as an anesthetic for general use possesses superior properties, according to Dr. W. E. Brown, who has used it in a Toronto hospital. Mixed with nitrous oxide and oxygen it produces partial analgesia, or loss of pain, without loss of consciousness.

Multiple unit cars used for the transportation of chlorine gas cannot be classed as tank cars, according to C. F. Gerry, in a report submitted in the case of the Mathieson Alkali Works. This means that present freight charges are regarded as fair by the Interstate Commerce Commission.

Synthetic ammonia is to be produced in Spain by the Claude process, according to a recent Reuter dispatch. M. G. Claude is installing a factory there for a Spanish syndicate. The original plant is designed to use from 3,000 to 4,000 cu.m. of hydrogen a day—the output of the nearby electrolytic soda plant of the Electroquimica de Felix Co.

Swiss carbide plants having a yearly capacity of close to 120,000 tons are being closed down. Since only about 10,000 tons is used annually within the country, the present export crisis is affecting the industry vitally. The cement industry is likewise hard hit due to the present high price of coal and to its dependence on export markets.

Facts and Figures That Influence Trade in Chemical Products

Market Conditions

Current Prices Imports and Exports The Trend of Business

Domestic Buying Movement in Chemicals Has Become Less Active

Good Export Inquiry Continues for Some Selections—Higher Producing Costs Strengthen Acetone and Acetate of Lime—Tin Oxide Reduced in Price—Lower Prices for May Deliveries of Prussiate of Soda

REPORTS of a slowing up in buying were prevalent throughout the week. This was especially true of buying for domestic consumption. In several cases the decline in activity is due to the fact that consuming trades are well covered for nearby wants. In other cases lessened activity in the trades is responsible for their absence from the materials markets. The fertilizer chemicals have passed their active season and no active buying is to be expected. Reports from the rubber trade say that a drop in tire production is in contemplation to obviate a sharp decline at the middle of the year. Reports from the tanning trade state that April business was not so good as that of March and a report from Milwaukee says that tanning plants are running only about 50 to 60 per cent of capacity.

Export Buying Holds Up

The movement of alkalis into export channels is holding up well and considerable business is being placed in the case of many heavy chemicals. From statistics made public last week it is seen that caustic soda is being shipped to a large number of foreign markets. Total shipments of caustic soda to foreign countries during February were 7,405,064 lb. of which 5,022,031 lb. went to Argentina, Canada, Brazil, Cuba and Japan, these countries being named in their relative position according to quantities taken by them. The value of export shipments in February figures out at slightly in excess of 3.40c. per lb., according to declared valuations.

Price Changes

There was no decided price movement during the period. Chemicals depending on wood distillation were stronger under higher producing costs. Lessened competition helped to firm up other quotations, notably bichromates, oxalic acid, and formaldehyde. Lower selling prices for metals have taken the edge off most of the metal salts and some of the latter are openly quoted at lower figures. Prussiate of soda was easier due to lack of buying and selling pressure on the part of holders. Arsenic, which is one of the most interesting items at present, failed to show any new developments and buyers are holding off evidently with the hope of covering their needs later on at more attractive price levels. Copper sulphate is weakened both by declines in the metal and by heavy offerings of imported grades at relatively low prices.

Acids

Acetic Acid—Higher costs for raw materials have been the feature of this market. A very strong undertone existed and the outlook is regarded as favoring a higher price level for a long time to come. There is very little competition from resale lots and the present price schedule is firm at $3.17½ for 28 per cent, $6.35 for 56 per cent and $12.05@$12.85 for glacial.

Citric Acid—Inquiry has continued fairly active but actual business has been restricted by the scarcity of stocks. Domestic makers are well sold ahead and are shipping out regularly on old contracts. They are holding prices steady and apparently are not trying to take advantage of the differential held by imported offerings. Prices are given at 49c. per lb., although it is admitted that this price is largely nominal for prompt deliveries. Imported holds at 52@53c. per lb. with shipments in some cases quoted above that level.

Gallic Acid—There is no indication of price changes for this acid. Sellers say values are established on a steady basis. Trading is along quiet lines with nothing to disturb routine conditions. Technical grades are quoted at 45@50c. per lb.

Hydrofluoric Acid—Consuming interest is not pronounced and while fundamental conditions are strong, producers are not inclined to advance prices in the slow season and continue to offer on a basis of 7@8c. for 30 per cent and 11@12c. for 48 per cent.

Oxalic Acid A few odd lots were offered in the spot market at 13¼c. per lb. and even late in the week there were reports that 13¼c. could be done on a firm bid. Yet there seems good evidence that spot goods have been well depleted and the general asking price is 13½c. as an inside figure with an upward range according to seller. Reduced offerings of imported both on spot and for shipment have strengthened prices for domestic and 13c. is held as an inside price for round lots at the works. At present there is no competition in domestic oxalic but a new producer is expected to begin offering next month.

Sulphuric Acid—Limited stocks in the possession of first and second hands give a firm appearance to prompt deliveries and in many quarters prices are given as nominal due to inability to take on new business for spot and nearby deliveries. Prices quoted are $9.50@$11 for 60 deg. in tanks and $16@$16.50 for 66 deg.

Tartaric Acid—Reports on the activity of the market vary. Some sellers say that consumers bought freely in anticipation of higher prices and are now well covered for considerable periods ahead. Other reports say inquiry remains good. Reports agree that values are firm and holdings limited. Asking prices are 36c. per lb. for both domestic and imported.

Potashes

Bichromate of Potash—While demand during the week was quiet, stocks in sellers' hands are reported to have been reduced by recent deliveries and sellers are competing less keenly for business. Prices now range from 10¾c. to 11c. per lb. at the works.

Caustic Potash—A quiet market ruled throughout the period. Buyers are interested only when prices are in their favor and there was a lack of shading in the spot market with imported 88-92 per cent quoted at 8¼@8½c. per lb., and the inside figure applying on shipments. The price of domestic makers is maintained at 8½c. per lb. carlots at the works.

Muriate of Potash—Advices from Germany state that higher price schedules are to be put into effect on May shipments. The influence of these reports in domestic markets is lessened by free offerings of Alsatian muriate and prices at present are by no means

"Chem. & Met." Weighted Index of Chemical Prices

Base = 100 for 1913-14

This week	179.23
Last week	178.31
April, 1918 (high)	286.00
April, 1919	231.00
April, 1920	261.00
April, 1921 (low)	140.00
April, 1922	158.00

The firmer position of sulphuric acid is reflected in the advance of 92 points in the weekly index number. Copper sulphate was lowered but as the decline was moderate the price change had no important bearing on the general situation.

firm. While quotations of $35 per ton are given as representing the market it is an open secret that this price is being shaded materially in actual transactions.

Nitrate of Potash—The market for saltpeter has been gaining in strength and an advance of one-half cent per lb. was announced by leading sellers in the past week. For a long time imported material has been underselling domestic makes and kept selling prices for the latter at close to production cost. Recently imports began to decline and with diminished competition the domestic market has moved up to a position more favorable for sellers.

Permanganate of Potash—Prices have been very irregular with conflicting views held by sellers. Shipments were not quoted as freely as a week ago. Spot goods are reported to have sold at 23c. per lb., but this is far from a general quotation, as 23½@24c. is held by many sellers and stocks afloat were generally held at 23c. per lb. It is evident that prices depend on seller with no decided price trend in either direction.

Sodas

Bichromate of Soda—Contract orders take up enough of production to prevent selling pressure and even concessions in order to equalize freight rates are now seldom met with. Prices at the works are firm at 7½@7¾c. per lb. for round lots with up to 8c. per lb. asked for smaller amounts. Spot stocks also are not present for sale and the local market is represented by quotations of 7¾@8c. per lb.

Caustic Soda—Export inquiry remains prominent and considerable amounts have been sold for May shipment. Standard brands are generally quoted at 3.45c. per lb. f.a.s. but sales are said to have been made at 3.40c. per lb. f.a.s. and outside brands have sold at 3.35c. per lb. with intimations that 3.30c. could be done for the last half of May. Home demand is less active as the majority of consumers are covered. Prices for standard goods hold at 2½c. per lb. for carlots at the works, basis 60 per cent.

Chlorate of Soda—Seasonable buying is holding the market in a steady position. Imported material holds at 6½c. per lb. and upward on a quantity basis. Prices of domestic producers are unchanged at 6½c. per lb. at works. New business is not heavy and no price disturbances are looked for from that direction.

Cyanide of Soda—Cyanide is said to have found a greater outlet this season in the color trade as a substitute for prussiates and demand from that source is still noted. The market is barely steady, as general consuming demand is not active and imported grades are competing and undoubtedly the latter would be more of a factor if consumers were convinced of their quality. Prices are 20@21c. per lb. for imported and 22½@23c. per lb. for domestic.

Nitrate of Soda—A fair amount of business is being done in spot and prompt delivery, but futures are not attracting attention in spite of quotations for later shipments at prices under those ruling for spot goods. Spot prices vary according to seller and if resale lots are taken into consideration the range may be given as $2.60 to $2.65 per 100 lb. On futures as low as $2.50 per 100 lb. has been quoted.

Prussiate of Soda—A sale of 5 tons of yellow prussiate on spot was reported at 18c. per lb. The market has been easy, however. In the first place demand has been very slow and holders of stocks have been forced to cut prices in order to move holdings. In the second place some large producers have announced prices of 17½c. per lb. works, on round lots for May shipment.

Miscellaneous

Acetate of Lime—Higher producing costs have resulted in an advance of one-half cent per lb. for this material. Producers say that raw material and labor costs made it impossible to continue former quotations and they are now asking 4@4.05c. per lb. Demand is good especially on the part of domestic buyers.

Acetone—Following the lead of acetate of lime a stronger market exists for acetone and prominent factors have marked up their prices to 24½c. per lb. at works, which is equivalent to a delivered price, New York, of 25c. per lb.

Arsenic—Inquiry is persistent, but most buyers are bidding at levels which are too low to effect sales. Reports on asking prices are irregular, as quotations of 12½c. per lb. for shipments are heard, whereas bids at that figure have gone unfilled. In fact some sellers say they can place large amounts at 13c. per lb. but can find no reliable offerings at that level for any nearby positions. The spot market is quiet as far as sales go, with 15½c. per lb. as the prevailing asking price. Reports on increased production are having some effect on buyers. Based on production for the first quarter of the year, the domestic output for 1923 is estimated to reach a total of 22,000 tons of refined white arsenic

Copper Sulphate—Prices for domestic makes are none too steady as a result of lower prices for the metal and because of continued weakness in imported. Demand has been slowed up by the downward trend of values, although contract deliveries are said to be ordered out promptly. There is no fixed quotation for imported sulphate on spot or for shipment. Sales are going through on firm bids and at different levels. Spot material can be picked up at 5½c. per lb. and possibly less and shipments have been offered under the 5½c. level. Standard makes of domestic are more firmly held, but some reports credit sales at 6c. per lb. and up to 6½c. per lb. is asked.

Formaldehyde—A few odd lots are said to be held in the spot market which are a matter of negotiation and on which 14½c. per lb. might still be done. But the absorption of resale goods has again placed the market in the hands of producers and general asking prices are 15@16c. per lb. according to seller.

Tin Oxide—Weakness in the metal market has brought out lower prices for tin oxide and prominent sellers were offering at 50c. per lb. There was no change in the asking price for tin crystals or bichloride of tin.

Sulphur—First-hands report a satisfactory volume of business in refined sulphur and prices are steady. Larger quantities than formerly are moving into agricultural channels. Commercial sulphur, in bags, held at $1.35 per 100 lb., and $1.70 per 100 lb. in cooperage. The roll held at $2 in bags and $2.15 in cooperage. Flowers settled at $3 in bags and $3.35 in barrels. The flour in bags is available at $2.25. Crude sulphur is steady at $18@$20 per ton, New York. At the mines $16 is the ruling quotation, bulk basis.

Alcohol Demand Fair

Offerings of denatured alcohol by outside interests were not so much in evidence and producers here saw no reason to come down in their ideas as to prices. Business was not active, but satisfactory considering the season of the year. Denatured special No. 1, 190 proof, held at 33c. per gal. in drums, and 39c. per gal. in barrels. The No. 1 completely denatured, 188 proof, in drums, was available at 41c. per gal Formula No. 5, denatured, was unchanged at 32c., in drums. U. S. P. ethyl spirits, 190 proof, was offered by first-hands at $4.70 per gal. Cologne spirit held at $4.75. Methanol was firm but nominally unchanged at $1.18 per gal., in barrels, basis 95 per cent, and $1.20 per gal., in barrels, 97 per cent.

New Use for Salt and Sodium Arsenate

An increased demand for low-grade salt and for sodium arsenite for use in the campaign against the barberry bush may be expected. This bush spreads the black-stem rust to the wheat fields. Because of that fact, the Department of Agriculture is making a drive on it. Ten pounds of common rock salt applied to the center of the crown of the bush is sufficient to kill the plant. A gallon of the stock solution of sodium arsenite will make 50 gal. of solution, of which 2 gal. poured in the center of the crown of the bush is sufficient for its eradication, the department states.

The department also is recommending increased use of copper sprays and barium water sprays in potato growing. It is pointed out that the expenditures for these sprays ordinarily would constitute only a small part of the profit that would come from the increased yield and from the better composition of the tubers.

Coal-Tar Products

Crude Naphthalene Higher Abroad—Phenol Production to Be Augmented—Benzol Quiet—Solvents Scarce

CABLES from England reported a higher market on crude naphthalene, and, according to private advices, production abroad appears to be sold up for the next 2 months. This news led traders here to hold out for full prices quite regardless of the state of trade. Actual buying by the consuming trades was inactive, but, with leading producers in this country behind in deliveries, this situation did not discourage operators. The announcement that the largest consumer of phenol would soon enter the producing field on a scale broad enough to be in a position to offer supplies in the open market took much of the "snap" out of the speculative element and business in outside goods naturally fell away. However, prices did not ease off any.

There were no new developments in the cresylic acid situation. The committee appointed recently for the purpose of handling the application for a reduction of 50 per cent in the prevailing rate of duty held another meeting, but nothing definite was accomplished. Owing to the fact that dyes and coal-tar products are being shipped to this country in a more concentrated form the Treasury Department is considering the proposition of assessing duty in accordance with the increase in the strength.

Coal-Tar Crudes, Etc.

Benzene—Demand has been disappointing but with the motoring season not yet under way, producers are inclined to mark time. The undertone of the market at the close was barely steady. Benzene, 90 per cent. in tanks, was available on contract at 27c. per gal. The pure, water-white, was nominally unchanged at 30@32c. per gal.

Cresylic Acid—The past week witnessed the arrival of 131 drums from British ports. Demand was quiet and prices for the imported redistilled were unsettled. On duty-paid material there were sellers at $1.25@$1.35 per gal., a decline of 10c. from the nominal price named a week ago. Domestic production is well sold ahead and first hands refused to name a flat price. Contract deliveries are going out against purchases at close to 78c. per gal.

Naphthalene—The feature in the market was the stronger position in crude in the British markets. Cables received late in the week quoted 4c. per lb. on good quality crude for April-May shipment, which compares with 3⅞c. per lb. a week ago. Some traders go so far as to say that English producers, with few exceptions, are sold up over the summer positions. Demand in New York from distributors was good, but actual consuming call was not up to expectations. Flake was nominally unchanged at 9½c., immediate delivery, with balls at 9¾@10c. per lb., round-lot basis.

Phenol—While offerings of resale material were light and prices ruled firm, interest in this material fell off somewhat. The announcement that new production would soon come on the market discouraged speculative activity. U.S.P. phenol on spot sold at 55@57c. per lb., but before the close asking prices on resale lots ranged from 57@58c. per lb. Producers took on "regular" contract business at 28c. per lb.

Aniline Oil—Prices were repeated by first hands on the 16c. round-lot basis, immediate delivery. Trading was moderate only.

Salicylic Acid—Trading in salicylic acid was not so active as a week ago, but, with stocks materially reduced, the market presented a firm undertone in all directions. The technical variety brought 47c. per lb. On the U.S.P. grade 50c. per lb. represented the market.

Paranitraniline — Producers reported a firmer market, but did not alter prices. Leading makers quote 75c. per lb.

Solvent Naphtha—Demand exceeds the supply and prices named in producing circles were only nominal. The current production is sold up. Nominal prices range from 37@40c. on the water-white, in drums.

Adopt Standards for Paint

Reduce Number of Shades and Eliminate Odd-Sized Containers

Reduction in the number of shades and tints of paints, stains and varnishes and elimination of a number of odd sizes of containers were agreed upon Wednesday at a conference of manufacturers, distributors and large consumers with the Division of Simplified Practices of the Department of Commerce. This was the outgrowth of a preliminary conference on this subject held last September.

Plans agreed upon provide that all ⅛-gal. cans of all types be discontinued and all sizes of containers smaller than ½ pt. except for stains, gold and aluminum paints and household enamels. Two- and three-pound cans are to be eliminated. Pints are to be eliminated in house paints, flat wall paints and porch paints. All sizes less than gallons are to be eliminated for barn and roof paints and shingle stains. Oblong or square varnish cans are to be eliminated in sizes smaller than gallons.

Shades and tints are to be limited as follows: Floor paints, 8; house paints, 32; flat wall paints, 16; enamels, 10; porch paints, 6; roof and barn paints, 4; shingle stains, 12; carriage paints, 8; oil stains, 8; varnish stains, 8; spirit stains, 14; all of the foregoing being exclusive of black and white; oil colors, including black but counting the several shades of a single color as one color, 32; architectural varnish, interior and exterior, 10; marine varnish, 4; miscellaneous, including all not specified in the foregoing, such as japan driers, asphaltum, etc., 28.

Rubber Latex Forges to Front

The use of rubber latex in tire fabrication is no longer impossible. Recent developments in the art of using this latex promise great improvements in rubber manufacture, according to C. B. Seger, chairman of the board of the United States Rubber Co. Because of the new processes developed it is purposed to begin the import of latex on a large scale at once. In outlining the use of the new material Mr. Seger said:

"Sprayed rubber, the result of a new method of producing crude rubber from original latex, insures a pure and absolutely uniform product for the first time since rubber was discovered.

"Heretofore all rubber produced and sold on the market has been coagulated out of rubber latex, by means either of smoke or chemicals.

"Rubber produced by old primitive native methods of heat and astringent smoke over slow fire is contaminated with smoke and other combustion products. Nor can there be any assurance of uniform quality.

"When rubber is produced by treating latex with acetic acid, rubber contains acid residues. Acid tends to destroy some of the valuable natural properties of latex.

"New spraying process takes latex, sprays it into a snow-white mist and brings this snow-white mist into contact with pure superheated air, driving the water out of the latex—and nothing else.

"Sprayed rubber is 100 per cent pure solids from virgin latex. No acid, no smoke. It is dry and pure and remains so.

"Sprayed rubber has greater strength, because it contains all natural strength of rubber of original latex unimpaired by chemicals or destructive effect of machine working. It is uniform in quality, something never before obtained."

Finds Nitrate Refining Process

A large saving in labor costs and a much better product is secured by the application to Chilean nitrates of a new process of refining, according to a report which has been received by the Department of Commerce from Santiago.

The process is the invention of M. Davieusart, a French chemical engineer. He recently demonstrated his process before a gathering of engineers at Santiago.

Vegetable Oils and Fats

Cottonseed Steadies—Linseed Futures Unsettled—China Wood at New High—Tallow Closes Lower

THE feature was the decline in tallow prices which took place late last week. The lower London market frightened holders and brought out actual business at a decline of ⅛c. Cottonseed oil steadied on support in the nearby positions, refiners evidently taking on May contracts because of the strong statistical position of the old crop months. Arrivals of foreign linseed oil were reported, which helped out the spot situation. On futures traders were disposed to hold off for lower prices. China wood sold at 40c. per lb., on spot, a belated short being the buyer. Coconut oil was offered at 9c., sellers' tanks, coast.

Linseed Oil—Spot oil was tight in all directions and prices were maintained on the basis of $1.17 per gal., in barrels, carload lots. June oil, domestic, held at $1.14, with July forward at $1.10. Foreign oil, June shipment from the other side, sold at $1.02@$1.03, duty paid, bulk basis. On futures the undertone was easier, the larger consumers holding off because of the good crop prospects in this country and the feeling that Argentine offerings of seed will not diminish for some time to come. The fact that the Argentine has shipped 26,500,000 bushels of seed since the first of the year has convinced many in the trade that a record crop was produced in that country. According to the Department of Agriculture the area in the United States this coming season will be almost doubled. This preliminary estimate on the flaxseed crop is based on a report covering "intended plantings" and will be subjected to many changes. There were offerings of Argentine seed afloat at $2.40 per bu., c.i.f. New York. During the past week India exported 448,000 bushels of seed, indicating that the new crop is moving. Linseed cake for export was nominal at $34.50@$36 per ton, f.a.s. New York, as to seller and position. Importations of seed from the Argentine assumed large proportions last week and mills are gradually catching up on deliveries.

Cottonseed Oil—Refiners were buyers of nearby refined in the option market and sold distant futures in an effort to hold prices down. However, the market developed a firmer undertone, reflecting the strong statistical situation and unfavorable news on weather conditions in the cotton belt. The estimate on "intended plantings" of cotton, showing an increase of 12 per cent in the acreage, had little influence upon the market. The report which was issued about a week ago by the Department of Agriculture was very much in line with private estimates. Crude oil sold at 10c. per lb., tank cars, f.o.b. mills, southeast and Texas, with offerings light. Bleachable oil was quiet but steady at 10½c., f.o.b. mills, Texas common points. Cash trade in refined oil was less active. Lard was unsettled in the west. Hogs held at $7.60@$8.00 per 100-lb., Chicago, with receipts liberal. Lard compound was unsettled at 13½c. per lb., carload lots, f.o.b. New York. Oleo stearine sold at 10½c. per lb

China Wood Oil—A parcel of 50 barrels sold on spot at 40c. per lb., a new high for the movement. May-June closed at 30c., with July forward at 26½@26¾c.

Coconut Oil—No large sales went through last week. The market held at 9½c., sellers' tanks, New York, and 9c., sellers' tanks, f.o.b. Pacific coast ports. The undertone was barely steady. Copra was nominally unchanged. South Seas sun-dried, in bags, held at 5½c., coast and 5⅝@5¾c. New York, c.i.f. basis.

Corn Oil—Sales of crude oil were reported at 10½c., sellers' tanks, f.o.b. middle western points.

Olive Oil—Sulphur oil, prime green, was raised to 10¼@10½c. per lb. in some quarters, in sympathy with the higher primary markets.

Palm Oils—Demand slow and market closed easy on the drop in tallow. Lagos for shipment 8½c. per lb. Niger for summer positions closed at 8@8¼c. nominal.

Rapeseed Oil—English refined on spot was offered at 84½c. On April-May shipment from the other side 85½c. per gal. was asked.

Soya Bean Oil—May shipment from the Pacific coast was offered at 10½c., duty paid, sellers' tanks. On futures 10⅞c. was asked. Bulk oil in bond, May-June shipment from the Orient, closed at 7.90c. per lb., c.i.f. New York.

Fish Oils—The nominal quotation for crude menhaden oil for future delivery was 53c. per gal., tank car basis, f.o.b. works. No new business came to light. The market was barely steady at the close. Newfoundland tanked cod oil was unchanged at 68@70c. per gal.

Tallow and Greases—Sales of extra special tallow at 8⅝c. per lb., ex plant, a drop of ⅛c. for the week, completely upset the market. At the regular London weekly auction prices declined 2 shillings per 112-lb. Yellow grease was easy at 8¼@8⅜c. per lb., New York.

Procter & Gamble Suit Dismissed

The Federal Trade Commission announces the dismissal of its formal complaint against the Procter & Gamble Distributing Co., of Cincinnati, Ohio. The practice complained of was that of guaranteeing against price decline in the sale of soaps.

Miscellaneous Materials

Varnish Gums—There were sellers of Batavian damar on spot at 30@31c. per lb. Cables were firm and import prices were virtually on a parity with the New York market. Trading was described as routine only. In high-grade kauri gums prices were firmly maintained because of the light offerings from the primary centers, production being disappointing.

Fluorspar—Steady prices were the rule. Acid grades, 98½ per cent or better, settled at $27.50@$28 per ton, delivered.

Casein — Recent importations, together with freer offerings from domestic sources, eased the market. There were sellers of nearby material at 22@23c. per lb. Spot casein was available at 23@24c. per lb.

Barytes—The market on prime floated barytes held at $28 per ton, f.o.b. St. Louis. Trading at these prices has been moderate only. The New York market was unchanged at $42 per ton, asked.

Shellac—Offerings were freer and T. N. on spot sold down to 70c. per lb. Unsettled primary markets brought out a little pressure. Bleached, bone dry, settled at 84@86c. per lb. Superfine orange on spot closed at 77@78c. per lb.

Naval Stores—Prices again went off in the market for spirits and final quotations of $1.42@$1.43 per gal. were little more than nominal. The recent sharp uplift in prices restricted buying, while new season's offerings continue to come forward. Rosins were in steady demand and prices were maintained on the $6.25 basis for the "B" grade.

Glycerine — Chemically pure was barely steady at 18c. per lb., in drums. Dynamite was available at 16½c. in the middle west, while operators in New York territory quoted 16½c. Crude soap-lye, basis 80 per cent, loose, held at 10½c., with no sales reported. On the saponification 11⅜c. was asked at middle-western points, carlots, loose.

White Lead—The recent decline in pig lead to the 8c. basis brought out no changes in the market for pigments. Corroders, however, were no longer so bullish in their ideas. Standard dry white lead (basic carbonate) held at 9⅜c. per lb., casks, carload basis.

Zinc Oxide—Easier prices again prevailed for the metal without affecting the market for zinc oxide. Producers continued to quote American process lead free at 8c. per lb., carload lots. Red seal, French process, was traded in on the 9⅜c. carload basis. Demand, taken as a whole, was less active.

Unreasonable Rate on Muriate

The Interstate Commerce Commission has found the rate on muriate of potash in carloads from Wilmington, Cal., to Bay City, Mich., and to Niagara Falls, N. Y., to be unreasonable. Reparation was awarded to the Diamond Match Co., the complainant.

The Swiss Dye Industry

In 1922 the exports of aniline dyes from Switzerland totaled 3,872,800 kg., with a value of 55,257,000 francs, thus exhibiting very little change as compared with the previous year. On the other hand, the exportation of artificial indigo made good progress and totaled 3,460,800 kg., with a value of 13,158,000 francs, as against 1,182,900 kg., with a value of 9,497,000 francs in 1921. The chief purchaser was China, with 9,948,000 francs; that country requires large quantities of artificial indigo for her cheap cotton fabrics. Although the quantity of exported indigo has almost trebled, the value has not gone up by more than four-tenths, as competition on the world's markets has been very keen of late. The second best customer for Swiss artificial indigo was Japan, which, however, took a much smaller amount, this country having itself developed a considerable dye-making industry in recent years. The principal buyers of Swiss aniline dyes were: France (13.9 million francs), Great Britain (13.1), United States (12.7), Belgium (2.5), Italy (2.0) and Japan (1.4).

Will Smoke Protect Orchards?

Orchard protection by smoke clouds may become a commercial possibility. Arrangements to measure the effectiveness of such clouds in preventing nocturnal cooling have been made recently by the Weather Bureau, as a result of requests from fruit growers and others. Further tests will be made at Edgewood Arsenal in co-operation with the Chemical Welfare Service of the army. Prof. H. H. Kimball and Prof. J. W. Smith of the Weather Bureau will be in charge of this work. It is proposed to set up instrument shelters over a large area, and to cover a part of this area with a smoke screen on nights favorable for frost. Temperature readings in both the covered and uncovered areas will be made and compared.

It is believed that several tests of this kind will establish the feasibility of this method of frost protection and make it possible for the Weather Bureau to decide whether it is economical and practical.

Alcohol Interests to Produce Potash and Fertilizer

Two Baltimore concerns, the United States Chemical Co. and the research department of the United States Industrial Alcohol Co., are planning improvements which are estimated at not less than $1,000,000.

The reclamation plant, which manufactures potash for agricultural purposes, is to be enlarged and its capacity increased.

The plans include the erection of a fertilizer factory, which will utilize directly the potash produced there and will be a complete mixed fertilizer producing unit.

Imports at New York

April 20 to April 27

ACIDS—400 csk. citric, Palermo, Order, 20 cs stearic, Rotterdam, M W Parsons, 140 cs formic, Rotterdam, R. W. Greeff & Co, 40 dr. cresylic, Glasgow, Order; 60 kegs hydrosulphite, Liverpool, Kuttroff, Pickardt Co, 24 dr. cresylic, Liverpool, Jordan Bros., 67 dr. cresylic, Livorpool, Order, 3 bbl acetic, Genoa, Bush, Beach & Gent

ALCOHOL—80 bbl. denatured, Arecibo, C Esteva, 25 bbl. do, Arecibo, M Felgel Bros

ALUM—75 csk, Hamburg, Order

AMMONIUM—15 pkg. carbonate, Liverpool Brown Bros. & Co.

ARGOLS 27 csk. Liverpool, Royal Baking Powder Co.

ARSENIC—130 csk, Liverpool, Order, 100 bbl., Tampico, American Metal Co., 50 cs., Rio de Janeiro, Order.

ASPHALTUM—428 sk, Havana, Lamson Asphalt & Chemical Co.

BORAX — 16 bbl., Cienfuegos, Knauth Bros

BRONZE POWDER — 21 cs., Bremen, Gerstendorfer Bros., 17 cs, Bremen, B. F Drackenfeld & Co.; 15 cs, Bremen, Fuchs & Lang Mfg. Co

CASEIN 210 sk, Wellington, Asia Banking Corp., 267 bg, Havre, National City Bank, 667 bg., Buenos Aires, Nat'l City Bank, 1,251 bg., Buenos Aires, Bank of America, 1,231 bg., Buenos Aires, Order

CHALK 900 pkg, Antwerp, Bankers Trust Co, 822,998 kilos, Dunkirk, Taintor Trading Co, 508,073 kilos, Dunkirk, J. W Higman Co

CHEMICALS—5 csk., Hamburg, Pfaltz & Bauer, 3 cs, Hamburg, Merck & Co., 105 pkg, Hamburg, Order

COPRA 1,203 bg, Kingston, Franklin Baker Co, 150 bg, Port Antonio, Order

COPPER SULPHATE—160 csk., Marseilles, Order; 200 csk., Liverpool, Order, 60 csk., Marseilles, Order

COLORS — 29 pkg., Bremen, Hensel, Bruckmann & Lorbacher, 68 csk earth, Bremen, L H. Butcher Co, 16 csk. ultromarine, Liverpool, Fezandie & Sperrle, 2 cs aniline, Hamburg, H. A. Metz & Co, 6 csk. do, Hamburg, Franklin Imp & Exp Co, 10 csk. do., Hamburg, E C. Foster; 5 csk. do., Hamburg, H. R. Jahn; 26 csk. aniline, 2 dr do, 2 bbl do., 1 cs. do, Genoa, Wetterwold & Pfeister; 4 pkg aniline, Genoa, H R. Ackermann, 1 bbl aniline, Genoa, Am. Aniline Products Co; 101 cs. dyes, Genoa, National Aniline Chem. Co, 12 bbl aniline, Genoa, Bachmeier & Co., 17 bbl aniline colors, Genoa, Order, 18 csk. earth, Havre, Reichard-Coulston, Inc.; 8 csk colors, Havre, Italian Discount & Trust Co, 58 csk earth, Rotterdam Heller & Merz Co, 8 pkg. aniline, Rotterdam, Wetterwold & Pfeister; 11 pkg. aniline, Rotterdam, H A Metz & Co, 200 pkg red, Havre, Heemsoth, Basse Co., 12 csk. aniline, Havre, Sandoz Chem. Works 5 csk do, Havre, Order, 7 cs. do, Havre, Irving Bank, 3 csk. aniline, Liverpool, Order; 203 pkg. earth, Leghorn, Reichard-Coulston, Inc, 88 bbl earth, Leghorn, Order; 64 csk. ocher, Marseilles, Bankers Trust Co.; 100 csk. ocher, Marseilles, Metropolitan Trust Co; 488 csk. ocher, Marseilles, Reichard-Coulston, Inc; 60 csk ocher, Marseilles, Order

DEXTRINE—250 bg, Rotterdam, Stein, Hall & Co

DIVI-DIVI — 818 bg., Curacao, Selma Merc Corp.

FERTILIZER—20 bg chemical, London, C. Schwake & Co.

FERRO-CHROME — 546 csk, Gothenburg, C Hardy & Ruperti, 15 csk. Gothenburg, Heydemann & Co

GLAUBERS SALT 168 pkg, Hamburg, Roessler & Hasslacher Chem. Co

GLYCERINE—70 dr, Marseilles, Order, 58 dr, Buenos Aires, Core & Herbert.

GUMS—395 bg yacca, Port Adelaide, W. Schall & Co; 13 bg. copal, London, S. Winterbourne & Co., 100 bg gum, London, Anglo Egypt. Bank; 24 bg. tragacanth, London, Order; 36 bg. copal, London, Order; 100 cs. damar, Batavia, W. Schall & Co, 500 cs damar, Batavia, Order; 100 cs. damar, Singapore, Chase Nat'l Bank; 447 cs elemi, Manila, H. Dobler.

IRON OXIDE—72 csk., Liverpool, J. A. McNulty; 10 csk., Liverpool, Toch Bros.; 10 csk. Liverpool, Order.

LYCOPODIUM—4 pkg., Danzig, Rapaport Food Products.

LOGWOOD—1,743,588 lb., Hayti, Oakes Mfg. Co.

MAGNESIUM—250 bg. calcined, Rotterdam, H. J Baker & Bro; 140 csk. calcined, Glasgow, Brown Bros. & Co., 250 bg carbonate, Glasgow, Order.

MYROBOLANS — 7,635 pkt, Calcutta, Order.

NAPHTHALENE 720 bg., Liverpool, Order.

QUEBRACHO — 411 bg., Buenos Aires, Columbia Trust Co.

OILS—**Cod**—300 csk, St. Johns National Oil Products Co.; 200 csk., St Johns, R. Badcock & Co. **Fusel**—17 bbl., Riga, Order **Linseed**—176 bbl., Rotterdam, Elbert & Co., 177 bbl, Rotterdam, Welch, Holme & Clark Co., 141 bbl, Rotterdam, F D Lockwood; 570 bbl., Rotterdam, Nat'l Lead Co., 141 bbl., Rotterdam, Meteor Products Co., 115 bbl., Rotterdam, Bur-Mac Chemical Co, 100 bbl, Rotterdam, Nat'l City Bank, 1,688 bbl., Rotterdam, Order, 8,219 bg., Buenos Aires, Order; 300 bbl., Copenhagen, Order **Olive Foots** (sulphur oil)—100 csk, Leghorn, Am Co for Int'l Commerce **Palm**—214 csk., Rotterdam, Order; 189 csk, Liverpool, Niger Co, 34 csk., Liverpool, Fourth St. Nat'l Bank, 99 csk., Liverpool, Order **Palm kernel**—48 bbl, Liverpool, E. F Drew & Co. **Rapeseed**—10 bbl, Rotterdam, Order.

PLUMBAGO—200 bbl., Colombo, H. P Winter & Co, 384 bbl. Colombo, Brown Bros. & Co., 483 bbl, Colombo, H. W Peabody & Co.; 20 bbl., Colombo, Nat'l City Bank, 443 pkg., Colombo, First Federal Foreign Banking Association

POTASSIUM SALTS 2,000 bg. sulphate, Bremen, A Vogel; 256 csk. salts, Hamburg, Superfos Co., 2,000 bg muriate, 2,500 bg sulphate, 4,000 bg. manure salt, Hamburg, Order, 18 bbl. prussiate, Hamburg, Order, 200 dr. permanganate, Hamburg, Order, 40 dr. permanganate, London, R. W Greeff & Co.; 60 kegs prussiate, Liverpool, Order.

PHOSPHATE—300 bg. bone, Antwerp, Hollinghurst & Co., 500 bg do, Antwerp, Order

SAL AMMONIAC — 20 bbl, Hamburg, Roessler & Hasslacher Chem. Co.

SEEDS—**Linseed**—28,866 bg., Rosario, Spencer Kellogg & Sons, 44,221 bg., Rosario, Order, 19,730 bg, Rosario, Am. Exchange Nat'l Bank; 6,234 bg, Rosaria, Am. Linseed Co.; 24,899 bg., Rosario, Am Linseed Co; 32,688 bg., Villa Constitucion, Order, 32,552 bg., San Nicolas, Order.

SHELLAC — 10 cs., Hamburg, Irving Bank-Col. Trust Co.; 516 pkg, 30 pkg button, 150 pkg. garnet, Calcutta, Bank of British West Africa; 500 bg., Calcutta, Irving Bank-Col. Trust Co, 200 bg., Calcutta, N Y. Trust Co, 109 bg, Calcutta, Lee, Higginson & Co; 100 bg., Calcutta, N. Y. Trust Co.; 2,036 pkg., Calcutta, Order.

SILVER SULPHIDE—Antofagasta, Am Smelting & Refining Co.

SODIUM SALTS—300 csk. hyposulphite, Hamburg, Order; 22 csk. perborate, Hamburg, E. Suter & Co.; 6,320 sk. sulphate, Antogafasta, Graham, Rowe & Co; 15,281 bg nitrate, Iquique, Baring Bros & Co, 336 cs. salts, Havre, Nat'l City Bank, 23 csk. prussiate, Liverpool, H. J. Baker Bros.

STARCH—250 bg. potato, Rotterdam, J. Wertheimer & Sons; 250 bg do., Rotterdam, G. J Kluyskeus, 500 bg. Starch, Rotterdam. Spier, Simmons Co

STRONTIUM NITRATE—37 csk., Hamburg, Order.

SUMAC — 20 csk. extract, Glasgow, American Dyewood Co

TALC—1,000 bg, Genoa, Italian Discount & Trust Co

TALLOW — 180 bbl., Vancouver, Van Iderstine Co.; 23 bbl., Ponce, Swift & Co., 295 csk., Buenos Aires, Bank of the Manhattan Co.

TARTAR—600 bg, Buenos Aires Tartar Chem. Co.; 199 sk, Marseilles, Royal Baking Powder Co.; 110 sk., Marseilles, C. Pfizer & Co.

WAXES—21 bg. bees, London, Order; 16 bg. bees, San Antonio Order; 62 bg. bees, Talcahuano, Order; 40 cs. bees, Havre, Salomon Bros.; 50 bg. bees, Singapore, A. M. Allison & Co.; 25 bg. bees, Havana, W. H. Bowdlear Co.; 25 bg. bees, Havana, Order.

ZINC WHITE—25 bbl., Marseilles, Order.

Current Prices in the New York Market

For Chemicals, Oils and Allied Products

THESE prices are for the spot market in New York City, but a special effort has been made to report American manufacturers' quotations whenever available. In many cases these are for material f.o.b. works or on a contract basis and these prices are so designated. Quotations on imported stocks are reported when they are of sufficient importance to have a material effect on the market. Prices quoted in these columns apply to large quantities in original packages.

General Chemicals

Acetic anhydride, 85%, drums	lb.	$0.38 - . . .
Acetone, drums	lb.	.25 - .25½
Acid, acetic, 28%, bbl.	100 lb.	3.17½ - 3.92½
Acetic, 56%, bbl.	100 lb.	6.35 - 6.37
Glacial, 99½%, bbl.	100 lb.	12.05 - 12.85
Boric, bbl.	lb.	.11 - .11½
Citric, kegs	lb.	.49 - .50
Formic, 85%	lb.	.14½ - .17

No. 5, 188 proof, dr.	gal.	.32 - .34
Alum, ammonia, lump, bbl.	lb.	.03½ - .03¾
Potash, lump, bbl.	lb.	.03 - .03½
Chrome, lump, potash, bbl.	lb.	.05½ - .05¾
Aluminum sulphate, com., bags	100 lb.	1.50 - 1.65
Iron free bags	lb.	.02¼ - .02½
Aqua ammonia, 26°, drums	lb.	.06½ - .07½
Ammonia, anhydrous, cyl.	lb.	.30 - .30½
Ammonium carbonate, powd. casks, imported	lb.	.09½ - .10
Ammonium carbonate, powd. domestic, bbl.	lb.	.13 - .14
Ammonium nitrate, tech., casks	lb.	.10 - .11
Amyl acetate tech., drums	gal.	3.50 - 3.75
Arsenic, white, powd., bbl.	lb.	.15½ - .16
Arsenic, red, powd., kegs	lb.	.14½ - .15
Barium carbonate, bbl.	ton	78.00 - 80.00
Barium chloride, bbl.	ton	90.00 - 95.00
Barium dioxide, drums	lb.	.18 - .18½
Barium nitrate, casks	lb.	.08 - .08½
Barium sulphate, bbl.	lb.	.04 - .04½
Blanc fixe, dry, bbl.	lb.	.04½ - .04¾
Bleaching powder, f.o.b. wks., drums	100 lb.	2.15 - . . .
Spot N. Y. drums	100 lb.	2.60 - 2.70
Borax, bbl.	lb.	.05½ - .05¾
Bromine, cases	lb.	.28 - .30
Calcium acetate, bags	100 lb.	4.00 - 4.05
Calcium carbide, drums	lb.	.04½ - .04¾
Calcium chloride, fused, drums	ton	22.00 - 23.00
Gran. drums	lb.	.01½ - .01¾
Calcium phosphate, mono, bbl.	lb.	.06½ - .07
Camphor, cases	lb.	.88 - .90
Carbon bisulphide, drums	lb.	.07 - .07½
Carbon tetrachloride, drums	lb.	.10 - . . .
Chalk, precip.—domestic, light, bbl.	lb.	.04½ - .04¾
Domestic, heavy, bbl.	lb.	.03½ - .03¾
Imported, light, bbl.	lb.	.04½ - .05
Chlorine, liquid, cylinders	lb.	.06 - .06½
Chloroform, tech., drums	lb.	.35 - .38
Cobalt oxide, bbl.	lb.	2.10 - 2.25
Copperas, bulk, f.o.b. wks.	ton	16.50 - 20.00
Copper carbonate, bbl.	lb.	.19 - .20
Copper cyanide, drums	lb.	.47 - .50
Copper sulphate, crys., bbl.	100 lb.	6.00 - 6.25
Cream of tartar, bbl.	lb.	.25½ - .26½
Epsom salt, dom., tech., bbl.	100 lb.	1.90 - 2.15
Epsom salt, imp., tech., bags	100 lb.	1.10 - 1.25
Epsom salt, U.S.P., dom., bbl.	100 lb.	2.50 - 2.60
Ether, U.S.P., drums	lb.	.13 - .15
Ethyl acetate, com., 85%, drums	gal.	.80 - .85
Ethyl acetate, pure (acetic ether, 98% to 100%)	gal.	.95 - 1.00
Formaldehyde, 40%, bbl.	lb.	.14½ - .16
Fullers earth—imp., powd., net ton		$30.00 - $32.00
Fusel oil, ref., drums	gal.	3.55 - 4.05
Fusel oil, crude, drums	gal.	2.30 - 2.40
Glaubers salt, wks., bags	100 lb.	1.20 - 1.40
Glaubers salt, imp., bags	100 lb.	1.00 - 1.25
Glycerine, c.p., drums extra	lb.	.18 - .18½
Glycerine, dynamite, drums	lb.	.16½ - .16¾
Iodine, resublimed	lb.	4.55 - 4.65
Iron oxide, red, casks	lb.	.12 - .18
Lead:		
White, basic carbonate, dry, casks	lb.	.09½ - .10
White, basic sulphate, casks	lb.	.09½ - . . .
White, in oil, kegs	lb.	.12½ - .14
Red, dry, casks	lb.	.11½ - .12
Red, in oil, kegs	lb.	.13½ - .15
Lead acetate, white crys., bbl.	lb.	.13½ - .14
Brown, broken, casks	lb.	.12 - . . .
Lead arsenate, powd., bbl.	lb.	.23 - .24
Lime-Hydrated, bbl.	per ton	16.80 - 17.00
Lime, Lump, bbl.	280 lb.	3.63 - 3.65
Litharge, comm., casks	lb.	.10¾ - .11
Lithophone, bags	lb.	.07 - .07¼
in bbl.	lb.	.07½ - .07¾
Magnesium carb., tech., bags	lb.	.08 - .08½
Methanol, 95%, bbl.	gal.	1.21 - 1.23
Methanol, 97%, bbl.	gal.	1.23 - 1.25
Nickel salt, double, bbl.	lb.	.10½ - . . .
Nickel salts, single, bbl.	lb.	.11½ - . . .
Phosgene		.60 - .75
Phosphorus, red, cases	lb.	.35 - .40
Phosphorus, yellow, cases	lb.	.30 - .35
Potassium bichromate, casks	lb.	.10½ - .11
Potassium bromide, gran., bbl.	lb.	.16½ - .23
Potassium carbonate, 80-85%, calcined, casks	lb.	.06½ - .07
Potassium chlorate, powd.	lb.	.07½ - .08
Potassium cyanide, drums	lb.	.45 - .50
Potassium, first sorts, cask	lb.	.09 - .09½
Potassium hydroxide (caustic potash) drums	100 lb.	8.25 - 8.50
Potassium iodide, cases	lb.	3.65 - 3.75
Potassium nitrate, bbl.	lb.	.06½ - .07½
Potassium permanganate, drums	lb.	.23 - .24
Potassium prussiate, red, casks	lb.	.77 - .79
Potassium prussiate, yellow, casks	lb.	.37 - .37½
Salammoniac, white, gran., casks, imported	lb.	.07 - .07½
Salammoniac, white, gran., bbl., domestic	lb.	.07½ - .08
Gray, gran., casks	lb.	.08 - .09
Salsoda, bbl.	100 lb.	1.20 - 1.40
Salt cake (bulk)	ton	26.00 - 28.00
Soda ash, light, 58% flat, bags, contract	100 lb.	1.60 - 1.67
Soda ash, light, basis, 48%, bags, contract, f.o.b. wks.	100 lb.	1.20 - 1.30
Soda ash, light, 58%, flat, bags, resale	100 lb.	1.75 - 1.80
Soda ash, dense, bags, contract, basis 48%	100 lb.	1.17½ - 1.20
Soda ash, dense, in bags, resale	100 lb.	1.85 - 1.90
Soda, caustic, 76%, solid, drums, f.a.s.	100 lb.	3.35 - 3.45
Soda, caustic, basis 60%, wks., contract	100 lb.	2.50 - 2.60
Soda, caustic, ground and flake, contracts	100 lb.	3.80 - 3.90
Soda, caustic, ground and flake, resale	100 lb.	3.72½ - . . .
Sodium acetate, works, bags	lb.	.05½ - .06½
Sodium bicarbonate, bbl.	100 lb.	2.00 - 2.50
Sodium bichromate, casks	lb.	.07½ - .08
Sodium bisulphate (niter cake)	ton	6.00 - 7.00
Sodium bisulphite, powd., U.S.P., bbl.	lb.	.04½ - .04¾
Sodium chlorate, kegs	lb.	.06½ - .07
Sodium chloride	long ton	12.00 - 13.00
Sodium cyanide, cases	lb.	.20 - .23
Sodium fluoride, bbl.	lb.	$0.09½ - $0.10
Sodium hyposulphite, bbl.	lb.	.02½ - .03
Sodium nitrite, casks	lb.	.08½ - .09
Sodium peroxide, powd., cases	lb.	.28 - .30
Sodium phosphate, dibasic, bbl.	lb.	.03½ - .04
Sodium prussiate, yel. drums	lb.	.17½ - .18
Sodium silicate (40° drums)	100 lb.	.80 - 1.25
Sodium silicate (60°, drums)	100 lb.	2.00 - 2.25
Sodium sulphide, fused, 60-62%, drums	lb.	.04½ - .04¾
Sodium sulphite, crys., bbl.	lb.	.03½ - .03¾
Strontium nitrate, powd., bbl.	lb.	.09½ - .10
Sulphur chloride, yel. drums.	lb.	.04½ - .05
Sulphur, crude	ton	18.00 - 20.00
At mine, bulk	ton	16.00 - 18.00
Sulphur, flour, bag	100 lb.	2.25 - 2.35
Sulphur, roll, bag	100 lb.	2.00 - 2.10
Sulphur dioxide, liquid, cyl.	lb.	.08 - .08½
Talc—imported, bags	ton	30.00 - 40.00
Talc—domestic powd., bags.	ton	18.00 - 25.00
Tin bichloride, bbl.	lb.	.13½ - .14
Tin oxide, bbl.	lb.	.50 - .52
Zinc carbonate, bags	lb.	.14 - .14½
Zinc chloride, gran, bbl.	lb.	.06 - .07
Zinc cyanide, drums	lb.	.37 - .38
Zinc oxide, lead free, bbl.	lb.	.08 - .08½
5% lead sulphate, bags	lb.	.07½ - . . .
10 to 35% lead sulphate, bags	lb.	.07 - . . .
French, red seal, bags	lb.	.09½ - . . .
French, green seal, bags	lb.	.10½ - . . .
French, white seal, bbl.	lb.	.12 - . . .
Zinc sulphate, bbl.	100 lb.	2.50 - 3.00

Coal-Tar Products

Alpha-naphthol, crude, bbl.	lb.	$0.70 - $0.80
Alpha-naphthol, ref., bbl.	lb.	.85 - .95
Alpha-naphthylamine, bbl.	lb.	.36 - .38
Aniline oil, drums	lb.	.16 - .16½
Aniline salts, bbl.	lb.	.24 - .25
Anthracene, 80%, drums	lb.	.75 - 1.00
Anthracene, 80%, imp., drums, duty paid	lb.	.70 - .75
Anthraquinone, 25%, paste, drums	lb.	.70 - .75
Benzaldehyde U.S.P., carboys	lb.	1.40 - 1.45
Benzene, pure, water-white, tanks and drums	gal.	.32 - .35
Benzene, 90%, tanks & drums	gal.	.27 - .30
Benzene, 90%, drums, resale	gal.	.30 - .33
Benzidine base, bbl.	lb.	.85 - .90
Benzidine sulphate, bbl.	lb.	.70 - .75
Benzoic acid, U.S.P., kegs	lb.	.72 - .75
Benzoate of soda, U.S.P., bbl.	lb.	.57 - .65
Benzyl chloride, 95-97%, ref., drums	lb.	.45 - . . .
Benzyl chloride, tech., drums	lb.	.35 - . . .
Beta-naphthol, subl., bbl.	lb.	.55 - .60
Beta-naphthol, tech., bbl.	lb.	.23 - .23½
Beta-naphthylamine, tech.	lb.	.80 - .90
Carbazol, bbl.	lb.	.75 - .90
Cresol, U.S.P., drums	lb.	.25 - .29
Ortho-cresol, drums	lb.	.28 - .30
Cresylic acid, 97%, resale, drums	gal.	1.30 - . . .
95-97%, drums, resale	gal.	1.25 - . . .
Dichlorbenzene, drums	lb.	.07 - .09
Diethylaniline, drums	lb.	.50 - .60
Dimethylaniline, drums	lb.	.42 - .43
Dinitrobenzene, bbl.	lb.	.19 - .20
Dinitroclorbenzene, bbl.	lb.	.22 - .23
Dinitronaphthalene, bbl.	lb.	.30 - .32
Dinitrophenol, bbl.	lb.	.35 - .40
Dinitrotoluene, bbl.	lb.	.20 - .22
Dip oil, 25%, drums	gal.	.25 - .30
Diphenylamine, bbl.	lb.	.50 - .52
H-acid, bbl.	lb.	.85 - . . .
Meta-phenylenediamine, bbl.	lb.	1.00 - 1.05
Michlers ketone, bbl.	lb.	3.00 - 3.50
Monochlorbenzene, drums	lb.	.08 - .10
Monoethylaniline, drums	lb.	.95 - 1.10
Naphthalene, crushed, bbl.	lb.	.08 - .09
Naphthalene, flake, bbl.	lb.	.09½ - .10
Naphthalene, balls, bbl.	lb.	.10 - .10½
Naphthionate of soda, bbl.	lb.	.58 - .65
Naphthionic acid, crude, bbl.	lb.	.55 - .66
Nitrobenzene, drums	lb.	.10 - .12
Nitro-naphthalene, bbl.	lb.	.30 - .35
Nitro-toluene, drums	lb.	.15 - .17
N-W acid, bbl.	lb.	1.25 - 1.30
Ortho-amidophenol, kegs	lb.	2.30 - 2.35
Ortho-dichlorbenzene, drums	lb.	.17 - .20
Ortho-nitrophenol, bbl.	lb.	.90 - .92
Ortho-nitrotoluene, drums	lb.	.10 - .12
Ortho-toluidine, bbl.	lb.	.14 - .15
Para-amidophenol, base, kegs	lb.	1.20 - 1.30
Para-amidophenol, HCl, kegs	lb.	1.25 - 1.35
Para-dichlorbenzene, bbl.	lb.	.17 - .20
Paranitraniline, bbl.	lb.	.74 - .75
Para-nitrotoluene, bbl.	lb.	.60 - .65
Para-phenylenediamine, bbl.	lb.	1.45 - 1.50
Para-toluidine, bbl.	lb.	.95 - .98
Phthalic anhydride, bbl.	lb.	.35 - .38
Phenol, U.S.P., drums	lb.	.57 - .58
Picric acid, bbl.	lb.	.20 - .22
Pyridine, dom., drums	gal.	nominal
Pyridine, imp., drums	gal.	2.50 - 2.75

Resorcinol, tech., kegs	lb.	$1.40 - $1.50
Resorcinol, pure, kegs	lb.	2.00 - 2.10
R-salt, bbl	lb.	.55 - .60
Salicylic acid, tech., bbl	lb.	.47 - .48
Salicylic acid, U.S.P., bbl	lb.	.50 - .52
Solvent naphtha, water-white, drums	gal.	.37 - .40
Crude, drums	gal.	.22 - .24
Sulphanilic acid, crude, bbl	lb.	.18 - .20
Thiocarbanilide, kegs	lb.	.35 - .38
Toluidine, kegs	lb.	1.20 - 1.30
Toluidine, mixed, kegs	lb.	.30 - .35
Toluene, tank cars	gal	.30 - .35
Toluene, drums	gal.	.35 - .40
Xylidines drums	lb.	.45 - .47
Xylene, pure, drums	gal.	.75 - .85
Xylene, com., drums	gal	.37 - ...
Xylene, com., tanks	gal.	.32 - ...

Naval Stores

Rosin B-D, bbl	280 lb.	$6.25 - 6.35
Rosin E-I, bbl	280 lb.	6.35 - 5.46
Rosin K-N, bbl	280 lb.	6.40 - 6.50
Rosin W.G.-W W., bbl	280 lb	6.80 - 7.80
Wood rosin, bbl	280 lb	6.20 -
Turpentine, spirits of, bbl	gal	1.42 -
Wood, steam dist., bbl	gal	1.36 -
Wood, dest. dist., bbl	gal	1.10 - 1.15
Pine tar pitch, bbl	200 lb	- 6.00
Tar, kiln burned, bbl	500 lb	- 12.00
Retort tar, bbl	500 lb	- 11.00
Rosin oil, first run, bbl	gal	.45 -
Rosin oil, second run, bbl	gal	.48 - ...
Rosin oil, third run, bbl	gal.	.52 -
Pine oil, steam dist	gal	.80 - ...
Pine oil, pure, dest. dist	gal	.75 - ...
Pine tar oil, ref.	gal	.48 - ...
Pine tar oil, crude, tanks f.o.b. Jacksonville, Fla.	gal.	.32 - .32½
Pine tar oil, double ref., bbl	gal.	- .75
Pine tar, ref., thin, bbl	gal.	- .25
Pinewood creosote, ref., bbl	gal.	... - .52

Animal Oils and Fats

Degras, bbl	lb.	$0.03½ - $0.04
Grease, yellow, bbl	lb	.08½ - .08¾
Lard oil, Extra No. 1, bbl	gal.	.92 - .94
Neatsfoot oil, 20 deg. bbl.	gal.	1.28 - 1.32
No. 1, bbl	gal.	.92 - .94
Oleo Stearine		.10½ -
Red oil, distilled, d.p. bbl	lb	.11½ -
Saponified, bbl	lb	.11½ -
Tallow, extra, loose	lb	.08½ -
Tallow oil, acidless, bbl	gal	.95 - .97

Vegetable Oils

Castor oil, No. 3, bbl	lb	$0.14 -
Castor oil, No. 1, bbl	lb	.14½ -
Chinawood oil, bbl.	lb	.40 -
Coconut oil, Ceylon, bbl	lb.	.10½ - .10¾
Ceylon, tanks, N.Y.	lb	.09½ -
Coconut oil, Cochin, bbl	lb	.10½ - ...
Corn oil, crude, bbl	lb	.12½ -
Crude, tanks, (f.o.b. mill)	lb	.10½ - .10¾
Cottonseed oil, crude (f.o.b. mill), tanks	lb	.10 - .10½
Summer yellow, bbl	lb	.12½ - .12¾
Winter yellow, bbl.	lb	.13½ - .13¾
Linseed oil, raw, car lots, bbl	gal	1.17 -
Raw, tank cars (dom.)	gal	1.12 -
Boiled, cars, bbl (dom.)	gal.	1.19 - ...
Olive oil, denatured, bbl.	gal	1.15 -
Sulphur, (foots) bbl	lb	.10 - .10½
Palm, Lagos, casks	lb	.08½ - ...
Niger, casks	lb	.08½ - .08¾
Palm kernel, bbl	lb	.09½ - .10
Peanut oil, crude, tanks (mill)	lb	.13½ -
Peanut oil, refined, bbl.	lb	.17 -
Perilla, bbl	lb	.16½ - .16¾
Rapeseed oil, refined, bbl	gal	.84 - .85
Rapeseed oil, blown, bbl	gal	.90 - .91
Sesame, bbl	lb	.13 - .13½
Soya bean (Manchurian), bbl	lb	.13½ - ...
Tank, f.o.b. Pacific coast	lb	.10½ -
Tank, (f.o.b. N.Y.)	lb	.11 -

Fish Oils

Cod, Newfoundland, bbl	gal	$0.68 - $0.70
Menhaden, light pressed, bbl.	gal	.76 -
White bleached, bbl	gal	.78 -
Blown, bbl.	gal.	.82 -
Crude, tanks (f.o.b. factory)	gal	.53 - ...
Whale No. 1 crude, tanks, coast	lb	.06½ - ...
Winter, natural, bbl	gal	.76 - .78
Winter, bleached, bbl	gal	.79 - .80

Oil Cake and Meal

Coconut cake, bags	ton	$32.00 - ...
Copra, sun dried, bags, (c.i.f.)	lb	.05½ - ...
Sun dried Pacific coast	lb	.05½ - ...
Cottonseed meal, f.o.b. mills	ton	39.00 - 40.00
Linseed cake, bags	ton	6.00 - ...
Linseed meal, bags	ton	38.00 - ...

Dye & Tanning Materials

Albumen, blood, bbl	lb.	$0.45 - $0.50
Albumen, egg, tech, kegs	lb.	.80 - .85
Cochineal, bags	lb	.35 - .36
Cutch, Borneo, bales	lb.	.04½ - .05
Cutch, Rangoon, bales	lb.	.13 - .13½
Dextrine, corn, bags	100 lb.	3.64 - 3.69
Dextrine, gum, bags	100 lb	3.99 - 4.09
Divi-divi, bags	ton	38.00 - 39.00
Fustic, sticks	ton	30.00 - 35.00
Fustic, chips, bags	lb.	.04 - .05
Logwood, sticks	ton	28.00 - 30.00
Logwood, chips, bags	lb.	.02½ - .03¼
Sumac, leaves, Sicily, bags	ton	$70.00 - $72.00
Sumac, ground, bags	ton	65.00 - 67.00
Sumac, domestic, bags	ton	40.00 - 42.00
Starch, corn, bags	100 lb	2.97 - 3.07
Tapioca flour, bags	lb.	.05½ - .06½

Extracts

Archil, conc., bbl.	lb.	$0.17 - $0.18
Chestnut, 25% tannin, tanks	lb.	.02 - .03
Divi-divi, 25% tannin, bbl	lb.	.04 - .05
Fustic, crystals, bbl.	lb	.20 - .22
Fustic, liquid, 42°, bbl.	lb.	.08 - .09
Gambier, liq., 25% tannin, bbl.	lb.	.08 - .09
Hematine crys., bbl.	lb.	.14 - .18
Hemlock, 25% tannin, bbl.	lb.	.04 - .05
Hypernic, solid, drums	lb.	.24 - .26
Hypernic, liquid, 51°, bbl	lb.	.14 - .17
Logwood, crys., bbl	lb.	.19 - .20
Logwood, liq., 51°, bbl	lb.	.09 - .10
Quebracho, solid, 65% tannin, bbl	lb.	.04½ - .05
Sumac, dom., 51°, bbl.	lb.	.06½ - .07

Dry Colors

Blacks Carbongas, bags, f.o.b. works	lb	$0.16 - $0.18
Lampblack, bbl	lb	.12 - .40
Mineral, bulk	ton	35.00 - 45.00
Blues Bronze, bbl	lb.	.55 - .60
Prussian, bbl	lb.	.55 - .60
Ultramarine, bbl	lb	.08 - .35
Browns, Sienna, Ital., bbl	lb	.06 - .14
Sienna, Domestic, bbl	lb.	.03½ - .04
Umber, Turkey, bbl	lb.	.04 - .04½
Greens-Chrome, C.P. Light, bbl	lb.	.32 - .34
Chrome, commercial, bbl	lb.	.12 - .12½
Paris, bulk	lb.	.30 - .35
Reds, Carmine No. 40, tins	lb	4.50 - 4.70
Oxide red, casks	lb.	.10 - .14
Para toner, kegs	lb.	1.00 - 1.10
Vermilion, English, bbl	lb.	1.30 - 1.32
Yellow, Chrome, C.P. bbls	lb	.20 - .21
Ocher, French, casks	lb	.02½ - .03

Waxes

Bayberry, bbl	lb.	$0.28 - $0.30
Beeswax, crude, bags	lb.	.21 - .25
Beeswax, refined, light, bags	lb.	.32 - .34
Beeswax, pure white, cases	lb.	.40 - .41
Candelilla, bags	lb.	.24 - .25
Carnauba, No. 1, bags	lb.	.42 - .43
No. 2, North Country, bags	lb.	.23 - .23½
No. 3, North Country, bags	lb.	.19½ - ...
Japan, cases	lb.	.14½ - .15
Montan, crude, bags	lb.	.04½ - .04¾
Paraffine, crude, match, 105-110 m.p.	lb.	.04½ - .04¾
Crude, scale 124-126 m.p., bags	lb.	.03½ - .03
Ref., 118-120 m.p., bags	lb.	.03½ - ...
Ref., 125 m.p., bags	lb.	.03¾ - ...
Ref., 128-130 m.p., bags	lb.	.04½ - .04¾
Ref., 133-135 m.p., bags	lb.	.04½ - ...
Ref., 135-137 m.p., bags	lb.	.05½ - .05¾
Stearic acid, sgle pressed, bags	lb.	.13½ - ...
Double pressed, bags	lb.	.14½ - ...

Industrial

Financial, Construction and Manufacturing News

Construction and Operation

Alabama

PELHAM—The Superior Lime & Hydrate Co, recently organized, will immediately commence construction of a new plant on local site just acquired, to be equipped for a capacity of about 15,000 bbl. of hydrated lime per month It is estimated to cost close to $70,000, with machinery. The company is headed by H G. Bridgewater and W D. Lewis, Jr, P O Box 2311, Birmingham Ala

Arizona

WINKLEMAN—The Arizona Portland Cement Co., Phœnix, has acquired a tract of about 16 acres of land near Winkelman, and plans the construction of a new cement mill. It will consist of a number of buildings with power house, estimated to cost approximately $1,000,000, with machinery. Loren C. Barton, Corporation Bldg, Los Angeles, is assistant general manager, in charge

California

SAN DIEGO—The Vitrified Products Corp will commence the construction of a main 2-story building, 80x120 ft, for its proposed new plant in the Old Town district, to be equipped for the manufacture of vitrified sewer pipe and kindred hollowware. The installation will include a complete grinding and screening department; molding room; firing department and power house. The plant will cost $175,000 with machinery. Victor Kramer is president, and George W. Kummer, secretary and general manager.

LOS ANGELES—The California Cyanide Co, recently organized, has acquired property at Cudahy City, near Los Angeles, for the construction of its proposed plant, and purposes to break ground for the initial buildings at an early date. It will cost in excess of $500,000, with machinery. The company is headed by F W. Braun, president, the Braun Corporation, 363 New High St. The Air Reduction Sales Co., 342 Madison Ave., New York, is also interested in the new organization

Florida

KELSEY CITY—The Royal Palm Rubber Co, West Palm Beach, lately formed with a capital of $100,000, has acquired property on the Dixie Highway, and will have plans drawn at once for a new plant, to cost approximately $55,000, with machinery. William Manly King, West Palm Beach, is architect. C F. Laughlin is president; and Gordon Ware, West Palm Beach, secretary.

LAKELAND—The Non-Acid Fertilizer & Chemical Co. will hold in abeyance the construction of its proposed plant in the vicinity of Jacksonville, recently announced.

Georgia

AINSLIE—The Southern Portland Cement Co., Macon, Ga., recently organized under Delaware laws with capital of $6,000,000, will break ground in 60 days for its proposed new cement mill on local site, comprising a tract of 30 acres lately purchased. The plant will consist of a number of buildings, estimated to cost close to $1,000,000, with equipment. A power plant will be constructed. W. Jordan Masse, head of the Bibb Brick Co., Macon, is president.

Kansas

ANTHONY—The Anthony Salt Works, Inc., is perfecting plans for the rebuilding of its local plant, recently destroyed by fire with loss estimated at $250,000, including buildings and machinery. The new works will include a power house, and is estimated to cost a like amount.

Louisiana

SHREVEPORT—The Red River Refining Co. has preliminary plans under way for the construction of a new refining plant, estimated to cost about $500,000. A department will be established for the production of lubricating oils The company has recently increased its capital from $1,000,000 to $3,000,000, for general expansion.

LOREAUVILLE—The local refinery of the Vida Sugar Refining Co, Iberia parish, has been acquired by new interests headed by John O Bonin and John E Schwing. It is purposed to organize a company to operate the plant and plans are in progress for additions and improvements including the installation of machinery for increased output.

NEW ORLEANS—The American Tar & Turpentine Co, Broad St, will soon take bids on a general contract for the rebuilding of the portion of its plant, recently destroyed by fire with loss estimated at close to $100,000, with machinery The new structure will cost approximately a like amount.

Maine

RUMFORD—The Oxford Paper Co. has plans for the installation of additional equipment at its plant for considerable increase in production estimated to cost approximately $250,000

Massachusetts

HOLYOKE—The Chemical Paper Co. will make improvements at its plant to cost about $22,000.

FALL RIVER—The E S Parks Shellac Co., 844 South Main St. has awarded a contract to Joseph M Darling, Jr., 41 North Main St, for the erection of a 1-story addition, 50x100 ft., estimated to cost about $20,000.

Michigan

GRAND HAVEN—G. E. Burt, Muskegon, Mich, is organizing a new company to establish a local plant for the manufacture of a recently perfected processed product, similar to celluloid, to be known as kyloid. Plans for the works will be ready at an early date

IONIA—The Michigan Porcelain Tile Works, Inc., has authorized plans for enlargements in its plant to include the installation of additional equipment. The company has recently increased its capital from $100,000 to $150,000, for expansion. R A. Hawley is president; and Harvey E. Kidder, secretary and treasurer.

Mississippi

MOSS POINT—The Southern Paper Co. has broken ground for the construction of a new plant unit to cost in excess of $1,000,000 with machinery. It is purposed to more than double the present output.

Missouri

SPRINGFIELD—The Kream Olive Soap Co. has completed plans for the construction of a new plant on Glenstone Rd., comprising two 2-story structures, 40x110 ft. and 40x75 ft. respectively. Both buildings will be used for soap manufacture.

NEVADA—The National Asphalt Refining Co., recently organized with a capital of $1,500,000, has plans in progress for the construction of a new refining plant, on local site, estimated to cost approximately $400,000, with equipment.

ELSBERRY—The Crystal Carbonate Lime Co. has tentative plans for the rebuilding of the portion of its plant, recently destroyed by fire with loss estimated at about $65,000, including equipment.

New Jersey

NEWARK—The Eberhard Faber Rubber Co., 202-14 New St., has awarded a contract to Edward M. Waldron, Inc., 27 Central Ave., for the construction of an addition to its 4-story plant, 60x105 ft., estimated to cost $80,000.

ELIZABETH—The Standard Oil Co. of New Jersey, 26 Broadway, New York, has plans in preparation for the construction of a new oil-treating and filtering plant at its Bayway refinery, estimated to cost $200,000, with equipment. J. R. Carringer is superintendent.

NEWARK—The Capston Mfg. Co., 132 Union St., has acquired the factory on Plum Point Lane, formerly occupied by the Gulf Refining Co., consisting of a number of buildings, for the establishment of a new plant for the manufacture of oils greases, soaps, etc. The structures will be remodeled and machinery installed at once.

TRENTON—The State Highway Commission will have plans prepared in the near future for the construction of a state-operated cement manufacturing plant, as provided in a recent legislative bill, approved by Governor Silzer. An appropriation will be arranged.

New York

LONG ISLAND CITY—The Patterson-Sargent Co., Wason and Hamilton Sts., Cleveland, O., manufacturer of paints, varnishes, etc., has awarded a contract to the Guarantee Construction Co., 140 Cedar St., New York, for a 4-story and basement addition, 60x135 ft., at its plant on Hunters Point Ave., estimated to cost $500,000.

CORNING—The Roulette Glass Co., recently organized with a capital of $3,000,000, is reported to have plans in progress for the construction of a new plant for the manufacture of bottles and other hollow-ware. Dr. G. S. Goff is pres'dent, and Thomas F. Rogers, secretary, both of Corning.

BUFFALO—Pratt & Lambert, Inc., 79 Tonawanda St., manufacturer of varnishes, oils, etc., has filed plans for the erection of three 2-story additions to its plant to cost about $10,000.

BROOKLYN—A. Werbelovsky, 83 Meserole St., manufacturer of glass products, has completed plans for a new 2-story factory, 54x100 ft., at 57-59 Scholes St., estimated to cost $50,000.

Ohio

TOLEDO—The Ajax Rubber Co., Inc., Breunig Ave., Trenton, N. J., is planning for the erection of a new plant on local property recently acquired, estimated to cost in excess of $200,000, with machinery. Horace De Lisser is chairman of the board.

Oklahoma

DELAWARE—The Henderson Gasoline Co., is planning for the rebuilding of the portion of its refining plant, destroyed by fire, April 10, with loss estimated at $50,000, including equipment.

Pennsylvania

WILLIAMSPORT—The Keystone Glue Co. will make extensions and improvements in its plant, including the construction of a new power plant, estimated to cost about $200,000, with machinery.

EDGELY—The first unit of the new local mill of the Megargee Paper Co., Modena, Pa., will consist of a 3-story structure, 112x180 ft.; two 2-story buildings, 180x220 ft. and 75x200 ft. respectively; and a number of 1-story structures and power plant, the latter to have a capacity of 4,000 kw. As soon as this unit is completed, expected by the close of the year, work will be commenced on a second unit of approximately like size. The plant will cost in excess of $500,000, with machinery.

South Carolina

SPARTANBURG—The Farmers' Fertilizer Works has tentative plans under consideration for the rebuilding of the portion of its plant, recently destroyed by fire with loss estimated at about $25,000, including equipment.

Texas

TEXAS CITY—The Texas Sugar Refining Co., recently organized, has awarded a general contract to John Monks & Sons, 438 Broadway, New York, engineers, for the erection of the first unit of its new refinery on local site, to be equipped for a capacity of 500 tons per annum. It will cost in excess of $600,000.

BROWNWOOD—The HeLous Gasoline Co., Dallas, Tex., has commenced the erection of a new gasoline refining plant on local site, estimated to cost close to $250,000, with machinery.

BRECKENRIDGE—The Texas Carbon Industries, Inc., recently organized, has commissioned C. K. Springfield, engineer, Austin Street Railroad Co., Austin, Tex., to prepare plans for the construction of a new plant on local site for the manufacture of carbon black, estimated to cost about $175,000, with machinery. Bert Blair, Mexia, Tex., is president.

ELECTRA—The Texhoma Oil & Refining Co. has commenced the construction of a new local casinghead gasoline plant, to be equipped to handle 1,500 bbl. of oil per day. It will cost about $75,000. The initial unit will be enlarged at a later date.

Virginia

NORFOLK—The Norfolk Sugar Refining Co., recently formed with a capital of $3,500,000, is selecting a site on the waterfront for a new refining plant, estimated to cost in excess of $1,000,000, with machinery. Plans will be completed for the first unit at an early date. J. B. Morgan, Southern Produce Bldg., and R. B. Tucker, 112 Brooke Ave., head the new organization.

MISKO REFINERIES, INC., Laredo, Tex., construct and operate oil-refining plants, $200,000. Incorporators: O. W. Killam, S. P. Coblentz and W. T. Killam, all of Laredo.

GLOBE GASOLINE CO., Glasgow, Ky.; construct and operate oil and gasoline refineries, $200,000. Incorporators: W. J. Oliver, Robert Carlye and L. W. Jones, all of Glasgow.

NORTH SHORE FIBRE CO., INC., Lynn, Mass., fiber products, $10,000. John J. Sullivan, president; and George P. Batchelder, 116 Euclid Ave., Lynn, treasurer and representative.

EUKOL CHEMICAL CO., INC., New York, N. Y.; chemicals and chemical byproducts, $250,000. Incorporators: C. McBride, F. Katz and J. Polansky. Representative: N. L. Goldstein, 30 Church St., New York.

SPRINGFIELD LEATHER PRODUCTS CO., Springfield, O., operate a leather tannery; $120,000. Incorporators: John M. Cole and Lee Bayley, both of Springfield.

TRI-ME LABORATORIES, INC., Indianapolis, Ind.; chemicals and chemical byproducts, $50,000. Incorporators: Walter J. Le Saulnier, Russell V. Duncan and A. S. Burdick, all of Indianapolis.

WALTHAM PAPER MILL, INC., Waltham, Mass., paper products; $50,000. Harold A. Allen, president and treasurer; and R. W. Allen, secretary, both of Waltham.

NORFOLK TALLOW CO., INC., Norfolk, Va.; soaps, greases, etc.; $25,000. E. L. Field, president, and J. W. Field, secretary, both of Norfolk.

LINDEMANN LABORATORY, INC., Wallington, N. J.; chemicals and chemical byproducts; 2,000 shares of stock, no par value. Incorporators: John W. Heflin, E. Maurice Thyvaert and Otto Lindemann, 25 Kossuth St., Wallington.

APEX RUBBER PRODUCTS CO., Akron, O.; rubber goods, $25,000. Incorporators: N. O. Mather and Lloyd A. Fasett, both of Akron.

ACCO OIL CO., Tulsa, Okla., refined petroleum products; $50,000. Incorporators: C. L. and C. C. Anderson, Tulsa, and Y. R. Brooks, Okmulgee, Okla.

TOWER GASOLINE & REFINING CO., Wilmington, Del.; refined petroleum and byproducts; $1,000,000. Representative: Corporation Service Co., Equitable Bldg., Wilmington.

LEA MFG. CO., Waterbury, Conn.; lacquers, electroplating materials, etc.; $50,000. Incorporators: R. S. Leather, F. W. Carroll and John F. Barry, 91 Waterville St., Waterbury.

KIDWELL & BASCOM, INC., New York, N. Y.; chemicals; $14,000. Incorporators: P. H. Bascom, C. H. Kidwell and R. F. Bacon. Representative: P. D. Reed, 50 Union Sq., New York.

GREAT LAKES REFINING CO., Detroit, Mich.; 200,000 shares of stock, no par value; refined petroleum products. Incorporators: J. P. Shillaber, W. Leslie Miller and William H. Granse, 901 Blaine Ave., Detroit.

MURAL CO., INC., New Brighton, S. I.; paints, oils, varnishes, etc., $50,000. Incorporators: J. A., E. D. and A. P. King. Representative: Richard Kelly, 233 Broadway, New York.

SOUTHWESTERN OIL CORP., Dover, Del.; refined petroleum products, $1,000,000. Representative: Arley M. Magee, Dover.

NESTLER PRODUCTS CORP., New York, N. Y., rubber products, $10,000. Incorporators: J. C. Kimball and B. Cahn. Representative: J. Blumenthal, 1475 Broadway, New York.

Industrial Finances

TUCKER CHEMICAL MFG. CO., INC., Paducah, Ky., increased capital from $25,000 to $75,000, for expansion.

HARRITON GLUE CO., 71 Greene St., New York, N. Y., increased capital to $25,000, for increased operations.

SUNSET PETROLEUM CO., Houston, Tex., increased capital from $30,000 to $100,000, for general expansion.

CHELSEA FIBRE MILLS, INC., 212 5th Ave., New York, N. Y., reduced capital from $2,600,000 to $2,000,000.

GILLILAND OIL CO., 111 Broadway, New York, N. Y., reorganized, is arranging for a bond issue of $10,000,000, of which $5,400,000 will be used for extensions and improvements in plants and for the purchase of additional properties. P. J. Hurley is president and general manager.

EMERALD PETROLEUM CO., Washington, Pa., increased capital from $500,000 to $1,000,000 for expansion.

STANDARD SOAP CO., Emeryville, Calif., increased capital from $500,000 to $1,000,000, for extensions in plant and business.

Foreign Trade Opportunities

Parties interested in any of the following opportunities may obtain all available information from the Bureau of Foreign and Domestic Commerce at Washington or from any district office of the bureau. The number placed after the opportunity must be given for the purpose of identification.

COTTONSEED CAKES in whole cargoes or large parcels. Copenhagen, Denmark. Agency.—6087.

CRUSHING AND PULVERIZING PLANT for the manufacture of lime, of a capacity of 2 to 5 tons per day. San Jose, Costa Rica. Purchase. Quotations, c.i.f. Puntarenas or Limon. Terms: Payment against documents.—6136.

MANGANESE ORE in quantity of 60,000 tons annually. Paris, France. Purchase. Quotations, c.i.f. French port. Correspondence, French.—6150.

ASPHALT—Good grade of asphalt for street paving. Santos, Brazil. Purchase and agency. Quotations, c.i.f. Brazilian port. Correspondence, Portuguese or French.—6155.

CYANIDES OF SODA AND POTASH. Rhodesia, South Africa. Agency. Quotations, c.i.f. Portuguese East Africa.—6162.

ROSIN AND TURPENTINE. Mannheim, Germany. Agency. Quotations, c.i.f. Rhineport or Rotterdam. Terms: Cash upon receipt of sh'pment.—6163.

CHEMICALS, pharmaceutical products, and toilet preparations. Rio de Janeiro, Brazil. Agency.—6164.

ALUMINUM AND LEAD, 99 per cent pure, in pigs or bars for foundry work, muriatic acid in drums, and sheet iron in all sizes and thicknesses. Sao Paulo, Brazil. Purchase. Quotations, c.i.f. Santos.—6165.

TURPENTINE of medium and best quality, in shipments of from 50 to 100 bbl. Rotterdam, Netherlands. Purchase or agency. Quotations, c.i.f. Netherlands port. Terms: Cash against documents.—6166.

SPRAYING MATERIALS for the various fruits grown in South Africa. Johannesburg, South Africa. Agency and purchase. Quotations, f.o.b. New York.—6167.

PERFUMERY AND TOILET PREPARATIONS, drugs and chemicals, fancy goods, electrical appliances, automobile accessories and specialties, and tools of these trades. Melbourne, Australia. Agency. Terms: Cash against documents.—6168.

CHEMICAL & METALLURGICAL ENGINEERING

A consolidation of
ELECTROCHEMICAL & METALLURGICAL INDUSTRY *and* IRON & STEEL MAGAZINE

H. C. PARMELEE, Editor

Volume 28 New York, May 7, 1923 *Number* 18

"Tut-ankh-Amen's Vengeance" And Its Commercial Parallel

NEWSPAPER announcements of the illness and subsequent death of Lord CARNOVAN were followed by wild stories and rumors suggesting the vengeful spirit of King TUT-ANKH-AMEN as the direct cause. Although we attempt to laugh off such foolishness, back it comes, this time sponsored by the senescence of Sir ARTHUR CONAN DOYLE. If this curious mental attitude confined itself to explaining the Earl's untimely death, we might ignore it as a form of harmless idiocy; but it has more sinister phases. As exemplified by the anti-Darwinism of WILLIAM JENNINGS BRYAN, for example, it has been the signal for direct attack against modern science in school and college. This is serious, to be sure, although ultimately it should stimulate scientific men to a united effort in defence of science and scientific research.

There is a phase of this superstition, or a credulity that is closely allied to it, which affects us more directly. It is the peculiar lure of speculation that leads the investor into the realm of the questionable enterprise and the "blue-sky" security. Given two opportunities, one a legitimate, carefully planned manufacturing venture and the other a plain, hungry wildcat, a goodly share of the investing public will flock to the wildcat if for no other reason than the seductive superlatives in its promoter's prospectus.

Striking examples of wild gambles of this sort have recently been unearthed in the government's investigations of the use of the mails by fake oil-stock promoters' schemes. At a round-up at Fort Worth, Tex., such notable crooks as "Doc" COOK of North Pole fame and his "high-powered" publicist, S. E. J. COX, were hauled in along with the evidence that they had mulcted the public out of more than $6,000,000. The acting United States Attorney-General in charge of the prosecution has stated that credulous investors in this country are daily contributing over $100,000 to just such flagrant swindles.

This is the sort of superstition that always has been and is still a real menace to progress. It is the old drive to get something out of nothing. It is not begotten of ignorance so much as it is of stupid credulity. The crooks do not appeal to the hard-headed men of business; they cast their nets for the dull, weary people who can't produce with their heads and therefore must labor long and arduously with their hands. Or for women without experience in the ways of the world who know only that some get rich and some don't, but can't imagine any other reason for it than luck or chicanery. How to establish a beneficent guardianship for these easy marks who lack the wit to manage their own affairs is a never-ending problem. Perhaps a later and wiser generation of law-makers or law-givers will solve it.

In the meantime many of our technical men are producing ideas for legitimate enterprises that are needed in industry and are sound in conception, with abundant potential earning power. They are desirable in every way, but are held back by the lack of funds required to launch them. They are kept in check while this very stream of wealth seeking "investment" according to the illusions of its owners passes over the falls and under the bridge into the pockets of adventurers. It never comes back.

We are not interested in the notions of the oratorical WILLIAM JENNINGS BRYAN as to the faith of our fathers or in the number of ghosts Sir ARTHUR sees and hears. But we are interested in a more energetic and vigilant administration of justice in dealing with those who prey upon the innocent or ignorant and in the maintenance of higher standards in the licensing of corporations. We need both reforms.

Profit Sharing In a Small Plant

SOMETIMES we have been guilty of thinking of profit-sharing schemes as sort of frills that only the large, rich organizations can afford. They seemed to be something rather intangible that belonged in the realm of overhead and were properly charged off to good will and advertising. Recently, however, we have been forced to revise our notions, for our attention has been called to a successful system of profit sharing which a small Eastern manufacturer of chemicals has carried on uninterruptedly for more than 17 years. Although perhaps not entirely novel, the system is so interesting and its results so unique that we should like to share its story with our readers.

The scheme is based, of course, on a contract between the employer and his workmen. In return for the worker's promises to do his work quickly and carefully and to give his employer 2 months' notice before leaving, he receives a certain proportion of the company's profits. One-half of this sum is given in cash to the employee and the other is deposited to his credit in a savings bank. The employer, however, is the sole trustee of the savings fund, although it is never allowed to revert to him. If the employee dies the fund is given over, with interest, to his family. In case of sickness the employer can divert a part, or all of it, to the employee, and in addition to this relief the worker is kept on the payroll at half pay. Should the employee leave the company or be discharged for cause, the fund is distributed among the other participants at the next division of profits.

In 1905, when the system was begun, there were

twenty-one profit sharers; today there are forty-two. *During these 17 years the employees received $40,464. The first payment was 10 per cent of the total payroll and the last was 21.3 per cent, although in each case the proportion of the total profit was the same. What do these figures show? Do they prove that the bargain has been a good one? A* letter from the general manager of the plant addressed to the National Industrial Conference Board answers these questions quite conclusively. In this connection the employer writes:

"Inasmuch as my profits compared to the wages paid have increased, it seems to be obvious that the efficiency of my workers has improved; but above all, my own observation has convinced me that the morale of my employees is much superior to the average and that they are more contented and more willing, by far, than is usual in similar establishments. In fact I am satisfied that this bargain has been a good bargain—a good one for both parties to it—and that the extra money I have paid out has been well and profitably invested."

If this story has a moral, and we believe it has, it is simply this: What's good for a large manufacturer is usually good for the small one provided that it is based on sound principles and is wisely applied. Profit sharing is fundamentally a good policy and it makes no difference whether it is carried out on a large or a small scale. The results are the same.

Putting a Value On Education

IN A LATE number of *Commerce and Finance* E. J. BODMAN, a banker of Little Rock, Ark., contributed an article on agricultural education, a subject in which he takes a live interest. If all the farmers of Arkansas, he says, had secured from their crops and animals the same results as those obtained last year by the 3,000 pupils taking farm training at rural schools in that state, Arkansas' farm income would have been increased by no less than $217,532,000. He further declared that of all the people of the United States that have performed distinguished services and have been rewarded with high honors there was but one person out of each 150,000 who had had no schooling; one out of each 37,500 who had had a common school education, one out of each 1,724 who had completed high school, and one out of 187 who had a college degree. Of 5,000,000 persons with no schooling only 31 had attained distinction, whereas no less than 5,678 out of 1,000,000 persons with a college degree had done so. There are 277 times as many college graduates in the United States who have achieved great wealth as there are wealthy men without such a degree.

So much for that. We all know that it is right and proper to be good boys and to study hard and to mind teacher. It goes without saying. But here is a complaint from an eminent professor of physical chemistry. "I'm getting fed up with seniors," he exclaimed. "They're so sophisticated they are not interested in anything simple. They don't know anything—but they don't realize that. When I get a clear, succinct exposition of a difficult problem and give it to my post-graduate students they chortle with delight. Seniors don't want to know anything that may be expounded in simple words. I have to use abstruse terminology with them to keep their attention. They eschew curiosity, which ought to be their most precious possession. It is a quality without which it is useless to approach physical chemistry. My post-graduate students, on the other hand, are like children. They want to know why and *to sense every reason. They're busy and they want to do something, to accomplish something. They don't want frills; they're after facts. I have to work harder with them, and this involves using the simplest language I can find.*"

There are three kinds of men: Those who will get the means to solve their problems and satisfy their curiosity, whether they have the "chance" or not. They are supreme. Secondly, we have those who profit by their opportunities. But the third and largest class consists of those who merely take what comes. They have no curiosity. They are not worth educating. Their proper place is in the yard-gang, digging ditches, or at the filing cabinet in the office. There is no place for them in our profession.

An Idealists' Plaything

WHEN you stop to think of it, you will remember that many of the greatest of our scientific discoveries were made with absurdly simple apparatus. Doubtless FARADAY'S whole experimental laboratory could be duplicated for the cost of one intricate testing machine. It's the experimenter rather than the equipment that counts.

All of which is somewhat trite and obvious, yet strangely enough seemingly ignored by excellent agencies for fostering research. Some of the investigations are started, evidently on the theory that if enough men get interested in it, and enough tests are made, enough variables introduced and eliminated, then somehow from this Irish stew will come the effusive odor of inspiration.

It just doesn't work that way! Some thinker who doesn't need to be co-ordinated will devise a little model —only a wooden block sliding on a stick—to illustrate the plastic flow of a metallic crystal and presto, the whole mechanism of fatigue failure is explained! Not only qualitatively, but quantitatively. Properly designed, it predicts the action of a metallic specimen with uncanny precision. Undoubtedly the model might well say for itself, "I could have foretold the whole of the results of the tests which have taken you years to make."

The steady plodder who runs exhaustive (and exhausting) tests can truly retort that only by comparison with his determinations does the model acquire credence. True enough. But such a model as Professor JENKIN'S (described elsewhere in this issue) helps us to understand the true mechanism of fatigue, and demonstrates most tangibly the more or less abstruse conclusions of the theorist. It points to conclusions which can be readily checked. It guides experimentation. It furnishes quick and highly probable indications of what would happen under unusual conditions: unbalanced stresses, occasional heavy shocks, periods of rest, duplicate heat treatments—problems which would take unthinkable patience and enormous expense to solve by direct attack.

Another great use for such a toy is to illustrate the action of ideally perfect material. It reproduces the essential actions, meanwhile eliminating the influence of many obscure variables, whose very existence may be unsuspected. Too often a deal of work is done on

metal which is of unknown origin and doubtful uniformity. The results apply to that particular experimental piece, but have questionable generality. Thus we come to the dilemma of the committee which tested the effect of sulphur in rivet steel. They examined minutely several steels, well-made steel too, uniform as near as might be except for sulphur. Some differences in physical properties were measured, but these variations are probably due to something besides sulphur! What that something is, is a mystery. In other words, unknown material was examined with microscopic exhaustiveness; mere repetition of tests is futile.

It might not be amiss for some experimenters to look up from their testing machines long enough to insist upon material as uniform as their tests or to devise a toy model, a mechanical equivalent. Meantime Professor JENKIN'S plaything approaches the ideal ductile crystal so closely that if a sample of metal under fatigue test does not agree with the predicted action, we shall suspect abnormal metal rather than mistaken theory.

Fluorspar Resources— Past, Present and Future

THREE principal uses of fluorspar are for flux, for enamel and opalescent glass, and for chemical operations, such as the manufacture of hydrofluoric acid and fluorides. For fluxing purposes it is customarily required that not less than 80 to 85 per cent of calcium fluoride be present in the spar. The glass and enamel grade is usually expected to be 95 per cent or better. But for chemical uses, manufacturers generally specify spar of 98.5 or 99 per cent purity. All three of these grades are available in reasonable quantities today, although the American production, which in the past has commonly maintained the bulk of the supply of the world, is now being supplemented to some extent by imports. Those that have studied this subject most are convinced that within 5 or 10 years there is likely to be a decided shortage of the better grades of domestic fluorspar. All three of the principal groups of users will do well, therefore, to consider the situation at once, not waiting until the shortage, forecast today, actually confronts them.

These untoward prospects have already induced some of the large consumers to purchase important deposits or to take options on territory where such deposits are believed to be available. The government has also interested itself in the question and has undertaken to determine what foreign sources of flourspar there may be that are worthy of future consideration. But there is room for the chemical and metallurgical industries to attack this problem, particularly from the technologic viewpoint.

One of the most important problems will be the preparation for using lower grade spar for chemical purposes, in place of the very high grade now required. Perhaps today an 85 per cent spar cannot readily replace the 98 per cent material for the manufacture of fluorides, but the time may soon come when the increase in cost involved in this use of lower grade material will be less than the difference in the market prices of the two grades. And this may be expected soon unless special means for concentration and refining are developed by the mining industry.

The only alternate source of fluorine is cryolite, and present prospects are that cryolite of first quality will not be available at a more attractive price than high-grade fluorspar. These are practically the only two minerals known that contain fluorine in quantity sufficient to make them interesting to the fluorine-using industries. The logical conclusion from these facts is that the use of lower grade material will eventually come, first as a matter of economy, and a little later as a matter of necessity.

In the case of enamel manufacture and fluxing, there are undoubtedly other means of gaining substantially as satisfactory results as are now obtained with fluorspar. In some glass and enamel, cryolite is already used by many in preference to the combination of fluorspar and feldspar. But still further progress in an entirely different direction, by the use of other types of enamels, may be essential. It is none too soon to begin investigation of alternative possibilities.

Present conditions indicate that foreign sources of supply may be found where high-quality spar can be mined in such large quantities as to offset completely any prospective shortage from domestic sources. Although the location and extent of such deposits are as yet unknown, it is not until this possibility has been thoroughly investigated that we need be at all alarmed about the future. Even though such resources are developed, however, it will be a distinct advantage to industry to have an alternative procedure through the operation of metallurgical, enameling and chemical processes, without the necessity for using imported spar. It all comes down to our old story: Improvements in technology are to be preferred to dependence solely upon foreign resources.

Indexing Technical Journals

A CORRESPONDENT writes suggesting that we arrange for the compilation of a composite index of all that has appeared in *Chem. & Met.* and its predecessors, covering a period of the last 20 years. To us such a plan presents two serious disadvantages: The cost, although not by any means prohibitive, would be out of all proportion to the value to our readers, since it is only occasionally that reference is made to what is contained in the older volumes. Further, the plan is unattractive because it makes no provision for the future. If such a task is undertaken only every 20 years, it is clear that a sudden burden of work would be involved for which a special provision would be required. On the other hand, if the index were kept up to date, week by week or month by month, its inaccessibility to the average reader would make it valueless. Five or 10 years after one composite index had been published a limited though vehement demand for another would arise. The expense would be considerable and, we believe, unjustified.

Most of the trouble in tracing articles in back numbers is due to the necessity of handling the volumes in order to consult the index. We believe that reference would be facilitated if, in addition to the index bound in each volume, subscribers could purchase, for a nominal sum, bound or unbound copies of additional indexes, covering a period, say, of 5 years. Some of our readers have been doing this in the past. If there are others that desire this service, we should be glad to have a sufficient number of extra copies of our next index printed and reserved for special distribution. It seems probable that such a combined index, kept continually up to date, would prove a valuable addition to the technical bookshelf.

The Purpose Of a Standard

To the Editor of Chemical & Metallurgical Engineering

SIR:—It seems to me that the three fundamental functions outlined in the editorial[1] on "The Purpose of a Standard" are very clearly and succinctly presented. I have no criticism to offer on any one of them. However, it seems to me that the list is incomplete. Is not a principal purpose, if indeed not the most important purpose, the industrial economy which results to consumer and producer alike by concentrating production and utilization on specific products, whether they be defined by purchase specifications, by nomenclature or by denominational standards?

Subsidiary to the important purpose of bringing about industrial efficiency are such matters as: conserving and actually making use of the advances in the industry; simplifying the processes of production and distribution; and cutting down selling costs.

The attached list of fourteen advantages of industrial standardization was compiled for a different purpose than the editorial, but it occurred to me that it might be of interest to your readers in this connection.

P. G. AGNEW,
Secretary
American Engineering Standards Committee.

New York City.

Industrial Significance of Standardization

1. Stabilizes production and employment, since it makes it safe for the manufacturer to accumulate stock during periods of slack orders, which he cannot safely do with an unstandardized product.

2. Reduces selling cost. This is generally overlooked. Possibilities of reduced costs are generally even greater in distribution than in production.

3. It enables buyer and seller to speak the same language, and makes it possible to compel competitive sellers to do likewise.

4. In thus putting tenders on an easily comparable basis, it promotes fairness in competition, both in domestic and in foreign trade.

5. It lowers unit costs to the public by making mass production possible, as has been so strikingly shown in the unification of incandescent lamps and automobiles.

6. By simplifying the carrying of stocks, it makes deliveries quicker and prices lower.

7. It decreases litigation and other factors tending to disorganize industry, the burden of which ultimately falls upon the public.

8. It eliminates indecision both in production and utilization—a prolific cause of inefficiency and waste.

9. By concentrating on fewer lines, it enables more thought and energy to be put into designs, so that they will be more efficient and economical.

10. By bringing out the need of new facts in order to determine what is best, and to secure agreement on moot questions, it acts as a powerful stimulus to research and development, and it is thus in decided contrast to crystallization resulting from fixity of mental attitude.

11. It is one of the principal means of getting the results of research and development into actual use in the industries.

12. It helps to eliminate practices which are merely the result of accident or tradition, and which impede development.

13. By concentration on essentials, and the consequent suppression of confusing elements intended merely for sales effect, it helps to base competition squarely upon efficiency in production and distribution and upon intrinsic merit of product.

14. Standardization is increasingly impotent for the maintenance and development of foreign trade. There is strategy in nationally recognized "American" specifications.

15. The efficiency of competing countries, increasing through national standardization programs, is liable to transfer competition from foreign markets to our own shores.

16. Joint effort in bringing about standardization within and between industries almost invariably leads to better understanding and to beneficial co-operation along other lines—a step toward the integration of our industries.

[1] Vol. 28, No. 11, p. 479, March 14, 1923.

Some Recent Technical Developments in Great Britain

An enterprising Sheffield steel manufacturer is about to place on the market a stainless silver, which is the result of recent research, probably inspired by the success of stainless steel. The wastage and labor involved in cleaning silver articles are quite comparable to those now saved by stainless steel, but the difficulty has been that in order to obtain the hall mark, the silver content of an article must exceed 92½ per cent, which leaves a smaller margin for additional ingredients than has been found desirable in the production of stainless steel. It is stated that the new silver will remain bright for about 2 years without cleaning.

Attention has also been drawn to the claims for "Usco" alloy for furnace castings made by the International Combustion Engineering Co., Ltd. The properties of this material are stated to be such that while costing about 50 per cent more than cast iron, it will last from three to ten times as long at temperatures between 800 and 1,000 deg. C.; further, that the melting point is materially higher and while giving a practicable foundry mixture, the castings have high tensile strength and do not crack in use.

Although steam heating or oil or water circulation is generally considered as standard for temperatures up to 500 deg. F., a simple device such as the Stirling stove, made in Sheffield, England, deserves to be better known and appreciated. The underlying principle is the use of a number of special inclined steam tubes, the lower ends of which project through the back wall of the stove into the furnace, which burns coke. Each tube is a separate unit into which a small and definite quantity of water has been introduced before it is closed up. When heated up in the furnace, each tube is filled with steam at a high temperature, which gives up its heat to the stove. This, on condensing, runs back again to the furnace, the process being continuous so long as the fire is kept going. The cost of tubes and furnace ironwork to maintain 350 deg. F. in a stove 6x5x5 ft. is about $175 and the fuel consumption would be about 500 lb. of coke per week. The principle should be capable of adaptation to other items of chemical equipment.

Methods of Air Drying

A Discussion of the Theory and Practical Difficulties as Well as Comparison of the Different Methods of Drying Air

BY EDWIN C. HOLDEN
Consulting Engineer, Baltimore, Md.

THE number of metallurgical, chemical and other manufacturing processes requiring an atmosphere of anhydrous or exceedingly low-moisture air for advantageous operation is constantly increasing, and it is probable that there are many such for which the possibility of obtaining dry air has never been considered, but which would be greatly improved by anhydrous or at least arid working conditions.

In the following notes the attempt is made to give theoretical and practical data on the various methods of air drying which may assist a plant manager to decide upon the practicability of dry air for his requirements. For the same reason British units are used wherever convenient.

The drying of air or other gases, as here discussed, is defined as the reduction of the quantity of water vapor present per unit of volume and mass, or its complete removal, as distinguished from air-conditioning processes wherein the percentage of humidity is controlled by change of temperature without changing the mass relations, or where, by washing, steam injection, wet filters, etc., the aqueous saturation is increased.

AIR-DRYING METHODS

There are four possible methods of drying air—namely, by contact with deliquescent or dehydrating salts or acids; by compression with cooling, condensation and separation of condensate; by refrigeration with condensation and separation of condensate, and, finally, adsorption by substances with ultra-microscopic porosity.

Heating air, while it reduces the percentage saturation, does not reduce the mass ratio of vapor to air, and therefore does not come within our definition of air drying.

I—Drying by Reagents

Desiccation by exposure to caustic or other deliquescent salts is effective to the limits corresponding to the vapor pressures over them when equilibrium is attained.

The important chemical desiccators and their aqueous vapor pressures are given in Table 1.

TABLE I

Vapor Pressure in mm. of Mercury Over	At 0 Deg. C.	At 25 Deg. C.	At 50 Deg. C.
KOH			0.007
$CaBr_2$	0.09	0.18	0.19
$CaCl_2$*	0.07	0.34	1.34
NaOH	0.04	0.15	1.15
$ZnCl_2$		0.85	2.19
$ZnBr_2$	0.28	1.16	6.34

According to Baxter† the weight of water in milligrams in a liter of air after being dried by various agents is

H_2SO_4 at 50 deg. C.	0.003
KOH at 50 deg. C.	0.007
NaOH at 25 deg. C.	0.16
$CaBr_2$ at 25 deg. C.	0.2
$CaCl_2$* at 25 deg. C.	0.36
$ZnCl_2$ at 25 deg. C.	0.8
$ZnBr_2$ at 25 deg. C.	1.1

*Meaning $CaCl_2$, $CaCl_2 \cdot H_2O$.
†*J. Am. Chem. Soc.*, vol. 38, p. 840, and vol. 38, p. 2038.

Phosphorus pentoxide (P_2O_5) is the most effective desiccator. According to Morley‡, it leaves not more than 1 mg. of water in 40,000 liters of air. Because of its cost it is applicable only to laboratory work, and even with it absolute dryness is not theoretically obtainable.

With the other salts an atmosphere approaching equilibrium is obtained by passing the air through a bed or tube newly charged with the lump salts. The latter gradually lose efficiency as the surfaces take up moisture, and the lumps finally break down or coalesce in a sticky mass, so that the operation is intermittent and the spent material is corrosive and inconvenient to handle.

These difficulties and the cost of the reagents are the practical limitations to this method of drying, but it has until recently been the most satisfactory practice in the air products manufacturing industry.

DRYING BY SULPHURIC ACID

Sulphuric acid of 65.4 deg. Bé. (90 per cent) or stronger has an aqueous vapor pressure below 0.5 mm. of mercury even at 100 deg. C. It is, therefore, an excellent desiccating agent when complete contact is obtained and if the acid be replaced before dilution below 90 per cent at 100 deg. C. or 89 per cent at 80 deg. C.

Concentrated sulphuric acid is an excellent desiccating agent in the laboratory, where there is usually ample time for diffusion to attain equilibrium. The objections to it as a commercial desiccator are the high cost of 66 deg. Bé. acid, the impossibility of quickly obtaining complete contact without sprays, the danger of entrainment of acid mist from sprays, the corrosive action of the acid as it becomes weaker than 50 deg. Bé., the necessity of acid-proof cooling coils and large quantities of cooling water to remove the evolved heat of solution and thus maintain the lowest possible aqueous vapor tension, and, finally, the high heat consumption and costly equipment required to reconcentrate the acid. For commercial plants 60 deg. Bé. acid should be used, as higher grade acid is usually made to meet strict specifications as to purity and sells at a high price per unit of H_2SO_4 content.

Fig. 1 is a chart showing the vapor pressure and moisture content in an atmosphere over acid of varying strengths and temperatures. It emphasizes the importance of low temperature and indicates the possibilities of sulphuric acid as an industrial drier. The heat due to the latent heat of condensation of the vapor varies from 1,073 B.t.u. at 32 deg. F. to 1,007 B.t.u. at 150 deg. F. plus the heat of dilution, which varies with the dilution limits.

Fig. 2 gives the curves for the heat of dilution as calculated by Thomsen, and Knietsch's determinations, which are considerably higher. They indicate that diluting from 60 to 50 deg. Bé. each pound of water

‡*Amer. J. Sci.*, vol. 30, p. 441 (1885).

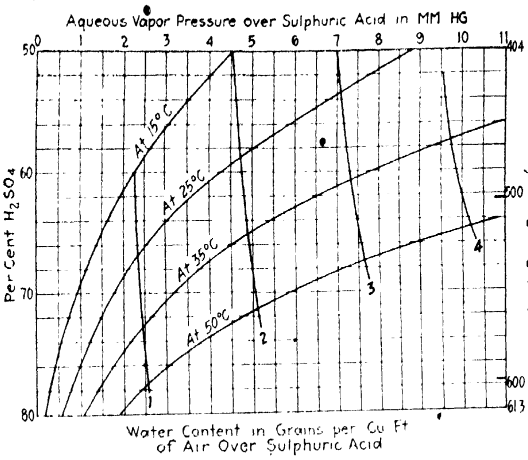

FIG. 1 VAPOR PRESSURE AND MOISTURE CONTENT IN AN ATMOSPHERE OVER ACID OF VARYING STRENGTHS AND TEMPERATURES

evolves 480 B.t.u., according to Knietsch's higher values. Each pound of water absorbed will dilute 4 lb. of 60 deg. Bé. acid to 50 deg. Bé. From these data both the acid and cooling requirements can be determined, and it is evident that drying on a commercial scale to from 1 to 2 grains per cubic foot is practicable.

The difficulties above noted have proved serious enough, however, to prevent any wide application of the sulphuric acid method of vapor absorption even in the vacuum process of ice manufacture where the conditions are favorable.

II—Drying by Compression

Compression followed by cooling and condensation produces a compressed air saturated, if enough moisture be present, to the dew point at the temperature of the air receiver or condenser, any excess of moisture present being condensed and settled out in the receiver. Upon isothermal re-expansion to atmospheric pressure, the percentage saturation due to the remaining vapor will be equal to 100 divided by the number of atmospheres absolute pressure at the condenser.

In Fig. 3 the curve *A* shows the moisture content per cubic foot of free air after drying by compression to the pressures indicated, cooling to 70 deg. F. and removing the condensate. The curves *B* and *B′* give the horsepower developed in single- and two-stage compressors respectively per 1,000 cu.ft. of air per minute when compressing to the pressures shown. Curves *C* and *C′* give the power developed in single- and two-stage compressors respectively in removing 1 lb. of water per minute from air saturated at 70 deg. F. If the air is originally saturated only to 70 per cent, the first half atmosphere of compression will be above dew point and a much larger volume of air is compressed per pound of water removed and in that case over 200 hp. is developed per pound of water removed per minute at one atmosphere pressure and 276 hp. per pound of water removed per minute when reducing the residual moisture to one grain per cubic foot.

It is evident that drying by compression is fairly effective at high pressures with low-temperature condensers of ample size to prevent entrainment of mist, but it is also apparent that the cost of drying by compression would be prohibitive unless such compression is incidental to some other process.

In Fig. 4 the power and drying conditions are given for high pressures using four-stage compressors. It will be noted that the resultant effluent moisture is about 0.25 grain per cubic foot at 500-lb. compression and that the further removal of moisture is then very gradual with increasing pressures.

In operations such as liquid air or oxygen manufacture where pressures up to 200 atmospheres are used, each cubic foot of compressed air saturated at, say, 70 deg. F. contains 7.98 grains of moisture, but this represents 200 cu.ft. of original free air with moisture reduced to 0.039 grain per cu.ft., or 0.49 per cent saturation. The compression and cooling have removed 99.5 per cent of the original moisture. The remaining quantity of moisture would, however, be prohibitive in the liquefying process, as the ice formed would quickly stop the refrigerating coils. The compression condensation which removes most of the moisture must, therefore, be followed by a more efficient desiccating method in order to approach an absolutely anhydrous condition.

III—Drying by Refrigeration

The vapor pressure and therefore quantity in a given volume of saturated air varies functionally with its temperature, hence lowering the temperature of air causes condensation of the excess of water in the air at its original temperature over its dew-point content at the lower temperature.

TABLE II

Temp., Deg. F	Vapor Pressure, In Hg	Gr Per Cu Ft	Volume Displaced, Per Cent
—40	0 0039	0 072	0 024
—20	0 0126	0 166	0.042
—10	0 0222	0 285	0 074
0	0 0383	0 481	0 128
+10	0 0631	0 776	0 211
20	0 1026	1 235	0 343
30	0 164	1 935	0 548
40	0 247	2.849	0 825
50	0 360	4 076	1 203
60	0 517	5 745	1 728
70	0 732	7 980	2 446
80	1 022	10 934	3 416
90	1 408	14 790	4.706
100	1 916	19.766	6 404
110	2 576	26 112	8 610

For convenient approximations, Table II gives in abridged form the standard psychrometric tables, including the vapor pressure, and weight of water per cubic foot in saturated air and the corresponding volumes of dry air displaced at various temperatures.

Thus if it be desired to refrigerate to a dryness of 2 grains per cubic foot, it is evident we must refrigerate

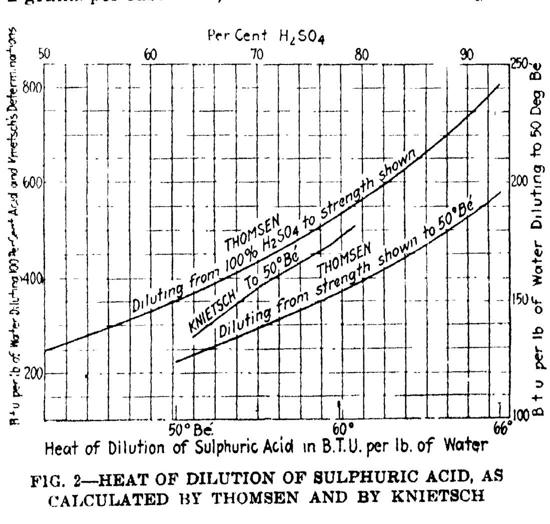

FIG. 2—HEAT OF DILUTION OF SULPHURIC ACID, AS CALCULATED BY THOMSEN AND BY KNIETSCH

below 31 deg. F., and for 1 grain below 16 deg. F. To determine accurately the total quantity of water to be removed allowance must also be made for the shrinkage in air volume proportional to the change in absolute temperature as given in the last column of Table II.

The power required for refrigeration is best indicated by an example:

The theoretical power required to make a heat transfer from a cool to a warmer body is:

$$\text{Hp.} = \frac{778}{33000} Q \frac{T_1 - T_2}{T_1}$$

in which

Q = B.t.u. refrigeration per minute.
T_1 = Inlet absolute temperature, deg. F.
T_2 = Outlet " " deg. F.

Let it be required to refrigerate 1,000 cu.ft. of air per minute at 65 deg. F. and 70 per cent saturation, or 4.75 grains moisture per cubic foot, to saturated air at 25 deg. F. which contains 1.55 grains per cubic foot.

$$T_1 = 65 + 460 = 525$$
$$T_2 = 25 + 460 = 485$$

The air weighs 75 lb., of which 0.678 lb. is water vapor. The cold air has contracted to 924 cu.ft. containing 0.204 lb. of vapor.

Q = for the air 74.32 lb. × 0.2375 × 40 = 706.1 B.t.u.
+ for vapor 0.678 lb. × 0.45 × 40 = 12.1 B.t.u.
+ for ice 0.678 − 0.204 = 0.474 lb.
× (1072 + 144) = 576.4 B.t.u.

Total = 1294.6 B.t.u.

It is evident from the above components of Q that more than half of the thermal work is consumed in cooling the dry air and less than 45 per cent by the water actually removed.

$$\text{Hp.} = \frac{778}{33000} \times 1295 \frac{40}{525} = 2.33$$

To this must be added the factors for the efficiency of boilers and engines or generators and motors and refrigerating compressors, radiation losses and the power consumed by circulating pumps and fans to move the air through the system.

The most efficient modern ice plants make 16 tons of ice per ton of coal. Based on reducing the water temperature 40 deg. F. in making ice, the process involves the transfer of 4,089 B.t.u. per minute requiring 7.36 hp. per ton of coal per 24 hours. Based on the same efficiency it will require 634 lb. of coal per 24 hours to refrigerate the assumed air current of 1,000 cu.ft. per minute. To this must be added not less than 2 motor horsepower for fans to overcome the air resistance of the system.*

Johnson gives an excellent discussion of refrigeration applied to drying blast in his "Blast-Furnace Construction," in which he concludes, by entropy diagram calculations, that to refrigerate 1,000 cu.ft. of air per minute from 85 deg. F. and 70 per cent saturation to 25 deg. F., with condenser temperature at 85 deg. F. will require:

With single-stage refrigeration	11.56 hp.
With two-stage refrigeration	7.95 hp.
With two-stage refrigeration and regeneration	4.97 hp.

Each refinement adds to the first cost of the plant, and the elaborate regenerating towers required in the last scheme would also add seriously to the power required to blow the air blast through the system, so that the ultimate relative economy is not what it appears from the above figures.

As the temperature of refrigeration is lowered the value of $\frac{T_1 - T_2}{T_1}$ and therefore the power required rapidly increases and Johnson's curve gives the follow-

*In his dry blast at the Isabella furnace Mr. Gayley allowed 75 hp. for circulating fans and brine pumps when the blast was 34,000 cu.ft. per minute.

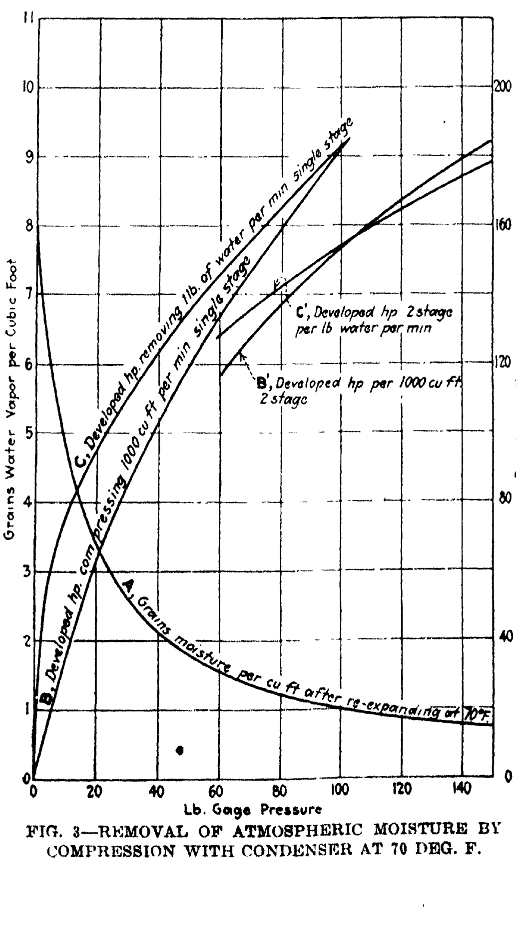

FIG. 3—REMOVAL OF ATMOSPHERIC MOISTURE BY COMPRESSION WITH CONDENSER AT 70 DEG. F.

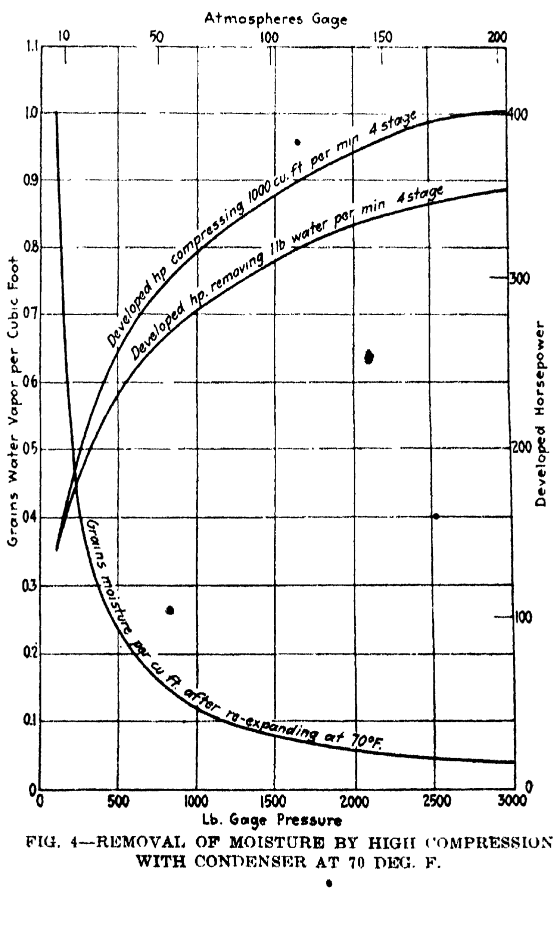

FIG. 4—REMOVAL OF MOISTURE BY HIGH COMPRESSION WITH CONDENSER AT 70 DEG. F.

ing figures for the horsepower required per pound of water removed per minute in refrigerating air below 40 deg. F. by direct expansion, single-stage refrigerator with condenser temperature at 70 deg. F.

	Hp.		Hp
At 40 deg. F	6	At 20 deg. F	24
32 deg F	10	15 deg F	35
30 deg. F	12	10 deg F.	50
25 deg. F.	17	5 deg F	68

The same relative increase in power consumption would apply also to the more economic type plants, and it is evident that the economic limit of refrigerating temperature and resulting dryness is soon reached because of the rapid increment in power required with each degree drop.

IV—Drying by Adsorption

Adsorbents are bodies having ultra-microscopically porous structures which possess such intense capillarity that they will selectively adsorb and condense within their pores vapors from air or other gases under conditions of temperature and pressure above the normal liquefying points of the vapors, the action being selective in inverse order to the vapor pressures. The action is purely mechanical, although it results in the separation of chemicals when vapors of different tensions are present, and the adsorbed vapors can be recovered in concentrated form from the adsorbent by the application of heat.

Natural substances such as clay, fullers earth, bauxite, alumina, charcoal, etc., when properly activated have this property in varying degrees, but as the pore structure and effective capacities of natural substances are widely variable, they do not meet the exacting requirements of uniform pore size, high capacity, durability and ease of reactivation necessary in most commercial processes.

Silica gel is an artificially prepared porous form of pure silica which appears to fulfill these requirements. It is made in different types for varying service. For water vapor adsorption the "type C" gel will take up 30 per cent of its weight of water vapor and still remain sensibly dry. After saturation it is reactivated by heat without change in its structure or efficiency.

Vapor pressures over activated adsorbents have not, to the writer's knowledge, been accurately measured. The work done with silica gel indicates that the vapor tension over activated gel is lower than over concentrated sulphuric acid and higher than over P_2O_5.

In a compression oxygen plant a filter of 175 lb. of granular silica gel running to the "break point" (i.e., until appreciable quantities of moisture escape the gel) ran over 200 hours on a net flow of 120 cu.ft. of free air per minute at 50 atmospheres pressure and 68 deg. F., as against the normal practice of the plant using lump caustic potash, when it did not average better than 50 hours run.

A more severe test was a 5-hour run on the same air stream as above, except that the preliminary washing towers for the removal of CO_2 were cut out and the gel adsorbed CO_2 as well as moisture, although the gel cells were within 20 deg. F. of the critical temperature of carbon dioxide. The possibility of removal of CO_2 by gel by slight refrigeration of the adsorber cells to develop a little more surface tension in the liquid CO_2 is thus indicated. The gel would be reactivated for CO_2 by simple decompression.

For the partial drying of large volumes where it is allowable to leave 0.1 grain or more of moisture in each cubic foot, silica gel is used in pulverized form in a counter-current series of applications in order to economize on the quantity of gel and of activating heat required. Vapor equilibrium is obtained almost instantly when proper contact is assured, as the total time of air-gel contact in a three-stage laboratory size plant is less than one second.

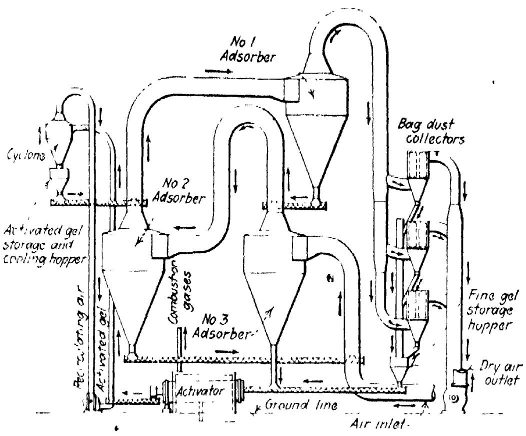

FIG. 5—DIAGRAMMATIC LAYOUT OF A CONTINUOUS THREE-STAGE COUNTER-CURRENT GEL ADSORPTION PLANT

Fig. 5 is a diagrammatic layout of a continuous three-stage counter-current gel adsorption plant such as is used for large volume air drying down to 5 per cent humidity or over. The active gel is fed into the inlet of adsorber No. 1, where it gives the air, which has already been twice treated, its final drying. The slightly saturated gel is then dropped out of adsorber No. 1 and fed into No. 2 and thence into No. 3 adsorber, where it meets the untreated humid air and receives its saturating load of moisture and is fed to the activator, which is either of the horizontal rotary indirect drier type as shown, or a multiple hearth turret furnace which is used to advantage for fractional activation. The air passing counter-current to the gel through Nos. 3, 2 and 1 adsorbers then goes through a battery of standard bag dust collectors to remove traces of gel escaping adsorber No. 1 and then through a multivane fan which balances the resistance of the whole system and delivers the dried air at a slight pressure.

The gel ratio depends upon the humidity of the inlet air, the temperature of the operation and the dryness required. Thus with a ratio of 0.75 lb. of gel per 100 cu.ft. of air, the following results are obtained at the respective outlet temperatures given using the type C gel:

Outlet Temp., Deg F.	Per Cent of Total Moisture Removed
80	92.6
85	86 6
90	82.0
95	78.6
100	75 5
105	72 9

The per cent adsorption can be controlled by varying the gel ratio, or by the use of cooling coils to lower the outlet temperature.

The power and heat required to perform the operation vary with the duty required. In a large installation the gross requirements for each 1,000 cu.ft. per minute flow are between 70 and 90 kw.-hr. and 3 to 5,500,000 B.t.u. per 24 hours, depending upon the original atmospheric humidity and the final dryness required.

What Is the Life of Silica Gel?

Experimental Results Show Possibility of Repeated Activation of the Gel After Adsorption*

VARIOUS gases have been recovered in the past by the use of silica gel. The process for the manufacture of phosgene may be cited as an example of this. In this process, a mixture of phosgene and nitrogen is obtained and the phosgene is recovered by passing the mixture through silica gel at 0 deg. C., whereby phosgene is adsorbed by the gel and the nitrogen allowed to pass through. The phosgene is then driven out by heat and condensed. Silica gel has also been used in small-scale plants for the adsorption of nitrogen peroxide. Because of its increasing use as an adsorption medium for gases, quite extensive tests have been carried out on this substance, with very interesting results. The object of these tests was primarily to find out how many times the gel could be used successively without diminishing its adsorptive power. Series of runs were made with water, benzene, nitrogen peroxide and nitric acid, respectively.

Simple Apparatus Used for Water Series

In conducting the test with water, the apparatus consisted of a flow meter, a sulphuric acid drier and containers for the water and the gel. The silica gel used was 8 to 14 mesh, made by the Davison Chemical Co.

To activate the gel the glass tube containing it was fitted into a malleable iron pipe, with suitable connections for the passage of air. This was heated to a temperature of 200 deg. C., while a slow current of dry air was passed through to remove the adsorbed material. The condensed vapors were collected and weighed.

Air bubbled through water at 20 to 25 deg. C., thereby humidified to a uniform degree, was then passed through the activated gel in the tube. This vapor was passed through at a uniform rate, until the saturation point was reached. In most cases the time required was from 12 to 15 hours. Having reached this saturation point, the tube was weighed, then reactivated and weighed again. Results obtained appear in Table I.

These data show that the amount of water adsorbed drops off slightly, being 9.3 per cent of the weight of the silica gel for the first fourteen runs and 15.9 per cent for the last fourteen runs. Considering the occurrence of experimental errors in these runs, it is probable that extremely high figures obtained in runs 2, 7 and 13 were in error. Omitting these values, the average adsorption for the remaining eleven runs was 18.5 per cent. The gel itself showed no evidence of disintegration and was apparently in as good condition after the last run as it was at the beginning of the series.

On benzene runs made with the same lot of silica gel as in the runs on water, but with the flow of air through the apparatus lowered somewhat, it was found possible to saturate the gel in 4 to 5 hours, keeping the benzene at room temperature (20 to 25 deg. C.). The results shown in Table II point out the fact that the adsorption in the first forty runs (17.45 per cent) was somewhat higher than that obtained in the remaining forty-three runs (16.35 per cent). The gel was apparently as good at the end as at the beginning.

To obtain satisfactory adsorption with nitrogen peroxide, it was necessary to pack the tube and the nitrogen peroxide container in ice. The gas was allowed to pass through the gel until the nitrogen-peroxide vapors could be seen issuing from the top of the tube. The length of time required for this varied from 2 to 3 hours. Since silica gel was used at Edgewood Arsenal to adsorb nitrogen peroxide during its manufacture there, particular interest was attached to the determination of the life of silica gel when used on this material. The results shown in Table III show a variation in the amount of nitrogen peroxide adsorbed from 60 to 68 per cent of the weight of silica gel used. The average of all runs was 63.86 per cent. The variations shown are probably caused by experimental error. The gel apparently had not deteriorated in any respect at the end of these runs, and it was apparent that its power of adsorption was equally as high at the end as at the beginning. Because of the fact that the gas used was impure it was thought advisable to follow the nitrogen-peroxide run with nitric acid.

These runs were made in the same general manner as in the case of the NO_2. Commercial 70 per cent HNO_3 was used in this series. The temperature employed in carrying out this test was from 20 to 25 deg. C. It was found necessary to run the air through the gel at the rate of 1,000 cc. per minute, over a period of about 16 hours, for the gel to reach the saturation point. Tabulated results of the experiments appear in Table IV.

*Abstract of a report on work done in the research laboratories of the U. S. Chemical Warfare Service at Edgewood Arsenal. This work, done by E. M. Faber and H. G. Olson, was supervised by W. A. Taylor, chief of the organic department.

Easier Reading Mercury Thermometers

While mercury thermometers are necessary from the standpoint of accuracy, fault has been found because they are read with difficulty. The C. J. Tagliabue Co. is marketing a new type of tube which corrects this fault by showing a broad red band from the top of the mercury column to the top of the tube.

Production of Synthetic Vanillin By the Ozone Process

Design, Construction and Operation of Equipment for Commercial Manufacture by a Method Which Appears to Hold Many Interesting Possibilities

BY BURTON G. WOOD
Chemical Engineer Los Angeles, Calif

THE OXIDATION of isoeugenol to vanillin by means of ozone takes place rapidly at ordinary temperatures. In fact the reaction is so rapid that it must be retarded or an undesirably large amount of resin will be formed. The process is subject to a basic patent[1] in this country, but it is doubtful if any yield could be obtained if the process therein described were followed literally.

In 1904 the Ozone Vanillin Co. was formed in this country for the purpose of manufacturing synthetic vanillin by the ozone process. The company was equipped with a wide variety of expensive equipment. However, the plant never attained efficient production and was abandoned when, seemingly, on the very point of success.

In a previous article in this magazine (vol. 28, No. 9, p. 399, Feb. 28, 1923) Mr. Wood outlined the properties of synthetic vanillin and discussed in a general way the various processes that have been proposed for its manufacture. He points out that the chief commercial methods depend upon the oxidation of isoeugenol, a product obtained from clove oil. Although the ozone process described in this article is not at present in commercial operation in the United States, it is the belief of the editors that the interesting discussion points out a number of very promising possibilities.

The general plan of the process is shown in Fig. 1. The ozonized air is drawn through the isoeugenol rather than being blown through it, because of the difficulty in designing an ozone machine that would withstand the pressure. The blower cannot be placed between the ozone room and the oxidizing tower, because the ozone will attack the impellers of the blower and cause a loss of ozone as well as rusting the blower unless it is kept well coated with oil. Another reason for drawing rather than blowing the air is that the tower top is likely to open up with a slight inside pressure, while a slight suction will tend to keep it tight. Accordingly the best place for the blower is at the final end of the apparatus, making it act as a vacuum pump or so-called negative blower.

The ozone room should preferably be separated from the rest of the plant. A room 10x20ft. is large enough to accommodate eight machines of 4 kva. capacity each, or capable of using 32 kva. One air-cooled transformer of 4 kva. is placed under each ozone machine. In case one machine is out of commission, it is not necessary to close down all of them, or if this machine be temporarily disconnected, the transformer does not become inefficient due to partial load, as would be the case if only one large transformer were used. Ventilation should be made at the top of the room. In fact, it is well to have an ordinary exhausting fan to keep the air circulating and the room free from ozone, particularly if it is necessary to have a man working around one of the machines. The breathing of ozone even for a short time is very painful.

The generation of ozone is one of the first difficulties met in this process. Many of the patented machines designed for laboratory use fail to give satisfactory results when used on the large scale demanded by this process. The writer, after experimenting with a number of standard type machines, finally evolved a commercial-sized unit that gave excellent results. On the large machine using plates 22 in. square it was found possible to maintain a yield of 65 grains of ozone per kva. when drawing air across the plate at the rate of 3 cu.ft. per plate per minute. Precautions were taken to prevent the formation of any salts on the face of the plate. Each machine was built to use 4 kva. of power with a tension of 9,000 volts. The maximum yield obtained with this machine was 3 oz. of vanillin per kva.

The ozonized air is carried from the ozone room to the oxidation apparatus in a 3-in. pipe, which is an ordinary iron pipe lined with a shellac coating. All turns in the lines are made with tees and the idle end of the tee fitted with a 1-in. valve. The 3-in. line runs to the bottom of tower 1 (see Fig. 1). This tower is made of 24-in. sewer pipe set on a cement foundation. Its height is 18 ft. A 1½-in. outlet pipe is set in the base. The tower is partly filled with splash plates or balls that will break the flow of the air. It is desirable, of course, to get all of the ozone from the air, and this is not an easy task. Between tower 1 and tower 2 there is a check valve. The second tower is exactly the same as the first one; the pipe between the two towers runs from the top of the first to the bottom of the second one. Tower 3 is made of the same size pipe as the other towers, but is only 8 ft. high. This tower is also filled with packing except at the lower section. A small bronze circulating pump lifts the material from the bottom to the top of this tower. The pipe between tower 2 and tower 3 runs from the top of the second

[1] U. S. Pat 553,039.

tower to within 2 ft. of the bottom of the third. The last tower is made of iron and filled to within 2 ft. of the bottom with iron splash plate or old iron fitting. This tower is also equipped with a small circulating pump. The pipe from tower 3 to tower 4 runs from the bottom of tower 3 to within 2 ft. of the bottom of the fourth tower. The blower is connected to the top of tower 4, and there is a 3-in. relief valve between the tower and the blower. The valve is always opened just before the blower is shut down. The blower should best be belt driven, so that if a line should become clogged, the belt will slip off, thus giving relief to the system and at the same time indicating trouble. The top of each tower should be air tight. This can be accomplished by putting a 2-in. plank cover in the top and then packing the joints with cotton and finally coating them with water glass.

Operating Procedure

The operation of this apparatus is carried out as follows: Tower 1 is filled with 150 lb. of isoeugenol and 100 lb. of sodium bisulphite (40 per cent) solution. Tower 2 is filled with 100 lb. of isoeugenol and 75 lb. of the bisulphite solution. Tower 3 is charged with 40 gal. of 10 per cent sodium carbonate solution. Into tower 4 is poured 40 gal. of 10 per cent sodium hydroxide solution. As previously explained, the function of towers 1 and 2 is to take the ozone from the air. As soon as the ozonized air comes in contact with the isoeugenol, the latter is oxidized to vanillin and the vanillin enters into combination with the sodium bisulphite and passes from the reaction sphere. As the ozonized air passes through towers 1 and 2, some sulphur dioxide is given off and collected by the air. The sulphur dioxide is absorbed in tower 3 and in turn carbon dioxide is given off. The air then passes to tower 4 and the isoeugenol vapor and carbon dioxide are removed by the sodium hydroxide. The air, then free from ozone, isoeugenol, sulphur dioxide and carbon dioxide, is discharged through the blower.

Tower 1 contains the largest amount of absorbed vanillin, tower 2 the next amount, and a considerably smaller quantity will be found in towers 3 and 4. To towers 1 and 2 every hour there is added a certain amount of 25 per cent sodium bisulphite solution. Furthermore, the rapid passage of the air causes a large

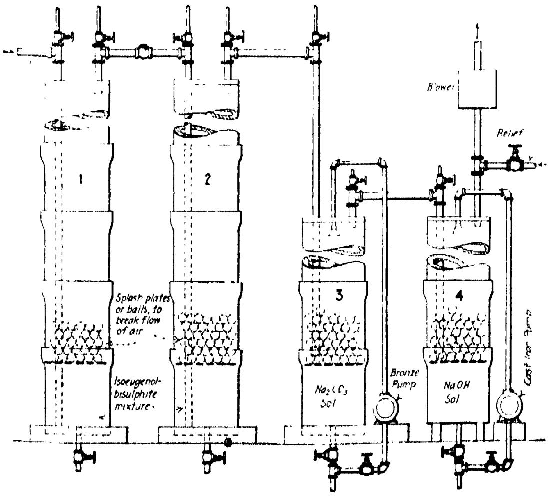

FIG. 1—APPARATUS FOR ISOEUGENOL OXIDATION BY OZONE PROCESS

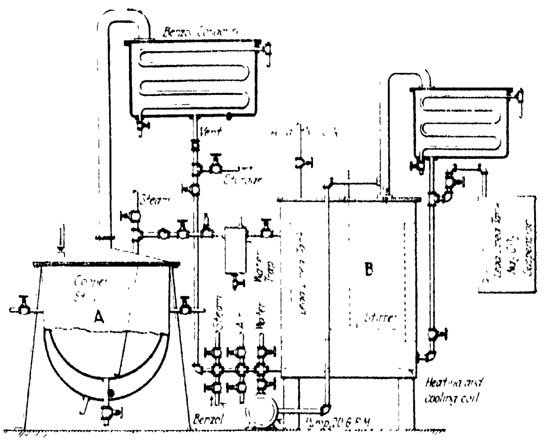

FIG. 2—DECOMPOSITION AND EXTRACTION APPARATUS

loss of water from the towers which must be replaced from time to time. Unless this is done, the bottom of the towers will become clogged with crystals of sodium sulphite.

It is essential that the sodium bisulphite and vanillin react immediately after the latter is formed from the isoeugenol. Otherwise the vanillin will be turned to resin and lost.

After 8 hours of running, the apparatus is shut down and the bisulphite and oil will separate from each other. The bisulphite liquid is then drawn into the decomposer and extractor shown in Fig. 2.

Extraction of the Vanillin

The decomposer and extractor consists essentially of two parts, the still *A* and the lead-lined decomposing tank *B*. The bisulphite liquid is drawn into tank *B*, which is provided with a stirring apparatus. The charge is measured and a sample titrated against Congo red, in order to determine the amount of sulphuric acid necessary to decompose the bisulphite compound and the remaining bisulphite. It is necessary to heat the liquid to 80 deg. C. to insure complete decomposition of the vanillin-bisulphite compound and at the same time to expel all of the sulphur dioxide. The stirrer is then started and 30 per cent sulphuric acid is admitted slowly through a top opening until the required quantity has been added. Heating is accomplished by a coil or a booster of live steam may be used. As soon as the temperature of the liquid reaches 80 deg. C., the sulphur dioxide begins to come off. This is absorbed in a suspension of sodium carbonate or a saturated solution of this salt. After the sulphur dioxide is about all expelled, air is blown through the solution to remove last traces.

After this point it is necessary to make sure that the liquid is slightly alkaline, and for this purpose it is titrated with sodium carbonate solution. Any sulphuric acid present materially affects the color of the product, for there is always some trace of isoeugenol, which chars in the presence of sulphuric acid, especially under heat in the still.

As soon as the sodium carbonate has been added, the water is turned on in the cooling coil and the temperature is brought down to below 75 deg. C. Benzol is then admitted till it overflows into the water trap. The alkaline vanillin solution is now pumped from the bottom of the tank and sprayed on the benzol. As soon as the water shows only traces of vanillin, more benzol

is admitted through the bottom of the tank *B* until the copper still *A* is about half filled. The still is run for a while, the benzol distilled being run into *B* at the bottom and thus washing the liquid free from vanillin. When the liquid in *B* has been exhausted of its vanillin content, the benzol is bypassed and run into a receiving tank. Water is now admitted through the bottom of *B* and thus all of the benzol is washed into the still. Toward the end the water trap has to be used frequently.

The crude vanillin is now drawn into a receiver, where it is crystallized into a very light brown mass. It smells strongly of the oil. The extracted liquid in *B* is then run to waste. When the sodium bisulphite liquid in the absorber has reached proper strength, it is returned to the process, in this way avoiding much of the loss.

Preliminary and Final Crystallizations

The crude vanillin is dissolved in a wood lead-lined tank in fifteen parts of hot water containing about 5 per cent of a filterchar. After boiling for about 5 minutes the mass is pumped through an aluminum filter using a rotary pump capable of operating at 60 lb. pressure at a rate of 20 gal. per minute. The mass is pumped into an aluminum crystallizer. The product from the second crystallization is very much improved in both odor and color. It has only a slight yellow color and practically no odor except when heated on the point of a knife. The water from the second crystallization is used as dissolving water for the first. The first two crystallizations may be made with ordinary water, but the third and last should be made with distilled water absolutely free from iron.

In this final crystallization the water is heated to 90 deg. C., and the vanillin is added while stirring. The stirrer should not have a speed of over 10 to 12 r.p.m. As soon as the vanillin is all dissolved, the stirrer is stopped and the solution allowed to cool very slowly until the first needles are well formed. The stirrer is then started and the cooling hastened by the use of cooling water in the outside jacket. Continuous stirring from the time the crystals are dissolved will produce flat plates rather than desired needle crystals. The melting point and other qualities will be the same as the needle crystals. However, the trade seems to have the idea that vanillin crystals must be needle shaped. If there is a trace of iron in the water, it will give the vanillin a slight yellow color, which shows up especially on being dried. When thoroughly dry, vanillin has a melting point of about 83 deg. C., although a small amount of moisture, 2 to 4 per cent, will lower the melting point to 81 to 82 deg. C.

Magnesite Production Increases in 1922

The production of crude magnesite in the United States in 1922 was 32 per cent greater than 1921. It amounted to 63,487 short tons, valued at $650,742, according to figures compiled by J. M. Hill, of the U. S. Geological Survey. Practically all of the magnesite mined in 1922 was obtained from the California deposits, of which the two producing the most were that of the Western Magnesite Co. at Red Mountain and that of the Sierra Magnesite Co. at Porterville.

During 1922 prior to Sept. 22, when the tariff act took effect, the imports amounted to 112,159 tons, valued at $1,750,636, as compared with 42,486 tons, valued at $592,491, for the 12 months of 1921. There were no exports of the crude or calcined magnesite to balance the imports in 1922. The exports of magnesia products such as pipe and boiler covering were valued at $223,686. Of the domestic magnesite used in the year more than 90 per cent was sold in the calcined form, at an average of about $40 per ton. The remainder, sold for chemical uses, brought about $11.50 per ton.

The assurance of good prices upon the passage of the new tariff act greatly stimulated the domestic industry.

"Wood Alcohol" and "Methanol"

Practice of New Nomenclature Gains Headway—Should Cut Down Accidental Poisoning

The National Wood Chemical Association, through the assistance of W. A. Hamor, assistant director of research for the Mellon Institute, has recently issued a clear-cut statement regarding the nomenclature of wood alcohol. This statement, sent out by F. J. Goodfellow, secretary of the association, is as follows:

"Methyl alcohol, or methyl hydroxide, which is commonly known as wood alcohol, is a clear, colorless and poisonous liquid obtained by the distillation of hard wood. In its crude state it is readily identified by a heavy, pungent odor; but, when refined for commercial use, this odor is almost wholly eliminated. Enough odor usually remains, however, to distinguish it from ethyl (grain) alcohol. Wood alcohol, when ingested in any of its grades and in any solution, is dangerously poisonous. However, there is no conclusive evidence that its external application or ordinary exposure to its vapors is injurious. Cases of poisoning among workmen in wood-distillation plants are almost unknown.

"On account of the large number of casualties attributed to drinking liquor containing wood alcohol, the importance of surrounding its use with every precaution to protect human life has attracted attention for many years, and as a result, numerous protective and restrictive measures have been adopted. One of these measures is the proposal to discontinue from usage the name 'wood alcohol' and use the scientific term 'methanol.' This term came into scientific usage as a result of the action of the International Conference of Chemical Nomenclature, which met in Geneva, Switzerland, in April, 1892. One of the resolutions adopted at this conference was as follows: 'The alcohol and phenols will be called after the name of the hydrocarbons from which they are derived, terminating with the suffix ol; as, for example, methanol, ethanol, etc.'

"Soon after that time the term methanol found its way into German textbooks, but until 1920 did not come into favor with the American chemical profession. In that year the late Dr. Charles Baskerville published several articles wherein he advocated a general adoption by chemists of the correct scientific term methanol. Also Dr. E. J. Crane stated in 1922, for the committee of the American Chemical Society on occupational diseases in chemical trades, that the usage of the word methanol was favored, although not required.

"At the present time, in the New Standard Dictionary, as well as in most of the scientific and trade journals, the word methanol is in common usage. The subject is of such universal importance that the suggestion is made to all interested persons to co-operate in the effort to establish the name methanol for the better protection of those who are not educated along chemical lines."

The Steam Accumulator

The Ruths Accumulator, as Used in Europe, Points the Way to Boiler Plant Economies for Users of Process Steam

BY ISMAR GINSBERG
Consulting Chemical Engineer, New York City

CHEMICAL and metallurgical plants, paper mills, rubber factories and other establishments in which steam is used as such in the manufacturing process, must contend with the problem of variable steam demand and production. The steam plant is generally designed to meet the conditions of maximum steam demand, with the result that during most of its operation it is running below capacity. In these plants, where steam is used in the chemical process, the demand for steam as motive power may be comparatively small, while the consumption of steam in the actual manufacturing process is quite large and at the same time intermittent. It is needless to remark that steam plants that are run below their capacity in this manner do not operate with the highest attainable efficiency.

This condition is accentuated in paper mills perhaps more than in any other kind of plant, and it was therefore to be expected that the solution of the problem should come from the paper industry. One solution lies in the Ruths heat or steam accumulator, an apparatus of comparatively simple construction, which has given very good results in the Swedish paper mills, where it has been used for some time. Dr. Ruths is a Swede, and although the invention is camparatively new, it has already spread to various English plants as well as to those on the Continent. The importance and practical utility of the apparatus is substantiated by no less an authority than Philip T. Dodge, president of the International Paper Co., who in a recent address said that he deemed the Ruths heat accumulator of paramount importance to every paper manufacturer—in fact to every industry where there is large and variable steam consumption. He added that the International Paper Co. was installing one apparatus at once and that the other mills of the company will be so equipped later on.

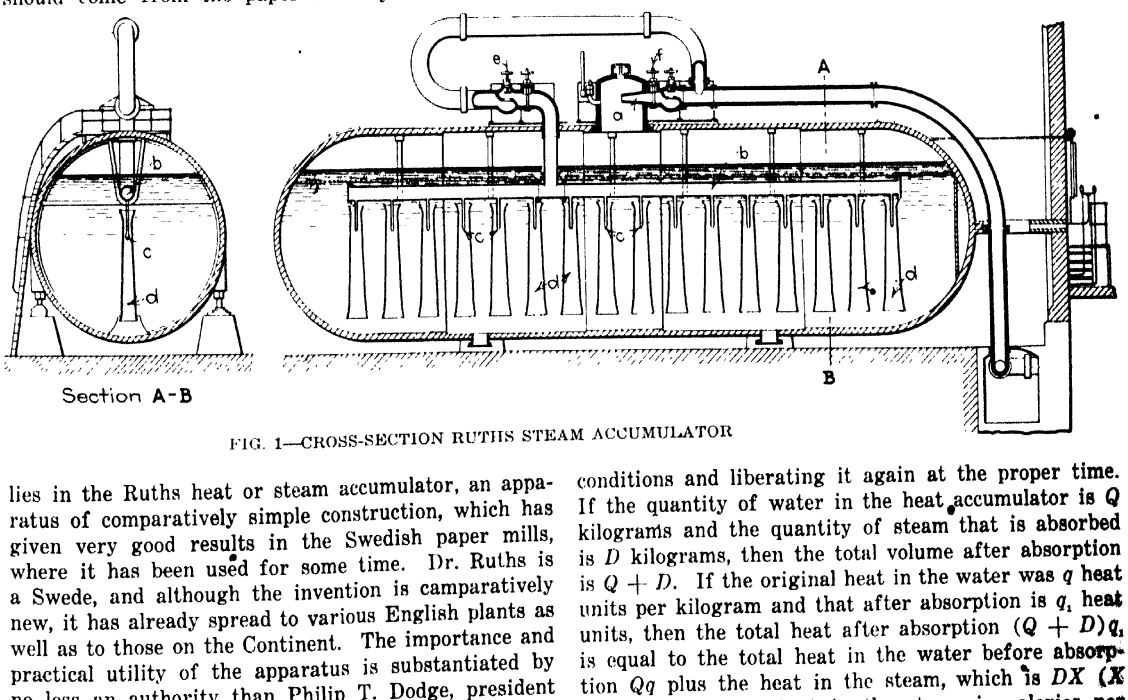

FIG. 1—CROSS-SECTION RUTHS STEAM ACCUMULATOR

THE HEAT ACCUMULATOR IN PRINCIPLE

This heat or steam accumulator is nothing more than a great tank, filled with water to about nine-tenths of its capacity and so thoroughly insulated that it is cold on the outside no matter what the temperature is within. The heat accumulator is connected with the steam line in the plant. When the boiler plant, which is built for minimum capacity when the heat accumulator is used, produces steam in excess of what the plant requires, this excess steam is stored in the heat accumulator. On the other hand, when the plant draws more steam from the boiler plant than it can produce, then the steam that was stored in the heat accumulator in the former case is released and made available for use in the plant. The action is entirely automatic and is accomplished by the difference in pressure on the steam lines actuating double-acting automatic regulating valves. The advantages of a boiler plant which can be operated in this manner, always at its full capacity no matter what the load may be, are great. The apparatus delivers the steam, after storing it for variable lengths of time as the conditions of operation vary, at almost the same pressure at which it was originally produced. In one test the steam was stored for about 3 weeks and practically all of it was recovered from the accumulator, the loss being only 2 per cent.

ABSORPTION AND RELEASE OF STEAM

The steam accumulator is therefore an apparatus that acts like the flywheel in an engine. It stores energy and delivers it when required. It is a hot-water apparatus, the water absorbing the steam under certain conditions and liberating it again at the proper time. If the quantity of water in the heat accumulator is Q kilograms and the quantity of steam that is absorbed is D kilograms, then the total volume after absorption is $Q + D$. If the original heat in the water was q heat units per kilogram and that after absorption is q_1 heat units, then the total heat after absorption $(Q + D)q_1$ is equal to the total heat in the water before absorption Qq plus the heat in the steam, which is DX (X being the heat content in the steam in calories per kilogram). The complete equation will then read, disregarding heat losses, as follows:

$$Qq + DX = (Q + D)q_1.$$

On the other hand, when steam is being removed from the heat accumulator, which of course results in the pressure within the apparatus being diminished, the magnitude of this diminution can be determined from the following equation:

$$Q_1q_1 - D_1X_m = (Q_1 - D_1)q_2.$$

In this equation no account is taken of the losses that take place during cooling. Consequently the symbol X_m

denotes the heat content in the steam leaving the accumulator.

Construction of the Accumulator

The construction of the accumulator may be seen from Fig. 1. The apparatus is made in cylindrical form and is provided with hemispherical ends. The safety nozzle is shown at *a*, and has for its purpose the limiting of the rapidity of the removal of steam, so as to prevent the boiling over of the contents of the accumulator when great quantities of steam are suddenly removed from the apparatus or when a tube breaks. Thus the introduction of water into the outgoing steam pipes is avoided.

The charging arrangement consists of a horizontal distributing pipe *b*, which is located near the water surface and which extends along almost the entire length of the accumulator. To this distributing pipe charging necks or outlets, *c*, are fastened at equidistant points and dimensioned so that equal quantities of steam can stream through all these outlets. The charging outlets are surrounded by tubular casings, *d*, formed to produce diffusion of the steam. These tubular casings extend downward until they almost touch the bottom of the accumulator. This method of charging produces good circulation of the water within the accumulator, so that the maximum difference of temperature noted within the water mass is only 0.2 deg. C. The double-acting valve controlling the charging of the apparatus is seen at *e*, and that controlling the discharge of the apparatus is seen at *f*. The apparatus is also provided with one or two safety valves, an air valve, mud blow-off cocks and the ordinary manholes and hand-holes.

Location of the Apparatus

Fig. 2 shows the location of the accumulator in a typical steam line. The connection is made in parallel with the steam line L_1 in which the steam demand is extremely variable. The connection between the Ruths accumulator and the boiler is made through the automatic double-acting valve *U*, which opens at a very slight pressure rise, a condition which ensues just as soon as the production of steam is greater than the requirement. When the plant is consuming all the steam that the boilers produce, then the valve *U* closes automatically due to drop in pressure on the boiler side of the valve and the total production of the steam plant is rendered available. Furthermore, the steam accumulated in the Ruths apparatus is also allowed to flow into the line L_1 and through the bypass and double-acting valve D_1 into L_2 and L_3 as well.

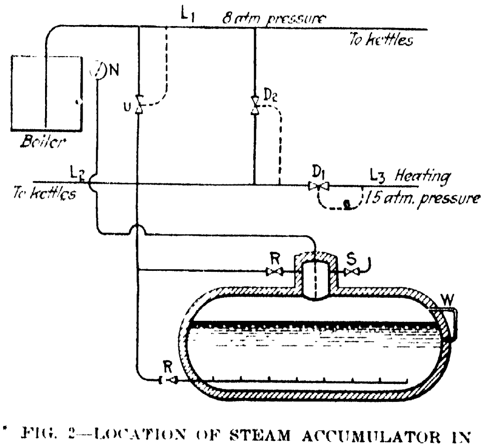

FIG. 2—LOCATION OF STEAM ACCUMULATOR IN STEAM MAIN

There are other methods of arranging this heat accumulator in the piping system of the plant, but this need not concern us here. Each method must fulfill the operating conditions of the plant. Special regulatory devices are provided as well at the power-producing machines and at the overflow valves, which allow the excess steam to flow toward the heat accumulator. All the instruments may be located on a main instrument board, so that the entire operation of the apparatus can be observed and controlled from a single point.

This apparatus has been used in several large paper mills in Sweden and accurate operating data are available on its efficiency. The efficiency of boiler plant operation is considerably increased by installing an accumulator and it is stated that in one Swedish mill the efficiency was increased to 80 per cent and more. The fuel saving has been claimed to vary between 15 and 23 per cent. The largest accumulator is installed in the paper mill of A. B. Kaukas in Wilmanstrand, Finland. The diameter of this apparatus is 5 m., the length 19.5 m. and the capacity 345 cu.m. The accumulator load is 12,000 kg. of steam. The plant operates four B. & W. boilers, each possessing 393 sq.m. of heating surface. Before the accumulator was installed the boiler plant consisted of 20 fire-tube boilers, run by seventy firemen. Now only four firemen are required. The efficiency of the plant is 83 per cent.

National Research Council Provides Informational Bulletins

A useful activity of the Research Information Service of the National Research Council in Washington is the compilation and issuance in convenient form of significant facts concerning scientific research and its industrial relations.

Often the facts assembled to meet the immediate needs of an individual engineer-investigator, firm or association are of sufficiently widespread interest and general value to justify mimeographing, printing or publishing. Informational reports thus prepared by the Information Service ordinarily are available either at cost or free.

Among the compilations which have been made available by Research Information Service or by other divisions or committees of the National Research Council of special interest to engineers are:

Bulletin 3. List of "periodical bibliographies and abstracts of the scientific and technological journals of the world."

Bulletin 9. "Funds available in 1920 in the United States of America for the encouragement of scientific research."

Bulletin 16. "Research laboratories in industrial laboratories in the United States, including consulting research laboratories."

Bulletin 22. "Mechanical aids for the classification of American investigators, with illustrations in the field of psychology."

Reprint 9. "Reading list of scientific and industrial research and the service of the chemist to industry."

Reprint 33. "Informational needs in science and technology."

Reprint 35. "American research chemicals."

Reprint 40. "The usefulness of analytic abstracts."

Several lists of scientific and technological bibliographies also have been issued. Among them are lists of published or unpublished bibliographies of corn and corn products, colloid chemistry, geology and geography, astronomy, mathematics and physics.

Fatigue in Metals*

Theory of Fatigue Demonstrated by Use of Model—Results Predicted by Model Agree With Test Data—Use of This Model to Form Basis of Accurate Strength Calculations and Introduce Fatigue Limits Into Steel Specifications

BY C. F. JENKIN

ABOUT a year ago I was asked to read this paper. About 6 months ago I wrote a paper, knowing that I should be very busy this autumn, and made a model to illustrate a small point in it. But as I played with the model to learn how to use it, it grew too strong for me and took command, and for the last 6 months I have been its obedient slave—for the model explained the whole of my subject—Fatigue. The model destroyed my first paper, and I have been obliged to write a new one in haste, putting it off from day to day as the model taught me new things. The written paper has suffered, but I hope you will find my account of the model more interesting than the tentative theories which filled the old paper. But in any case, I can speak of nothing else.

A simple form of model is shown in Fig. 1. It is made up of three or more "units" fastened together top and bottom. The units are all similar. Each is made up of three pieces—a block A with a rod fixed in it, a block B sliding freely on the rod, and a block C sliding on the rod stiffly, the friction being adjustable. Blocks B and C are connected by a spring. The model may be constructed in many other ways. The only requirements are (1) that it shall be elastic up to a point and then slip with solid friction; (2) that all the units shall not slip at once as the load on the model is increased. This latter requirement may be met in two ways—either by making the friction different in the different units, or by making the springs of different strengths. The former method is the simpler, and is used in all the models I shall speak of today.

The model may be adjusted so as to have different properties by varying the friction in the different units and also by pushing up or pulling down some of the blocks C, so as to give the units initial compression or tension. The model will set itself so that the compression and tension forces will balance.

Let us choose a three-unit model for the first test and give No. 2 unit twice the friction of the two others, and give No. 1 unit a small tension, and No. 3 unit an equal compression, so that the model will still be in equilibrium. Let us imagine that the model is put in a static testing machine with an extensometer attached and tested in tension. At first it stretches elastically, then No. 1 slips, and later No. 3 slips, and finally No. 2 slips. No larger force can be applied. The load-extension diagram given by the extensometer would have the form shown in Fig. 2. This figure is easily constructed. The three lines at 45 deg. are the load-extension lines for the three equal springs. They slope up to the points at which they slip and then are horizontal. The graph for the whole model is found by adding the co-ordinates of all three. If the model were made up of more units, the graph would be less angular. P is the limit of proportionality (elastic limit). YP is the yield point, FL is the fatigue limit. How this is found I shall explain later. Now compare this with Fig. 5, which is a load-strain graph for hardened, but untempered, 225,000-lb. steel.

Next, let us set the model differently. Give No. 2 unit a certain tension and Nos. 1 and 3 a compression of half that amount. The load-strain graph is shown in Fig. 3. Compare this with Fig. 6, which is the load-strain graph for a well-tempered steel.

Next, let us take a model of ten units, and give eight of the units nearly equal friction and the remaining two slightly less. As I pull this model, the weakest unit slips first, then the next. As each slips, more load is thrown on the rest, and when the first of the eight nearly equal units slips, the extra load will cause the next to slip at once, and they will all slip—Jack-run-for-mustard. The graph for this model is shown in Fig. 4. Compare this with Dalby's photographic model for mild steel—Fig. 7.

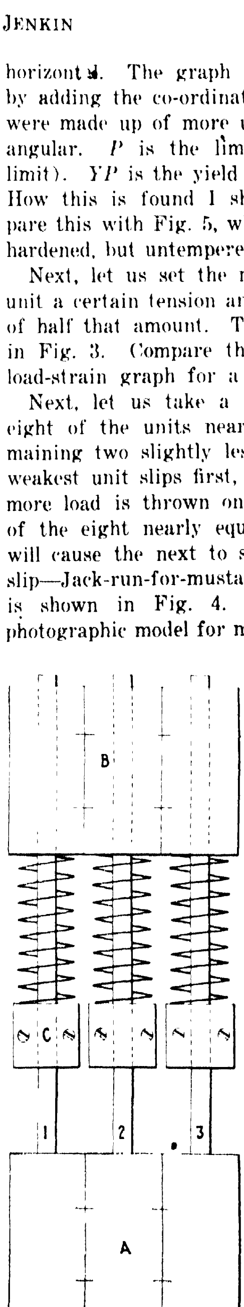

FIG. 1—MODEL REPRESENTING THREE CRYSTALS

In this explanation I have assumed that when the unit slips it becomes weaker, and so throws more load on the rest. I return to this point later.

But there is another very pretty point to notice. Watch the model closely. The units tend to move in little jerks, not quite smoothly, owing to the difference between the static friction and the sliding friction. These little jerks appear in Dalby's photograph of the steel.

If we compress Model No. 2, we shall get the lower curve in Fig. 3. Note that the elastic limits are different in compression and tension. If we carry the test on these models round a cycle we shall get the hysteresis loops shown in Figs. 2 and 3. These have the typical shape of metal hysteresis loops; curved rising lines and straight falling lines. The model will thus represent any of the typical

*Paper read before the Royal Aëronautical Society on Dec. 7, 1922, and reprinted from *The Engineer*, vol. 134, p. 612.

steels very closely—up to the yield point. I have not made it go higher for reasons that I shall explain later.

Now let us see what it does when tested under alternating loads. To start with, apply a large alternating strain to the three-unit model. All the units slip backward and forward, but as the amplitude of the motion is reduced, first one, then another, and finally all the units cease slipping. The amplitude now is the largest which the weakest unit will stand without slipping. The motion is elastic, and, as Bauschinger first stated, the metal will stand this motion indefinitely. We have found the fatigue limit. When the model comes to rest, the units are all stress-free. They are all in what may be called the central position. The fatigue limit points marked *FL* in Figs. 2 and 3 were found in this way.

The truth of Bauschinger's theorem—the identity of elastic range and fatigue range—has been confirmed by Bairstow[1]; also by Gough[2]. Gough invented a test which has turned out to be of the greatest value. A mirror is fixed on the end of the Wöhler test piece and adjusted to run truly in a plane perpendicular to the axis of rotation. The spot of light is reflected by this mirror on to a scale, and as the specimen is loaded this spot moves down the scale. If the deflections are plotted against the load, the graph is a straight line as long as the metal is elastic. Thus the limit of proportionality in Gough's rotating test indicates the fatigue limit. The accuracy of this test has been repeatedly confirmed both by Gough and Lea for many metals. This test gives a method of finding the fatigue limit in a few minutes on a single test piece.

Let Gough's test be applied to a copper test piece. Under static test, copper is not elastic for even the smallest load. The stress-strain curve bends off from the origin without any straight portion. The model representing copper has the maximum possible initial stresses in the units, so that one begins to slip the moment any load is applied. Applying the alternating load to the model, the units will slip into central positions, and we shall find a fatigue range as before. But this test will leave the units in a stress-free condition, and we ought therefore after the test to find the copper elastic. This remarkable result was found experimentally by Gough, and at my suggestion he repeated the test, raising the range gradually first to one-quarter, then to one-half, then to three-quarters of the full range. In this way, the elastic limit of the copper was found to be raised first to one-quarter, then one-half, then to three-quarters of the full range. Thus the experiment exactly confirmed the prophecy based on the model.

The same experiment is now being tried on hardened 225,000-lb. steel. The stress-strain curve—Fig. 5—we have already seen bends off almost from the origin. By applying an alternating stress the steel should be made elastic up to the fatigue limit, according to my theory.

The fatigue limit we have been discussing above is for equal tension and compression loads, but there are infinite series of fatigue limits for unequal loads. How can their magnitudes be found? Suppose that an alternating stress were applied to the model unsymmetrically, so that the tension were greater than the compression. This might be increased till the weakest unit began to slip backward and forward. When that occurred we should have reached the fatigue limits for these particular unequal loads, and the range [or algebraic difference between maximum and minimum load] is the same as before. We may go on making such tests, making the motion more and more unsymmetrical, and the range will remain the same till a new limiting condition intervenes—viz., that the maximum tensile stress must not exceed the ultimate strength of the test piece. This condition reduces the range of stress which can be applied by limiting the magnitude of the larger load. The graph representing the *range* of stress plotted against the *inferior* stress will therefore consist of two straight lines—one horizontal at the range for the weakest unit and the other at 45 deg. through the ultimate strength—see Fig. 9. This graph, according to the textbooks, should be Gerber's parabola—shown in the figure. The model appears to fail here. But compare the graph with the actual results shown in Fig. 8 from Bairstow's paper. The model is clearly right and Gerber wrong.

Before considering further properties of the model,

let us see whether there is anything in the metal which can behave as the units in the model behave. The crystals are obviously the units. Ewing and Rosenhain[3] have shown that they are elastic up to a point and then slip along slip planes. They also pointed out that the slip planes lie at all angles with the line of action of the load, so that the resolved shearing stresses along the planes will have all values from a maximum in planes at 45 deg. to zero in planes perpendicular to the load. Thus the crystals will not all slip at once, but one after another. Thus we see that the known properties of the crystals exactly correspond with the assumed properties of the model. Finally, Ewing and Humfrey[4] showed that when slipping backward and forward takes place the slipping surfaces wear, and a crack is ultimately formed, which grows till final fatigue failure occurs. Thus our criterion for the fatigue limit is correct—viz., that we must have no slipping even in the weakest unit.

But if the model represents the metal so accurately, why does it cease to do so at the yield point? The ultimate strength of a metal is much higher, but the ultimate strength of the model is the same as the yield point. It would not be difficult to alter the model to make it imitate the real metal, but the additions necessary for this purpose would not correspond with any reality in the metal. The rise of strength in the metal above the yield point is, I believe, due to the mutual interferences between the crystals. These must have a great effect as soon as there is much distortion—that is, after the yield point. The model and my theory are therefore limited to stresses not exceeding the yield point.

[3]*Phil. Trans. Roy. Soc.*, vol. 193A.
[4]*Phil. Trans. Roy. Soc.*, vol. 200, p. 248.

But fatigue is not quite so simple as this. Think of a crystal shearing and then of the two parts slipping backward and forward on each other. We should expect to find that it required a larger force to shear the crystal than to keep it slipping when once it had been sheared. In other words, that the adhesion between the surfaces would be greater than the friction. Experiments show that this is the case. The model can be altered so as to show this difference by making the sliding blocks grip a collar on the rod, off which they slip when the force is greater than the adhesion. How will this modification of the model affect the results we have already got? I have not time to prove it tonight, but you will find that nothing we have so far found is essentially altered till we come to the graph of the complete series of fatigue ranges. Fig. 10 shows the range graph for a five-unit model arranged to represent Bairstow's axle steel allowing for the effect of adhesion. Instead of being horizontal at the top it rises by steps, but these steps may be smoothed out by using more units in the model. Compare this with Bairstow's graph for axle steel—Fig. 8. You will see how closely they agree.

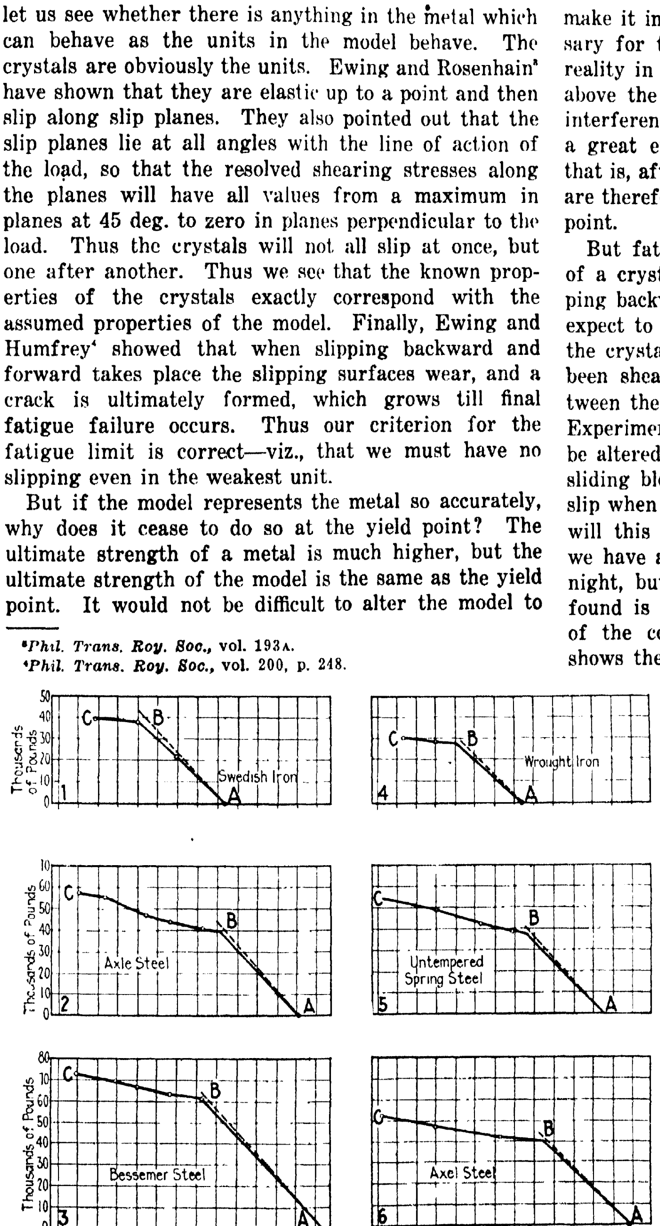

FIG. 8—ELASTIC RANGES BY BAIRSTOW AND SAFE FATIGUE RANGES BY WOHLER IN VARIOUS STEELS

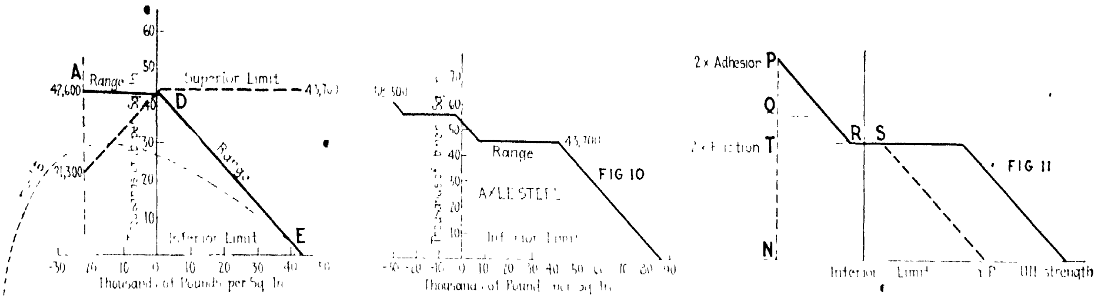
This graph suggested two remarkable experiments. If all the adhesions could be broken down, then the fatigue limit should fall to the value 19.5 tons (44,000 lb. per sq.in.). This can be done by bringing the metal into the "cyclic condition" by overloading it under alternating stress and then gradually reducing the load. All the adhesions are broken down by this treatment, and the crystals are left in the stress-free condition, as we have seen. Tested in this condition, axle steel should have a fatigue limit 25 per cent lower than in the normal condition. I tried this experiment on some 0.33 carbon steel. The fatigue limit was lowered 29 per cent.

The second experiment was even more remarkable. If the steel could be made stress-free, and then have its adhesion



FIGS. 9, 10 AND 11—FATIGUE RANGES DERIVED FROM MODELS

Fig. 9—Swedish Iron. Fig. 10—Axle steel. Fig. 11—Abused steel (dotted) and "fatigue hardened" (full line).

restored, the fatigue limit should be raised to the full adhesion value—20 or 30 per cent above the ordinary value. I took the sample which I have just described, which was in the stress-free condition, and boiled it in water for 2 hours. This caused the crystals to heal, and so restored their adhesion. I then tested it, and the fatigue limit was 21 per cent above the original value. These remarkable experiments show that the fatigue limit of steel can have any value between two limits. They are shown in Fig. 11. Finally, these experiments give a direct measure of the ratio of adhesion to friction along crystalline slips, which for the steel tested was 1.7.

Other methods may be employed for raising the fatigue limit. If the metal is very slightly overloaded in the Wohler test for a few seconds and the load then reduced again, the adhesion of some of the crystals is broken down, but so little damage is done that the sheared faces heal at once and the process can be repeated again and again, each time raising the maximum load a little. Gough, at the National Physical Laboratory, raised the fatigue limit in this way 20 per cent for the steel already referred to, and Professor Lea in Birmingham raised another specimen by rather more.

These experiments show that healing of sheared crystals occurs and that this action may be hastened by very moderate temperatures. Also that the time required for healing depends on the extent to which the slipping faces have been damaged by rubbing. We are thus introduced to a new idea—healing may be taking place during a fatigue test, and the ultimate result (fracture or safety) may depend on a sort of race between slipping and healing. Healing may be thought of as the recrystallization of the minute quantity of metal disarranged by slipping, and it is not difficult to see why this takes place easily and quickly when we remember that the surfaces between which it occurs are parallel arrangements of crystallized material.

If healing produces an appreciable effect, it will raise the fatigue range above the elastic range and the amount it raises the fatigue range will be greater the more time there is for the action to take place—i.e., the slower the alternations of stress. A second modification of the fatigue range may occur, due to the fact, first demonstrated by Hopkinson, that it takes time for the crystals to slip. Hopkinson showed that for a very short duration of stress, say one-thousandth of a second, metals were elastic far above their ordinary limit. This phenomenon should also raise the fatigue range above the elastic range, but will be most effective at high speeds. These two actions make it necessary to qualify Bauschinger's general statement on the equality of the elastic range and the fatigue range. The magnitude of the two effects is being investigated. It seems probable that healing may be very effective at the temperatures at which some parts of engines—for example, valve springs—work.

The events occurring in the metal undergoing a fatigue test may be examined in other ways. If there is friction between the parts of crystals there must be heat generated, and we can measure this heat by observing the rise of temperature of the metal. This was first done by Hopkinson, and many observers have used the method since. The temperature rise follows closely on the departure from elasticity—i.e., it becomes large when the crystals start slipping. But there is found to be a very small evolution of heat at stresses far below the fatigue limit, and that the heat gradually increases as the load is increased. In other words, there is a small elastic hysteresis. The model does not indicate this elastic hysteresis, and what it is due to is not yet known.

Temperature observations have brought to light some very striking phenomena. When nickel is tested, there occur sudden heat bursts which rapidly disappear again. They recur every time the load is raised. How can these temporary evolutions of heat be explained? Consider the model. If it were stretched and compressed 2,000 times a minute without lubrication, what would happen? The sliding block would "run hot and seize." While it slipped heat would be generated, but the moment it seized the generation of heat would cease. That this may be a true explanation of what happens in nickel is confirmed by two striking facts. If the heat is due to slipping, heat bursts cannot begin below the elastic limit, for this is the point at which the first crystal slips. Experiment shows that they do not. Again, if a sample is tested up to fairly high stresses and all the crystals which slipped have seized, then if the test is repeated on the same sample no heat bursts can occur. This remarkable result is also confirmed by experiment. The trouble is like an infantile illness—a rapid rise of temperature, which a day or two later subsides, and immunity from the illness follows for the rest of one's life. Similar heat bursts occur in hard steel, but they last very much longer and are less pronounced.

In 1915 Prof. F. H. Smith and Mr. Wedgwood published a paper[5] on what they call yield ranges, illustrated with a very large number of figures showing the results of their tests. I have gone through those figures and find that a model consisting of only three units will reproduce them all. Of course, the figures given by the model are very angular, since it has so few units, but that defect could be remedied to any extent by multiplying the number of units.

I am not sure if I have made it clear that the model

[5]*Journal Iron and Steel Institute*, vol. 91.

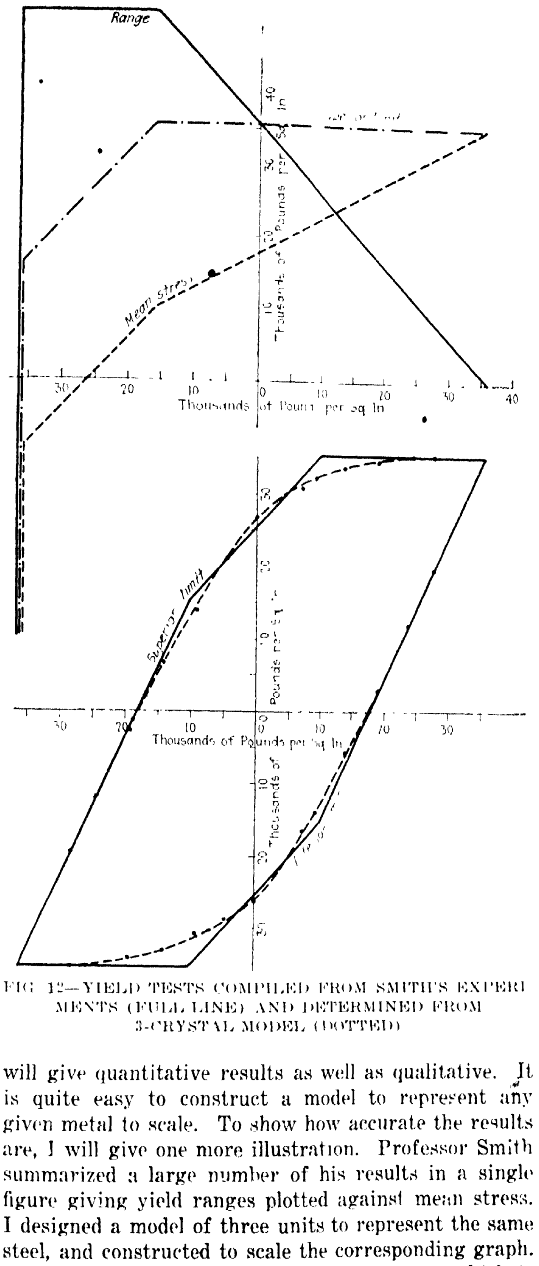


FIG. 12—YIELD TESTS COMPILED FROM SMITH'S EXPERIMENTS (FULL LINE) AND DETERMINED FROM 3-CRYSTAL MODEL (DOTTED)

will give quantitative results as well as qualitative. It is quite easy to construct a model to represent any given metal to scale. To show how accurate the results are, I will give one more illustration. Professor Smith summarized a large number of his results in a single figure giving yield ranges plotted against mean stress. I designed a model of three units to represent the same steel, and constructed to scale the corresponding graph. Fig. 12 shows the graph of the yield ranges, which is very similar to that for the fatigue ranges. On it is plotted the superior stress and the mean stress. Below it, the superior and inferior stresses are plotted on a mean stress base; the figure is a skew polygon. On this, to the same scale, I have drawn Smith's figure representing his test results. The agreement is, I think, striking. If the model could speak it would say: "I could have foretold the whole of the results of the tests which have taken you years to make."

The theory I have outlined. applies to iron, steel, nickel and copper. Whether it is true for all metals is not yet known. It is not unlikely that brittle materials like cast iron may behave differently. It ought to apply to fatigue in shear as well as in tension, but whether it does has not yet been ascertained.

Perhaps you wish to know the practical end of all these researches, and may feel inclined to say: "What is the use of your pretty models and fine theories?"

We hope before long to be able to put figures into designers' hands which will be a sure basis for all their strength calculations, figures which will not need factors of safety to allow for our ignorance of the strength of the materials. We hope to introduce fatigue limits into steel specifications, so that you will buy your materials on the basis of their useful strengths. We hope to have methods of fatigue testing as simple as tensile tests. We hope to be able to issue instructions which will save endless failures of engines. All these things are already possible. We have now only to verify and confirm before issuing our reports.

I will venture to make one suggestion today to all engine builders. Never run a new engine on a full-power test till you have raised the fatigue limits of all the highly stressed parts. This can be done, as Gough and Lea have shown, for test pieces by making a series of short runs at gradually increasing loads, finishing up at the highest overload which the engine will ever be called on to exert and slowing down between each. No marine engineer ever starts up a ship's engine at full load. He coaxes it up gradually. This may be partly to give the bearings time to run in; but the experiments I have described suggest that it may also be most valuable in giving time for the steel to "slip into the central position" and to heal. A proper start may add 20 per cent to the engine's strength.

Radio Principles in Induction Heating

It is quite recently (since about 1916) that electromagnetic energy intercepted in a secondary circuit has been absorbed before it escapes and used for producing heat free from the contaminating carbon of the arc furnace.

In a recent publication of the Engineering Foundation the development of the high-frequency induction furnace is described by its inventor, E. F. Northrup, who developed it with the assistance of G. H. Clamer. It is an ironless induction furnace which in its smaller sizes is used to melt the precious metals, gold, platinum, iridium and their alloys; also samples of carbonless iron and its alloys with various metals of the tungsten group. In its larger sizes, silver and the base non-ferrous metals and their alloys are melted; also nickel and iron alloys which must be maintained extremely pure.

The heating and melting of these materials result from the direct transformation of electromagnetic energy into heat energy within the substance itself or within the walls of a conducting crucible used to hold the product heated. If the substance to be heated does not conduct electrically, Pyrex glass for example, it is nevertheless heated and melted by the same process by placing it in a crucible which is made of conducting material.

These ironless induction furnaces, depending as they do upon the passing of a high-frequency current through an inductor coil, require for their operation a source of current of much higher frequency than the current supplied by commercial circuits. So-called "high-frequency" converters (up to from 3,000 to 30,000 cycles per second) of new design have been developed especially to meet this requirement. It is but a short step, however, to adapt the high-frequency, high-power converters which have been developed for transoceanic radio transmission to the service of inductive heating. Thus, again, the electron vacuum tube arises as the genie to do useful things.

Trade Custom and Written Contract

Unambiguous Agreement Cannot Be Altered by Oral Evidence of Trade Practices

A sales contract was the basis of an action brought by the Youngstown Sheet & Tube Co. against the Etna Forge & Bolt Co. The question of custom or usage in the trade became one of the main considerations determining the final disposition of the case in the United States Circuit Court of Appeals, 282 Federal 786.

Suit was brought on the contract to recover the balance of the purchase price of 400 tons of steel bars at "$3.50 per cwt., delivered." Judgment was entered in the District Court for the full amount claimed to be due for want of sufficient affidavit of defence.

Misleading Representations Claimed

The contract provided that the seller was to ship the 400 tons of steel "at mills' convenience," which refers to convenience of the plaintiff. Defendant purchaser alleged in its affidavit of defence that in the negotiations for the sale it "made known to the plaintiff that it did not require more than 100 tons of steel for immediate delivery, but that it would require the full amount of 400 tons during the remainder of the year 1920"; that plaintiff "represented to the defendant that there was very little likelihood that any steel on the said order could be shipped before the last quarter of the year"; that delivery could not possibly be made, except from time to time during the fourth quarter of 1920; that the price of steel fell shortly after the contract was made, and that by a custom of the steel trade it was entitled to receive the steel not already shipped at the reduced price, and that defendant was induced to enter into the contract by these fraudulent and misleading representations of the plaintiff, which shipped the entire 400 tons within 6 days after the contract was made.

The trial court gave two important reasons why it entered judgment against the purchaser of the steel. It pointed out, first, that the defendant received and unloaded all the steel, notwithstanding the alleged representations, when it was not compelled to do so under its theory of the case; second, the court said damages (as claimed by the defendant) to be recovered must always be the natural and proximate consequence of the act complained of, and those results must be considered proximate which the wrongdoer from his position must have contemplated as a probable consequence of his fraud or breach of contract. Now the defence did not charge that the plaintiff contemplated a drop in the price of steel, and so the damage demanded from the plaintiff was not such natural and probable consequences of the breach as to have been in the contemplation of the parties at the time of entering into the contract.

The defence contended that the apparent inconsistency of receiving and unloading the steel when it was not compelled to do so was within its legal rights, for after discovering the fraud, he had the right to affirm the contract and recover damages on account of the fraud, or the right to disaffirm it, and he chose the former. The court was not disposed to read into the contract the allegations as to delivery being made only in the last quarter of 1920. If these claims as to shipment being agreed upon to be in the last quarter were true the court points out that a wise business precaution would have seen to it that the precise understanding between the parties was incorporated into the written contract.

Rule Cited by the Court

The contract was written, short and its terms clear. The rule of law applicable as approved by the U. S. Supreme Court in many cases is:

"When parties have deliberately put their engagements into writing, in such terms as impart a legal obligation, without any uncertainty as to the object or extent of such engagement, it is conclusively presumed that the whole engagement of the parties, and the extent and manner of their undertaking, was reduced to writing; and all oral testimony of a previous colloquium between the parties, or of conversation or declarations at the time when it was completed, or afterward, as it would tend in many instances to substitute a new and different contract for the one which was really agreed upon, to the prejudice, possibly, of one of the parties, is rejected." Greenleaf's Evidence, Section 275.

This is the rule in Pennsylvania, where this case originated. In another case the Court of Appeals said:

"It is almost always true that a written contract has been preceded by parol negotiations, and that the terms of the contract are thus agreed upon before they are reduced to writing. Of course, the parties may leave the transaction parol, and if they adopt this course the contract must be proved by oral testimony in the usual manner, but if they put the complete contract into writing afterward, they may not contradict or vary the writing, unless fraud, accident or mistake has supervened." (222 Federal 8731.)

In the present case the court said on the question of fraud that it was so indefinitely and inconsistently alleged that it doubted its sufficiency to sustain the defence offered or to serve as a basis for damages. In any event, the court said, the defendant was liable, at the latest on Dec. 31, 1920, for the purchase price of the steel, unless the custom as claimed was a valid defence.

The defendants charged that if the plaintiff had fulfilled its contract as regards the time for shipment, by a custom of the steel trade defendant would have received the advantage of the reduced price of steel on so much of its order as was undelivered at the time of said price reduction, and would have been entitled to a credit of $3,000 upon 300 tons of steel. But the court says that if the custom did exist it would not relieve the defendant from paying the contract price. Some time after the steel had been delivered and accepted by defendant the price fell.

The rule as to custom to give it the force of law is that it must be notorious, and have existed long enough to justify the inference that the parties had it in view in making their contract. Such custom must be certain and uniform and not loose and variable.

The court said the custom, if it did exist, could not aid the defendant, for the terms of the written contract

were clear and unambiguous, that the steel was to be shipped "at mills' convenience," and when so shipped defendant was to pay "$3.50 cwt. delivered."

Custom or usage in a trade may be resorted to in order to make definite what is uncertain, clear up what is doubtful, or annex incidents, but not to vary or contradict the terms of a contract. (25 Sup. Ct. 202.)

Revelation of Trade Secrets

Defendant Must Disclose Processes, So That the Truth May Be Known

In an earlier decision, but recently reported, the federal District Court through Judge Learned Hand held that a plaintiff in a suit for infringement of a patent may require the revelation of trade secrets of defendant in order to ascertain whether there has been infringement. It appears the decision has not been appealed.

The suit was for infringement of a patented process brought by the Grasselli Chemical Co. against the National Aniline & Chemical Co., 282 Federal 381, and the defendant sought to avoid answering certain interrogatories propounded to it by the plaintiff. Since the suit was for treble damages, the defendant claimed the privilege to refuse to answer the interrogatories, but as the defendant was a corporation, it could not claim such privilege. Again it denied infringement in its answer in the case and the court held that this denial, making up the issue in the case, must be a full and complete answer. Interrogatories as here under consideration are a substitute for a bill of discovery in favor of the plaintiff whereunder the latter would have been entitled to discovery as to whether the defendant practiced the invention. That being a part of plaintiff's case, the court said it was entitled to have an answer to the interrogatories which were equivalent to the discovery.

Now to establish its case of infringement the plaintiff must prove that the defendant was practicing a process made up of several elements. It would be no evidence of that fact, says the court, to procure an admission that it has practiced a process made up of some of these elements, because that would not be the same process. But it would be material evidence to procure an admission that in its process the defendant used certain of those elements. The evidence might turn out to be insufficient, but that does not make it immaterial because it may fail completely to establish the plaintiff's case, says the court.

Truth Must Prevail, Says Court

In addition the defendant urged that it should not be required to disclose its secret processes. On this question the court points that the "situation is difficult, on the one hand to secure the plaintiff's right to get relevant evidence, and on the other, to protect the defendant from disclosing secrets which are not material. In the end the right of the plaintiff to bring out the truth must prevail, in so far as the inquiry is honestly limited to the actual issue of infringement."

In this case the court says that at the hearing the questions could be asked and the defendant would be obliged to answer them, and hence they could be asked by interrogatories in advance. The result may be to compel the defendant to disclose how far it goes in the process, though it does not use the process as a whole, and that might damage the plaintiff, says the court. This, however, is an inevitable incident to any inquiry in such a case; for if the defendant may not be made to answer, the plaintiff is deprived of its right to learn whether the defendant has done it a wrong.

An earlier case was cited as holding that a defendant may refuse to answer a revelant interrogatory because it would disclose a trade secret, but Judge Hand would not so interpret the ruling.

Infringement of Patented Article

Where Such Merchandise Is Not Marked, Notice of Infringement Is Prerequisite to Recovery of Damages

What notice the records of the Patent Office gives to the world is involved in an infringement suit brought by the Flat Slab Patents Co. against the Northwestern Glass Co. to recover damages for the infringement of patent 698,542, issued, April 29, 1902, to Orlando W. Norcross for improvements in "flooring for buildings." 281 Federal 53.

Section 4,900 of the Revised Statutes of the United States provides that a patentee must mark articles manufactured and sold as patented and that no damages shall be recovered for infringement except on proof that the defendant was duly notified of the infringement. Therefore where articles sold were not so marked or labeled, the court held that a notice of infringement was a prerequisite to recovery of damages, even though the patentee did not manufacture or sell the patented article and only granted licenses to others to engage in such manufacture.

Plaintiff contended that as it had never been engaged in manufacturing or selling the patented article it was not barred from recovery of damages under the statute. The court answers this by saying that it is true that under the law a patentee is not obliged to manufacture and sell the patented device. But the reason for giving some kind of notice to the alleged infringer would be as great or greater where the patented product was not manufactured or sold by the patentee as where it is. And the court held the requirement of notice was not limited here.

Patent Office Record Not Sufficient Notice

Counsel for plaintiff contended that the record of the Patent Office was sufficient notice of plaintiff's patent. The court said, however, that if the patentee was within the statute for giving notice he must give the notice the statute requires, and may not excuse himself by claiming that the record in the Patent Office was sufficient notice.

The case of the U. S. Mitis Co. vs. Carnegie Steel Co., 89 Fed. 206, and a number of other cases were cited in support of the proposition that when none of the patented devices have been made and sold, or where the patent is exclusively for a process, the section of the statute requiring notice does not apply. In the Carnegie Steel case the court there decided the section of law as to notice was not applicable where the patent in suit was exclusively for a process. But it was here pointed out that it was charged and not denied that the infringement was "after full notice" of the plaintiff's rights under his patent. This case is no authority that the statute does not apply where the patentee does not vend or sell. The court was not satisfied that any of the cases was an authority, and controlling, and therefore it thought that, after examining the statute, sound reason required applying the statute in this case.

Machinery and Appliances for Production and Control

Equipment News

From Maker and User

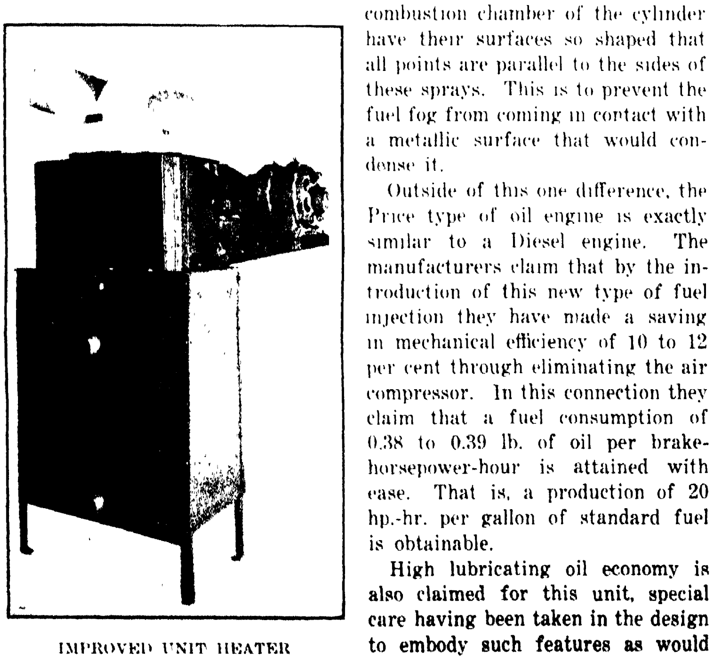
Materials and Accessories for Chemical Industries

Unit Heater for Industrial Plants

The York Heating & Ventilating Corporation, of Bridgeport, Pa., has recently placed on the market a unit heater which it recommends for industrial heating and ventilating purposes.

The makers of this equipment claim for it several advantages that have not been embodied in previous units of this type. In the first place the heating coil is made of the best grade of pipe with all joints at both headers welded and the whole is tested to a pressure of over 200 lb. per sq.in. This permits the unit to be used with either high- or low-pressure steam as desired. Another distinctive feature is claimed in the air-circulating fan. This fan has been provided with ball bearings so as to insure quiet and vibration free operation. In the accompanying photograph is shown this unit provided with a bracket on one side upon which the motor is mounted and direct connected to the circulating fan.

This heater is provided with a discharge outlet at the top which will direct the air in one, two, three or four directions as desired. The air inlet at the bottom takes the air from all four sides, thus having a low velocity of entrance and insuring the removal of the cold air from the floor, where it naturally settles. These units are supplied from a capacity of 346,000 B.t.u. per hour and a circulation of 3,870 cu.ft. of air per minute up to a maximum capacity of 1,850,000 B.t.u. per hour, and 9,820 cu.ft. of air per minute.



IMPROVED UNIT HEATER

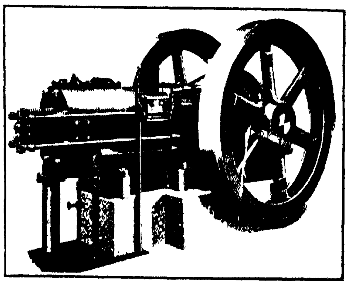
Horizontal Oil Engine

The Ingersoll-Rand Co., 11 Broadway, New York City, has placed on the market a horizontal oil engine for which are claimed numerous advantages.

This engine has as its distinguishing feature the employment of the Price system of fuel injection. In this system the oil is pumped by an ordinary pump into the cylinder through two spray nozzles, the sprays of which impinge one upon the other. The manufacturer lays stress on the fact that the head and combustion chamber of the cylinder have their surfaces so shaped that all points are parallel to the sides of these sprays. This is to prevent the fuel fog from coming in contact with a metallic surface that would condense it.

Outside of this one difference, the Price type of oil engine is exactly similar to a Diesel engine. The manufacturers claim that by the introduction of this new type of fuel injection they have made a saving in mechanical efficiency of 10 to 12 per cent through eliminating the air compressor. In this connection they claim that a fuel consumption of 0.38 to 0.39 lb. of oil per brake-horsepower-hour is attained with ease. That is, a production of 20 hp.-hr. per gallon of standard fuel is obtainable.

High lubricating oil economy is also claimed for this unit, special care having been taken in the design to embody such features as would count for a saving in lubricating oil. In connection with this effort, a cast-iron case has been used for covering the moving parts, such as the crank, rather than a sheet-iron case, because it is found that this



HORIZONTAL OIL ENGINE

effects a saving in lubricating oil, as it has no vibration to cause splashing. The manufacturers claim a delivery of 4,000 hp.-hr. for each gallon of lubricating oil used. The accompanying photograph shows this new horizontal oil engine.

Rubber-Lined Acid Tank

For the definite purpose of storing hydrochloric acid, the Hauser-Stander Tank Co., of Cincinnati, Ohio, has had on the market for some time a rubber-lined storage tank.

These tanks are especially made for lining with rubber, having fillets and wearing pieces so placed that the rubber lining is subjected to the least possible wear. The lining itself is made of pure rubber from $\frac{3}{32}$ to $\frac{3}{16}$ in. thick and is cemented to the wooden tank by a special process. The cover is either lined with rubber or coated with special pitch paint.

The tank is provided with a Duriron or hard rubber pipe and plugcock outlet. Other equipment of hard rubber or Duriron, such as pumps, piping, etc., can be used in connection with this equipment as desired. The manufacturer states that the system of storing hydrochloric acid in rubber-lined tanks shows an appreciable saving over any other method such as storage in carboys.

The Arca Regulator

The Arca Regulator is manufactured by the Aktiebolaget Arca Regulatorer of Stockholm, Sweden, and by British Arca Regulators, Ltd., of London, England. This device, which is the invention of Mr. Ragnar Carlstedt, is for the purpose of regulating apparatus in which variations of temperature, pressure, voltage, humidity, steam, density or other physical quantity occurs. It is in use for the purpose of regulating numerous types of equipment where sensitive and accurate regulation is required.

The principle of operation is as follows: The main features of the device are a pilot valve and a relay operated by a low hydraulic pressure. The variation in the physical quantity which is to be regulated acts on the relay. This relay controls the pilot valve, which in turn, through the amount of water which it allows to flow past, operates the mechanism which actually controls the equipment which it is desired to regulate.

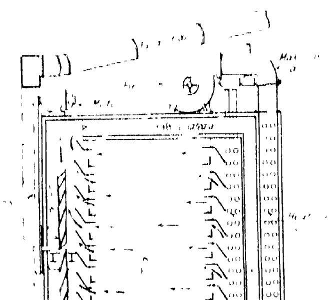
The relay consists essentially of a lever pivoted on one end and having the other end so located that it governs the opening of a jet of water which reaches the relay from the pilot valve. The position of this lever, and hence the amount of water flowing through the jet, is controlled by some such element as a copper bellows for pressure regulation, an ebonite strip for temperature regulation and other appropriate devices depending on the type of physical quantity to be controlled.

The amount of water which flows in the jet controls—through a diaphragm and spring—the position of the pilot valve. This pilot valve will in turn govern the amount of water which flows to the regulating device as against that which is allowed to flow to waste and hence governs the action of this regulating device. The regulating device is generally a hydraulic cylinder. The amount of water used is small and in most cases city pressure will suffice to actuate the regulator.

Up to the present time the installations of this apparatus have all been in Europe. The majority of these have been for the purpose of controlling steam or gas pressure. Others have been used for the control of the temperature of heat-treating furnaces. Among the most interesting applications have been one for controlling the position of the electrodes for an electric furnace, and one for controlling the flow of pulp in a paper machine.

Judelson Drier

Within the past decade great advances have been made in constructing shelf driers. In the old type of drier a material was frequently "casehardened," or in other words, the outside surface was dried rapidly and formed a crust, leaving the inside still wet. To overcome this a number of different designs were placed on the market using slightly moist air rather than absolutely dry air. The drying was thus effected more evenly and no casehardening resulted. One rather serious difficulty with many of the designs was the uneven drying of the various trays in the drier. In other words, the air would pass more effectively over one tray than another.



THE JUDELSON DRIER

To avoid this the Judelson drier, manufactured by the Domestic Laundry Equipment Corporation, places the trays in such a manner as to obtain an even distribution of the drying air. This will be seen by referring to the sketch, which shows the trays fairly wide apart at the top of the drier and increasingly close together toward the bottom.

The air comes into the system through the fan at the top and is forced down over steam coils at the right-hand side of the apparatus. At the bottom of the chamber it blows underneath a baffle plate and meets the return air, which has been recirculated. This mixture is the drying medium and is distributed through the drying trays by means of angle-iron deflectors. At the other side of the apparatus a large fan sucks the air through the trays and forces it partly through the return pipes, which pass just under the top of the drier and partly out through the exhaust pipe, shown in the photograph. A damper in the effluent pipe regulates the amount of air which is returned to the system and thus it is easy to obtain air of any degree of humidity or saturation for drying. Substantial proof that the distribution of drying air is fairly even is obtained by reading the two thermometers in the door of the drying chamber. Both the one at the top and the one at the bottom check during the drying of a given material. The equipment in addition embodies all the usual features of a drier, being insulated, substantially built, easy to control and cheap in operation.

Catalogs Received

KANSAS CITY OXYGEN GAS CO., Kansas City Mo. Catalogs 10 and 11. Catalog 10 describes equipment for doctors hospitals and laboratories for the use of nitrous oxide, oxygen, hydrogen and carbon dioxide. Catalog 11 describes apparatus and other specialties used in connection with oxy-welding and cutting.

GENERAL ELECTRIC CO. Schenectady, N. Y. Bulletin 41,316 describing synchronous motor drive for ammonia compressors, and Bulletin 46,053, describing a portable timing device which is used to supplant the stop watch in connection with timing instruments and other appliances.

DE LAVAL STEAM TURBINE CO., Trenton, N. J. Publications E1051, E1052 and E1053. E1051 describes the use of De Laval equipment in the textile dyeing and finishing plant of the United States Finishing Co at Norwich Conn. Bulletin E1052 describes an installation of De Laval steam turbine equipment in a byproduct coke plant of the New England Fuel & Transportation Co. at Everett, Mass. Bulletin E1053 describes the use of De Laval centrifugal pumps in an irrigation project in California.

AJAX ELECTROTHERMIC CORP. Trenton, N. J.—Bulletin 2—Describes the Ajax-Northrup 15-kva converter and small furnace for temperatures up to 2,000 C., which is used for electric furnace work in the laboratory.

GRAVER CORP., East Chicago, Ind. Bulletin 509, Feb. 1, 1923. A new issue of the Graver Corporation's bulletin on Zeolite Water Softening.

SULLIVAN MACHINERY CO., Chicago, Ill.—Circular 72-G. A handbook on rock drill steel, treating of its selection, heating, forging and tempering. This catalog also contains instructions for the care and use of drill sharpeners and drill steel furnaces.

SPEERE ENGINEERING CO., Detroit, Mich. -Pamphlet 211. A leaflet covering the Speere design of the Doherty direct condensation apparatus for water gas, known as the Doherty washer-cooler.

WESTINGHOUSE ELECTRIC & MFG. CO., East Pittsburgh, Pa.—Several new leaflets as follows: No. 1611, describing Type AF automatic auto-starters for polyphase squirrel cage induction motors. No. 1161-A, describing large squirrel cage induction motors of Type CF. No. 1765, describing motors for Westinghouse-Baldwin mine locomotives, series 900. No. 2390-A, describing Type E engine-driven alternating current generators. No. 3400, describing Type F-10 oil circuit breakers. No. 3499-A, describing Type CF control switches.

SCHUTTE-KOERTING CO., Philadelphia, Pa.—Bulletin 4-C, describing the Koerting venturi stack draft system. Bulletin 7-C, describing the Koerting centrifugal acid pump. Bulletin 17-A, describing the Koerting gear pump for viscous liquids.

SWENSON EVAPORATOR CO., Harvey, Ill.—Bulletin P-123. A new bulletin describing the Swenson reclaiming machinery for soda or sulphate processes, for use in pulp and paper mills.

Synopsis of Recent Literature

Elastic Limits of Fatigued Steel

Leonard Bairstow read a paper before the Royal Society of England (*Philosophical Transactions*, vol. 210A, p. 35) on "Elastic Limits of Iron and Steel Under Cyclical Variations of Stress," in which he described a series of experiments on an "axle steel" containing C 0.35 per cent, Mn 0.75, and with yield point 56,000 lb. per sq.in., maximum strength 85,500 and elongation in 2 in. 33.5 per cent. Similar experiments gave consistent results on a harder bessemer steel and Swedish iron. His tests were made on small tensile specimens mounted in a single-lever tension machine, so arranged that stresses could be alternated leisurely and automatically. A delicate optical extensometer measured the changes in length during the operation of the machine, studies being taken at intervals after the specimen had adjusted itself to conditions.

First tests on the axle steel were made with the stresses alternating between a stress of 31,600 lb. per sq.in. in tension and the same amount in compression. For several thousand repetitions of stress the steel was truly elastic—i.e., a stress-strain curve was a straight line going through the origin. As the test progressed, however, a slight hysteresis loop showed up in the stress-strain curve even when working between the same limits—that is, the line representing conditions during loading bent slightly, then as the load was released the specimen recovered in an elastic manner and drew a straight line. Conditions were exactly opposite during the compression cycle. The total stress-strain curve therefore appeared as a loop, the width of which represented the permanent set caused by one repetition of the load. After 19,000 repetitions of ±31,600 this "cyclical permanent set" measured by the width of the hysteresis loop equaled 11 per cent of the original elastic change. This loop, however, is fairly narrow compared with others obtained on heavier loading, and the author thinks that if the load alternated between 29,000 lb. per sq.in. in tension and 29,000 lb. per sq.in. in compression, the specimen would act in a truly elastic manner. In other words, the "superior" elastic limit of the original bar as determined by alternating load is 29,000 lb. per sq.in. in tension; the "inferior" elastic limit is 29,000 lb. per sq.in. in compression and the elastic range for symmetrical load is 58,000 lb. per sq.in.

After 19,000 repetitions the load was changed to 33,500 lb. per sq.in. in tension and compression. The narrow hysteresis loop immediately widened and gradually attained a certain width. Increasing the number of repetitions does not seem to change this, except that for very heavy loads it actually seems to decrease somewhat from the width assumed just after readjustment to the increased load. In other words, the specimen has apparently a "self-healing" property.

Loads were increased by steps, after the previous set of conditions seemed to be stationary. As the hysteresis loops widened, they continually showed the same nature; the curve on loading, either in tension or compression, is inelastic, but the specimen recovers in a truly elastic manner. Just before the specimen broke the extensometer was working perfectly and measuring distances equal to 1/100,000 of the length of the specimen. Therefore, the damage which is done by fatigue stresses is extremely localized. "It would appear that individual slips in the crystalline grains cannot have increased their extent prior to failure due to repetition."

To study the effect of unequal stresses, a first series fixed the maximum at 41,000 lb. in tension. The range of stress was increased by reducing the minimum stress, starting first at 18,500 lb. per sq.in. in compression. As this loading was repeated the stress-strain curve (which originally was truly elastic) gradually developed a hysteresis loop, and after 27,000 cycles, the width of this loop remained constant. On relieving the load, the specimen was found to have acquired a permanent extension, even though the maximum stress, 41,000 lb. per sq.in., is considerably below the yield point (56,000). As the loading continued this permanent extension increased at a very small but steady rate. Increasing the stress range by changing the compression stress to 21,800 lb. per sq.in. immediately increased the width of the hysteresis loop. No sudden increase in the permanent extension occurred, but it increased at a more rapid rate. In other words, if the permanent extension were plotted against the number of repetitions, it drew a straight line sloping upward at a slight angle. Every increase in the range of load was characterized by an angle in this line—the slope became steeper. The shape of the hysteresis loop remained exactly similar to that observed during symmetrical loading—i.e., the metal was plastic during half its loaded cycle, and perfectly elastic during the first half of the unloading cycle. The stress-strain curve is symmetrical about the average stress rather than about the zero load.

A second series of experiments with unequal stresses was then made with the superior stress at 52,000 lb. per sq.in. (still below the yield point) and the inferior stress at zero. The steel acted in a perfectly elastic manner until 2,000 repetitions had passed, then a rapid permanent extension occurred; simultaneously a hysteresis loop developed to measurable quantity, but remained stationary in width from 8,000 to 15,000 cycles. During this time the permanent extension remained nearly constant. The author thinks that a slightly lower range would have stabilized both these conditions and the steel would have been stable, even though a slight hysteresis loop would have been observed. This might have remained temporarily, but "there is every reason to believe that it would have disappeared by recovery if sufficient time were allowed. An extension of 0.2 mm. would have been produced in the process of raising the superior elastic limit from 29,000 to 51,500."

Other tests were made, one series starting with a maximum of 63,700 lb. per sq.in. in tension and an inferior stress of 17,000 in tension. Since the superior stress is above the yield point, a permanent extension occurred at the first load, but did not progress. A very narrow hysteresis loop was observed, gradually growing narrower.

Important Articles In Current Literature

More than fifty industrial, technical or scientific periodicals and trade papers are reviewed regularly by the staff of *Chem & Met.* The articles listed below have been selected from those publications because they represent the most conspicuous themes in contemporary literature, and consequently should be of considerable interest to our readers. Those that are of unusual interest will be published later in abstract in this department, but since it is frequently impossible to prepare a satisfactory abstract of an article, this list will enable our readers to keep abreast of current literature and direct their reading to advantage. The magazines reviewed have all been received within a fortnight of our publication date.

THE USE OF BREATHING APPLIANCES IN CHEMICAL WORKS. Leonard Levy. *Chemical Age* (London), April 7, 1923, pp. 362-3.

THE CENTENARY OF THE ALKALI INDUSTRY IN ENGLAND. (To be cont'd.) Anon. *Chemistry & Industry*, April 20, 1923, pp 383-6

Other tests starting with a superior load of 77,000 lb. per sq.in. in tension and an inferior load of 42,500 lb. in tension acted in the same way. In this series the hysteresis loop gradually decreased in width and finally traced a straight line. Increasing the range by decreasing the lower limit to 34,000 lb. per sq.in. in tension did not change these conditions. Further decrease, however, immediately increased the hysteresis loop and caused the permanent extension to increase. However, the loop was very narrow even later when the extension was increasing rapidly to failure.

In general, it was found that the hysteresis loops were similar for all fatigue stresses: they contain evidence of elastic recovery for one-half the cycle. The width is greatest at equal and opposite stresses, decreasing in width as the load is unbalanced. It is probably zero at the limit. Permanent extension due to a superior load above the elastic limit rapidly grows when the piece nears failure. At the beginning of a test a large permanent extension may occur on the first overload, but if the stresses are not excessive remain stationary as the hysteresis loop approaches zero. In these circumstances the author thinks that the specimen may be safe—that is, acting in a truly elastic manner—even though at first it appears to have a cyclic permanent set. An experiment illustrative of this point is on a bar of Swedish iron which was strained between 20,000 lb. per sq.in. in tension to 18,500 lb. per sq.in. in compression. It acted in an elastic manner to 100,000 repetitions, and suddenly developed a hysteresis loop, which remained constant, even up to 1,000,000 repetitions. The specimen was unbroken, and was laid aside for months, after which it was tested again in a similar manner. Its elasticity was completely restored. Therefore the author is of the opinion that the appearance of a narrow hysteresis loop is not necessarily a sign that failure impends.

The accompanying table contains approximate data on the elastic ranges under these cyclic tests. If the range of stress is plotted against the minimum (inferior) stress the curve shown in Fig. 8 of Prof. Jenkin's article on p. 813 of this issue may be had.

ELASTIC RANGE OF AXLE STEEL UNDER STRESS

Superior Stress	Inferior Stress	Range Lb./Sq. In.
+29,000	—29,000	58,000
+39,000	—17,000	56,000
+52,000	0 0	52,000
+63,000	+18,000	45,000
+76,000	+34,000	42,000

If this steel is tested in a tension machine in the ordinary way, it acts in an elastic manner and acquires no permanent set up to 56,000 lb., whereupon the yield point occurs and a rapid permanent stretch occurs. However, **the above-described experiments show that an unbalanced cyclic load with a maximum *less* than the yield point will develop a gradual permanent extension. This occurs at any load below the yield point and above 29,000 lb. per sq.in. The latter figure might be called the "natural" elastic limit.** "Below the static yield point, iron and steel appear to be capable of maintaining an unstable condition for a considerable time against cyclical variations of stress which ultimately produce a considerable change of length. Bauschinger's 'primitive' and 'natural' elastic limits really state that ordinary extensometers are not sufficiently sensitive to detect the first signs of want of elasticity, and that fatigue increases these signs to recognizable magnitude."

Bairstow then goes on to compare the elastic ranges which he determined by the same methods described above for Swedish iron, axle steel and hard bessemer steel with similar materials actually tested in fatigue under unbalanced stresses by Wöhler. These curves are reproduced as Fig. 8 of Prof. Jenkin's paper, p. 813 of this issue. The agreement is so very good that the author believes it establishes the identity between elastic range and safe fatigue range. He, therefore, restates Bauschinger's theorem as follows: "The superior limit of elasticity can be raised or lowered by cyclical variations of stress and at the same time, the inferior limit of elasticity will be raised or lowered by a definite, but not necessarily the same, amount. The range of stress between the two elastic limits has, therefore, a value which depends only on the material and the stress at the inferior limit of elasticity. This elastic range of stress is the same in magnitude as the maximum range of stress which can be repeatedly applied to a bar without causing fracture, no matter how great the number of repetitions."

Can Gasoline Be Made From Animal and Vegetable Oils?*

The motor fuel problem in France is a peculiar one and its solution would justify unusual methods. The fact that France is dependent upon foreign sources of supply for petroleum has led to an intensive investigation of various substitutes for mineral oils. Most of the attempts to solve the motor fuel problem have turned around alcohol, naphthalene and various other substitutes that have been tried in other countries with varying degrees of success. There is one raw material, however, which France seems to possess in an almost inexhaustible supply, that has only recently been considered in connection with the possibilities of developing a gasoline substitute. The crude vegetable oils that the French colonies are able to produce in almost **unlimited quantities have previously** been used solely as food products or in the manufacture of soap, paint, etc. They have never been used for combustion, except in certain special Diesel engines and then only on a small or experimental scale.

*An abstract of a paper by Prof. A. Mailhe of Toulouse, France presented at the International Congress of Liquid Fuels in Paris, France, October, 1922, and appearing in *Chimie et Industrie*, February, 1923. Translated by Joseph F. Shadgen, Consulting Engineer, New York City.

The work of Professor Mailhe, **an associate** of Sabatier at Toulouse, **has** demonstrated **that by a catalytic dehydration** these oils **may be disintegrated** to yield water, **acrolein, combustible** gases and **low-boiling liquids.** The catalyzers used were **magnesium** oxide, kaolin and alumina. **This process** is then followed by **hydrogenation,** using metallic copper, preferably **electrolytic,** as a catalyst. **Its action is** less pronounced than that of **nickel and** iron, and therefore it causes **less carbon** to be deposited. **To prepare the** catalyst equal parts of powdered **copper** and magnesium oxide are **mixed, using** glue or starch as a binder. **Small balls** made from this mixture **are air-dried** and introduced into a copper **tube 1⅛ in.** in diameter, 40 in. long **and heated to** 500 deg. C. by a row of **bunsen burners.** The temperature should never **exceed** 650 deg. C. The oil is **introduced at** one end of the tube, where **its input is** regulated by a needle valve. **The incoming** oil vaporizes **immediately and** after the vapors pass over **the catalyzer** they leave the tube to enter **refrigerating** coils and absorption **apparatus.**

DECOMPOSING LINSEED OIL

With this simple equipment **Professor** Mailhe studied the **decomposition** of linseed, palm, whale, fish, **coconut** and cottonseed oils. Linseed oil **produced** an abundant supply **of gas and** considerable quantities **of low-boiling** liquids. The composition **of the gases** so obtained was CO_2 6 **per cent, CO** 9 per cent, C_nH_{2n} 54 **per cent,** C_nH_{2n} + H 31 per cent. **The liquid** products were **of mahogany color with** a strong odor and **acid reaction. On** redistillation they were **split up into** three fractions distilling **below 40 deg.** C., between 50 and 150 deg. C. **(density** 0.76) and between 150 and 230 **deg. C.** (density 0.86). **The residue was re**treated in the catalyzer. **Washing the** direct acid condensate **with diluted soda** solution changed the **color to a light** yellow. **Analysis showed the presence** of hydrocarbons almost **exclusively and** the liquid resembled **cracked gasoline** in appearance **and in properties when** used in internal combustion **motors.**

When submitted to **further hydrogenation** in the presence **of metallic** nickel at about 180 deg. C., **a water-white** liquid was produced **which had** no disagreeable odor **and made up** almost entirely **saturated compounds.**

A study of the composition **of the** original condensates **showed that they** consisted of complex **mixtures of paraffine,** aromatic and **cyclo-paraffine** hydrocarbon.

Numerous tests were **made by Professor** Mailhe on samples **of other oils** of animal or **vegetable origin and of** various **fatty acids and their glycerides.** All **were found to yield the same or** similar results as **those previously described** for linseed oil.

In general it may be said that the process consists of two steps as follows: (1) Rupture of the complex glyceride and the elimination of the oxygen in the form of water, acrolein, CO and CO_2. Excess acids are neutral-

ized with soda to give a product resembling unrefined cracked gasoline. (2) Transformation of that liquid into a water-white saturated gasoline or kerosene by the catalytic hydrogenation in the presence of metallic nickel. Either water gas or pure hydrogen can be used in the hydrogenation.

If desired, the oils may first be saponified to yield glycerine. The remaining fatty acid may then be put through this process to yield first a rich gas of exceptionally high heat value, and second a mixture of liquid hydrocarbons which boil somewhat below 250 deg. C.

Laboratory tests indicate that on the average a ton of crude oil will yield 10,500 to 11,500 cu.ft. of gas and 650 to 750 lb. of motor fuel. It is evident, of course, that at the present value of vegetable or animal raw materials it is extremely impractical. Its only value lies in the possibility of developing the almost inexhaustible resources of the tropics on a scale such as has been approached by systematic plantation of rubber and other colonial products. If the deposits of mineral oil are ever exhausted it may be that such a process as this will provide our future motor fuel.

Review of Recent Patents

Dehydrating Chlorhydrin Solutions—Ethylene and propylene chlorhydrins, when in very concentrated or anhydrous form, are excellent solvents for natural and synthetic resins, particularly copals, for fatty oils, and for use in varnishes, cellulose ester solutions and lacquers. Small amounts of water seriously interfere with these applications. For example, ethylene and propylene chlorhydrins containing 8 per cent of water will only partly dissolve copals. Concentration of dilute chlorhydrin solutions by fractional distillation is difficult, since constant boiling mixtures are formed. Benjamin T. Brooks, of Bayside, N. Y., has found, however, that saturation of the fractions with an inert salt improves the separation, the method being as follows:

A 5 per cent aqueous solution containing ethylene and propylene chlorhydrins is distilled through an efficient fractionating column until about 40 per cent of the solution has been distilled. The distillate is saturated with common salt and distilled again and the second distillate thus obtained is saturated with common salt. The aqueous saline solution is separated from the oily chlorhydrin layer and returned to the still for reconcentration. The oily chlorhydrin layer is treated with an equal volume of benzene and the aqueous layer thus formed is separated and also returned to the still. The benzene solution is distilled, thus recovering the benzene, and the fraction boiling from 126 to 134 deg. C. is collected as anhydrous chlorhydrins. As thus prepared the chlorhydrins are excellent solvents for copals and cellulose esters and may be incorporated in other solvent mixtures in which aqueous chlorhydrin mixtures could not be used. (1,446,874. Assigned to Chadeloid Chemical Co. Feb. 27, 1923.)

increasing cur-
temper-

Standard cells are used, such as that covered by United States patent 1,269,-566 to MacDougall and Middleton. The improved method of manufacture depends upon the fact that relationship of space between electrodes to temperature has been found to exist. If the **electrodes are spaced under ¼ and over ⅛ in. and if diaphragms of asbestos cloth are used, the current density and consequently the temperature may be increased. The current density may be raised from 0.25 ampere per square inch, which has been the maximum density obtainable in the past, to from 1.5 to 3 amperes per square inch. A temperature of 90 to 95 deg. is employed and an aqueous electrolyte consisting of 17 per cent caustic soda is used. The voltage required when operating at a density of 3 amperes per square inch and a temperature of 95 deg. is approximately 2.5.** To facilitate the removal of the gases evolved at the electrodes, porous material, the composition of which is not specified, is used in making these. (1,446,736. Feb. 27, 1923.)

Preparation of Solid Preservative Substance for Rubber Latex—The preservative used in transporting rubber latex, which is alkalized phenol, may be obtained by a method patented by S. C. Davidson, deceased, of Belfast, Ireland. Since the transportation of this alkalized phenol in fluid-tight metal

American Patents Issued April 24, 1923

The following numbers have been selected from the latest available issue of the *Official Gazette* of the United States Patent Office because they appear to have pertinent interest for *Chem. & Met.* readers. They will be studied later by *Chem. & Met.'s* staff, and those which, in our judgment, are most worthy will be published in abstract. It is recognized that we cannot always anticipate our readers' interests and accordingly this advance list is published for the benefit of those who may not care to await our judgment and synopsis.

1,452,520—Process for Carrying Out Continuous Fusions. W. O. Mitscherling, Wilmington, Del., assignor to Atlas Powder Co., Wilmington, Del.

1,452,553—Dechlorinated Chlorinated Glycerides and Derivatives Therefrom. H. A. Gardner, Washington, D. C.

1,452,573—Electrodeposition of Tin. L. D. Simpkins, Brooklyn, N. Y., assignor to National Lead Co., New York City.

1,452,589—Electrolytic Cell—D. A. Brading, Chicago, Ill.

1,452,594—Thermally Insulated Apparatus and Method of Insulating the Same. G. Claude, Paris, France, assignor to Société l'Air Liquide Société Anonyme pour l'Étude des Procédés Georges Claude, Paris, France.

1,452,605—Arsenical Compound. L. M. Hussey, Philadelphia, Pa., assignor to J. F. Hamner, Philadelphia.

1,452,617—Process of and Apparatus for Distilling Liquids. W. E. Sanger, New York City, assignor to William Gartigue & Co., New York City.

1,452,662—Method of Recovering Zinc From Lead Zinc Ore. R. V. Smith, Eureka, Utah.

1,452,739—Decolorizing and Purification of Saccharine Materials. J. J. Hood, P. G. Clark of London and John Clark of Hutton, England.

1,452,750—Readily Fusible Alloy. A. D. Mulligan, London, England.

1,452,774—Intermediates and Dyestuffs of the Anthraquinone Series. F. W. Atack, Manchester, England, and C. W. Soutar, St. Andrews, Scotland.

1,452,778—Process and Apparatus for the Recovery of the Vapors of Volatile Liquids From Aeriform Mixtures. E. A. Barbet, Paris, France.

1,452,805—Dyestuffs Containing Sul- and Dyeing Vegetable Fibers With- a Mordant and Process of Making ort, and H. Balhorn, Hochst, Germany, assignors to Leopold Cassella & Co., a corporation of Germany.

1,452,813—Method of Decomposing Mixed Metal Salt Solutions. H. Pauling, Berlin, Germany.

1,452,815—Process of and Apparatus for Grading Solid Materials. C. I. Reed, Glenside, Pa.

1,452,898—Process of Treating Rock Asphalt. J. B. Smyth, Beaumont, Tex.

1,452,928—Drying Kiln. E. F. Perkins, Chicago, Ill.

1,452,931—Zinc Smelting Furnace. B. Raeder, Kykkelsrud, Norway, assignor to himself and to A. Zink, both of Kykkelsrud.

1,452,966—Agitator. C. Field, Yonkers, N. Y., assignor to Chemical Machinery Corp., New York City.

1,452,971—Carboy. F. E. Hodes, Denver, Colo.

1,453,021—Preparation for Dyeing Furs, Hairs and the Like. P. Onnertz, Berlin, Germany, assignor to Actien Gesellschaft für Anilin Fabrikation, Berlin, Germany.

1,453,037—Apparatus for the Treatment of Naturally Occurring Hydrocarbon-Containing Materials. C. P. Bowie, Berkeley, Calif., and M. J. Gavin, Boulder, Colo.

1,453,060—Conversion of Ammonia Into Ammonium Chloride. C. Bosch and C. Kircher, Ludwigshafen, and E. Dehnal, Rossen, assignors to Badische Anilin & Soda Fabrik, Ludwigshafen, Germany.

1,453,113—Drying Cylinder. E. Hutchins, New York City, assignor to International Paper Co., Inc., of New York.

1,453,132—Process for the Recovery of Pure Alkalis From Impure Lyes. K. Heinemann, Heidenau, Germany.

1,453,210—Process for Purifying the Residue Obtained in Producing Ammonia From Cyanide. C. T. Thorssell, and L. R. Lunden, Gottenberg, Sweden, assignors to Aktiebolaget Kvafveindustri, Gottenberg.

1,453,215—Method of Volatilizing, Distilling, or Separating Absorbed Vapors. C. L. Voress, New City and V. C. Cantor, Bradford, Pa., assignors to Gasoline Recovery Corp., of Delaware.

1,453,254—Alloy and Process of Making Same. A. B. Norton, Cleveland, Ohio, assignor to Aluminum Manufacturers, Inc., Cleveland, Ohio.

Complete specifications of any United States patent may be obtained by remitting 10c. to the Commissioner of Patents, Washington, D. C.

drums is very expensive, the solid form is desirable. In carrying out the proposed method of preparation, 2 parts by weight of phenol crystals are mixed with 1 part by weight of caustic soda in solid form. These ingredients are mixed or ground together in a warmed receptacle for a few minutes, during which time the mixture becomes semi-fluid. Gradually it assumes the condition of a fine white powder. Under pressure, this powder may be pressed into solid blocks. These blocks may be readily transported in lead-lined wooden boxes out of contact with the air. (1,447,930. March 6, 1923.)

Smokeless-Powder Dynamite—L. H. Jones of Kenvil, N. J., has assigned to the Hercules Powder Co., of Wilmington, Del., the following patent covering the production of smokeless powder dynamite. Ordinary smokeless gunpowder is utilized in admixture with either sodium nitrate or ammonium nitrate, chalk, nitro-glycerine and water. Wood pulp and corn meal may also be used to give bulk, while at the same time a certain amount of the smokeless powder may be replaced by trinitrotoluol. The moisture content of the materials going into the explosive must be less than 2½ per cent and, better, not over 1 per cent. The nitroglycerine is primarily included for the purpose of agglutinating any smokeless powder and nitrate dust that may be present and thus insure against premature explosion, and at the same time assure regulatable detonation. The sensitiveness of the mixture is controlled by varying the relative amount of the nitrates employed and also by decreasing or increasing the amount of ammonium nitrate in comparison with the amount of smokeless powder. The resulting explosive is safe to use and to transport. It is dry, non-balling, non-freezable and may be readily loaded into cartridges or boreholes. (1,447,248. March 6, 1923.)

Composition of Matter for Use as a Roof Paint—To J. Gower and H. Wolfe, of Sparta, Ill., a patent has been granted for a roof paint the composition of which involves inexpensive materials and for which claims are made of great resistance to deterioration and the action of the elements. This material is impervious to the action of the sun's rays and also to moisture.

The recommended proportions are 1½ qt coal tar; 1½ qt. of melted rubber compound, and 1 qt. of varnish. These are mixed together thoroughly, the tar and rubber compound forming the body of the paint, while the varnish acts as a drier and renders the paint more elastic than would otherwise be the case. (1,447,208. March 6, 1923.)

Viscose Threads and Filaments—Unevenness in size of cellulose threads, filaments, etc., made from viscose, due to globule formation, can be overcome by a method patented by H. J. Hegan, of Coventry, England. In the usual process of fabrication the viscose is forced through an orifice into an acid bath containing only sulphuric acid, some sulphate and such compounds as glucose and zinc salt. During this process tendency for globules to form and pass on to the winding apparatus is common. By the addition of sodium oleate in the proportion of 2 parts to 10,000 of viscose this tendency may be overcome. The addition of the sodium oleate may be made during the manufacture of the viscose, but it is made preferably afterwards, or just previous to the time of thread and filament formation. (1,446,301. Feb. 20, 1923.)

Reduction of Nitro-Compounds—An improved method for the reduction of nitro-compounds to amino-compounds has been patented by D. A. Legg, of London, England. This is based mainly upon the use of an improved catalyst which consists of fused copper oxide prepared as indicated in British patent application 21,667. This is claimed to work with complete satisfaction under the conditions which must be met. Nitro-compounds in the vapor state in conjunction with such a reducing agent as hydrogen are passed over this catalyst at a temperature which may range from 180 to 300 deg. C. The nitro-compound reduced may also be mixed with water gas, other reducing gases, or with an alcohol that is capable of being dehydrogenated under the conditions as indicated suitable for the reduction of the nitro-compound.

The reduction of nitro-benzene to aniline is specifically covered in the patent. Nitro-toluenes can be reduced to toluidines in a similar manner. The catalyst used does not readily become inactivated and when it does it can be restored by superficial reoxidation by heating in air to a high temperature (1,447,557. March 6, 1923.)

Flattening Sheet Glass—Patents to I. W. Colburn, 1,248,809, dated Dec. 4, 1917, and 1,274,385, dated Aug. 6, 1918, cover an apparatus in which a sheet of glass is drawn upward from a bath of molten glass, bent into a horizontal plane, reheated, and then passed through a drawing mechanism which gives the required longitudinal pull to produce the continuous sheet of glass and at the same time flattens the reheated and softened sheet into its final form. This mechanism has been improved by Seth B. Henshaw, of Charleston, W. Va., through the addition to the draw bars of a series of worms which operate by means of rack and pinion drive to stretch the sheet laterally. The threads of the worms engage the softened thick edges of the sheet, with the result that there is a tendency to stretch the sheet laterally over the whole area engaged by the draw-bars and draw-table. This aids in obtaining a flatter sheet and also tends to draw out wrinkles and waves which may be present. (1,447,661; assigned to Libbey-Owens Sheet Glass Co. March 6, 1923.)

Drawing Sheets of Glass Simultaneously—In the application of Joseph P. Crowley, Serial No. 386,440, filed June 4, 1920, is disclosed a system of drawing sheet glass wherein a pair of sheets are drawn vertically from a bath of molten glass and, after becoming partially set so that they will not adhere to one another, are brought into contact and bent collectively about a single bending roller and then passed through a single drawing mechanism and into the leer. Such a system doubles the output of the sheet drawing apparatus and also has the advantage that a traveling surface of glass (the lower sheet) is interposed between the upper sheet of the pair and the operating portions of the drawing and bending devices so that nothing encounters this upper sheet to mar its surface.

The present invention is an addition to and improvement upon the sheet glass drawing system set forth in this Crowley application. In the present system the sheets are drawn as before in separable contact with one another, but as they enter the leer, mechanism is provided whereby the sheets are separated and conveyed individually through the leer, from which they emerge onto individual cutting tables. In this way both surfaces of each sheet are exposed throughout the travel of the sheet through the leer, thus obtaining more uniform and satisfactory annealing. Also since each sheet emerges separately onto its own cutting table the process of severing the respective sheets into suitable lights or sections is greatly facilitated. (1,447,654. Arthur E. Fowle, of Toledo, Ohio, assignor to the Libbey-Owens Sheet Glass Co. March 6, 1923.)

Sagger Construction—In the burning of ceramic wares, such as sanitary ware, the molded ware is often of large size and the strain put upon the saggers when several of these are superimposed in the kiln is very great. Consequently the life of these saggers is short, due to cracking, warping or settling in such a way as to cause the ware to deform and become ruined. Sometimes these saggers, which are usually made of burnt clay, last for only one run. Silicon carbide when made into refractory forms (see for example U. S. Pat. 1,042,844) has remarkable mechanical strength even at high temperature. At 1,350 deg. C. the modulus of rupture is approximately 2,200 lb. per sq.in., whereas the corresponding value for fireclay is only about 115 lb. per sq.in. Hence at kiln temperatures a silicon carbide refractory structural member has about nineteen times the resistance to cross breaking that is possessed by a fireclay refractory. For this reason, Frank J. Tone, of Niagara Falls, N. Y., proposes to use silicon carbide plates for reinforcing fireclay saggers. The plates may be of such size and shape as nearly to cover the inside bottom of the sagger, or they may be large enough to form a cover, thus supporting the entire bottom of the sagger above. In this way life of saggers has been prolonged to several hundred runs. (1,448,011. Assigned to the Carborundum Co. March 13, 1923.)

Men in the Profession

Dr. E. F. ARMSTRONG has been nominated to the presidency of the Society of Chemical Industry (London) for a second year of office.

ALBERT V. BLEININGER, ceramic engineer and chemist for the Homer Laughlin China Co., Newell, W. Va., gave an interesting address before the members of the Rotary Club, East Liverpool, Ohio, April 24, on "Manufacture of Optical Glass."

B. E. BROWN, of the Bureau of Plant Industry, Washington, recently visited Freehold and Hightstown, N. J., where he supervised the application of fertilizers in the co-operative experiments being conducted in that state.

R. R. CAMPBELL, vice-president of the American Writing Paper Co., Holyoke, Mass., in charge of production, has resigned.

Dr. G. H. A. CLOWES, chemical director, Eli Lilly & Co., Indianapolis, Ind., was the principal speaker at the meeting of the Indiana Section of the American Chemical Society, April 13, at Indianapolis.

C. R. DELONG, M. G. DONK and E. M. WHITCOMB sailed for Europe from New York on May 3 on the steamer "Mongolia." The party intends to conduct investigations of the cost of producing certain chemicals in Germany, Norway, Holland and Switzerland.

JOHN J. EVANS, general manager of the Lancaster, Pa., plant of the Armstrong Cork Co., has been elected president of the Lancaster Chamber of Commerce.

ALEX. L. FEILD, of the Union Carbide & Carbon Research Laboratories, delivered an instructive and interesting lecture on metallography before the senior class of the Cooper Union Night School on April 23.

Dr. KUNO B. HEBERLEIN returned the latter part of April from a business trip in Europe.

Dr. L. O. HOWARD, chief of the Bureau of Entomology, according to word from Holland, has been made honorary president of the International Conference of Phytopathologists and Economic Entomologists, which is to be held June 24 at Wageningen, Holland. Dr. Howard sailed for Europe May 5. While abroad he will attend the International Congress of Agriculture at Paris, May 22 to 26, and the International conference concerning *Dacus olea* to be held at Madrid June 18. He will visit entomological institutions in England, France, Italy, Spain, Belgium and Holland, and will consult with many experts concerning the entomological exchange of living beneficial parasites of injurious insects.

Dr. ALBERT W. HULL, scientist in the research laboratory of the General Electric Co., Schenectady, N. Y., has been awarded the Howard N. Potts gold medal for scientific research by the Franklin Institute, Philadelphia. The award was made for his studies in the crystalline structure of matter by means of X-rays and was based on a paper entitled "Crystal Structures of Common Elements" read before the Franklin Institute last year. The Potts medal was established in 1906 from a trust fund left by the will of H. N. Potts of Philadelphia. It is awarded for "distinguished work in science or the mechanic arts."

FORREST K. PENCE, ceramic engineer, has resigned as head of the research department of the Knowles, Taylor & Knowles Co., East Liverpool, Ohio, manufacturer of pottery, to become president and general manager of the Paducah Pottery Co., Paducah, Ky. R. V. MILLER, formerly of the ceramic department, Ohio State University, Columbus, Ohio, will succeed Mr. Pence at the Knowles plant.

G. W. ROBINSON, head of the department of agricultural chemistry, University College, Bangor, North Wales, recently visited the Department of Agriculture, Washington, to learn something of the research work being done in soil physics in the United States. Professor Robinson, who holds a traveling fellowship from the Wales university, plans to spend 2 months studying the experimental work in soil physics at state experiment stations in Georgia, Texas, Arizona, California, Utah, Kansas, Illinois, Michigan, New York, Massachusetts and New Jersey.

Dr. J. J. SKINNER, of the Bureau of Plant Industry, has returned to Washington from Fayetteville and New Bern, N. C., where he supervised the application of fertilizers in the co-operative experiments and inaugurated fertilizer experiments with cotton.

E. W. TREND, representing the mines and chemical works of the Mount Lyell Mining & Railway Co., Ltd., Melbourne, Australia, is a visitor in the United States on business and is making his headquarters at the Chemists' Club, New York City, for several weeks.

Obituary

WILLIAM BRADY, chief chemist and chemical engineer, South Chicago plant, Illinois Steel Co., died on April 22. He was active in chemical circles in the Chicago district, having served as chairman of the Chicago Section of the A.C.S. in 1905, as councilor from 1909 to 1917 and as director from 1913 to 1916. He was also a member of the Chicago Chemists Club, American Electrochemical Society, A.S.T.M. and A.A.A.S.

Calendar of Coming Society Meetings

AMERICAN ASSOCIATION OF CEREAL CHEMISTS will hold its ninth annual convention at Hotel Sherman, Chicago, June 4 to 9.

AMERICAN ASSOCIATION OF ENGINEERS will hold its annual convention in Norfolk, Va., May 7 to 9.

AMERICAN ELECTROPLATERS SOCIETY will hold its eleventh annual meeting at Providence, R. I., July 2 to 5.

AMERICAN GAS ASSOCIATION will hold its annual convention the week of Oct. 15 at Atlantic City. An elaborate exhibition of gas making and gas-utilization equipment is planned.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS will hold its summer meeting June 20-23 at Wilmington, Del.

AMERICAN LEATHER CHEMISTS ASSOCIATION will hold its twentieth annual convention at the Greenbrier, White Sulphur Springs, W. Va., June 7, 8 and 9.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS will hold its spring meeting May 28 to 31 in Montreal, Canada.

AMERICAN SOCIETY FOR TESTING MATERIALS will hold its twenty-sixth annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, beginning Monday, June 25, 1923, and ending either Friday or Saturday of that week.

AMERICAN ZINC INSTITUTE, INC., will hold its fifth annual meeting at the Hotel Chase, St. Louis, May 7 and 8.

ASSOCIATED COOPERAGE INDUSTRIES OF AMERICA will hold its eighth annual meeting May 8 and 9 in St. Louis, Mo. Headquarters will be the Jefferson Hotel.

CANADIAN INSTITUTE OF CHEMISTRY will hold its annual meeting in Toronto, May 29 to 31.

CHAMBER OF COMMERCE OF THE UNITED STATES will hold its eleventh annual meeting in New York May 7 to 11.

NATIONAL ASSOCIATION OF MANUFACTURERS OF THE UNITED STATES OF AMERICA will meet in annual conference May 14 to 16, inclusive, at the Waldorf-Astoria, New York City.

IRON AND STEEL INSTITUTE (London) will hold its annual meeting May 10 and 11 at the House of the Institution of Civil Engineers, London, S. W. 1.

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (NINTH) will be held in New York Sept. 17-22.

NATIONAL FERTILIZER ASSOCIATION will hold its thirtieth annual convention at White Sulphur Springs, W. Va., the week of June 11.

NATIONAL LIME ASSOCIATION will hold its fifth annual convention at the Hotel Commodore, New York City, June 13 to 15.

NATIONAL SYMPOSIUM ON COLLOID CHEMISTRY will be held at the University of Wisconsin, June 12 to 15.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stetters Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month.

PACIFIC DIVISION, American Association for the advancement of Science, will hold its seventh annual meeting at the University of Southern California, Los Angeles, Sept. 17 to 20, in conjunction with the summer session of the national association and a meeting of the Southwestern Division of the National Association.

SOCIETY OF CHEMICAL INDUSTRY, Canadian Section, will meet in Toronto, May 29 to 31.

SOCIETY FOR STEEL TREATING — Eastern sectional meeting will be held June 14 and 15, in Bethlehem, Pa.

The following meetings are scheduled to be held in Rumford Hall Chemists' Club, East 41st St., New York City: May 11 —Société de Chimie Industrielle (in charge) American Chemical Society, American Electrochemical Society, Society of Chemical Industry, joint meeting. May 18—Society of Chemical Industry, regular meeting. June 8 — American Chemical Society, regular meeting.

Industry and Trade

Current News and Market Developments

May 7, 1923

CHEMICAL & METALLURGICAL ENGINEERING

Tenth Avenue at 36th Street, New York

H. C. PARMELEE, *Editor*

The Summary of the Week

F. E. Breithut appointed chemical trade commissioner for the Department of Commerce, to be stationed in Berlin.

Report from Rome states that, according to American-Sicilian sulphur agreement, world's consuming requirements will be apportioned among producers.

Standards of strength for coal-tar dyes are specifically defined in list emanating from Washington. The standards, when adopted, will be used as a basis for levying import duties.

Acetic acid has been marked up in price, following the recent advance in acetate of lime.

There were offerings of Indian linseed, c.i.f. New York, at a price only 15c. per bushel higher than the prevailing quotation for Argentine linseed. This indicates that the United States may import from India.

Another advance in price was registered in the market for tartaric acid. Frequent price advances have failed to check buying interest.

Tin bichloride and tin crystals are offered at lower prices for May delivery. The decline resulted from lower producing costs as represented by declines in the metal.

Prices for pure spirits of turpentine show a decline of 12c. per gal. for the week. New production is coming in, and demand both at home and for export has been quiet.

Red prussiate of potash sold off sharply during the week. This was due to eagerness of holders to unload.

Arrivals of nitrite of soda from foreign markets were pressed for sale and market prices were forced downward.

Why Produce Synthetic Phenol?

AT THE moment phenol is probably the most interesting commodity on the chemical market. A shortage not entirely anticipated by the consuming industries has recently sent prices skyward. Spot market quotations have risen 65 per cent in 2 months and over 400 per cent during the past year. Naturally contracts have been made at somewhat lower prices, but the figure of 28c. per lb., reported for some recent business, is more than double the manufacturers' prices of a year ago. As one of the results of this situation synthetic phenol works that have been closed down since 1919 are planning to resume production, while the construction on at least one new synthetic plant is already nearing completion.

The question is asked: Why is it necessary to make phenol synthetically? Is not the present record-breaking production of byproduct coke making available greater supplies of coke-oven tar than ever before in history? It is true, to be sure, that the output of byproduct coke in March was three and a quarter million tons, or nearly 50 per cent more than the average monthly output during any previous year and that 1923 will undoubtedly set a new record for the industry. But this does not necessarily mean that the output of phenol will increase in that proportion. Our supply of phenol is determined by the amount of tar that is distilled—not by the amount that is made. During the past year the shortage of both transportation and coal caused an increased quantity of tar to be burned as fuel in steel plants and gas works. Thus the quantity of tar which could be handled profitably by the tar distiller was considerably restricted.

The 1922 output of natural phenol - estimated between a million and a million and a half pounds—was practically all that could be produced under the circumstances. Furthermore, the consumers got little relief from imports, for the high duties of the tariff act of 1922 have proved practically prohibitive.

In 1918, it will be recalled, because of war demands we had an enormous output of phenol (106,794,277 lb.), which was made almost entirely in synthetic phenol plants. At the time of the armistice the government's surplus stocks amounted to 35,000,000 lb., or nearly three times the normal annual consumption. As this surplus found its way to the market, prices declined sharply—falling from 40c. per lb. to less than 10c. per lb.—although early in 1920 the market recovered to about 15c. Production during 1920 and 1921 was practically nil, and in the latter year the reported sales amounted to only 292,645 lb. The market was considerably depressed during these 2 years and it was not until the last quarter of 1922 and the enactment of the new tariff that the present movement had its beginning.

In the U. S. Tariff Commission's "Census of Dyes and Coal-Tar Chemicals" for 1919 the following was said of the phenol situation:

> It is probable that the present and future consumption of phenol will be in excess of the amount of natural phenol obtained from coal-tar distillates, and that when the surplus stocks have been consumed some of the synthetic plants will necessarily resume production.

Present developments, it would seem, form a striking confirmation of this prediction.

Tentative Standards Evolved for Coal-Tar Dyes in Import Trade

Duties Will Be Levied According to These Standards of Strength—Producers and Importers Invited to Criticise List

A TENTATIVE list of standards of strengths of coal-tar dyes in ordinary use in the United States prior to July 1, 1914, has been issued by the Customs Division of the Treasury Department. Copies have been sent to prominent producers and importers for criticism. Suggestions received by May 7 will be given consideration in the final draft of the list, according to the announcement of Director Ernest W. Camp.

About 100 dyes are named in the list. Others are to be classified according to their characteristics corresponding to some one dye in the list. The new tariff act provides that coal-tar products when imported be assessed for duty on the basis of the strength in ordinary use prior to July 1, 1914. Many dyes and chemicals now are imported in more concentrated forms. In such cases, the specific duty of 7 cents per pound will be multiplied in proportion to the increase in strength. The lowest commercial strength in ordinary use prior to the outbreak of the war in Europe is taken as the basis.

The announcement of the Customs Division accompanying its tentative list makes it plain that because a certain dye is chosen as a standard of strength it is not necessarily meant that this particular dye is the best or purest of the class, although its dyeing properties have been taken into consideration. This announcement is to forestall possible efforts to capitalize inclusion in the standard strength list for advertising purposes.

Supplemental lists of such dyes as have been determined to fall within the class corresponding to each standard will be issued in the future.

Following is the announcement of the Customs Division, together with the tentative list:

TREASURY DEPARTMENT,
May , 1923.

To Officers of the Customs and Others Concerned:

Attention is invited to the following proviso of paragraph 28, tariff act of 1922: "That in the enforcement of the foregoing provisos in this paragraph the Secretary of the Treasury shall adopt a standard of strength for each dye or other article which shall conform as nearly as practicable to the commercial strength in ordinary use in the United States prior to July 1, 1914; that if a dye or other article has been introduced into commercial use since said date, then the standard of strength for such dye or other article shall conform as nearly as practicable to the commercial strength in ordinary use, that if a dye or other article was or is ordinarily used in more than one commercial strength, then the lowest commercial strength shall be adopted as the standard of strength for such dye or other article."

Pursuant to the foregoing provisions of law standards of strength are hereby adopted as follows:

Calendar

The following important technical meetings are scheduled for the immediate future:

AMERICAN ZINC INSTITUTE
St. Louis, May 7-8

AMERICAN ASSN OF ENGINEERS
Norfolk, May 7-9

AMER SOCIETY MECHANICAL ENGRS
Montreal, May 28-31

CANADIAN INSTITUTE OF CHEMISTRY
Toronto, May 29-31

SOCIETY OF CHEMICAL INDUSTRY
Canadian Section
Toronto, May 29-31

AMER. ASSN CEREAL CHEMISTS
Chicago, June 4-9

AMER LEATHER CHEMISTS ASSN
White Sulphur Springs, W. Va., June 7-9

NAT'L FERTILIZER ASSOCIATION
White Sulphur Springs, W. Va., June 11-16

NATIONAL LIME ASSOCIATION
New York City, June 13-15

SOCIETY FOR STEEL TREATING
Eastern Sectional Meeting
Bethlehem, Pa., June 14-15

AMER INST CHEMICAL ENGRS.
Wilmington, Del., June 20-23

AMER SOC FOR TESTING MATERIALS
Atlantic City, June 25-29

Argentina Imports American Printing Ink

Argentine requirements for printing and lithographic inks reaches 1,000,000 lb. annually, of which 80 per cent is imported from the United States. The business is largely in the hands of a few houses that import the ink in barrels and rework it in local shops. Some ink is imported prepared in cans, but this is not considered as successful nor as economical a method as to import in bulk, since the saving of about 5 cents a pound in import duties on ink imported in bulk more than pays for the cost of reworking and packing. The journey through the tropics also affects the prepared ink, and it is therefore possible to supply the consumer with a superior and more uniform product when it is prepared for the market in Buenos Aires. One American manufacturer, with a factory in Buenos Aires, has the bulk of the trade, and by personal work has captured a market which was formerly in the hands of German and French firms.

Linseed Exports From India

Shipments of linseed from India for the crop year ended March 31 reached the total of 10,596,000 bu. The United Kingdom was the principal buyer, taking 5,944,000 bu. The Continent absorbed 4,652,000 bu. The new crop situation is favorable and the exportable surplus for the 1923-24 season is estimated by shippers at 12,000,000 bu.

In selecting the standards set forth in the foregoing list the main consideration has been the choosing of that dye which corresponds in strength as nearly as practicable to the lowest commercial strength of the given class, in conformity with paragraph 28 of the tariff act of 1922 The fact that a certain dye is chosen as a standard does not necessarily mean that that particular dye is the best or purest of the class although its dyeing properties have of necessity been taken into consideration

It is the intention of the department to issue from time to time supplementary lists of such dyes as have been determined to fall within the class corresponding to each standard adopted

Would Make Goldsmith Chief Tariff Investigator

The long-vacant post of chief foreign investigator for the United States Tariff Commission is to be filled soon. It has recently been learned that the commission is agreed upon Alan Goldsmith, now chief of the Western European Division of the Bureau of Foreign and Domestic Commerce of the Department of Commerce as the man for the work. Mr. Goldsmith is expected to return soon from Rome, where he represented the Department of Commerce at the recent meeting of the International Chamber of Commerce.

At the present time the commission has two representatives in Europe. Chairman Marvin, it is known, has been advised by them that great difficulty may be expected by the investigators who are seeking data upon which to base recommendations for changes in the tariff rates. In France, especially, it is said that manufacturers are openly hostile to these inquiries, being unwilling to open up their books and let the investigators learn what it costs them to produce the commodities which are exported to the United States. Some offers of co-operation have been made in Germany.

The foreign investigations naturally are not expected to get well under way until a directing head is chosen. For more than a year the office has been unfilled and the commissioners have been apparently unable to unite upon one man. However, it is understood that Mr. Goldsmith was quite acceptable to all the commissioners.

War Gases Cure Disease

Recent Experiments Show That Influenza, Tuberculosis and Paresis Are Benefited by Treatment

To cure rather than to kill is the most modern use of the so-called poison gases. Experts of the Chemical Warfare Service believe that the possibility of successfully treating influenza, tuberculosis, paresis and other afflictions by the use of poison gases has been demonstrated by experiments now being conducted at Edgewood Arsenal.

It is asserted that through experiments with chlorine gas, the chemists have established the fact that epidemics of grip and colds may be checked almost instantly by the introduction of weak concentrations of the gas into the rooms occupied by those exposed.

Mustard Gas for Tuberculosis

That mustard gas is a specific for tuberculosis apparently seems to be demonstrated by the experiments conducted under the direction of Lieutenant-Colonel E. B. Vedder of the Army Medical Corps. Guinea pigs inoculated with tuberculosis germs and a concentration of mustard gas were apparently rendered immune by the gas and failed to contract the disease. An equal number of guinea pigs inoculated with tuberculosis germs and not subjected to the mustard gas treatment contracted the disease.

Experiments With Lewisite

As a result of experiments with lewisite, the chemists have evolved what appears to be a remedy, if not a cure, for paresis and locomotor ataxia.

Dr. A. S. Loevenhart of the University of Wisconsin has been studying the effects of lewisite upon the human system in conjunction with the chemists at Edgewood Arsenal. He has the records of forty-two persons committed to insane hospitals with paresis, who have come under this treatment. Of that number twenty-one have been cured.

Chlorine as Cold Cure

The fact that chlorine might be used to prevent or cure colds, influenza and pneumonia was demonstrated during the war at Edgewood Arsenal by accident. It was remarked that cases of influenza or pneumonia did not occur among the workers in the laboratory where chlorine was being made, although 10 to 20 per cent of others on duty at the arsenal were victims. Investigation showed that in the rooms where chlorine gas was being made there was a slight leakage of chlorine, just enough to act as a germicidal agent.

Following out this idea, the Chemical Warfare Service and the Medical Department have made great advances on this line and it is now believed practicable to introduce small quantities of chlorine into school rooms, factories, churches and other places where persons gather.

Testing Materials Meeting Plans Announced

Society's Twenty-sixth Annual Session to Have a Program Replete With Committee Reports and Papers

The twenty-sixth annual meeting of the American Society for Testing Materials is to be held at Chalfonte-Haddon Hall, Atlantic City, N. J., June 25 to 29. The program promises to be very complete. Besides the reports of about thirty-five committees several special papers are to be read. Some of the features of the meeting are as follows

Metals—The Endurance of Metals Under Repeated Stresses is discussed in two papers, one devoted primarily to steel and the other to duralumin and manganese bronze. The work of the Bureau of Standards in the study of Gases in Steel is described. There will be a discussion on the desirability of including Chemical Requirements in Cast-Iron Specifications. A further report on Effect of Sulphur in Steel will be presented by the joint committee on that subject.

Concrete and Reinforced Concrete.—The outstanding feature is a discussion (to which an entire session will be devoted) on the topic "What Properties of and Methods of Making Concrete Require Further Investigation?" Slag as an Aggregate in Concrete is discussed in one paper; Fatigue of Concrete in another; and there are two papers on the use of Calcium Chloride in Concrete.

Consistency—This subject has long been a troublesome one. A paper by the sub-committee on consistency will record the various conceptions of consistency and methods of test developed by the several committees, and the whole discussion will be introduced by a paper treating with fundamental considerations involved in this property of materials.

Slate—The program contains two papers on this subject, which will be discussed at an A.S.T.M. meeting for the first time.

Glue—A comprehensive discussion on "The Testing of Glue" has been arranged at the request of a number of glue chemists and large users of glue. This is an important matter in many industries.

Testing—The entire meeting is replete with valuable papers and reports on methods of testing, covering such topics as babbitt metal, magnetic properties, tool steels, insulating varnishes, paints, concrete, etc. There are also included descriptions of new devices in extensometers, an accelerometer for measuring impact, and a new machine for testing textiles.

Chicago Lard Stocks Gain

Stocks of lard in Chicago increased 20,717,000 lb. in the past month. The stocks on May 1 were estimated at 34,212,000 lb., which compares with 13,495,000 lb. on April 1 and 45,147,000 lb. on May 1 a year ago.

Agreement Between American and Italian Producers of Sulphur

Prices Will Be Fixed From Time to Time—American Production to Supply Demands of North America—World Consumption Apportioned

IN A REPORT dated March 27, Consul H. Earle Russell of Rome, Italy, gives interesting details of the agreement recently made by American and Sicilian producers of sulphur. Mr. Russell states that the essential points of the accord concern the determination of the sales prices and the designation of the quantities to be placed by each of the contracting parties.

Prices will be fixed from time to time with reference to the conditions in the individual consuming countries, and in such a manner as to reach gradually the pre-war level.

By agreement made at the time of signing the accord, prices have on the average been increased by more than one dollar per ton over those provisionally determined in October, 1922.

Division of Markets

With regard to the division of markets, it has been decided that the American production shall supply the demands of North America, while the Italian product will be reserved for the national needs The remaining world consumption will be met in determined proportions by America and Sicily, to the latter being given the exclusive right of sale up to 65,000 tons for the manufacture of sulphuric acid in any country On the basis of the approximate figures of the present world consumption, it is calculated that Sicily will be able to export annually about 145,000 tons of raw and worked sulphur, in addition to the 65,000 tons destined for the manufacture of sulphuric acid. These quantities are considerably greater than those exported by Italy in the last few years.

The exportation of raw sulphur to individual markets will then be regulated, taking into account as far as possible the advantages accruing to each of the contracting parties from their geographical position in relation to the various consuming countries. The exportation of worked sulphur remains entirely unfettered. The contracting parties are pledged to maintain the present situation in the industry of refining and grinding of sulphur, which represents a guarantee for the Italian production of worked sulphur.

Agreement Holds Until 1926

The duration of the agreement is fixed until Sept. 30, 1926, and may be prolonged. It is, however, proper for the parties to denounce the convention even before the above date by a notice from one to the other of not less than 6 months. However, it is arranged that the rupture of the agreement will not take place during the sulphur selling season.

There is also created a central office in London with representatives of both parties for the exchange of data, information and statistics, and for the maintenance of a closer contact between the parties themselves in regard to the execution of the agreement.

Settlement of Disputes

Each dispute that may arise over the same will be submitted to the judgment of a board of arbitration with headquarters in London, composed of a representative of each of the parties and of a third named by the first two, or, in default thereof, by the president of the Chamber of Commerce.

The agreement is viewed with much jubilation by the Sicilian producers, who consider it of great importance to the sulphur industry as giving to it a period of recuperation and relative tranquillity necessary to cure the evils of the recent past and to provide for a better system and organization.

General Reduction in German Export Duties

A general abolition or reduction in the German export duties became effective April 29, according to a cablegram of that date, received at the Department of Commerce from Commercial Attaché Charles E. Herring at Berlin. It is stated that owing to the heavy decrease in export orders since February and to high prices this measure has been deemed necessary.

It is also reported that German manufacturers and wholesalers, with the exception of the clothing industry, are generally in favor of abolishing the export control boards, which are known in German as the "Aussenhandelsstelle."

Personals

Jerome Rockhill, son of the late Clayton Rockhill, has joined the staff of Julian W. Lyon & Co., importers and dealers in essential oils in New York.

M. F. Austin, manager of the vegetable oil department of J. C. Francesconi & Co., has returned from a business trip to points in New England.

William L. Greenbaum has been appointed receiver for the Kemiko Co., disinfectants, 426 Broome St., New York. Liabilities are placed at $4,295; assets about $2,000. The company is incorporated under the laws of New Jersey with authorized capital of $25,000.

Major Breithut Appointed Chemical Trade Commissioner at Berlin

Has Had Broad Experience in Chemical Industries and Unusual Background in Chemical Economics—Widely Known for Work in Chemical Warfare Service and War Industries Board

THE significance of the German chemical industry in its relation to our own developments has led the U. S. Department of Commerce to appoint Dr. F. E. Breithut to the staff of Commercial Attaché Herring at Berlin as Chemical Trade Commissioner. In this capacity, Dr. Breithut will be of considerable service to the American industry.

In selecting Dr. Breithut for this post, the Department of Commerce secures the services of a trained chemical economist. During the war he served as an assistant to Herbert Hoover in various food conservation campaigns and was later commissioned as a major in the Chemical Warfare Service. In the latter capacity he was attached to the headquarters staff of Major-General W. L. Siebert, acting first as chief of personnel, then as chairman of the chemicals group, price section, of the War Trade Board, and subsequently as chief of procurement, salvage and sales.

After the armistice, Dr. Breithut spent 4 years in dyestuff and other industrial chemical work, returning to the College of the City of New York last year.

While teaching there Dr. Breithut instituted a course in the economics of the chemical industry. This attracted widespread interest in educational circles and it so impressed the chemical trade that the Salesman's Association of the American Chemical Industry induced Dr. Breithut to give a special evening course particularly adapted to the requirements of its members.

F. E. BREITHUT

The new trade commissioner has contributed several articles to the literature of chemistry, both popular and technical. His technical publications include "Is There an American Dye Monopoly?" "The Economic Status of the American Chemical Industry," and "Prices of Chemicals During the War." More recently he has published "The Inspection of Establishments Producing, Using or Refining Wood Alcohol," and "A New Method of Measuring the Partial Vapor Pressures of Binary Mixtures."

New York Chapter Formed by Institute of Chemistry

The New York Chapter of the American Institute of Chemistry came into being on April 30. On that date about thirty members of the National Institute gathered for dinner and preliminary election of officers for a New York chapter. Dr. R. V. Bacon was made chairman. Dr. A. Naglevoort was elected vice-chairman, Thomas Wright treasurer and C. L. Bryden secretary. At the same time publicity and membership committees were appointed.

The first work to be done in the state of New York is that of classification of chemists according to economic status. To this end it is proposed to make a fact-finding survey concerning the chemists of the entire district. Following this classification a more definite plan of activity will be adopted.

In the meantime the enrollment of properly qualified members is sought. The next meeting of the chapter is to be held on May 28. The hour and place will be announced later.

Dye Importers Contemplate New Association

Several importers of dyes are considering the formation of a separate and distinct organization. What form the new body will take is as yet unannounced. Question exists as to the advisability of affiliating with a national association of importers as a dyestuff group.

Among those mentioned as interested in such a project are William Baur, of Bachmeir & Co.; Mr. Loeffler, of the American Aniline Products Co.; Mr. Rosenthal, of the Ackerman Color Co., and Dr. Pickerall, of Herman A. Metz & Co.

G. C. Davis, former government tariff expert, has been called into consultation by those interested in the plan. Mr. Davis has acted in an advisory capacity in tariff matters for a number of the larger dye houses in New York, and his views are being sought with respect to the problems with which an organization such as is contemplated must cope.

News Notes

Eighty per cent of the dyes consumed in Great Britain are now being produced by the British dye-making industry, according to an analysis of the dyestuffs business in the United Kingdom received recently by the Commerce Department from Consul General Robert P. Skinner, at London.

Another war-time project of Uncle Sam is being offered for sale. Bids on the Norfolk army supply base, covering an area of 900 acres, with terminal improvements, are to be opened on May 22. As a shipping, export and storage base, this area is one of the best located on the Atlantic seaboard.

The quantity of hydrocyanic acid absorbed by a large number of fumigated fruits, vegetables, seeds, flour and other foodstuffs has recently been determined in the Bureau of Chemistry. The results of this work, as well as a brief review of the literature, are to be given in a bulletin, immediately obtainable from the Division of Publications at Washington.

Synthetic apple oil prepared by Dr. F. B. Power and his associate, V. K. Chesnut, of the Bureau of Chemistry, for which a public service patent was granted in 1922, is now being manufactured by a commercial concern in New York. This apple oil possesses the aroma of ripe apples and is the result of a prolonged chemical investigation of their odorous constituents.

Barely 1,000 ounces of platinum constitutes the total production of the United States for 1922. J. M. Hill, of the Geological Survey, points out that the larger part of this was produced in California.

War mineral claims to the number of about 800 have now been settled. This leaves about 400 of the less important ones open to adjustment. Of the $8,500,000 appropriated by Congress 2 years ago, $2,250,000 remains for the remaining settlements, which it is planned may all be made by January, 1924.

Recent specifications that have been submitted to the American Engineering Standards Committee for comment and criticism, prior to their formal adoption by the Federal Specifications Board, include: Steel castings, foundry pig, semi-steel castings, ingot copper, ingot tin, slab zinc and phosphor copper.

Swiss iron foundries are operating in many cases at a loss. The outlook is regarded as extremely dubious due to the cutting off of iron and coal supplies. A rise in prices is considered urgently necessary if activity at these works is to be continued.

The British America Nickel Co. is shortly to resume operations, discontinued two years ago. C. A. Rose of New York is to be general manager of technical operations. The capacity of the plant will eventually be 10,000 tons of nickel a year. Production of other metals, especially copper, will also be carried on.

Coal-Tar Dyes Imported Through Port of New York During April

Detailed Information Compiled by Chemical Section of Commerce Bureau and Tariff Commission

IMPORTS of coal-tar dyes for April totaled 242,022 lb., with an invoice value of $256,751.

The four dyes leading in quantity imported were xylene light yellow, diaminogene blue, patent blue (No. 543) and diazamine blue BR. Of the total quantity imported in April, 1923, 42 per cent came from Switzerland, 37 per cent from Germany, 18 per cent from Italy, 2 per cent from Canada and 1 per cent from England. Switzerland led for the first time in 1923, indicating that the Ruhr occupation has not seriously affected the supply of raw material for dye making in that country. Prior to the war Switzerland depended almost exclusively on Germany for these materials. Official statistics for 1922, however, show that she imported crude and intermediates from France, Great Britain, Poland, Italy, Czechoslovakia, United States and Germany

The dyes in this report are grouped by Schultz numbers and in the case of those which could not be identified by Schultz number, the classification according to ordinary method of application was adopted. As the pastes and powders of the vat dyes vary widely in strength and quantity, each vat dye has been reduced—in nearly every case—to a single strength basis.

The designation "c" for competitive, and "n.c.' for non-competitive, in column 1 of the report, indicates the appraisement basis for the assessment of the ad valorem duty in paragraph 28 of the tariff act of 1922. Those dyes without designation are doubtful, pending further investigation.

The ad valorem rate for competitive dyes is based on the American selling price, as defined in subdivision (*f*) of section 402 of title IV; the ad valorem rate for non-competitive dyes is based on the United States value, as defined in subdivision (*d*) of section 402 of title IV of the tariff act of 1922. All dyes are listed where imports for the month were 500 lb. or more.

Head of Nitrate Survey Named

The nitrate investigation of the government is to be in charge of H. A. Curtis, formerly general manager of the Clinchfield Carbocoal Corporation and during the war connected with the Ordnance Department.

William H. Walker, of Glenn Willows, Calif., was named as assistant head of the nitrate survey. He is a vice-president of the American Farm Bureau Federation and is to take charge of the study of the probable demand for nitrates, chiefly from the agricultural point of view.

The work of the investigation will be carried on in close collaboration with trade and governmental organizations already active in the field.

Potash, according to a statement by Secretary Hoover, probably will be the next chemical commodity to be taken up by the foreign monopoly survey. Thus far Mr. Hoover sees no necessity for an investigation into the Japanese control of camphor production, on the theory that a large part of the product is manufactured synthetically. It is the department's intention, however, to make a study of all raw materials of import upon which this country is dependent and which are produced under foreign monopolies.

Ernest C. Klipstein Dies

Ernest Christian Klipstein, head of E. C. Klipstein & Co., the Warner-Klipstein Co. and the Bulls Ferry Chemical Co., died Sunday morning, April 29. Mr. Klipstein had been stricken with an attack of kidney trouble only 4 days prior to his death and was taken to St. Vincent's Hospital, New York City, but failed to respond to treatment. He was born in Virginia in 1851 and for many years had occupied a prominent position in the dye and chemical industries of this country. He is survived by his wife and three sons, Ernest H., Gerald P. and Kenneth H. Mr. Klipstein had lived in East Orange, N. J., since 1889, and funeral services were held at his late home there on Tuesday afternoon, May 1.

Financial Notes

A large percentage of the securities of the St. Louis Coke & Chemical Co. has been pledged to the readjustment plan of the company's financial structure, which would reduce fixed charges from $1,230,248 to $454,160. The readjustment of the finances will undoubtedly be through the medium of a new company, says a report from St. Louis.

Mathieson Alkali Works, Inc., reports for the quarter ended March 31 last net earnings of $386,303 after depreciation, compared with $151,667 a year ago. Gross earnings totaled $521,227, against $286,750.

Stockholders of the Commercial Solvents Corporation at a special meeting authorized an issue of $1,000,000 8 per cent first preferred stock for the purpose of building a new plant.

Tennessee Copper & Chemical Corporation shows a net income of $337,421 for 1922, equivalent to 42c. a share earned on the 794,426 shares of capital stock of no par value. This compares with a net income of $147,175, or 18c. a share, in the previous year.

The New Jersey Zinc Co. reports income of $1,905,456 for the first 3 months of 1923. This includes dividends from subsidiary companies and is after deduction of expenses, taxes, maintenance, depreciation and other charges. The total compares with $1,126,080 in the same period in 1922.

The American Hide & Leather Co. reports a deficit of $118,175 for the first 3 months of 1923, after payment of all operating expenses, interest on loans, reserves for depreciation and other charges. This compares with a deficit of $23,221 in the same period last year.

The Columbia Textile Co. for the quarter ended March 31 reports net sales of $1,513,177 and net income available for bond interest, after depreciation and other charges, of $111,631.

Facts and Figures That Influence Trade in Chemical Products

Market Conditions

Current Prices Imports and Exports The Trend of Business

Irregular Price Movement Features Trading in Chemicals

Acetic Acid Advanced in Price—Bichromates Stronger—Formaldehyde Steadies—Tin Crystals Lower—Nitrite of Soda Weakens Under Increased Offerings—Red Prussiate of Potash Sells Off Sharply—Glaubers Salts Weak

THE movement of prices for chemicals in the past week has been very irregular. In some cases imported makes have come on our market in sufficient volume either to beat down the prices asked for domestic goods or to cause their own offering at buyers' prices. Nitrite of soda is one of the materials which came in from abroad only to find an unreceptive market and many holders preferred to cut prices rather than hold for a higher market later on. Glaubers salt was in a similar position, with little chance of a stronger market until supplies get into stronger hands. In a few cases such as bichloride of tin and tin crystals lower prices were the result of reduced production costs. On the other hand the advance in acetate of lime as announced a week ago had the effect of bringing out new price schedules for acetic acid, but as some producers were affected more than others by the change in the raw material it was natural to look for a difference in quotations for the acid and there is a range according to seller, especially on the higher grades.

Export buying, which has been a feature in the market for caustic soda so far this year, was less pronounced and values were a little less firm, as some sellers were willing to sacrifice a little in order to book business. On the other hand heavy arrivals of arsenic from foreign markets were readily absorbed on arrival here. The arsenic situation shows little if any change. Buyers have their ideas as to what they want to pay and when their limit has been reached they retire from the market. In spite of reports that an extensive short interest exists, this is not borne out in the market, which would be highly sensitive to heavy buying. Formaldehyde still feels the effects of second-hand offerings, but the latter have been much reduced in volume and the market is coming under the control of producers who say that resale lots recently have sold under the cost of production. Red prussiate of potash was practically a drug on the market a short time ago. Some holders of stocks began to sell at private terms and far enough under the quoted levels to interest buyers. In this way considerable of this material has changed hands, but there is no such thing as firmness in price.

Acids

Acetic Acid—The market has been in a rather unsettled position, following the recent advance in acetate of lime. Producers of acid who require acetate of lime have put up prices, but some difference is found according to seller. Several of the largest consumers are covered on old contracts, but business was reported to have been good during the past week. Prices for 28 per cent are given at 3.38c. per lb. and for 56 per cent 6.75c. per lb. These quotations are for carlots with the usual premiums for smaller lots. Glacial acetic acid is still available at 12c. per lb., carlots, although most sellers are asking higher prices.

Boric Acid—Some producers lowered asking prices during the period. Demand was moderate, but competition is rather keen. Present prices show a range from 11c. to 11½c. per lb., in barrels, for round lots, the difference being according to seller.

Hydrofluoric Acid—According to a report just issued by the Department of the Interior there were 4,800 short tons of fluorspar shipped to makers of hydrofluoric acid in 1922, as compared with 1,833 short tons in 1921. This would indicate a material increase in the output of the acid last year. The present market is a quiet affair. Asking prices are unchanged at 7@8c. per lb. for 30 per cent and 11@12c. per lb. for 48 per cent.

Sulphuric Acid—Inquiry for prompt delivery has eased off a little, but contract holders are calling for stocks and the position of producers has hardly improved. With some sellers prices are little better than nominal, but former prices are still holding, with 60 deg. acid quoted at $9.50@$11 in tanks and 66 deg. acid at $16@$16.50.

Tartaric Acid—With the buying movement holding up, the strength of the market was demonstrated by another advance of 1½c. per lb. last week. The revised asking price is 37½c. per lb. and the market was reported to be strong even at the advance. Imported tartaric sold earlier in the period at 36c. per lb. and an offering for shipment was made on the basis of 29c. per lb. in bond.

"Chem. & Met." Weighted Index of Chemical Prices

Base = 100 for 1913-14

This week	179.28
Last week	179.23
May, 1918	270.00
May, 1919	248.00
May, 1920 (high)	280.00
May, 1921 (low)	143.00
May, 1922	159.00

The index number for the week shows a moderate gain. The advances in acetic acid, formaldehyde in outside selling channels, and caustic potash, brought about the 5 point rise

Potashes

Bichromate of Potash—Some delays in deliveries are reported and the market has taken on a stronger tone as far as prices for prompt shipment are concerned. The general asking price is given at 11c. per lb., f.o.b. works.

Caustic Potash—Sales of small lots of imported were made at 8¼c. per lb. on spot and some goods afloat sold at 8c. per lb. The general asking price for imported on spot was 8½c. per lb. Some producers of domestic caustic put prices up to 9c. per lb. at works, but there were offerings of domestic make at 8½c. per lb. and prices showed a range according to seller. Opinions differed regarding the strength of prices and regarding the outlook for the present.

Muriate of Potash—New prices on German muriate have been expected but so far have not been made. The market is unsettled, as offerings are widely scattered and selling pressure has weakened values. The current quotation of $35 per ton is still subject to shading.

Permanganate of Potash—While prices of 22c. to 24c. per lb. were asked for spot material there was not much trouble in finding sellers at the inside figure. Offerings afloat were available at 21½c. per lb. and prompt shipment was quoted at 21c. per lb. Demand was not large and this no doubt influenced some holders to offer inducements in order to dispose of stocks that they have on hand.

Prussiate of Potash—Red prussiate has been quietly selling at private terms for the past 2 weeks or more. Last week prices were lower than ever, and sales went through as low as 70c.

per lb. The market closed unsettled, with intimations that 70c. could still be done by buyers. Yellow prussiate was in quiet demand and while 37c. per lb. is asked, this price likewise can be shaded.

Sodas

Bichromate of Soda—The market is stronger with reports that the output of some producers has been curtailed. Sellers have been less eager for round lot orders, especially for prompt shipment. The asking price is generally held at 8c. per lb., with spot offerings having changed hands in a small way at 7⅞c. per lb.

Caustic Soda—While export orders still are heard and some of good volume, it is evident that the demand from overseas has fallen off as standard makes have been offered at 3.40c. and other brands were free at 3.30c. for New York. Domestic buyers are taking deliveries with regularity, but total business for the week appeared to be on the decline. Prices for standard makes continue at 2½c. per lb., carlots, at the works, basis 60 per cent, and upward for smaller lots.

Fluoride of Soda—Increased production costs have been a factor in the market for domestic made fluoride and asking prices have responded. The quotation for round lots is now 11c. per lb. works. Offerings of imported also are firmer and 9½@9¾c. per lb. is asked.

Nitrate of Soda—Demand from the fertilizer trade has been of small proportions and prices for 95 per cent are easy as a result. There were offerings at $2.50 per 100 lb. f.o.b. Charleston, during the week, but spot material at New York was limited and was pretty well held at $2.60 per 100 lb. There were no new developments as far as shipments were concerned and new contract prices have not yet been named.

Nitrite of Soda—Imported material has been reaching the market in a rather large way. In fact the pressure of such offerings has had a depressing effect on prices and offerings were freely available on spot at 8c. per lb. For shipment 7¾c. per lb. could be done and with lower cables from primary points abroad the situation showed a decided change in buyers' favor.

Prussiate of Soda—The market for yellow prussiate of soda has settled at the 17½c. per lb. level. This price is quoted by first hands and any material held by others must meet this competition. Imported was largely neglected, with shipment prices reported fractionally higher than the price asked for domestic.

Miscellaneous

Acetate of Lime—The new price list was in effect throughout the week and sellers agree that price shading will not be a factor unless there is a change in fundamental conditions which will admit of manufacture at a larger margin of profit. Current prices are 4@4.05c. per lb.

Acetone—For spot goods the price is 25c. per lb. and upward on a quantity basis. On round lot shipments from works the quotation is 24½c. per lb. The recent marking up in price brought about increased inquiry, but actual orders placed are said to be moderate.

Arsenic—There were reports of sales of white arsenic in the spot market at 15¼@15⅜c. per lb. Interest is keen but reports differ on the volume of business placed. Rather heavy arrivals from abroad were reported but most of these seemed to be destined to fill old orders. From the various reports heard it is clear that no decided price movement threatens. This is shown by offerings of immediate from Canada at 15c. per lb., with the same price quoted for May-June shipment. Until buying becomes more active it would seem that offerings are large enough to prevent any sharp advances in price.

Bleaching Powder—Recent slowing up in consuming demand has brought out some selling pressure. Producers who found goods accumulating began to cut values in order to attract new accounts and this has been done by so many factors that it is almost equivalent to a general lowering of prices on prompt shipment from 2c. to 1.90c. per lb. for large drums, f.o.b. producing point. The contract price is unchanged at 1.90c. per lb. works

Copperas—Producers report fairly active trading and a firm situation, business passing at $29@$29.75 per ton, f.o.b. works.

Copper Sulphate—There was no change in the position of imported sulphate and prices continue to be easy. On spot goods said to be of good quality are offered at 5½c. per lb., with the possibility of buying under that level on a firm bid. The same price applies to shipments. Domestic sulphate is affected somewhat by the competition from foreign, but some producers have a good part of their output sold ahead and are relying on quality to uphold demand for their goods even at a price differential. Prices for domestic are quoted at 6c. to 6.50c. per lb. according to seller and quantity.

Formaldehyde—Odd lots still appear on the market. Sales at 14¾c. per lb. were noted and it is believed that more lots at that figure can be located. In general, however, the market is working into a firmer position as 15c. per lb. is the lowest price of prominent factors and 15½c. per lb. is quoted by many. It is a question of cleaning up the second-hand lots before the market will settle at the higher level.

Methyl-Acetone—Makers announced an advance of 5c. per gallon, following closely upon the uplift in the market for acetate of lime. The revised schedule of prices quotes 80c. per gal. in tank cars and 85c. per gal. in drums, round-lot basis.

Tin Crystals—Lower price levels have been announced for May deliveries. The easier position of the metal market is responsible for the reduction in crystals. Current prices are 35½@36c. per lb., or a decline of 1½c. per lb. from the April figures. Bichloride of tin also was marked down and is offered at 12½@13c. per lb.

Denatured Alcohol Steadies

Some traders reported a better feeling in the market for denatured alcohol as outside offerings were not so much in evidence. The demand was fair and holdings were not considered large. On the No. 1 special the market held at 33c per gal. in drums, and 39c. per gal. in barrels, round-lot basis. The No. 1, 188 proof, completely denatured, was maintained at 41c. per gal., in drums. Ethyl spirits, U.S.P., 190 proof, closed unchanged at $4.70 per gal., in barrels. Producers of methanol reported the market as firm, but quotably unchanged at $1.18 per gal. for the 95 per cent, and $1.20 per gal. for the 97 per cent. The fact that other wood distillates were advanced about a week ago apparently had no influence on methanol.

Philip Weisenthal Arrested On Charges of Fraud

Philip Weisenthal, president of a chemical firm in Hamburg, Germany, and with New York offices at 565 Broadway, was arrested on Monday as he reached New York on the steamer "American Legion." Mr. Weisenthal is charged with defrauding the American Express Co of $300,000, secured as loans against fraudulent invoices. Sidney Hass, manager of the New York branch of the Weisenthal interests, also was taken into custody. Both men are charged with grand larceny and forgery.

It is stated that Weisenthal, after getting export invoices passed by the American consular agent at Hamburg, made out new invoices in which the value of the goods was increased materially over the amounts shown on the original invoices. The false invoices were then presented to the Hamburg agent of the American Express Co. and loans negotiated on the basis of the raised figures. Weisenthal led his pursuers a lengthy chase before being taken into custody. He left Germany for London and from the latter city sailed to Las Palmas, thence to Rio de Janeiro, to Buenos Aires, and from the latter port to New York.

Cobalt and Cellulose Imports Included in Return

Beginning on May 1, the Chemical Division of the Department of Commerce expanded its service of recording chemical imports through the port of New York by adding those chemicals covered by paragraphs 27 and 28 of the tariff law. Paragraph 27 refers to cobalt oxide and other cobalt salts and compounds. Paragraph 28 refers to compounds of pyroxylin and other cellulose esters.

Coal-Tar Products

Spot Phenol Steady—Consumers Not So Anxious Over Future Supply —Benzyl Chloride Higher—Creosote Oil Arrives From Hull

THE output of the byproduct coke ovens has increased steadily since the first of the year, yet the supply of coal-tar bases has not shown a corresponding gain. This is explained by the fact that producers and distillers have found it more profitable to utilize this material in crude form for heating purposes, manufacturing roofing materials, road-binders, etc. As a result the output of natural phenol is not likely to increase appreciably, and with sufficient tariff protection the trade is now looking forward to a larger output of the synthetic product. Phenol on spot sold in a small way during the past week at prices ranging from 55@57c. per lb., but on contract there was a possibility of doing business at close to 28c.

The drop in gasoline naturally led traders to look for an easier situation in benzol, but producers announced no change in their policy of marketing this commodity. The production is moving in a satisfactory way in motor fuel channels and so far as the pure grade is concerned prices are firmly maintained. The arrival of a cargo of creosote oil from Hull attracted much attention. The demand for creosote oils has been good and firm prices were the rule. Producers of benzyl chloride advanced contract prices. Benzaldehyde, technical, was in good demand. Naphthalene on spot was nominally unchanged. Cresylic acid was offered more freely by producers, and this was reflected in easier prices for the imported material for either immediate or nearby delivery. There were no new developments in connection with the tariff on cresylic acid. Xylenes were in scanty supply and so far as spot material was concerned the market was in a wholly nominal position.

Benzene—The production appears to be well taken care of despite numerous reports of a quiet state of trade. The decline in prices for gasoline did not change the attitude of producers, who seem to feel that consumption of motor benzol will not meet with any serious setback. Production of the pure benzol is moderate and prices ruled steady in nearly all directions. The 90 per cent benzol held at 27c., contract basis. The pure was unchanged at 30@32c. per gal., in drums, carload lots or more.

Creosote Oils—A round lot of creosote oil arrived at New York last week from Hull. The market was fairly active and with domestic production well taken care of prices were firmly maintained. On the 25 per cent grade the market settled at 34@36c. per gal.

Cresylic Acid — New production is coming in, and this influenced holders of foreign material to offer supplies a little more freely. Nominal quotations on the 97 per cent grade, in drums, ranged from $1.25@$1.30 per gal.

Naphthalene — New contract prices were not announced, but a feeling prevails that the range will be higher than last year, when the bulk of the output of domestic producers sold at 6½@7c. per lb. The spot market for ball and flake was nominal at 9½@10c. per lb. Demand was not up to expectations.

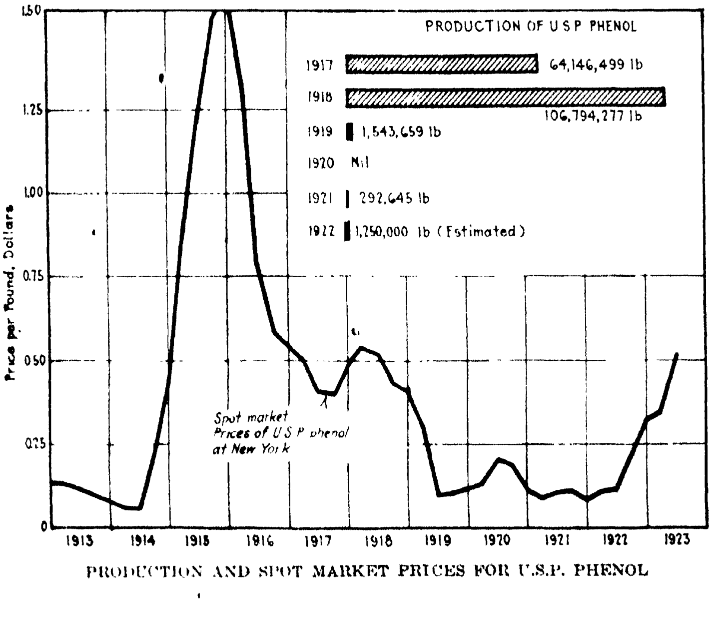
Phenol—Scattered lots of spot material sold through second-hands at 55@57c. per lb. The traders were not so bullish on forward material, feeling that enough new production of the synthetic phenol would come on the market in the near future to take care of the expansion in business. On contract material producers were not openly quoting, but it was reported that last sales went through around 28c. Producers were not at all pleased with the efforts of speculative traders to "bull" the market.

Benzyl Chloride — Production will soon be increased so as to meet the requirements of the trade, but prices will be raised because of the higher cost of manufacture. The leading producer will revise his schedule on the 95@97 per cent refined to 45c. per lb. and on the technical to 30c. per lb., deliveries to commence in July.

Benzaldehyde—There was a good call for the technical grade at 75c. per lb. in drums and 80c. in cans. The market closed firmer.

Salicylic Acid—Demand was quiet all last week, but with stocks moderate prices were steady at 47@48c. for the technical.

Xylene—The pure in drums, on spot, sold through outside channels at 95c.@$1 per lb. The contract price was unchanged at 75c. per lb.



PRODUCTION AND SPOT MARKET PRICES FOR U.S.P. PHENOL

Trade Notes

The Naphthalene Products Co. is a new concern at Birmingham, Ala., which has begun to manufacture refined naphthalene products.

The purchase by Certainteed Products Corporation of the properties of Cook's Linoleum Co. and the Standard Inlay Co. has been ratified by the stockholders of all of the corporations and titles have been passed.

John D. Ryan, chairman of board of directors of the Anaconda Copper Mining Co., in commenting on the income statement of the company, stated that the zinc oxide plant at East Chicago operated throughout the year and produced 2,008,535 lb. Construction of an operating unit of a French process plant with capacity of approximately 16,000 lb. of zinc oxide daily was about completed, while a similar plant was in process of construction at Akron, Ohio.

The Air Reduction Co. has leased offices in the Canadian Pacific Building, Madison Ave. and 44th St.

The United Smelting & Aluminum Co., Inc., of New Haven, Conn., has opened a new warehouse at 216-218 Water St., New York City, to which it is also removing its offices.

The annual meeting and election of officers of the Paint, Oil and Varnish Club of New York will be held on Thursday, May 10, at Delmonico's. Senator Royal S. Copeland will be the guest of honor.

The plant of the Cornwall Chemical Corporation, at Cornwall, below Newburgh, was destroyed by fire May 1, with an estimated loss of $100,000. The fire started when chemicals, leaking from a storage tank, came in contact with boilers and exploded.

Vegetable Oils and Fats

Linseed Oil Futures Lower—Nearby Cottonseed Oil Steady—China Wood Easier—Coconut Unsettled—Tallow Declines

TRADING in vegetable oils and animal fats was quiet all week and the tendency of prices, taken as a whole, was toward lower levels. Liquidation in imported linseed oil resulted in a very unsettled market for the foreign material. Domestic linseed oil for summer delivery went off fully 5c. per gal. Shorts were buyers of May cottonseed oil in the option ring and this served to steady prices for the old crop months. Crude was nominally unchanged. China wood oil was offered more freely for shipments. Easier prices obtained for coconut, soya, palm and sesame oils. Tallow again went off, outside goods equal to extra bringing 8¼c. per lb. delivered. There was little or no buying interest in fish oils for future delivery.

Linseed Oil—Crushers continued to offer spot oil in a rather limited way and prices held on the $1.17 per gal. basis for carload lots, cooperage included. On futures, however, the situation eased off until several crushers appeared anxious for July forward business at $1.05 per gal., carload lots, cooperage basis. Demand was quiet all week and the larger consumers could not be interested in forward material. The fact that close to 5,000,000 bushels of seed are now afloat consigned to United States ports led many to take the stand that the oil situation will soon right itself. Argentine shipments continue at a liberal rate and last week saw several offerings of Indian seed at a premium of only 15c. per bushel over the prevailing c.i.f. quotation on the Argentine product. A small parcel of Moroccan seed also was available. With indications of a larger acreage in the northwest the seed supply in sight for the remainder of the year looms up rather large, notwithstanding the healthy increase in the volume of oil sales. Domestic cake prices were steady so far as crushers were concerned, the market settling around $36.50 per ton, f.a.s. New York. Imported oil was unsettled all week. Receipts were larger and this prompted some "profit taking" by the speculative element. Spot foreign oil sold down to $1.05 per gallon, in barrels, Private advices from London reported sales of bulk oil for June-July shipment to America. May shipment from the other side closed nominally at $1.05 per gal., in barrels, duty paid.

Cottonseed Oil—May oil in the option market on the Produce Exchange was steady to firm on covering by shorts. Futures were unsettled on the general weakness in other commodities. The sugar investigation put a damper on speculative activity. New crop developments attracted attention and several private preliminary estimates on acreage indicated an increase in the plantings of approximately 10 per cent. May oil, prime summer yellow, sold up to 11.83c. during the week. December sold under 9c. per lb. Crude held at 10c. mills on actual sales. Rumors that this figure could be shaded lacked confirmation. Bleachable oil was offered at 11¼c., buyers' tanks, f.o.b. New York, with no buyers. Cash trade in cooking oil and lard compound was slow, yet no weakness developed in the local market. Operators now believe that the April consumption figures when available may show that not more than 150,000 barrels were disposed of. Lard stocks in Chicago increased 21,000,000 pounds during the month of April. Lard compound was nominally unchanged at 13½c. asked, carload lots, f.o.b. New York. Oleo stearine was easy at 10½c., with no sales.

China Wood Oil—The undertone was easier on free offerings from the coast. Spot oil settled at 35@38c. per lb., while on futures there were sellers at 26@27c. per lb., f.o.b. New York, according to position. Trading was dull.

Coconut Oil—The coast market for Ceylon type oil was unsettled with sales of several tank cars of May at 8⅞c. Most traders, however, continued to ask 9c. on coast business. Ceylon type oil was offered in the New York trade at 9¼c. per lb., sellers' tank cars, immediate shipment. Copra was quiet but unchanged at 5⅜@5⅝c. per lb., c.i.f. coast, standard brands. Copra cake was offered at $31@$32 per ton, f.a.s. New York.

Corn Oil—The market held at 10⅜c. per lb. tank cars, f.o.b. point of production, or 10½c. Chicago.

Olive Oil Foots—There were offerings of Greek prime green foots for immediate shipment from the other side at 9½c. per lb. landed weights, ex-dock New York.

Palm Oils—Lagos oil sold to tin-plate mills at 8⅜c. per lb. nearby delivery. Niger oil sold on spot at 7¼c. per lb., while on futures there were offerings at 7¾c. per lb.

Soya Bean Oil—Bulk oil for shipment from the Orient was worked at 7.75c. per lb. in bond, c.i.f. New York. The coast market on nearby crude settled at 10⅜@10½c. per lb. sellers' tanks, duty paid, a decline of ⅛c. for the week. Demand was less active because of the unsettled market for linseed oil for future delivery.

Fish Oils—There were offerings of crude menhaden oil for future delivery, "if made," at 50c. per gal. in tanks, f.o.b. fish factory. No sales were reported. Newfoundland tanked cod oil closed at 70c. per gal., in barrels, f.o.b. New York.

Tallow and Greases—The last sale of extra special tallow went through at 8½c. per lb., f.o.b. plant, a decline of ¼c. Outside goods, equal to extra in quality sold at 8¼c. per lb. delivered. The market was easy at the close. At the London auction, held May 2, 1,716 casks were offered and 424 were disposed of. Prices realized were unchanged to 1 shilling lower. Yellow grease in the New York trade closed at 8c. nominal

Miscellaneous Materials

Glycerine—The feature in the market was the firmer position of crude glycerine, several cars selling at 10¾@11c. per lb., on the soap-lye, basis 80 per cent, the top figure prevailing towards the close. There were bids at 11c. on Friday. Saponification was more or less nominal at 12½@12¾c., loose, basis 88 per cent. There were no transactions in saponification. Dynamite was offered at 16¾c., in drums, carload lots, f.o.b. New York territory, with last sales at 16½c Chemically pure was unsettled in some directions and a little business was placed at 17¾c. per lb., in drums. Refiners generally held out for 18c. per lb.

Shellac—The market was quiet and irregular, closing prices being slightly lower than a week ago. T. N. was offered at 69c. on spot. Bleached, bone-dry, held at 82@84c. per lb., nearby delivery. Superfine orange was available at 74@76c. per lb. Cables from Calcutta were easier and speculators were disposed to favor the bear side for the time being. Demand was routine only so far as the consuming trades were concerned.

Naval Stores—A sharp drop in spirits of turpentine occurred last week, amounting to 12c. per gal. The demand fell away because of the recent showing of weakness and with new crop offerings on the increase the market favored buyers. At the close the nominal quotation stood at $1.30 per gal. Rosins also were easier, but no important price movement took place. Rosin oils closed unchanged.

Lithopone—Demand was seasonally active and with no change in basic materials, prices held at 7@7¼c. per lb. carlots, the inside obtaining for bags.

White Lead—Another drop in the price of the metal failed to bring out a change in the market for lead pigments. Pig lead closed at 7¾c. per lb., which compares with 8c. a week ago Demand for white lead was fairly active. Corroders have sent a notice to the trade offering lead pigments for shipment through to August on a guarantee against decline basis. Standard dry white lead, basic carbonate, held at 9¾c. per lb. in casks, carload lots or more.

Zinc Oxide—Spelter was easier, but not so as to influence the market for oxide. Prices held on the basis of 8c per lb. for the American process, lead free, carload lots. The French process, red seal, was unchanged at 9¾c. per lb. Several plants are under construction to produce Franch process oxide, according to reports.

Imports at the Port of New York

April 27 to May 8

ACIDS—12 dr cresylic, Manchester, Order, 85 dr cresylic, London, Celluloid Co., 100 bg stearic, Hamburg, Innis, Speiden & Co., 60 dr cresylic, Glasgow, Order.

ALCOHOL—51 csk. butyl, Bordeaux, Order

ALIZARINE—12 csk., Liverpool, A Klipstein & Co.

AMMONIUM—22 cs. phosphate, Hamburg, Bengol Trading Co., 42 csk muriate, Liverpool, Brown Bros. & Co., 10 cs carbonate, Liverpool, Brown Bros. & Co

ANTIMONY SULPHIDE—14 csk, F B Vandegrift & Co

ARSENIC—28 csk., Bordeaux, N Y Trust Co, 144 dr, Durban, C Tennant Sons & Co., 100 bbl., Tampico, American Metal Co, 100 cs., Rotterdam, Lunham & Moore, 215 csk., Marseilles, Order.

ASBESTOS—1,300 bg, Cape Town Irving Bank-Col Trust Co., 626 bg, Durban D. D Crumpton.

BARIUM CHLORIDE—212 pkg, Hamburg, Roessler & Hasslacher Chem Co, 24 bbl., Hamburg, Innis, Speiden & Co, 28 bbl, Hamburg, Order, 11 csk, Hamburg, Order, 12 csk, Hamburg, Innis, Speiden & Co., 26 csk, Hamburg, E Suter & Co.

BARYTES—399 bg, Bremen, N Y Trust Co

BLANC FIXE—68 bbl., Hamburg, A Murphy & Co, 4 csk, Hull, Meteor Products Co.

BRONZE COLOR—41 cs, Bremen, Baer Bros.

CASEIN—10 bg, Hamburg, Hensel, Bruckman & Lorbacher 266 sk., Bordeaux, J A W Bird, 50 sk Bordeau, Monito Waterproof Glue Co. 584 bg, Buenos Aires, T. M. Duche & Sons, 1393 bg, Buenos Aires, Brown Bros & Co, 1,812 bg., Buenos Aires Kalbfleisch Corp, 274 bg., Buenos Aires, Brown Bros & Co, 700 bg., London, Brown Bros & Co.

CALCIUM CHLORIDE—317 dr, Hamburg, Blackburn Trading Co., 323 dr, Hamburg, H J Baker & Bro

CAMPHOR—280 cs, Hamburg, A. Oehse & Co

COAL-TAR DISTILLATE—38 dr., Liverpool, Order.

CHEMICALS—80 bbl, Hamburg, Roessler & Hasslacher Chem. Co, 25 pkg, Hamburg, Jungmann & Co, 112 pkg, Hamburg, Order, 74 cs, Bremen, Pfaltz & Bauer, 126 csk, Rotterdam, Hummel & Robinson, 20 bbl, Hamburg, Hummel & Robinson, 27 csk., Hamburg, Jungmann & Co, 100 pkg, Gothenburg, Powers, Weightman & Rosengarten

CHALK—1,150 bg Antwerp, Bankers Trust Co, 508,000 kilos, Dunkirk, J W. Higman & Co.; 1,666,317 kilos, Dunkirk, Tainter Trading Co, 500 tons, London, Baring Bros. & Co., 1,000 tons, London, Tainter Trading Co.

COLORS—55 cs bronze, Hamburg, Bank of the Manhattan Co, 2 bbl. aniline, Hamburg, Fezandie & Sperrle, 21 csk do., Hamburg, H. A. Metz & Co, 21 csk. do., Hamburg, Bank of the Manhattan Co, 21 csk. do, Hamburg, G. A Kuhl; 37 csk do., Hamburg, Guaranty Trust Co; 4 csk do., Hamburg, N Y Color & Chemical Co., 7 csk do., Hamburg, Carbic Color & Chemical Co, 45 csk do., Hamburg, Grasselli Chemical Co; 50 csk do Hamburg, Kuttroff, Pickardt & Co, 7 csk do., Hamburg, Guaranty Trust Co 4 cs, do, Hamburg, J. C. Robold & Co, 12 csk aniline, Hamburg, H. R Jahn, 10 csk do., Hamburg, Franklin Imp & Export Co.; 4 dr. aniline, Southampton, Order, 20 csk dry, Southampton, Order; 11 csk aniline, Hamburg, Kuttroff, Pickardt & Co, 56 csk aniline, Hamburg, E. C Foster, 42 pkg do., Antwerp, Geigy Co., 100 csk venetian red, Liverpool, J L. Smith & Co.; 190 pkg. dry colors, Hull, J. L Smith & Co.; 4 csk. vermilion, London, C H. Powell & Co; 17 cs aniline, Havre, Sandoz Chem. Works, 8 csk. do., Havre, Irving Bank, 10 bbl. aniline, Genoa, Nat'l Aniline & Chem Co, 24 bbl. do., Genoa, Order.

COPPER SULPHATE—107 bbl., Hamburg, Order; 94 csk., London, Ore & Chem. Corp.; 100 csk., Liverpool, Westminster Bank; 129 bbl., Hamburg, Order.

COPRA—75 bg, Port Antonio, Order.

CREOSOTE—100 csk., Manchester, T. D. Downing & Co, Round lot of oil in bulk, Hull Order

DEGRAS—162 bbl., Hull, Order.

DIVI-DIVI—983 bg, Maracaibo, Am Trading Co, 1,781 bg., Maracaibo, Paris & Co 1,652 bg, Monte Cristi, N Y & Hanseatic Co.

EPSOM SALT—48 bg, Bremen, A Blank, 500 bg, Bremen, Globe Shipping Co.; 835 bg Hamburg, Innis, Speiden & Co.; 218 csk Hamburg, Roessler & Hasslacher Chem Co

FUSEL OIL—8 dr., Dunkirk, Guaranty Trust Co, 11 dr., Dunkirk, Order

GLYCERINE—20 csk, Bordeaux, Order, 25 csk., Marseilles, Brown Bros & Co, 60 cs Marseilles, Order.

FUSTIC—460 pc, San Juan de Sur, W. R Grace & Co

GUMS—60 bg damar, London, S Winterbourne & Co., 305 bg. copal, Antwerp, Central Union Trust Co.; 345 bg do., Antwerp, Chemical Nat'l Bank; 102 bg copal, Antwerp, Order, 35 bg copal and 70 cs. damar, Singapore, France, Campbell & Darling, 385 bg copal, Singapore, Order, 200 cs damar, Batavia, Chem. Nat'l Bank, 100 cs. damar, Batavia, Nat'l City Bank, 181 sk copal, Matadi, L. C Gillespie & Sons, 230 cs. damar, London, France, Campbell & Darling, 1,604 bg. copal, Matadi, L. C. Gillespie & Sons; 579 bg copal, Matadi, Niger Co; 100 cs damar, Singapore, Baring Bros. & Co., 420 pkg arabic, Sudan, Thurston & Braidich, 1,210 pkg arabic, Sudan, Order, 114 bg copal, London, Order

GAMBIER—501 cs, Singapore, N. Y. Trust Co, 504 cs., Singapore, Order; 85 cs, London, Order.

IRON OXIDE—28 bbl, Malaga, C. F. Olson & Co, 100 bbl, Malaga, E. M & F Waldo, 38 bbl, Malaga, L H Butcher & Co, 125 bbl, Malaga, Reichard-Coulston, Inc, 10 csk, Liverpool, C B Crystal & Co, 72 csk., Liverpool, Reichard-Coulston, Inc, 34 csk, Liverpool, J Lee Smith & Co.

LYCOPODIUM—179 pkg, London, Order.

MAGNESITE—88 csk., Rotterdam, Speiden-Whitefield Co.

MAGNESIUM—20 csk sulphate, Manchester, Order, 50 cs calcined, Newcastle, Order, 250 dr chloride, Hamburg, Innis, Speiden & Co.; 61 dr chloride, Hamburg, A. Kramer & Co.

MANGROVE—1,600 bg, Beira, Cooper & Cooper

MYRBANE—12 dr., Manchester, Rendrock Powder Co.

NAPHTHALENE—269 bg, Manchester, Order, 1 cs, London, J. C. Robold & Co

OILS—Castor—150 bbl., Hull, Order. **Cod**—300 bbl, Aberdeen, Order. **China Wood** 223 bbl., London, Order, 30 bbl., London, S. Winterbourne & Co, 584 csk. Hankow, Equitable Eastern Banking Co **Linseed**—177 bbl., Rotterdam, Welch, Holme & Clarke Co., 143 bbl, Rotterdam, Meteor Products Co; 141 bbl., Rotterdam, Bur Mac Chem. Corp; 128 dr, Rotterdam, W. Van Doorn; 665 bbl., Rotterdam, Order; 200 bbl, Hull, Order, 444 bbl., London, Irving Bank-Col Trust Co.; 438 bbl., London, Nat'l City Bank; 295 bbl., London, Order. **Olive Foots** (sulphur oil) —699,830 kilos in bulk, Bari, Order; 350 bbl., Naples, Banco Commercial Ital.; 200 bbl., Naples, Banca Comm Italo. **Palm** — 264 csk, Liverpool, Niger Co.; 1,017 csk., Matadi, Niger Co; 1,635 csk, Matadi, Niger Co, 33 csk, Grand Bassam, Oelrichs & Co., 171 csk., Liverpool, Fourth Nat'l Bank; 174 csk, Liverpool, D. Bacon; 70 csk, Liverpool, Niger Co.; 25 csk., Liverpool, Thornett & Fehr, 138 csk., Liverpool, Nat'l Bank of Commerce, 5 csk., Liverpool, Order. **Rapeseed**—500 bbl, Hull, Vacuum Oil Co.; 600 dr, Liverpool, Vacuum Oil Co.; 188 bbl., Liverpool, Busk & Daniels.

PHOSPHATE—200 bg. bone, Antwerp, Hollingshurst & Co.; 1,250 bg. bone, Antwerp, Order.

POTASSIUM SALTS—46 bbl. carbonate, Hamburg, Hans Hinrichs Chem. Corp.; 20 bbl prussiate, Hamburg, Broedermann & Litzrodt, 237 bbl nitrate, Brown Bros. & Co, 240 dr., permanganate, Hamburg Meteor Products Co.; 28 dr. permanganate, Hamburg, Bengol Trading Co.; 100 dr permanganate, London, Order; 135 csk salts, Hamburg, Roessler & Hasslacher Chem Co., 1,500 bbl chlorate, Hamburg, Columbia Trust Co., 75 dr. caustic, Hamburg, Peters, White & Co.; 1,000 csk chlorate, Hamburg, Columbia Trust Co.; 700 csk. do., Hamburg Mech. & Metals Nat'l Bank, 13 csk. chlorate, 79 dr. caustic, 68 csk alum, Hamburg, Order; 13 csk. carbonate, Bremen, P. H. Petry & Co.; 17 csk. permanganate, Rotterdam, Order, 1,000 bg. sulphate, Bremen, A. Vogel; 19 dr permanganate, Hamburg, Bengol Trading Co., 20 dr permanganate, Hamburg, S. Rosenblatt; 65 csk. salts, Hamburg, E Suter & Co, 208 dr. salts, Hamburg, Superfos Co, 125 dr. caustic, Hamburg, E. Suter & Co, 65 csk carbonate, Hamburg, Goldschmidt Corp., 4,000 bg. muriate, Hamburg, Order, 1 lot manure salts, Hamburg, Order

QUEBRACHO—21,211 bg., Buenos Aires, Order.

SEEDS—Linseed—47,834 bg and 1,165,212 kilos in bulk, Buenos Aires, Order; 69,672 bg, Rosario, Order; 34,190 bg., Buenos Aires, Order, 43,349 bg., Rosario, Spencer Kellogg & Sons, 24,330 bg., Buenos Aires, Spencer Kellogg & Sons

SAL AMMONIAC—75 bbl., Hamburg, Hans Hinrichs Chem Corp.; 29 bbl., Hamburg, Roessler & Hasslacher Chem Co.; 28 csk., Hamburg, Order.

SHELLAC—700 pkg, London, Order, 15 bg garnet, Hamburg, Kasebler-Chatfield Shellac Co, 30 cs. garnet, Hamburg, Order, 17 bg garnet, Hamburg, Irving Bank-Col. Trust Co, 4 cs, Hamburg, Broedermann & Litzrodt, 18 bg. garnet, Hamburg, Order

STARCH—1,000 bg. potato, Rotterdam, Stein-Hall & Co, 500 bg do., Rotterdam, Spier, Simmons & Co.; 250 bg. do, Rotterdam; Order

SODIUM SALTS—113 dr salts, Hamburg, C S Grant & Co., 360 pkg salts, Hamburg, Roessler & Hasslacher Chem. Co, 300 bbl. chlorate, Hamburg, Monmouth Chemical Co, 300 csk hyposulphite, Hamburg, Order, 50 bg. silicate, Hamburg, Order; 500 csk nitrite, Hamburg, Kuttroff, Pickhardt & Co; 1,580 cs. cyanide, Hamburg, Roessler & Hasslacher Chem. Co.; 200 csk. hyposulphite, Hamburg, Order; 50 csk. perborate, Hamburg, Order, 160 csk. nitrate, Brevik, Norwegian Nitrogen Products Co, 175 csk. nitrite, Hamburg, E Suter & Co.; 250 bg. sulphate, Hamburg, A. J Marcus, Inc.; 42 csk. bisulphite, Hamburg, Order, 48 csk. nitrite, Bergen, Order, 100 csk hyposulphite, Marseilles, E. Walters, 125 csk. do., Marseilles, Nat'l City Bank.

SUMAC—350 bg, Palermo, Order

TALC—200 bg., Bordeaux, E. M. & F. Waldo; 150 bg, Bordeaux, Reichard-Coulston, Inc., 400 bg., Bordeaux, L. A. Salomon & Co, 400 bg., Genoa, Order.

TARTAR—46 csk. crude, Naples, Tartar Chemical Works; 110 sk, Marseilles, C. Pfizer & Co, 83 sk., Marseilles, Tartar Chem Works, 140 sk., Lisbon, Tartar Chem Co; 100 sk., Bilboa, Tartar Chem. Co.

TALLOW—445 csk. beef, Buenos Aires, Order.

WAXES—387 bg ozokerite, Hamburg, J. Dick; 52 bg. carnauba, Cara, London & Braz. Bank; 111 bg. carnauba, Cara, Order, 47 bg. bees, Cardenas, D. Steengrafe; 12 bg bees, Santo Domingo, J. J. Julia; 8 bg. bees, Santo Domingo, F. Ricart & Co.; 63 bg. bees, Rio de Janeiro, Order; 50 cs. bees, Hamburg, Hummel & Robinson; 48 cs bees, Havana, Order

WHITING — 380 bg, Dunkirk, Taintor Trading Co.

ZINC CHLORIDE—37 csk., Hamburg, Order.

ZINC OXIDE — 25 bbl., Antwerp, Reichard-Coulston, Inc.; 22 bbl., Hamburg, A. Kramer & Co.; 400 bbl., Marseilles, Bankers Trust Co.

ZINC WHITE — 50 bbl., Marseilles, Reichard-Coulston, Inc.

Current Prices in the New York Market

For Chemicals, Oils and Allied Products

THESE prices are for the spot market in New York City, but a special effort has been made to report American manufacturers' quotations whenever available In many cases these are for material f.o.b. works or on a contract basis and these prices are so designated. Quotations on imported stocks are reported when they are of sufficient importance to have a material effect on the market. Prices quoted in these columns apply to large quantities in original packages.

General Chemicals

Acetic anhydride, 85%, drums	lb	$0 38 –	
Acetone, drums	lb.	25 –	25½
Acid, acetic, 28%, bbl	100 lb.	3 38 –	3 50
Acetic, 56%, bbl	100 lb.	6 75 –	7 00
Glacial, 99½%, bbl.	100 lb.	12 00 –	12 50
Boric, bbl	lb.	.11 –	11½
Citric, kegs	lb.	49 –	50
Formic, 85%	lb.	.14½ –	17
Gallic, tech.	lb	45 –	50
Hydrofluoric, 52%, carboys	lb.	.12 –	12½
Lactic, 44%, tech, light, bbl.	lb	.11½ –	12
22%, tech, light, bbl.	lb	05½ –	06
Muriatic, 18° tanks	100 lb	90 –	1 00
Muriatic, 20°, tanks	100 lb.	1 00 –	1 10
Nitric, 36°, carboys	lb	04½ –	05
Nitric, 42°, carboys	lb.	.06 –	06½
Oleum, 20%, tanks	ton	18 50 –	19 00
Oxalic, crystals, bbl	lb.	.13½ –	13¾
Phosphoric, 50% carboys	lb.	.07½ –	.08½
Pyrogallic, resublimed	lb.	1 50 –	1 60
Sulphuric, 60°, tanks	ton	9 50 –	11 00
Sulphuric, 60°, drums	ton	13 00 –	14 00
Sulphuric, 66°, tanks	ton	16 00 –	16 50
Sulphuric, 66° drums	ton	20 00 –	21 00
Tannic, U S P, bbl	lb.	65 –	70
Tannic, tech, bbl	lb.	.45 –	50
Tartaric, imp crys, bbl	lb.	.36½ –	
Tartaric, imp, powd, bbl	lb.	36½ –	
Tartaric, domestic, bbl.	lb.	37½ –	
Tungstic, per lb	lb.	1.10 –	1 20
Alcohol, butyl, drums, f o b works	lb	.26 –	28
Alcohol ethyl (Cologne spirit), bbl	gal	4 75 –	4 95
Ethyl, 190 p'f U S P, bbl	gal	4 70 –	
Alcohol, methyl (see Methanol)			
Alcohol, denatured, 190 proof			
No 1, special bbl	gal	.39 –	41
No 1, special, dr	gal	33 –	35
No. 1, 188 proof, bbl	gal	.40 –	42
No 1, 188 proof, dr	gal	34 –	36
No 5, 188 proof, bbl	gal	38 –	40
No 5, 188 proof, dr	gal	.32 –	34
Alum, ammonia, lump, bbl	lb	.03½ –	03¾
Potash, lump, bbl	lb.	03 –	03½
Chrome, lump, potash, bbl	lb.	.05½ –	05¾
Aluminum sulphate, com., bags	100 lb.	1 50 –	1 65
Iron free bags	lb	02½ –	02¾
Aqua ammonia, 26°, drums	lb	.06½ –	07½
Ammonia, anhydrous, cyl	lb	.30 –	30½
Ammonium carbonate, powd casks, imported	lb	.09½ –	10
Ammonium carbonate, powd domestic, bbl	lb	.13 –	.14
Ammonium nitrate, tech, casks	lb	10 –	11
Amyl acetate tech, drums	gal.	3 50 –	3 75
Arsenic, white, powd, bbl.	lb	15 –	15½
Arsenic, red, powd, kegs	lb	14½ –	15
Barium carbonate, bbl.	ton	78 00 –	80 00
Barium chloride, bbl.	ton	90 00 –	95 00
Barium dioxide, drums	lb.	.18 –	18½
Barium nitrate, casks		.08 –	08½
Barium sulphate, bbl.	lb.	04 –	04¼
Blanc fixe, dry, bbl	lb.	.04½ –	.04¾
Bleaching powder, f o b wks., drums	100 lb.	1 90 –	
Spot N. Y. drums	100 lb.	2 40 –	
Borax, bbl.	lb.	05½ –	05¾
Bromine, cases	lb.	28 –	30
Calcium acetate, bags	100 lb	4 00 –	4 05
Calcium carbide, drums	lb.	04½ –	04¾
Calcium chloride, fused, drums	ton	22 00 –	23 00
Gran. drums	ton	28 00 –	30 00
Calcium phosphate, mono, bbl.	lb.	.06½ –	07
Camphor, cases	lb.	.86 –	.88
Carbon bisulphide, drums	lb.	.07 –	.07½
Carbon tetrachloride, drums	lb.	.10 –	.
Chalk, precip.—domestic, light, bbl	lb.	.04½ –	.04¾
Domestic, heavy, bbl.	lb.	.03½ –	.03¾
Imported, light, bbl	lb.	.04½ –	.05
Chlorine, liquid, cylinders	lb.	.06 –	.06½
Chloroform, tech., drums	lb.	.35 –	.38
Cobalt oxide, bbl.	lb	2 10 –	2 25
Copperas, bulk, f.o b wks.	ton	19 00 –	20.00
Copper carbonate, bbl.	lb	19 –	.20
Copper cyanide, drums	lb	47 –	.50
Coppersulphate, crys., bbl	100 lb.	6 00 –	6.25
Cream of tartar, bbl.	lb.	.25½ –	.26½
Epsom salt, dom., tech, bbl.	100 lb.	1 90 –	2.15
Epsom salt, imp., tech, bags	100 lb.	1.00 –	1 15
Epsom salt, U.S.P., dom, bbl.	100 lb.	2.50 –	2.60
Ether, U.S.P., drums	lb.	.13 –	.15
Ethyl acetate, com., 85%, drums	gal.	.80 –	.85
Ethyl acetate, pure (acetic ether, 98% to 100%)	gal.	.95 –	1.00
Formaldehyde, 40%, bbl.	lb.	.14½ –	.15½

Fullers earth—imp, powd	net ton	$30 00 –	$32 00
Fusel oil, ref, drums	gal	3 55 –	4 05
Fusel oil, crude, drums	gal	2 30 –	2 40
Glaubers salt, wks, bags	100 lb	1 20 –	1 40
Glaubers salt, imp, bags	100 lb	85 –	.95
Glycerine, c p, drums extra	lb	.18 –	18½
Glycerine, dynamite, drums	lb	16½ –	16¾
Glycerine, crude 80%, loose	lb	11 –	11½
Iodine, resublimed	lb	4 55 –	4 65
Iron oxide, red, casks	lb	12 –	.18
Lead:			
White, basic carbonate, dry, casks	lb	09½ –	.10
White, basic sulphate, casks	lb	09½ –	
White, in oil, kegs	lb	.12½ –	14
Red, dry, casks	lb	11½ –	12
Red, in oil, kegs	lb.	13½ –	.15
Lead acetate, white crys, bbl	lb.	13½ –	14
Brown, broken, casks	lb	12½	
Lead arsenate, powd, bbl	lb	23 –	24
Lime-Hydrated, bbl	per ton	16 80 –	17 00
Lime, Lump, bbl	280 lb	3 63 –	3 65
Litharge, comm, casks	lb	.10½ –	.11
Lithophone, bags	lb	07 –	07½
in bbl	lb	07 –	07¾
Magnesium carb, tech, bags	lb	08 –	.08½
Methanol, 95%, bbl	gal.	1 18 –	1 20
Methanol, 97%, bbl	gal.	1 20 –	1 22
Nickel salt, double, bbl.	lb	10½ –	.
Nickel salts, single, bbl.	lb.	11½ –	.
Phosgene		.60 –	.75
Phosphorus, red, cases	lb.	35 –	40
Phosphorus, yellow, cases	lb.	30 –	35
Potassium bichromate, casks	lb	11 –	.11½
Potassium bromide, gran, bbl	lb	19 –	.20
Potassium carbonate, 80-85%, calcined, casks	lb	.06½ –	07
Potassium chlorate, powd	lb	07½ –	08
Potassium cyanide, drums	lb	.45 –	50
Potassium, first sorts, cask	lb.	.09	09½
Potassium hydroxide (caustic potash) drums	lb	08½ –	09
Potassium iodide, cases	lb	3 65 –	3 75
Potassium nitrate, bbl.	lb.	06¾ –	.07½
Potassium permanganate, drums	lb.	22 –	22½
Potassium prussiate, red, casks	lb.	.70 –	.75
Potassium prussiate, yellow, casks	lb.	.37 –	37½
Salammoniac, white, gran, casks, imported	lb.	.07 –	07½
Salammoniac, white, gran., bbl, domestic	lb.	.07¾ –	.08
Gray, gran, casks	lb.	08 –	09
Salsoda, bbl.	100 lb.	1 20	1 40
Salt cake (bulk).	ton	26 00 –	28.00
Soda ash, light, 58% flat, bags, contract	100 lb.	1 60 –	1.67
Soda ash, light, basis, 48%, bags, contract, f.o b. wks.	100 lb.	1.20 –	1 30
Soda ash, light, 58%, flat, bags, resale	100 lb.	1.75 –	1.80
Soda ash, dense, bags, contract, basis 48%	100 lb	1.17½ –	1 20
Soda ash, dense, in bags, resale	100 lb.	1 85 –	1 90
Soda, caustic, 76%, solid, drums, f.a.s.	100 lb	3 30 –	3.40
Soda, caustic, basis 60%, wks, contract	100 lb	2.50 –	2 60
Soda, caustic, ground and flake, contracts.	100 lb.	3 80 –	3.90
Soda, caustic, ground and flake, resale	100 lb.	3 72½ –	.
Sodium acetate, works, bags	lb.	05½ –	.06¼
Sodium bicarbonate, bbl	100 lb.	2.00 –	2.50
Sodium bichromate, casks	lb.	.08 –	
Sodium bisulphate (niter cake)	ton	6.00 –	7.00
Sodium bisulphite, powd., U.S.P., bbl.	lb.	.04½ –	.04¾
Sodium chlorate, kegs	lb.	.06½ –	.07
Sodium chloride	long ton	12.00 –	13.00
Sodium cyanide, cases	lb.	.20 –	.23
Sodium fluoride, bbl.	lb.	$0.09½ –	$0 10
Sodium hyposulphite, bbl.	lb.	.02½ –	.03
Sodium nitrite, casks	lb.	.08 –	.08½
Sodium peroxide, powd, cases	lb.	.28 –	.30
Sodium phosphate, dibasic, bbl.	lb	.03½ –	.04
Sodium prussiate, yel drums	lb.	.17½ –	.18
Sodium silicate (40°, drums)	100 lb.	80 –	1.25
Sodium silicate (60°, drums)	100 lb.	2.00 –	2.25
Sodium sulphide, fused, 60-62% drums	lb.	04½ –	.04¾
Sodium sulphite, crys, bbl.	lb.	.03½ –	.03¾
Strontium nitrate, powd, bbl.	lb	.09½ –	.10
Sulphur chloride, yel drums	lb.	.04½ –	.05
Sulphur, crude	ton	18.00 –	20.00
At mine, bulk	ton	16 00 –	18.00
Sulphur, flour, bag	100 lb.	2 25 –	2.35
Sulphur, roll, bag	100 lb.	2.00 –	2.10
Sulphur dioxide, liquid, cyl.	lb	.08 –	.08½
Talc—imported, bags	ton	30 00 –	40.00
Talc—domestic powd, bags	ton	18 00 –	25.00
Tin bichloride, bbl	lb.	.12½ –	.13¾
Tin oxide, bbl.	lb.	.50 –	
Tin crystals, bbl	lb.	.35½ –	.36
Zinc carbonate, bags	lb.	.14 –	.14½
Zinc chloride, gran, bbl.	lb.	.06 –	.07
Zinc cyanide, drums	lb.	.37 –	.38
Zinc oxide, lead free, bbl	lb.	.08 –	.08½
5% lead sulphate bags	lb.	.07½ –	......
10 to 35% lead sulphate, bags	lb.	.07 –	......
French, red seal, bags	lb.	09½ –	......
French, green seal, bags	lb.	.10½ –	......
French, white seal bbl	lb	12 –	......
Zinc sulphate, bbl	100 lb.	2.50 –	3.00

Coal-Tar Products

Alpha-naphthol, crude, bbl.	lb.	$0 65 –	$0.80
Alpha-naphthol, ref, bbl	lb	.75 –	.90
Alpha-naphthylamine, bbl	lb.	.36 –	38
Aniline oil, drums	lb.	.16 –	.16½
Aniline salts, bbl	lb	24 –	.25
Anthracene, 80%, drums	lb.	.75 –	1.00
Anthracene, 80%, imp, drums, duty paid.	lb.	.70 –	.75
Anthraquinone, 25%, paste, drums	lb	70 –	.75
Benzaldehyde U S P, carboys	lb.	1 40 –	1.45
tech, drums	lb	75	80
Benzene, pure, water-white, tanks and drums	gal.	.30 –	.32
Benzene, 90%, tanks & drums	gal	.27 –	.30
Benzene, 90%, drums, resale	gal.	.30 –	.33
Benzidine base, bbl	lb.	.85 –	.90
Benzidine sulphate, bbl.	lb.	.70 –	.75
Benzoic acid, U S P, kegs	lb.	.72 –	75
Benzoate of soda, U S P., bbl.	lb.	.57 –	.65
Benzyl chloride, 95-97%, ref, drums	lb.	.45 –	.
Benzyl chloride, tech, drums	lb.	.30 –	.35
Beta-naphthol, subl, bbl.	lb.	.55 –	.60
Beta-naphthol, tech, bbl	lb.	.23 –	.23½
Beta-naphthylamine, tech	lb.	.80 –	.90
Carbazol, bbl	lb.	.75 –	.90
Cresol, U.S P, drums	lb.	.25 –	.29
Ortho-cresol, drums	lb.	.28 –	.30
Cresylic acid, 97%, resale, drums	gal.	1 30 –	...
95-97%, drums, resale	gal.	1.25 –	.
Dichlorbenzene, drums	lb.	.07 –	.09
Diethylaniline, drums	lb.	.50 –	.60
Dimethylaniline, drums	lb.	.42 –	.43
Dinitrobenzene, bbl	lb.	.19 –	.20
Dinitroclorbenzene, bbl	lb.	.22 –	.23
Dinitronaphthalene, bbl	lb.	.30 –	.32
Dinitrophenol, bbl	lb.	.35 –	.40
Dinitrotoluene, bbl	lb.	.20 –	.22
Dip oil, 25%, drums	gal.	.25 –	.30
Diphenylamine, bbl	lb.	.50 –	.52
H-acid, bbl.	lb.	.85 –	....
Meta-phenylenediamine, bbl.	lb.	1.00 –	1 05
Michlers ketone, bbl	lb.	3.00 –	3.50
Monochlorbenzene, drums	lb.	.08 –	.10
Monoethylaniline, drums	lb.	.95 –	1.10
Naphthalene, flake, bbl.	lb.	.09½ –	10
Naphthalene, balls, bbl	lb.	.09¾ –	.10¼
Naphthionate of soda, bbl.	lb.	.58 –	.65
Naphthionic acid, crude, bbl.	lb.	.55 –	.60
Nitrobenzene, drums	lb.	.10 –	.12
Nitro-naphthalene, bbl.	lb.	.30 –	.35
Nitro-toluene, drums	lb.	.15 –	.17
N-W acid, bbl.	lb.	1.25 –	1.30
Ortho-amidophenol, kegs.	lb.	2.30 –	2.35
Ortho-dichlorbenzene, drums	lb.	.17 –	.20
Ortho-nitrophenol, bbl	lb.	.90 –	.92
Ortho-nitrotoluene, drums	lb.	.10 –	.12
Ortho-toluidine, bbl	lb.	.14 –	.15
Para-amidophenol, base, kegs	lb.	1.20 –	1.30
Para-amidophenol, HCl, kegs	lb.	1.25 –	1.35
Para-dichlorbenzene, bbl.	lb.	.17 –	.20
Paranitraniline, bbl.	lb.	.74 –	.75
Para-nitrotoluene, bbl.	lb.	.60 –	.65
Para-phenylenediamine, bbl.	lb.	1.45 –	1.50
Para-toluidine, bbl	lb.	.95 –	.98
Phthalic anhydride, bbl.	lb.	.35 –	.38
Phenol, U.S.P., drums	lb.	.55 –	.57
Picric acid, bbl.	lb.	.20 –	.22
Pyridine, dom., drums	gal.	nominal	
Pyridine, imp., drums	gal.	2.50 –	2.75

Resorcinol, tech., kegs......	lb.	$1.40 - $1.50
Resorcinol, pure, kegs...	lb.	2 00 - 2.10
R-salt, bbl.	lb.	.55 - .60
Salicylic acid, tech., bbl.	lb.	.47 - .48
Salicylic acid, U.S.P., bbl	lb.	.50 - .52
Solvent naphtha, water-white, drums	gal.	.37 - .40
Crude, drums	gal.	22 - 24
Sulphanilic acid, crude, bbl	lb	18 - .20
Thiocarbanilide, kegs	lb.	.35 - .38
Toluidine, kegs	lb.	1.20 - 1 30
Toluidine mixed, kegs...	lb.	30 - 35
Toluene, tank cars	gal.	.30 - 35
Toluene, drums	gal.	.35 - 40
Xylidines drums	lb	.45 - 47
Xylene, pure, drums......	gal.	.75 - 1 00
Xylene, com., drums	gal.	.37 -
Xylene, com., tanks...	gal.	.32 -

Naval Stores

Rosin B-D, bbl	280 lb	$6 30 - 6 35
Rosin E-I, bbl	280 lb	6 35 - 5 46
Rosin K-N, bbl	280 lb	6 40 - 6 50
Rosin W G-W W, bbl	280 lb	6 80 - 7 80
Wood rosin, bbl	280 lb	6 20
Turpentine, spirits of, bbl	gal	1 28 - 1 30
Wood, steam dist., bbl	gal	1 22 - 1 24
Wood, dest. dist., bbl	gal	1 05 - 1 10
Pine tar pitch, bbl	200 lb	6 00
Tar, kiln burned, bbl	500 lb	- 13 00
Retort tar, bbl.	500 lb	- 12 00
Rosin oil, first run, bbl	gal	45 -
Rosin oil, second run, bbl	gal	48 -
Rosin oil, third run, bbl	gal.	52 -
Pine oil, steam dist	gal	.80 -
Pine oil, pure, dest. dist	gal	.75
Pine tar oil, ref	gal.	.48 - ..
Pine tar oil, crude, tanks f o b Jacksonville, Fla	gal.	32 - 32½
Pine tar oil, double ref., bbl	gal.	- .75
Pine tar, ref., thin bbl	gal	25
Pinewood creosote, ref., bbl	gal	- .52

Animal Oils and Fats

Degras, bbl	lb	$0 03½ $0 04
Grease yellow, bbl	lb	08 - 08¼
Lard oil, Extra No 1, bbl	gal	92 - 94
Neatsfoot oil, 20 deg bbl	gal	1 30 -
No 1, bbl	gal	92 - 94
Oleo Stearine		.10½
Red oil, distilled, d p bbl	lb	11 - 11½
Saponified bbl	lb	11 - 11½
Tallow, extra, loose	lb	08½ -
Tallow oil, acidless, bbl	gal.	.95 - .97

Vegetable Oils

Castor oil, No 3, bbl	lb	$0 14 -
Castor oil, No 1, bbl	lb.	14½ -
Chinawood oil, bbl	lb.	38 - 40
Coconut oil, Ceylon, bbl	lb	10½ - 10¾
Ceylon, tanks, N Y	lb	.09¾
Coconut oil, Cochin, bbl	lb	10½ -
Corn oil, crude, bbl	lb	12½
Crude, tanks (f o b mill)	lb	10½ - 10¾
Cottonseed oil, crude (f o b mill), tanks	lb.	09½ - 10
Summer yellow, bbl	lb	12½ - .12¾
Winter yellow, bbl	lb	13½ - .13¾
Linseed oil, raw, car lots, bbl	gal	1 17 -
Raw, tank cars (dom.)	gal	1 12 -
Boiled, cars, bbl (dom.)	gal	1 19 -
Olive oil, denatured, bbl	gal.	1 15 -
Sulphur, (foots) bbl	lb	10 - 10½
Palm, Lagos, casks	lb	.08½ - 08¾
Niger, casks	lb	07½ - 08
Palm kernel, bbl	lb	.09½ - 10
Peanut oil, crude, tanks (mill)	lb.	.13½ -
Peanut oil, refined, bbl	lb.	.17 -
Perilla, bbl	lb.	.16½ - 16¾
Rapeseed oil, refined, bbl	gal	.84 - .85
Rapeseed oil, blown, bbl	gal	.90 - 91
Sesame, bbl	lb	12½ - 13
Soya bean (Manchurian), bbl	lb.	.13½ -
Tank, f o b Pacific coast	lb	.10½ -
Tank, (f o b N Y)	lb	.10½ - 10¾

Fish Oils

Cod, Newfoundland, bbl	gal	$0 70 - $0 72
Menhaden, light pressed, bbl.	gal	76 -
White bleached, bbl..	gal.	78 -
Blown, bbl	gal.	.82 -
Crude, tanks (f o b factory)	gal.	50 - 52
Whale No. 1 crude, tanks, coast	lb	.08 - ...
Winter, natural bbl	gal	.76 - 78
Winter, bleached bbl	gal	.79 - .80

Oil Cake and Meal

Coconut cake, bags	ton	$32.00 -
Copra, sun dried, bags, (c i f)	lb	.05¾
Sun dried Pacific coast	lb	05½ -
Cottonseed meal, f o b mills	ton	39 00 - 40 00
Linseed cake, bags	ton	36 50 -
Linseed meal, bags	ton	38 50 -

Dye & Tanning Materials

Albumen, blood, bbl	lb	$0 45 - $0 50
Albumen, egg, tech, kegs	lb.	.80 - 85
Cochineal, bags	lb	.35 - .36
Cutch, Borneo, bales	lb	.04½ - .05
Cutch, Rangoon, bales.....	lb.	.13 - .13½
Dextrine, corn, bags	100 lb.	3 64 - 3 69
Dextrine, gum, bags....	100 lb	3 99 - 4 09
Divi-divi, bags.......	ton	38 00 - 39.00
Fustic, sticks............	ton	30.00 - 35.00
Fustic, chips, bags..........	lb.	.04 - .05
Logwood, sticks	ton	28.00 - 30.00
Logwood, chips, bags........	lb.	.02½ - .03½
Sumac, leaves, Sicily, bags...	ton	$70 00 - $72 00
Sumac, ground, bags....	ton	65 00 - 67 00
Sumac, domestic, bags.. ...	ton	40 00 - 42 00
Starch, corn, bags	100 lb.	2.97 - 3 07
Tapioca flour, bags..	lb.	.05½ - .06½

Extracts

Archil, conc., bbl	lb.	$0.17 - $0 18
Chestnut, 25%, tannin, tanks	lb.	02 - .03
Divi-divi, 25%, tannin, bbl.	lb	.04 - .05
Fustic, crystals, bbl	lb	.20 - 22
Fustic, liquid, 42°, bbl.	lb.	08 - 09
Gambier, liq., 25%, tannin, bbl	lb	.08 - 09
Hematine crys., bbl	lb.	.14 - 18
Hemlock, 25%, tannin, bbl.	lb	.04 - 05
Hypernic, solid, drums	lb.	.24 - .26
Hypernic, liquid, 51°, bbl	lb	.14 - .17
Logwood, crys., bbl.	lb	19 - .20
Logwood, liq., 51°, bbl.	lb.	.09 - .10
Quebracho, solid, 65% tannin, bbl	lb	04½ - .05
Sumac, dom., 51°, bbl	lb	.06½ - .07

Dry Colors

Blacks-Carbongas, bags, f o b works	lb	$0 16 - $0 18
Lampblack, bbl	lb	12 - 40
Mineral bulk	ton	35 00 - 45 00
Blues-Bronze, bbl	lb	55 - 60
Prussian, bbl	lb	55 - 60
Ultramarine, bbl	lb	08 - 35
Browns, Sienna, Ital., bbl	lb	06 - 14
Sienna, Domestic, bbl	lb	03½ - 04
Umber, Turkey, bbl	lb	04 - 04½
Greens-Chrome, C P Light, bbl	lb	32 - 34
Chrome commercial, bbl	lb	.12 - 12½
Paris bulk	lb	30 - 35
Reds, Carmine No. 40, tins	lb	4 50 - 4 70
Oxide red, casks	lb	10 - 14
Para toner, kegs	lb	1 00 - 1 10
Vermilion, English, bbl	lb	1 30 - 1 32
Yellow, Chrome C P bbls	lb	20 - 21
Ocher, French, casks	lb	02½ - 03

Waxes

Bayberry, bbl	lb	$0 28 - $0 30
Beeswax, crude, bags	lb	20 - 23
Beeswax, refined, light, bags	lb.	.32 - .34
Beeswax, pure white, cases.	lb	.40 - .41
Candelilla, bags..	lb	24 - .25
Carnauba, No 1, bags ..	lb	.42 - 43
No. 2, North Country, bags	lb.	.23 - 23½
No 3, North Country, bags	lb	19½
Japan, cases	lb	14½ - 15
Montan, crude, bags	lb.	.04½ - .04¾
Paraffine, crude, match, 105-110 m p.	lb.	.04½ - .04¾
Crude, scale 124-126 m.p., bags	lb.	.03 - 03¼
Ref., 118-120 m.p., bags.	lb.	.03½ -
Ref., 125 m p., bags	lb.	.03¾ -
Ref., 128-130 m p., bags	lb.	.04½ - .04¾
Ref., 133-135 m p., bags.	lb	.05 - ...
Ref., 135-137 m p., bags	lb.	.05½ - .05¾
Stearic acid, sgle pressed, bags	lb.	.13½ -
Double pressed, bags	lb	.14½ -
Triple pressed, bags	lb.	.15½ - .16

Fertilizers

Ammonium sulphate, bulk, f o b works	100 lb.	$3 25 - $3 30
F a s double bags....	100 lb	3 85 - 3 90
Blood, dried, bulk	unit	4 25 -
Bone, raw, 3 and 50, ground	ton	27 00 - 30 00
Fish scrap, dom., dried, wks..	unit	nominal
Nitrate of soda, bags ..	100 lb.	2 60 - 2.65
Tankage, high grade, f.o.b. Chicago	unit	3 25 - 3 50
Phosphate rock, f.o.b. mines, Florida pebble, 68-72%..	ton	$4 00 - $4 50
Tennessee, 78-80%	ton	8 00 - 8 25
Potassium muriate, 80%, bags	ton	35 00 - 36.00
Potassium sulphate, bags basis 90%	ton	45 67 - ...

Crude Rubber

Para—Upriver fine..	lb	$0 28 - ..
Upriver coarse	lb	.23 - ..
Upriver caucho ball.	lb	.25 -
Plantation—First latex crepe	lb.	.31 - ....
Ribbed smoked sheets	lb	.31 - ....
Brown crepe, thin, clean	lb.	.29 - ..
Amber crepe No 1.	lb.	.29½ -.

Gums

Copal, Congo, amber, bags	lb	$0 12 - $0 13
East Indian, bold, bags	lb	.23 - 23½
Manila, pale, bags	lb	.20 - 20½
Pontinak, No 1 bags	lb	.20 - 20½
Damar, Batavia, cases	lb	.30½ - 31
Singapore, No 1, cases	lb	.34½ - 35
Singapore, No. 2, cases	lb	.24 - .25
Kauri, No 1, cases	lb	.65 - .67
Ordinary chips, cases	lb	.18 - 20
Manjak, Barbados, bags	lb	09 - 09½

Shellac

Shellac, orange fine, bags ..	lb.	$0.72 - ..
Orange superfine, bags......	lb.	.74 - .76
A. C. garnet, bags..	lb.	nominal
Bleached, bonedry.......	lb.	.82 - .84
Bleached, fresh. ...	lb	.70 - .71
T. N., bags............	lb.	.69 - .70

Miscellaneous Materials

Asbestos, crude No. 1, f.o.b., Quebec.......	sh. ton	$500 00-........
Asbestos, shingle, f.o.b., Quebec	sh. ton	$65.00 - $85.00
Asbestos, cement, f.o.b., Quebec	sh. ton	20 00 - 25.00
Barytes, grd., white, f.o.b. mills, bbl..	net ton	16.00 - 20.00
Barytes, grd., off-color, f o.b. mills bulk..	net ton	13.00 - 15 00
Barytes, floated, f.o.b. St. Louis, bbl ..	net ton	28 00 -
Barytes, crude f.o.b. mines, bulk ...	net ton	10 00 - 11 00
Casein, bbl., tech.	lb.	.22½ - .25
China clay (kaolin) crude, f.o b Ga	net ton	7.00 - 9 00
Washed, f o b Ga..	net ton	8 00 - 9 00
Powd., f o b Ga.	net ton	14 00 - 20 00
Crude f.o b Va.....	net ton	8 00 - 12 00
Ground, f o b Va...	net ton	14 00 - 20 00
Imp., lump, bulk	net ton	15 00 - 20 00
Imp., powd	net ton	45 00 - 50 00
Feldspar, No 1 pottery..	long ton	6 00 - 7 00
No. 2 pottery ..	long ton	4 00 - 5 50
No. 1 soap ...	long ton	7 00 - 7 50
No. 1 Canadian, f.o.b. mill	long ton	20 00 - 22 00
Graphite, Ceylon, lump, first quality, bbl	lb	06½ -
Ceylon, chip, bbl.	lb.	05½ -
High grade amorphous crude	ton	15 00 - 35 00
Gum arabic, amber, sorts, bags ..	lb	.15 - .16
Gum tragacanth, sorts, bags	lb	.50 .60
No 1, bags	lb	1.60 - 1 65
Kieselguhr, f o b Cal...	ton	40 00 - 42 00
F o b N Y	ton	50 00 - 55 00
Magnesite crude, f o b Cal	ton	14 00 - 15 00
Pumice stone, imp., casks	lb	03 - 05½
Dom., lump, bbl	lb	05 - .05½
Dom., ground, bbl	lb.	.06 - 07
Silica, glass sand, f o b Ind	ton	2 00 - 2 50
Silica, sand blast, f o b Ind	ton	2 50 5 00
Silica, amorphous, 250 mesh, f o b Ill	ton	17 00 - 17 50
Silica, bldg sand, f o b. Pa.	ton	2 00 - 2 75
Soapstone, coarse, f o b Vt, bags	ton	7 00 - 8 00
Talc, 200 mesh, f o b, Vt, bags	ton	6 50 - 9 00
Talc, 200 mesh, f.o.b Ga, bags ...	ton	7 00 - 9 00
Talc, 200 mesh, f.o b Los Angeles, bags.	ton	16 00 - 20.00

Mineral Oils

Crude, at Wells

Iridium	oz.	260 00@ 275 00
Palladium	oz	79 00
Mercury .	75 lb.	68 00-69 00

Finished Metal Products

	Warehouse Price Cents per Lb.
Copper sheets, hot rolled...........	25 50
Copper bottoms	30 75
Copper rods	25 25
High brass wire	19 50
High brass rods	17 00
Low brass wire	21 10
Low brass rods	22 00
Brazed brass tubing	24 25
Brazed bronze tubing	29 00
Seamless copper tubing	25 25
Seamless high brass tubing.......	23.50

OLD METALS —The following are the dealers' purchasing prices in cents per pound:

Copper, heavy and crucible......	11 30@ 11 50
Copper, heavy and wire	11 25@ 11 50
Copper, light and bottoms.........	9 25@ 9 50
Lead, heavy	5.75@ 6 00
Lead, tea	3.50@ 3 75
Brass, heavy	6.25@ 6 40
Brass, light	5 35@ 5 75
No. 1 yellow brass turnings..........	6.30@ 6 50
Zinc..........................	3.50@ 4.00

Structural Material

The following base prices per 100 lb. are for structural shapes 3 in. by ¼ in. and larger, and plates ¼ in. and heavier, from jobbers' warehouses in the cities named:

	New York	Chicago
Structural shapes..............	$3.29	$3.14
Soft steel bars................	3.19	3.04
Soft steel bar shapes..........	3.19	3.04
Soft steel bands...............	3 29	3.19
Plates, ¼ to 1 in. thick.........	3.29	3.14

Industrial

Financial, Construction and Manufacturing News

Construction and Operation

Arizona

GLOBE—The New Dominion Copper Co will make extensions and improvements at its plant to cost approximately $250,000, including the installation of additional equipment

Arkansas

EL DORADO—The Richardson Oil Co has tentative plans under consideration for the rebuilding of the portion of its plant destroyed by fire, April 18 with loss estimated at $75,000, including equipment

California

SAN FRANCISCO—The Paraffine Companies, Inc, 31 1st St, has plans in preparation for extensions and improvements in its 3-story plant on South Brannan St, near 3rd St, 275x275 ft, estimated to cost close to $40,000 The company has also broken ground for a plant addition at Antioch

SAN BERNARDINO—The Inland Oil Refinery Co, recently organized, has acquired property on West Rialto Ave for the construction of a new refining plant, to consist of a number of units Plans are under way for the first unit estimated to cost about $100,000, with machinery

LOS ANGELES—The Royal Dutch-Shell Oil Companies Inc., 343 Sansome St., San Francisco, has negotiations under way for the purchase of property at Watson Station, Wilmington, Los Angeles, as a site for a new refining plant It is reported that the initial works will cost in excess of $500,000.

FULLERTON—The Newton Process Co. has acquired a tract of land totaling about 30 acres, as a site for a new gasoline-refining plant, to operate under a recently perfected process. Plans will be prepared immediately. The company previously operated a plant at Santa Fe Springs, Calif. J. H and George Wentz, Anaheim, are heads

Colorado

DENVER—The Producers' & Refiners' Corp, California Bldg, has construction in progress on a new oil refinery at its properties in Wyoming, and plans for the early installation of machinery The initial unit will have a capacity of 10,000 bbl. per day.

Illinois

CHICAGO—The Standard Glass Co, 2533 Cottage Grove Ave, has filed plans for a new 2-story plant, 30x50 ft, at 2629 South Park Ave. R. A Williamson, 15 South LaSalle St, is architect

ARGO—The Corn Products Refining Co will commence immediately to rebuild the portion of its local plant destroyed by fire April 20, caused by an explosion. The estimated loss has not been announced.

CHICAGO—The National Lead Co., 900 West 18th St, will build a 1-story addition 35x100 ft., at its plant, 1711 Peoria St.

Indiana

VINCENNES—The Blackford Window Glass Co. will expend close to $500,000 for machinery for installation at its new local plant on which construction has been commenced. The works will cost approximately $800,000, complete

SHELBYVILLE—The Shelbyville Mirror Co., 450 East Henricks St., has tentative plans for the construction of a new plant, estimated to cost close to $50,000 with equipment.

HUNTINGTON—The Indiana Rubber Products Co., recently organized, has commenced the remodeling of its proposed local works, comprising the former plant of the Rapid Rim Co., and will convert for a modern rubber factory The installation of machinery will soon be commenced. C H. McDermott is president

Kentucky

OWENSBORO—New gas-purifying and scrubbing equipment will be installed at the local artificial gas plant of the Kentucky Public Service Co, estimated to cost approximately $35,000

Louisiana

SWARTZ—The Century Carbon Co has awarded a contract to the Rumbarger Engineering Co, Monroe for the construction of a new carbon black plant on local site recently acquired, estimated to cost approximately $250,000, including machinery.

Maine

RUMFORD—In connection with proposed improvements and new equipment at its local mill to cost about $250,000, previously announced the Oxford Paper Co purposes to build a complete new plant unit estimated to cost approximately $1,000,000, with machinery Plans will be drawn at an early date

Maryland

BALTIMORE—The United States Industrial Chemical Co has completed plans for the construction of a 1 story addition to its plant on the Patapsco County Rd., 50x250 ft

Massachusetts

STOUGHTON—The Meade Rubber Co. has commenced the construction of a 2-story addition, to increase the plant output about 50 per cent A list of machinery to be installed will soon be arranged E R. Simpson, 176 Federal St, Boston, is engineer.

AMHERST—The State Agricultural College has perfected plans for the immediate resumption of construction on the proposed chemical laboratory on the campus, and purposes to push the structure to completion It will be 3-story, 44x112 ft., estimated to cost close to $300,000, with equipment.

CAMBRIDGE—The Lever Brothers Co., Portland St, manufacturer of soaps, washing compounds, etc, will commence extensions and improvements in its plant to cost approximately $30,000.

LEOMINSTER—The Viscaloid Co., manufacturer of composition products, has construction under way on a new 2-story plant, 40x100 ft, on Lancaster St, estimated to cost $27,000

Michigan

STURGIS—D. A Hopping is perfecting the organization of a company to take over and operate the plant of the Utility Mfg. Co, recently acquired for the manufacture of paper products. The structure will be remodeled and improved, and equipment installed

Minnesota

MINNEAPOLIS—The Twin City Brass & Aluminum Foundry Co, 815 Washington St, S E, has tentative plans for the rebuilding of the portion of its plant destroyed by fire, April 21, with loss approximating $25,000.

ST PAUL—The Waldorf Paper Products Co will soon take bids for the construction of a new mill, estimated to cost close to $100,000, including equipment

Mississippi

JACKSON—The Buckeye Cotton Oil Co., Mill St., is perfecting plans for the rebuilding of the portion of its plant recently destroyed by fire with loss estimated at about $30 000. Additional equipment will be installed.

Missouri

JOPLIN—The General Explosives Co. will rebuild the portion of its plant destroyed

by an explosion on April 25. An official estimate of loss has not been announced.

ST. LOUIS—The Columbia Oil Co., 3417 Papin St., has plans for the construction of a new storage and distributing plant to replace its works lately destroyed by fire with loss estimated at about $75,000, including equipment.

Montana

GREAT FALLS—The Sunburst Refining Co. has increased the appropriation for its new oil-refining plant on site recently acquired at West Great Falls, and the initial unit will be enlarged. It is estimated to cost about $300,000, with machinery. W. M. Parker is construction engineer, and E. T. Wyatt general manager.

New Jersey

NEWARK—Kaufherr & Co., 42 Garden St., operating a leather tannery, have filed plans for the erection of a 1-story addition and will commence work at once.

BLOOMFIELD—The Condensite Co., Grove St., has broken ground for the construction of a new addition to its rubber insulation plant estimated to cost approximately $35,000.

New York

BROOKLYN—The Ancasco Chemical & Color Co., Inc., 123 Nostrand Ave., is arranging for the immediate occupancy of its proposed new plant at 61-63 Taaffe Pl., where property recently was leased. It will be equipped for the production of shellac, wood finishers and kindred products.

TONAWANDA—The National Roofing Co., Fillmore Ave., manufacturer of composition roofing products, is planning for the rebuilding of the portion of its plant destroyed by fire, April 20, with loss estimated at $75,000, including equipment.

TOTTENVILLE, S. I.—The Tottenville Copper Co., Arthur Kill Rd. and Bethel Ave., has authorized plans for the rebuilding of the portion of its plant destroyed by fire April 22, comprising eleven buildings with machinery, with loss estimated at close to $1,000,000. The rebuilding will cost approximately a like amount. Benjamin Lowenstein is president.

Ohio

MIDDLETOWN—Officials of the Paul A. Sorg Paper Co. have organized a subsidiary company to be known as the Frank Smith Paper Co., with capital of $1,500,000, to construct and operate a local mill. Plans have been completed for a 1-story mill unit, 250x600 ft., estimated to cost about $750,000, with machinery. Pretzinger & Musselman, Reibold Bldg., Dayton, O., are architects.

SEBRING—The Sebring Pottery Co. has work in progress on a new addition for increased production, estimated to cost about $30,000.

CINCINNATI—The Chemical Utilities Co., 1516 West 6th St., has plans for the rebuilding of the portion of its plant recently destroyed by fire with loss estimated at $50,000.

Oregon

ASTORIA—The Crown-Willamette Paper Co., 248 Battery St., San Francisco, Calif., has tentative plans under consideration for the construction of a new pulp mill at Young's River Falls, near Astoria, to cost more than $150,000 with equipment.

OREGON CITY—The Oregon Pulp & Paper Co. will soon commence the erection of a 3-story addition, estimated to cost about $75,000.

Pennsylvania

PHILADELPHIA—Woodward & Dickerson, Inc., 14 South Delaware Ave., manufacturer of fertilizer products, will make extensions and improvements in its plant at 143-5 Front St.

LEWISTOWN—The Pennsylvania Wire Glass Co., Pennsylvania Bldg., Philadelphia, is completing plans for the erection of the first unit of a new local plant, 100x500 ft., to cost in excess of $200,000, with machinery. Frank A. Hayes is engineer.

PITTSBURGH—The Standard Sanitary Mfg. Co., Bessemer Bldg., has filed plans for the erection of two additions to its plant at Preble Ave. and Ontario St., estimated to cost $70,000.

SPARTANSBURG—The Spartansburg Oil & Gas Co., lately organized, has broken ground for the construction of a new oil-refining plant to cost close to $200,000, with machinery.

South Carolina

LORIS—Rhodes & Hardwick are planning for the installation of a fertilizer plant in a local building, with initial capacity of about 75 tons per day.

Tennessee

KNOXVILLE—The Knoxville Glass Co. is arranging for the immediate erection of a new 2-story plant on North Broadway, estimated to cost close to $50,000. H. G. Kinney is head.

ERWIN—The Southern Potteries Co. is perfecting plans for the erection of a new plant addition, estimated to cost close to $100,000, with machinery. Charles W. Foreman is head.

Texas

ELSINORE—The Phillips Petroleum Co., Bartlesville, Okla., has commenced the construction of four new gasoline-refining plants at Bunger, Oil City, South Bend and Herron City, all in the same district, to cost about $700,000, including machinery.

HOUSTON—The Pinetree Products Co., West Bldg., has acquired property at Harrisburg, near Houston, for the erection of a new plant for the production of turpentine, paint, varnish, etc., with initial capacity of about 6,000 gal. per day. J. W. Barnes is general manager.

ROCKDALE—The Austin Petroleum Co. will commence the construction of an addition to its local oil-refining plant to increase the capacity by about 100 bbl. per day. The company was organized recently with A. C. Baldwin as president.

SAN ANTONIO—The San Antonio Portland Cement Co. has completed plans and will commence the construction of an addition to its mill for considerable increase in production. Willard E. Simpson is engineer.

BRECKENRIDGE—R. W. Raney is perfecting plans for the organization of a new company to construct and operate a plant in this vicinity for the manufacture of carbon black. It will cost about $200,000, including machinery. Permission has been granted and work will soon be commenced.

EL PASO—J. B. Spears, an official of Wells, Stilwell & Spears, Inc., has acquired a local building and adjoining site for the establishment of a new cottonseed oil mill. The structure will be improved and extended. The machinery installation is estimated to cost close to $60,000.

Virginia

RICHMOND—The Calcium Phosphate & Fertilizer Corp. has preliminary plans for the installation of additional equipment at its plant.

RICHMOND—The Economy Concrete Co., Inc., recently organized with a capital of $100,000, has acquired a tract of about 5 acres of land and plans for the construction of a new plant. It will cost about $45,000, including equipment. J. Scott Parrish is president.

Washington

ABERDEEN—The Western Oil Co. is planning for the construction of a new oil storage and distributing plant to cost about $10,000, including equipment. A similar plant will also be built at Hoquiam, Wash., to cost approximately a like amount.

Opportunities in the Foreign Trade

Parties interested in any of the following opportunities may obtain all available information from the Bureau of Foreign and Domestic Commerce at Washington or from any district office of the bureau. The number placed after the opportunity must be given for the purpose of identification.

CHEMICALS and all kinds fertilizers. All cattle feeding cakes. Purchase or agency.—6185.

LAUNDRY TABLETS in cake form. Bergen, Norway. Manufacturers' agency. Samples with offers desired.—6189.

CAMEL-HAIR FILTER-PRESS CLOTH. Alexandria, Egypt. Purchase. A sample showing the quality of cloth desired was forwarded and may be examined at the bureau or its district offices. (Refer to file 88,793.)—6193.

PARAFFIN and general drugs and chemicals. Oporto, Portugal. Purchase.—6205.

NITRATE OF SODA, about 10 tons; muriate of potash, about 15 tons; and phosphoric acid, about 10 tons. San Jose, Costa Rica. Purchase.—6206.

New Companies

WYATT RUBBER & CHEMICAL CO., 4000 Gough St., Baltimore, Md.; chemicals and rubber products; $50,000. Incorporators: Charles M. and C. E. Wyatt, and J. Lewis Warner.

PROTECTIVE COATINGS CORP., Kenilworth, N. J.; waterproofing products; 7,000 shares of stock, no par value. Incorporators: Thomas D. Osbourne, J. N. Dimmick and A. R. MacConnell, all of Kenilworth.

AMERICAN OLYMPIC OIL & REFINING CO., Bangor, Me.; refined petroleum products; $980,000. Frank Fellows, president, Raymond Fellows, treasurer, and James M. Gillian, Bangor, clerk and representative.

NEWTOWN BY-PRODUCTS MFG. CO., Brooklyn, N. Y.; oils, greases, etc.; $100,000. Incorporators: E. P. Arnold, E. R. Bohart and F. E. Ames, Brooklyn. Representative: F. J. Knorr, Albany, N. Y.

LIME BY-PRODUCTS CORP., Charleston, W. Va.; cement, lime, etc., $500,000. Incorporators: M. F. Matheny, J. S. Horan and G. L. Hartley, all of Charleston.

PACIFIC COAST FIBRE CO., Seattle, Wash.; fiber products, $750,000. Incorporators: Cassius E. Gates, S. F. Harwood. Representative: Hulbert, Gates & Helsell, 901 Alaska Bldg.

HIMMELEIN & BAILEY, INC., Camden, N. J., operate a leather tannery; $200,000. Incorporators: Frederick and F. E. Himmelein, and William G. Oaks, 807 Cooper St., Camden. The last noted is representative.

GELTAN CO., New York, N. Y., glue and other adhesive products; $300,000. Incorporators: John K. Tullis, Henry G. Stone and Edward M. Roche. Representative: Corporation Trust Co. of America, du Pont Bldg., Wilmington, Del.

NORTH BRANCH OIL CORP., Olean, N. Y., refined petroleum products, $500,000. Incorporators: H. L. Jacoby, J. I. Trenkle and A. E. Yahn. Representative: J. P. Quigley, Olean.

ENTERPRISE PAPER CO., Philadelphia, Pa.; paper products, $125,000. Nathan D. Isen, 2002 North Eighth St., is treasurer and representative.

ACME TILE MFG. CO., St. Petersburg, Fla.; cement tile and kindred products, $25,000. Harry Forkel, president, and Robert Arnold, secretary and treasurer, both of St. Petersburg.

GORDON REFINING CO., Wilmington, Del.; refined petroleum products, $5,000,000. Representative: Capital Trust Co. of Delaware, Dover, Del.

SOAP PRODUCTS CORP., St. Louis, Mo.; soaps, washing powders, etc.; $50,000. Incorporators: W. C. Harris, C. B. Brockett and F. S. Henderson, all of St. Louis.

UNITED PLATE GLASS CORP., Bridgeport, Conn.; glass products; $125,000. Incorporators: M. Cohen and Irving Elson, 400 Meigs Bldg., Bridgeport.

W. P. COLLINS OIL CO., 2619 Mary St., Chicago, Ill.; refined oils; 900 shares of stock, no par value. Incorporators: John J., Thomas P. and William J. Collins.

UNITED STATES SHEEPSKIN TANNING CORP., Brooklyn, N. Y.; leather tanning, $25,000. Incorporators: A. E. Wolz, H. Oppenheim and T. J. Healy. Representative: M. P. Schaffer, 1457-63 Broadway, New York.

AMERICAN CACTUS RUBBER PRODUCTS CO., Wilmington, Del.; rubber goods, $500,000. Representative: Colonial Charter Co., Ford Bldg., Wilmington.

STANDARD SOAP CORP., Oakland, Calif.; soaps, washing compounds, etc.; $1,000,000. Incorporators: John M. Simpson, Irving D. Hicok and A. E. Lees. Representative: Benjamin F. Woolner, First National Bank Bldg., Oakland.

DYDRA CHEMICAL PRODUCTS CO., Akron, O.; chemicals and chemical byproducts; $10,000. Incorporators: J. C. Timberous and C. E. Mills, both of Akron.

CUSTER PETROLEUM CORP., Wilmington, Del.; petroleum products; $250,000. Representative: Corporation Service Co., Equitable Bldg., Wilmington.

INTERSTATE REFINERIES, INC., Kansas City, Mo., operate oil refineries, $50,000. Incorporators: R. L. Langley, W. M. Bonner and J. O. Galloway, all of Kansas City.

EXCELSIOR CHEMICAL CO., 485 California St., San Francisco, Calif.; chemicals and chemical byproducts; organized with Anton Schaffhauser as head.

UNITED SUGAR CO., Kennebunk, Me., operate a sugar refinery; $2,000,000. John P. Deering, president; John C. Emmons, treasurer and representative, both of Kennebunk.

CHEMICAL & METALLURGICAL ENGINEERING

A consolidation of
ELECTROCHEMICAL & METALLURGICAL INDUSTRY *and* IRON & STEEL MAGAZINE

H. C. PARMELEE, Editor

Volume 28 New York, May 14, 1923 *Number* 19

Nitrogen Again To the Fore

A THOROUGH technical study of all important phases of the nitrogen industry has long been needed. During the war period and shortly thereafter, the Nitrate Division of the War Department made a significant study of nitrogen sources and possibilities, but this work was limited largely to the military aspects of the case. More recently the Fixed Nitrogen Research Laboratory, now under the auspices of the Department of Agriculture, has studied extensively the technology of nitrogen fixation and the possibilities of utilizing some nitrogenous raw materials such as cyanamide, but here again the problem has been largely that of one user interest—namely, the agricultural demands for inorganic nitrogen. Now fortunately the problem is to be approached from a different angle—the commercial and international aspects of nitrogen supply for all branches of industry.

Secretary HOOVER clearly regards this work as one of the most important phases of the survey of raw materials that was authorized in the closing hours of the last Congress. He rightly indicates that both agricultural and industrial considerations must be studied in order that adequate supplies of fixed nitrogen at reasonable prices may be available in the United States. Such study will, in part at least, answer the question: What are the prospects for a new nitrogen-fixing industry that may be made possible through further technical development of the cyanamide, the Haber, the cyanide and the arc processes? Or more specifically, what price limits must they meet in order to compete commercially?

It is a demonstrated fact that ammonia, nitric acid or any one of the important compounds of these two sources of inorganic nitrogen can be made successfully on a large scale by either the cyanamide or the Haber process. The cyanamide plant at Muscle Shoals was a complete technologic success. The Haber process plant at Syracuse has had most gratifying, and one might even say almost unexpected, success. Several other procedures for nitrogen fixation are equally promising from a technical point of view. But what of their commercial future?

The answer to this question will be determined by several independent factors. One of these factors is the minimum cost at which Chilean nitrate can be delivered in the United States. This, in turn, is fixed by the efficiency of nitrate recovery methods in Chile, by the magnitude of the export tax that Chile places upon nitrates, by ocean freight rates, and possibly even by American tariff protection. Another basic factor in determining the range and the average of inorganic nitrogen market prices will be the extent to which byproduct coke ovens are developed in the United States. Even at high prices for sulphuric acid, the modern coke oven cannot afford to operate without manufacturing ammonia liquor or ammonium sulphate. The ammonia is inevitably produced in the raw gas and in general it must be recovered before this gas is used or sold. The quantity of ammonium sulphate so produced is a factor in determining market tendencies; and at the present time with imposing increases in the byproduct coke-oven industry, this factor assumes enlarged importance.

All of these important influences will be analyzed in the survey contemplated by the Department of Commerce. Nor will this department work alone, for by law its efforts are to be supplemented by co-operation from all of the other branches of the government concerned. There is no question that all these agencies will gladly co-operate in the study, which is of mutual interest and importance.

Both Secretary HOOVER and Dr. KLEIN, director of the Bureau of Foreign and Domestic Commerce, in which the work will be done, appreciate the complexity and the importance of the task before them. However, they look forward with confidence to the result. They are particularly fortunate, too, in having selected for the task a man who knows this industry thoroughly. Dr. HARRY A. CURTIS, who will be in immediate charge of the investigation, has previously served as a captain in the Nitrate Division and as executive officer of the Fixed Nitrogen Research Laboratory of the Department of Agriculture. Thus he is well acquainted with the problems on which the government is equipped to assist. He also knows the situation at Muscle Shoals from extensive personal experience there; and the problems of the coke industry are well known to him through his experience during the past 3 years as a technical executive in that industry.

Every interest affected by the production or the supply of inorganic fixed nitrogen will be concerned in this study. The conclusions reached in it will be of large influence in determining the disposition of the government's properties at Muscle Shoals. They will largely determine the course of further industrial development in the industry during the coming decade, but with the favorable conditions which attend the beginning of this work, all can look forward with confidence and satisfaction. The Department of Commerce will do its work thoroughly. It will produce a well-balanced, constructive and fair report. It will doubtless upset the plans of some of the would-be industrialists who have desired a slice of the Muscle Shoals melon. It may even disturb the plans of some influential politicians. But in the end the results will be good, and industry should stand ready to give every possible assistance to the department, that its results may be achieved with the minimum of effort and the maximum of speed.

Electrochemical Society Honors E. G. Acheson

TO RECORD the award of honorary membership in the American Electrochemical Society to Dr. EDWARD G. ACHESON is a pleasant privilege These distinctions are worth while, eminently worth while, provided always good judgment prevails. There does not seem to be any method of rewarding the hard work that brings negative results, although many a fine life has been devoted to determining what not to do in the search for nature's secrets. But rewards of honor and distinction to those who reach important goals and who are the mediums of great contributions to human knowledge are none the less proper and worthy. They mark the high spots in achievement, and Dr. ACHESON has reached several of these All over the world methods of industry have been changed by his far-reaching activities in the study of conditions, in imagination, and in the will power and diligence to put his findings through.

Like a number of other American inventors, he was at one time associated with THOMAS A. EDISON. And like several of these, he also preferred to follow his own leads and to become, so to speak, an institution in himself.

The leads of Dr. ACHESON were practically all within the great domain of electrochemistry. Nearly every month some new use of one or another of the products of his inventions is discovered and the efficiency of manufacture is promoted. Why shouldn't such a benefactor be distinguished? The rewards of research in wealth are sometimes big and much more often they are very slight; but these honors have no bearing upon property. They are, in a way, unworldly; they outlast life and pass the name on into history. The occasion is unknown to the ignorant; the ceremony is modest; there are no great applauding crowds; but to the ear of the imagination there are, at such a time, ghostly trumpets and drums that sound the music of enduring fame.

Transportation And Our Prosperity

THERE may be some division of opinion as to the permanence of our present prosperity, but there can be no dissent from the view that its continuance depends in a large measure on the maintenance of adequate transportation facilities. Therefore, when the Chamber of Commerce of the United States, at its eleventh annual meeting, chose to discuss "Transportation in All Its Phases," it hit upon a theme of primary interest to every branch of business.

Freight rates are a significant item in manufacturing costs, particularly in industries such as ours that supply basic materials for further fabrication. But even more important is the element of delay and the great blight on industry resulting from the periodic shortage of cars and shipping facilities. It has been estimated that due to insufficient transportation during the past year the scarcity of coal alone penalized industry by an amount equivalent to more than half of all the freight charges paid on this commodity. Obstructions in the distribution of finished products may not always be as evident, but they are equally expensive to the ultimate consumer.

Under private management the railroads have made a remarkable comeback. By economies in operation and improved efficiency they have recently been able to handle a larger volume of traffic than ever before in their history. But during this time they have not been free from attack, and there is still the danger that radical legislation and ill-advised regulation will entirely throttle their progress. Pending before Congress at its last session were 134 separate bills designed to regulate the railroads and reduce their net incomes by lowering rates or revising valuations and rates of return. This antagonistic attitude threatens the investing public's confidence in railroad finances at a time when money is sorely needed for new rolling stock and other equipment as well as additional terminal and shipping facilities. It is evident from recent utterings of Senator LA FOLLETTE and other self-termed "progressives" that this campaign of destruction will be continued, and unless the saner representatives of the public vigorously oppose it, great harm will be done to the railroads and, therefore, to industry.

What is really needed is a sound national policy toward transportation that will provide adequately for future expansion, and at the same time properly co-ordinate the interests of both shipper and carrier. Good transportation is the crux of good business conditions and all who are interested in our permanent prosperity should recognize the seriousness of the present situation.

Up to Date In Going Backward

ACCORDING to CHARLES R. GOW, president of the Associated Industries of Massachusetts, taxes in the United States consumed in 1912 6.36 per cent of the nation's production. In 1921 this had increased to 16.7 per cent. That is, whoever worked at a gainful occupation, even if he worked 365 days in the year, spent 61 days to earn his proportionate share of taxes.

Before the war we used to consume 76 per cent of our production, leaving 24 per cent for taxes and new enterprises. If we consumed the same proportion last year--and we do not seem to have grown more provident since the war—we had left for taxes and new enterprises about $12,500,000,000. Of this sum, taxes took, roughly, about $8,500,000,000, leaving $4,000,000,000 for development. It is estimated that about $6,000,000,000 is needed to meet the reasonable expansion of our industries and the facilities to meet normal growth, so that we are as a nation about $2,000,000,000 short of our annual needs for legitimate progress.

Every dollar spent in public expenditures must be earned by somebody before it can be collected in taxes, so that, according to Mr. GOW, in order to get ahead we must produce more, spend less in taxes, or reduce the standards of living.

A large part of our taxes is for war debts, which, as Secretary WEEKS points out, are not properly to be considered as current military expenditures. No matter how peace loving we may be, we can't dodge debts. To be sure, there is great waste in the national budget, but there is also great neglect. We believe, however, that a careful analysis of government expenditures would show that, despite our preposterous Indian Bureau with its 5,000 to 6,000 clerks, the log-rolling river and harbor bills and bonuses and all sorts of easy-going munificences with public moneys there are works which should be undertaken and completed that would inhibit

even an ideal government from reducing expenses in any great measure. The change should be from useless outlays to useful ones.

Again, the old notion that money spent for luxuries and high living is kept in circulation and thus enriches somebody, no matter who he may be, will not go down any more. That is like paying men to carry stones from one field into another, and then to carry them back from the second field to the first. The men have earned a living and supported their families by the proceeds of their work, but there is no advancement in the process. We're not getting ahead by it. It is wealth consumed but not invested.

The only real way to meet the threat which Mr. Gow's figures represent is to save the pennies; to spend less than we earn and to put the money aside; to live modestly, to follow the homely advice of old BEN FRANKLIN. The most foolish ambition on earth is the desire to be up to date when we are going backward.

Changing Our Datum Points

UNITS of measurement and datum points are prime considerations to the technical man. They are fundamental in attacking any problem, and until they are settled definitely and precisely there can be no record of progress. Perhaps it is because HERBERT HOOVER is addicted to the engineer's methods of thinking that in his address last week before the Chamber of Commerce of the United States he felt the necessity for calling attention to our present methods of gaging business. "We must get our minds away from the notion that pre-war standards of living and volume of business are normal now." And, he added, "We must not be frightened when our output of steel, or textiles, or automobiles, or lumber, or corn, or our car loadings mount to figures far in excess of those that would be implied alone in a normal growth of population."

It was this necessity for changing our datum points that President BARNES of the National Chamber also stressed in a recent talk to the Merchants' Association of New York. The decade 1913-1922 witnessed tremendous expansion in business, he pointed out, due in no small measure to progress in science and invention, to labor-saving devices and other improvements in production processes, and to better management and administration. Briefest reference to business statistics shows how marked has been this change. From 1913 to 1922 our population increased from 95 000,000 to 110,000,000 and our annual income from $33,000,000,000 to $50,000,000,000. Savings almost doubled and national bank balances jumped from $6,000,000,000 to $16,000,000,000. But this growth in men and money was not without increased production efficiency and greater economy of human effort. Per capita earnings rose from $200 in 1890 to $600 in 1920 and the volume of factory production increased 95 per cent between the census years 1900 and 1920. But this progress is most striking when measured in terms of individual effort. From the metal industries, for example, we learn that pig iron production per worker in 1889 was 267 tons, and in 1919 it was 709 tons. In 1909 the output of automobiles amounted to 1.6 cars per person employed in the industry. By 1919 this had increased to 4.1 cars, while the capital investment per car had been lowered from $1,400 to $1,100.

Secretary HOOVER characterized the accomplishments of this decade in a single sentence: "A rough estimate would show that we could supply each person in the United States with the same amount of commodities he consumed 10 years ago and lay off 2,000,000 people from work." Fortunately, however, consumption and distribution have in general kept pace with production, so that this tremendous increment in output is marketed and consumed with but little apparent difficulty.

Perhaps some of our oldest industries have approached very near to saturation, but there is another great group that is only at the beginning of its development. In this category are many of our chemical and chemical engineering industries. Their growth can no more be measured in terms of 1913 production than can their future expansion be gaged on the basis of present performance. Who can say, for instance, what will be the saturation point for synthetic resins, or pyroxylin lacquers, or a special alloy, or some new food product? It is apparent that the time has come for us to change our datum points and to measure business progress on the basis of individual initiative and enterprise.

Ice Cream That Will Not Melt

IT IS not infrequent in our office to receive a call from a dignified, successful man in the, let us say, ice cream business. He has a scientific goal. He wants to produce ice cream that will not melt. No, really, we are not joking. Of course it is our duty to point out the fact that since the melting point of ice cream is considerably below room temperature, his desideratum is impossible.

If we did it in just that way, however, he would mistrust us and leave the office in the firm conviction that we would probably steal the idea or that science was bunkum. Actually we do suggest, for example, that unless considerable cornstarch is used the ice cream will melt out of shape but that with cornstarch or some other similar substance the ice cream would probably hold its shape even after it had melted. Of course it would no longer be ice cream and probably wouldn't taste very good, but perhaps it might be worth while getting someone to work on the problem.

So we get his royal ear, so to speak, and then we sow some real propaganda. Naturally, we say, the technical man you get to work on this job may not ever get non-melting ice cream, but he will solve a lot of other problems for you quite incidentally. For example, the corrosion of ice cream containers is a big expense; he may be able to help you there. This is bound up with the kind of salt you use in freezing. In addition there are raw materials and flavorings that have both an economic and a commercial side. On the one hand these should be cheap and on the other they must give a desirable product. On all these problems the technical man can work, and his work will be a positive benefit and a constructive factor. Thus non-meltable ice cream may become the minor end rather than the main problem.

And not infrequently we have been able to urge the business man to try out technical help. True, no ice cream manufacturer has come to us, but some men with ideas equally as foolish as non-meltable ice cream have come and seen and been persuaded. It is one of the ways of doing our bit for progress and humanity and the technical men.

Manufacture Of Chromium Steel

To the Editor of Chemical & Metallurgical Engineering

SIR:—A recent issue of *Revue de Métallurgie* contains a digest of an article by F. T. Sisco appearing in *Chemical & Metallurgical Engineering* for Jan. 11, 1922 (vol. 26, p. 71). In this article, entitled "The Manufacture of Chromium Ball-Bearing Steel in the Heroult Furnace," the author states: "The manufacture of electric high-carbon chromium ball-bearing steel has until recently been accompanied by the difficulty of producing a product which is free from surface seams and internal hair lines. This statement should not be construed to mean that no good ball steel is as yet made in the electric furnace. There are many manufacturers that are producing an excellent steel for this purpose, but the fact is they are not doing it consistently."

Your readers will doubtless be interested in learning that we have been making important quantities of ball-bearing steels by my system at Ugine, Savoy, at the "Forges & Aciéries Electriques P Girod" since 1912. During the war production of this analysis was at the rate of 6,000 tons per year, and for many years our plant has supplied practically the entire needs of French ball-bearing manufacturers. That this electric-furnace steel is not the least inferior to the best Swedish steels is proved by many tests—among them I may cite those made under the auspices of Hoffman, the distinguished technical administrator of the Compagnie d'Applications Mécaniques, and published in the official *Bulletin* of the Chambre Syndicale des Constructeurs d'Automobiles for July, 1922.

Fifteen bars were studied, three of each of the following analyses:

	C	Mn	Si	S	P	Cr
Swedish steel	0 97	0 30	0 30	0 01	0 03	1 49
Girod steel	1 03	0 24	0 17	0 07	0 02	1 19
Electric steel "C"	1 01	0 31	0 24	0 02	0 01	1 22
Electric steel "W"	1 03	0 17	0 29	0 01	0 01	1 58
Electric steel "K"	1 02	0 30	0 21	0 01	0 01	1 17

These bars were annealed to Brinell hardness of 200, making sure that their microstructure was comparable. Tension tests gave very uniform results, when individual samples are compared, indicating great uniformity in the bars. The test pieces show a pronounced neck, a very slight cup and cone fracture, and fine grain. Results follow:

	Elastic Limit	Ultimate Strength*	Elongation	Contraction
Swedish steel	99,100	183,000	39	24
Girod steel	104,800	183,000	44	24
Steel "C"	104,000	173,000	46	24
Steel "W"	110,000	185,000	41	23
Steel "K"	104,000	187,000	46	23

* Figured on area at neck

For testing in static flexure, pieces were machined 10x10x120 mm., heated for 5 minutes at 790 deg. C. in a salt bath, quenched in water, and gradually drawn back, reaching 180 deg. C. in 10 minutes. The pieces were tested on knife edges, 100 mm. apart, loaded centrally, and all broke with an excessively fine and silky grain. Breaking loads are as follows:

Swedish steel	1,550 kg	1,500 kg
Girod steel	1,500 kg.	1,500 kg
Steel "C"	1,700 kg	1,600 kg.
Steel "W"	1,550 kg.	1,600 kg.
Steel "K"	1,750 kg	

Thus no sensible differences can be noticed for these test samples, whether made by Swedish crucible process or by at least two styles of electric furnaces.

To make this steel, we at Ugine have always used a fusion with complete oxidation and without excessive temperature (which would produce suroxidation of the iron—a condition very difficult to correct), followed by a deoxidation stage at a temperature as low as is consistent with maintaining a fluid slag. Mr. Sisco recommends that in a Heroult furnace it is best to melt with only partial oxidation and deoxidize on a very hot bath. We have found that partial oxidation gives variable steel unless the raw materials are of very good quality and of uniform composition, whereas a consistently fine quality of steel may be made of rather variable raw materials if melted with complete oxidation. Our practice is followed not only for high-chromium carbon steel but also for other special steels, especially for armor-piercing shells.

From 20 years' experience with alloy steels, I have concluded that the faults found in electric steel are not due to chemical combinations, but most often to a high pouring temperature. Notably in chromium-nickel steel this results in abnormal crystallization, which is extremely difficult to break up and refine, even by very careful reheating.

The Resolution of Petroleum Emulsions

To the Editor of Chemical & Metallurgical Engineering

SIR:—In an article appearing in your journal[1] some time ago, Harold V. Dodd, writing on "The Resolution of Petroleum Emulsions," stated that the presence of asphalt is assumed to be the reason for the emulsion in crude petroleum oils. He also explained a number of elaborate measurements for combating the action of this asphalt.

If the asphalt is the interfering substance, why not remove it? The writer took a sample of Texas crude which had been in emulsion for about 10 years and on breaking the emulsion found it contained more than 50 per cent water. The resultant oil showed no emulsion by the centrifugal test.

These results were obtained by filtration, using infusorial earth as a filter-aid to hold back the colloidal carbon and asphalt.

I should be glad to hear of anyone who has had similar experience.

E. H. WILLIAMS.

British Chemical Industries

FROM OUR LONDON CORRESPONDENT

LONDON, April 18, 1923.

PRICES of chemical commodities are still firm, and this may be ascribed mainly to the situation in the Ruhr, competition from Germany being so small that it can almost be left out of account, although small stocks from Hamburg and Antwerp are still being offered. The fact is that production costs of British manufacturers are now in many cases below those on the continent, and with America consuming the bulk of her own production, there is likely to be considerable activity in British chemical industries during the next few months, a fact that is reflected to some extent by the recent remarkable rise in prices of chemical companies' stocks and shares. The budget introduced into the House of Commons 2 days ago, including as it did the 50 per cent reduction of the corporation tax on limited companies, together with the immediate prospect of a further reduction in railway rates, has not been without effect on the chemical trade.

INDUSTRIAL AND GENERAL DEVELOPMENTS

Speculation is rife as to the reason for the recent considerable appreciation in the shares of the British Cellulose Co., and important announcements are expected next month in regard to the production of acetyl cellulose silk and also in regard to the activities of Nobel industries. The subject of nitrogen fixation is again coming to the fore, and the breezy discourses of E. Kilburn Scott, whose activities in America are probably familiar to readers of *Chem. & Met.*, are very opportune, because public and governmental opinion in regard to empire nitrogen fixation has become somnolent and apathetic. There has been a tendency to assume that Brunner Mond and synthetic ammonia will have it all their own way and are too strong for others, but there can be no doubt that, at any rate in outlying parts of the empire, the arc and also the Häusser process will find application, while the latter can also be usefully developed alongside synthetic ammonia or cyanamide plants.

The increased use of decolorizing carbons has brought forth the usual crop of "new" processes, and there is certainly more competition at the present time in these products. It seems extraordinary that so little appears to be understood about the physical chemistry and constitution of these materials, which are only too often manufactured in a most unscientific and haphazard manner and without regard to economy or scientific control. This also applies to compound mixtures of decolorizing carbons with infusorial and other earths, and generally speaking the literature and information on the subject seem very deficient. Some interest has been aroused recently by the use of decolorizing carbons for medicinal purposes, and this presents a promising field for further investigation.

Further progress is reported in the various processes that are being developed by the Thermal Industrial & Chemical Research Co. in regard to the use of a bath of molten lead for the heat-treatment of various materials, particularly in cases where it is desired to reduce the time of treatment or reaction to a minimum. This company is a subsidiary of Woodall, Duckham & Jones and the pioneer work is being done by J. S. Morgan, who recently read a paper before the Coke Oven Managers' Association describing the application of the process to the low-temperature carbonization of shale and the like. It was stated that with a time of passage through the lead of less than 15 seconds, a lead bath 3 ft. 6 in. by 1 ft. 3 in. by 6 in. would treat 5 tons of material per day. A number of patents have been taken out for the treatment of other substances, and the same firm has also taken a hand in the barium carbonate process of nitrogen fixation, for which success has been claimed at the works of the British Cyanides Co.

The Departmental Committee on the Industrial Use of Lead and Leadless Paints has now reported against their abolition and considers that the chief danger has been the dry rubbing down of old paint, which should be adequately overcome by precautions directed toward wetting during rubbing down. This would merely involve the use of waterproof sandpapers and the matter is to be further considered by a technical commission to work in co-operation with the Department of Scientific and Industrial Research.

Combustion Myth to Be Settled

To establish or refute the general impression that salt or salt solutions, when sprinkled over fuel, have a beneficial effect, the Minister of Interior and Mines of Canada instructed the Dominion Fuel Board to undertake a series of experiments. From time to time liquids and powder have been placed on the market and extensively advertised, with the claim that they had the property of producing greater heat when applied to raw coal or to unburned cinders. In many of these preparations salt formed the basis, consequently the result of the experiments with this material are exceedingly valuable.

The tests were conducted under conditions identical to those which ordinarily apply in domestic heating furnaces, and, as completed, clearly demonstrate that salt, when sprinkled over fuel, has no beneficial effect, unless it be that the soot produced in combustion is packed down in the stove or furnace pipes.

The experiments were conducted at the Fuel Testing Station of the Mines Branch, where further tests on other materials which are claimed to have a beneficial effect upon fuel are being carried out.

Insecticide and Fungicide Symposium

Some recent developments in the use of insecticides and fungicides were brought out during the meeting of the American Chemical Society at New Haven. A symposium on the subject was conducted by the Division of Agricultural and Food Chemistry.

Analysis of the light and of the heavy white arsenic samples that show peculiar differences are explained partly by the different solubilities resulting from different sized crystals. The idea was set forth that this difference in size of crystals at least partly controlled the different results in use of this material as an insecticide. Addition of small amounts of lime influence the solubility of arsenic in the form of lead arsenate.

Bordeaux mixture is improved by the addition of a small amount of casein to one of the constituents of the mixture, when these two are put up in separate containers for dry storage. A mixture of 2 parts of copper sulphate to 1 part of lime is recommended.

The Chlorine Industry in the United States

An Economic Analysis of This Vitally Important Industry Shows That the Situation Is Serious With No Relief in Sight—This Article Presents the Data and Offers a Solution

BY PAUL S. BRALLIER

THE past 2 years has been a very trying time for the chlorine manufacturer. The fact that the same statement may be made of practically every other industrial division brings little comfort and no relief; for the troubles of the chlorine industry are the direct result of an extraordinary war expansion. The purpose of the following discussion is to present as accurate a picture of present conditions in the industry as available data will permit, and to suggest a means of overcoming the difficulties that are only too evident.

To begin with, the chlorine industry includes a great deal more than the preparation of chlorine by electrolyzing a salt brine in a suitably designed cell. The byproduct caustic liquor must be evaporated, and its salt content separated before caustic soda is ready for market; and the chlorine gas must be compressed and liquefied, or be combined with other reagents, before it is ready for sale. Thus the chlorine manufacturer must not only prepare the chlorine, but must absorb it as well, and his present problem can be stated very briefly as one of finding a suitable absorbent. For the purpose of this paper, the chlorine industry includes only those producers who market chlorine or its direct products.

A Few Notes on Size, Extent and Growth

As an indication of the size and importance of the chlorine industry, Bureau of Census figures for 1919 indicate a total annual tonnage of the various products, including caustic soda, of approximately 212,000 tons, with an aggregate value of about $16,000,000. This compares with a total valuation of $694,000,000 for all chemicals produced during the year. Chlorine and chlorine products have become necessities in a wide variety of industries and processes. They are indispensable in the paper industry; are finding increasing application in metallurgy; are widely used in general chemical and dye manufacture, and in the preparation of medicinal chemicals; are generally conceded to be most effective in sanitation and in water purification; have been applied to the refining of oils, and have played a most important rôle in warfare. The chlorine industry is therefore an essential industry, and any factors affecting its welfare are matters of general concern to industry as a whole.

The installed capacity for chlorine production in the United States is about 372 tons per day. This includes only the chlorine that is made for sale as chlorine or its direct products, and does not include chlorine made and used in the same plant, nor the chlorine capacity of the government plant at Edgewood Arsenal. Table I shows how this capacity is distributed among the various types of cell now in use.

The installed capacity is computed on the assumption that all cells installed are working at full load all the time. The actual continuous working capacity may be taken as approximately 300 tons per day. On this basis, and assuming that all the chlorine was made by the electrolysis of sodium chloride, the caustic soda produced by plants marketing chlorine and chlorine products during 1918 when all available chlorine capacity was being utilized would be 24 per cent of the total caustic production. The census figures for 1919 indicate 28.5 per cent of the total caustic soda production as electrolytic; but this includes caustic produced in plants consuming their own chlorine, so that 24 per cent seems to be a fair figure. A survey of the caustic soda manufacturing capacity of the country made by the War Department in 1917 showed that 20.6 per cent of the total capacity was electrolytic. Taking this lower ratio for the years 1914 to 1917 inclusive, and the higher for 1918 to 1922, the average daily chlorine production calculated from published data on caustic soda production is as shown in Table II. These figures are considered sufficiently broad to include the chlorine produced in the manufacture of caustic potash.

Going a step farther, and using the data of the census of chemical industries, the distribution of the chlorine produced among the various chlorine products has been tabulated in Table III.

These capacity, production and distribution data are presented with some misgivings, since they are for

TABLE I—INSTALLED CAPACITY OF VARIOUS CHLORINE CELLS

Cell	Tons Per Day	Cell	Tons Per Day
Nelson	79	Gibbs	64
Allen-Moore	55	Billiter-Siemens	31
Townsend	60	Wheeler	10
Castner	63	All others	10
			372

TABLE II—AVERAGE CHLORINE PRODUCTION IN THE UNITED STATES

Year	Tons Per Day	Per Cent of Working Capacity
1914	102	
1915	144	
1916	196	
1917	244	
1918	300	100
1919	180	61
1920	220	74
1921	133	45

TABLE III—CONSUMPTION OF CHLORINE AND CHLORINE PRODUCTS

Product	Tons Per Day 1919	Tons Per Day 1921	Tons Chlorine 1919	Tons Chlorine 1921	Per Cent of Total 1919	Per Cent of Total 1921
Bleaching powder	198	165	69	58	38.5	43.6
Liquid chlorine	47	49	47	49	26.1	36.8
Carbon tetrachloride	13	7	13	7	7.2	5.3
Chloroform	2.3	1.2	5	2.5	2.8	1.9

Chlor acetic acids						
All others						

the most part indirect. Installed capacity data for the Nelson and Allen-Moore cells were supplied by H. R. Nelson and by Kent R. Fox, of the Electron Chemical Co., respectively, and the figures for the Townsend cell have been published by A. H. Hooker in a paper read before the American Institute of Chemical Engineers. Installed capacities for the Billiter, Castner and Gibbs cells were figured from the percentages given in the government survey of caustic soda production in 1917, using the Hooker capacity as the basis of comparison. In the case of the actual daily chlorine production from 1914 to 1922, the applying of a flat percentage of total caustic soda production may be questionable; but the reticence of the chlorine fraternity prevents obtaining more reliable information.

Even with the above limitations in mind, however, the data given indicate a serious excess chlorine-producing capacity. The normal consuming capacity seems to be about 180 tons per day; and the remaining 120 tons working capacity represents a large capital investment that must necessarily lie idle, and that places an abnormal overhead charge against the actual production. Still more important is the fact that this excess capacity induces such keen competition among the various members of the industry that prices reach a level where amortization and depreciation charges are slighted, and expansion and development work curtailed, so that the future of the industry is endangered. A manufacturer should receive such a price for his products as to allow him a reasonable margin above his actual operating costs for replacement of capital invested, for obsolescence of equipment and for improvement, extension and expansion in whatever line of production he may be engaged. The buyer may profit temporarily by a lower price; but he will lose eventually in the failure of his source of supply. Healthy competition and friendly rivalry among various members of an industry are essential to the growth of that industry; but warfare is as much a destructive agency in business as in international relations.

Probable Development in the Chlorine Industry

Development in the chlorine industry will come under the two general heads of improvement of present apparatus and processes, and extension of the uses of chlorine and its compounds. Apparatus and process improvement would naturally be concerned first of all in reducing the cost of manufacture of chlorine gas. The principal items which the chlorine manufacturer buys are salt, fuel, power and labor; and local conditions at the various plants determine their relative importance. Salt and fuel efficiencies are purely individual plant problems; but all manufacturers would be interested in modification of cell design so as to raise the power efficiency and lower maintenance charges. The average chlorine cell shows an energy efficiency of approximately 60 per cent. The remaining is lost as heat, due principally to the internal resistance of the cell, which in turn is a function of current density. The recently described Marsh cell claims a higher efficiency due to lower current density brought about by the use of grooved anodes and corrugated cathodes designed to give increased electrode surface for the same over-all dimensions. The principal maintenance charges on cells are caused by graphite anode disintegration, and, with the exception of the Castner cell, by diaphragm stoppage. A study of these factors might very well be co-operative.

The second point of attack under process and apparatus improvement would be in the manufacture of chlorine products. Referring to the table of chlorine product distribution, it will be seen that bleaching powder is by far the biggest item. The data, of course, are for 1919 and 1921; and present conditions might show a larger percentage to liquid chlorine and a smaller percentage to bleach. Even so, bleaching powder is unquestionably the largest single chlorine consumer. While its manufacture dates from 1799, it is only within the past 15 or 20 years that any decided effort has been made to improve the method of manufacture. Practically all the bleaching powder made in this country today is made in "chambers," although mechanical bleach chlorinators have been used in Germany for some time. In the chamber process, hydrated lime of definite moisture content is spread in a layer about 4 in. thick over the floor of a room 15 to 20 ft. wide, 40 to 100 ft. long, and 5½ to 6½ ft. high. In the floor are imbedded cooling coils through which water is circulated in cold weather, and refrigerated brine in hot weather. Dilute chlorine gas is led into the chamber and is absorbed by the lime. When the lime has been saturated, the chamber is cleared of chlorine, and workmen enter and scrape the finished powder to outlets in the floor, through which it drops into the can-loading apparatus.

The spreading of the lime and the collecting of the bleaching powder are disagreeable jobs, and labor is consequently inefficient and expensive. A recent bleaching powder installation made by the Belle Alkali Co. and described in this journal[1] has utilized modern conveying systems to handle the lime to the chambers and the finished powder from them; but the most disagreeable part of the work, the collection of the powder, must still be done by hand. To get away from this high labor cost, one large company is said to be scrapping its present chambers and installing German mechanical chlorinators, which consist of a tier of nearly horizontal cylinders either rotating or with rotating paddles. The lime passes successively from one cylinder to the one immediately below, and chlorine is fed into the lowest cylinder and passes up through the system in counter-current to the lime. Another proposal that seems feasible is made by J. W. Moore in U. S. Patent 1,272,880 (1918), which covers the use of a rotary kiln not much less than 80 ft. long through which hydrated lime and chlorine are passed in counter-current. These mechanical chlorinators may be expected to replace the chambers quite generally if bleaching powder continues to be made in large quantities.

Liquid Chlorine a Growing Product

With development in the art of chlorine liquefaction and transportation, however, and increased experience on the part of consumers in handling the liquid, chlorine in this form is very likely to replace bleaching powder. Bleaching powder is not an ideal product even aside from its present method of manufacture; for it is disagreeable for the consumer to handle, is subject to considerable variation in chlorine content and in dissolving and settling properties, and deteriorates, especially in warm weather, so that it can be stored for only a limited length of time. By buying lime and liquid chlorine, the consumer may readily make his own bleach liquor by absorbing the chlorine in a

[1] Vol. 26, No. 22, p. 1038, May 31, 1922.

milk of lime of suitable strength. He is thus assured of his bleach supply with a decided saving in handling charges, as well as a more nearly uniform quality of bleach.

The various processes of chlorine liquefaction now used or proposed—pump, tower, and absorption—differ only in the means of getting the chlorine under pressure. In the pump process, the problem of lubrication was a serious one, since chlorine acted on lubricating oils. This was overcome by Knietsch in 1888 by the use of a sulphuric acid piston in a U-shaped compartment. Within the past 10 years a French pump has been developed that has a metal piston lubricated with sulphuric acid. This French machine has been tried out in this country during the past year and has been found to be very satisfactory in operation, and to have a capacity many times that of the German pump. Its initial cost is low and maintenance charges are small.

In the tower system, chlorine is drawn into a descending column of sulphuric acid through a modified injector, and the tower is made high enough so that the weight of the column of acid is sufficient to compress the gas for liquefaction in refrigerated condensers.

The absorption system parallels the ammonia absorption system very closely. The chlorine is dissolved from a more or less dilute gas by some suitable solvent. Goldschmidt patented the use of tin tetrachloride, and more recently C. T. Henderson has proposed the use of carbon tetrachloride. To obtain concentrated solutions, the solvent must be refrigerated. By heating the concentrated solution, the chlorine is driven off periodically and condensed, the necessary pressure being generated by the evolution of chlorine.

The pump and tower processes are the only ones in use in this country at the present time, and neither seems to have any great advantage over the other. Liquid chlorine can scarcely be expected to be a low-priced material, since the cost of liquefaction averages around $15 per ton, and the charge for containers, including inspection, valve repair and replacement, and return on capital invested is considerable, especially on the smaller sizes. During the war 1-ton and 15-ton containers were developed and have been in use for the past 4 years with uniformly good results. Where chlorine is required in sufficient quantities, these containers should prove much more satisfactory to the consumer and be much less expensive to the producer than the smaller "bottles."

Liquid chlorine is used at the present time quite extensively for water purification. This market is limited, however; for if the entire urban population of the United States were supplied with 130 gal. per capita per day of water treated with 2 lb. chlorine per million gallons, the chlorine consumption would be only 7 tons per day. Liquid chlorine is also used in the "aging" or bleaching of flour, the average dosage being given as 150 lb. chlorine per million pounds flour. Here again, if all the flour consumed in the United States were chlorine-treated, the daily chlorine requirement would be only about 6 tons. The high degree of purity and the convenience of liquid chlorine make it a desirable product in many other applications; but the consuming capacity is evidently covered by present production if contract price quotations are any index.

What is to be done to remedy the situation? The law of natural selection may be allowed to take its course, and the industry be stabilized by a process of elimination. This would result in a capacity not greatly in excess of our present consumption, and in the loss of millions of dollars of invested capital. On the other hand, the chlorine manufacturers of the country may get together on a program of research and education, and build up the consuming capacity to the present producing capacity or even farther. The first is a passive destructive solution; the second, active and constructive; and the chlorine producers must decide which course shall be followed, and must be responsible for the results of that decision. The saying, "He profits most who serves best" applies with equal force to industries and to individuals.

With one exception, the remaining chlorine products listed in the consumption table offer very little hope of expansion in volume of demand. A price war in carbon tetrachloride is on at the present time, and so far as low prices are concerned there is every inducement for the development of new uses for it. Chloroform is likely to be limited to pharmacal and very special solvent use, since for most solvent and extraction work it can be replaced by the less expensive carbon tetrachloride. Tin chlorides are expensive materials due to the high price of tin, and their use is limited to the silk and dye industries. Hydrochloric acid manufacture from hydrogen and chlorine is constantly competing with the salt-sulphuric acid process, so that while the volume consumed, equivalent in 1921 to 80 tons per day of chlorine, is quite satisfactory, the chlorine manufacturer can scarcely afford to take more than a limited percentage of the business. The war-time demand for monochlorbenzol and sulphur chlorides led to the installation of producing capacity far beyond peace-time requirements, so that conditions have been favorable for an expansion in their use for the past 4 years, with no evidence of any such development.

Aluminum chloride is the one hopeful item in the list. Its effectiveness in increasing gasoline yields in oil distilling has been demonstrated, and unless prohibitive royalties on the basic patents of the process interfere, the demand for anhydrous aluminum chloride is almost certain to increase as oil supplies decrease and the price of gasoline goes up. If only 10 per cent of the average daily gasoline production for the first 9 months of 1922 had been produced by aluminum chloride cracking, and if 50 per cent of the aluminum chloride had been recovered and re-used, the demand for fresh chloride would have exceeded 300 tons per day. Each ton of aluminum chloride requires in its manufacture something over 1,600 lb. of chlorine.

Up to a short time ago anhydrous aluminum chloride was produced altogether by the action of chlorine on metallic aluminum. The metal has been used in the form of pigs and clippings, but principally in the form of a dross collected in the Hall process of aluminum manufacture and containing 25 to 35 per cent metallic aluminum. Even the dross, however, has been an expensive source of metal, and a more extended use of the chloride has been prevented by its high cost. Numerous patents have been granted for various modifications of the general process of chlorinating a mixture of

bauxite and carbon, but it is only recently that the largest producer of the chloride has shifted from dross to bauxite as a source of aluminum. There are many factors that make this chlorination a difficult one to handle on a large scale, but the biggest single problem is the matter of supplying heat to maintain the bauxite-carbon mixture at the proper temperature, and at the same time introducing chlorine.

New Uses for Chlorine

The possible extension of the uses of chlorine and chlorine products has been very thoroughly discussed by V. R. Kokatnur in a paper presented before the American Electrochemical Society in 1918; and it would serve no useful purpose to review that discussion here. It may be said, however, that since the publication of that paper a chlorination process has been developed and successfully applied to the recovery of nickel and cobalt from arsenical ores; and it is entirely possible that other metallurgical uses may be found for chlorine, particularly if a type of furnace that can be heated in the presence of chlorine is developed. Another application that is interesting is the recent Henderson-Haggard process for killing offensive odors by injection of chlorine into the odorous gases. Chlorine has also been successfully applied to the production of pure cellulose from woody fibers; and while chlorine so used would displace a percentage of the bleaching powder now consumed in the paper industry, adoption of this process would mean an increase in chlorine consumption. Chlorine in the form of bleaching powder has recently been found a very satisfactory sweetening agent in gasoline refining.

The situation in the chlorine industry of the United States, then, is that with a producing capacity of about 300 tons per day, the normal consuming capacity seems to be less than 200 tons per day. Four years of unrestricted competition with all its attendant virtues has failed to increase to any great extent the demand for chlorine or chlorine products. Even assuming that present producers can continue to operate under prevailing conditions, the consumer must be paying a premium over and above the actual cost of the products he buys to take care of the overhead charges on this excess capacity. If consuming capacity can be increased, both producer and consumer will gain by the increased stability of the industry. The failure of the competitive period to bring about any marked increase in consumption of chlorine indicates that the problem is too big for individual producers to solve. It requires the co-operative effort of the whole industry.

Co-operation of Consumer and Producer Needed

This co-operation could take the form of the collection and publication of reliable production statistics for the industry. It could consist of the outlining and carrying out of a definite and comprehensive research program, to replace the present system of development, by individual producers, of the same products, which is wasteful in its duplication of effort, if for no other reason. It could take the form of a systematic education of industry as a whole in the use of present chlorine products, and such new products or uses as may be found. All three of these functions, the gathering of statistics, the carrying on of research, and of education, are beyond the capacity of the individual company. They are vital to the industry, and should be promoted and maintained by the industry.

This idea of co-operation is, of course, not new. In fact none of the ideas presented in this article have any claim to originality. All these things have been suggested and talked about before—and nothing has been done. The purpose throughout this discussion has been to present the facts again, fortified with such figures as were available, in the hope that, if the argument is repeated often enough, something will be done.

Arsenic Trichloride Affects Industrial Workers

Extensive laboratory research and factory investigations have shown that the local caustic action of arsenic trichloride and the absorption of the poison through the skin or through the lungs frequently result in death or serious disability. The current *Monthly Labor Review* of the U. S. Department of Labor describes these investigations, points out the effect of the poison when encountered in various ways, and also suggests a few precautions that may be taken to preserve the health of workers in industrial plants where the compound is manufactured.

Applied to the skin, arsenic trichloride kills the tissues very rapidly, the action being somewhat retarded by washing the part affected within one minute. In this case, however, the final result is not affected. Within a few hours after such application arsenic can be recovered from most of the tissues and organs of the body. Inhalation of 1 part of arsenic trichloride to 40,000 parts of air kills mice within 5 minutes.

The compound is very diffusible and enters readily into various combinations, forming visible particles where the air contains moisture. Vapors are quite likely to be invisible when the air is unsaturated. Experiments show that the atmosphere throughout the vicinity of apparatus in which arsenic trichloride is manufactured contains considerable amounts of the poison. Special ventilating arrangements are required to remove the fumes that arise when this compound is necessarily exposed to the air in filling drums and sampling their contents. Air containing fumes so removed can be purified by a fine water spray before being discharged into the atmosphere. Persons employed in this industry should wear impervious clothing, and only experience can show whether they should not also wear suitable gas masks.

Selenium Oxychloride Cleans Cylinders

Paint, japan or varnish may readily be removed by a treatment with the solvent selenium oxychloride, which was discovered by Prof. Victor Lenher of the chemistry department of the University of Wisconsin. Rubber, both pure and vulcanized, and resinous and glue binder substances, including the natural resins, glues, gelatins, celluloid, varnish, lacquer and paints, are soluble when treated with selenium oxychloride.

This solvent may also be used advantageously for the removal of carbon from the cylinders of gas engines. Such deposits usually consist of particles of carbon, more or less cemented together with hydrocarbons, such as partly carbonized oils or deposits from oils, including gasoline. Selenium oxychloride, alone or compounded with other substances, will sufficiently dissolve the binder constituents of the carbonized mass to cause the disintegration of them and the cleansing of the cylinders.

Microstructure of Paint Films

An Attempt to Determine Relation Between Microstructure and Protective Value of Certain Paints and Pigments

By Harold L. Maxwell
Department of Chemistry, Iowa State College, Ames Ia

THE use of photomicrography in examining paint films is relatively recent. Toch[1] photographed the surfaces of freshly applied red lead paint and recorded a separation of the oil from the pigment. Coye,[2] in making a study of the protective value of various paints on structural steel, prepared photomicrographs from the surfaces of the weathered test pieces after 1 and 2 years' exposure. Photomicrographs of cross-sections of paint films have been prepared by Gardner. In one[3] he shows the cross-section of a barytes paint film in which three layers or coats are easily distinguishable. In another[4] is shown a lateral view of a white enamel on oilcloth. This latter paper shows also, at relatively low magnification, the surface effect of too rapid drying of paint by evaporation of the volatile constituents, as well as the appearance of needle scratches on brittle and elastic varnishes.

The purpose of this work is to examine, at both high and low magnifications, cross-sections of some of the common paint films and to determine if possible a relation between the microstructure and protective value.

How Films Were Prepared

The films were prepared by painting on smooth tinfoil laid over glass. After the drying of this and additional coats, the tinfoil-paint film was taken up from the glass and cut into strips for convenience in handling. The strips were placed, as suggested by Gardner,[3] on the surface of mercury contained in a porcelain vessel. The tin amalgam formed dissolved in the excess of mercury, leaving the paint film clean except for traces of amalgam which were removed on a dry towel.

A piece of the film about 2 cm. square was pressed between two blocks of plastic, medium melting paraffine and allowed to set. It was found advisable to trim away the ragged edges and dip the block in melted paraffine After this protection, the block was dipped quickly into cool water, so as to harden the surface only, leaving the inner portion relatively less rigid. This prevented a breaking away of the paraffine from the paint film and insured a smooth, uniform surface when sectioned by means of a microtome.

The paint used for the red lead films was prepared from commercial boiled linseed oil and commercial red lead (85.22 per cent Pb_3O_4, 0.28 per cent insoluble matter, 14.50 per cent PbO by difference) approximately at the rate of 25 lb. of the pigment to 1 gal. of oil, which is a proportion widely used in practice. The white lead films were made from commercial boiled linseed oil and Dutch Boy white lead.

A photomicrograph of a three-coat film of red lead paint is shown in Fig. 1. Each coat was applied immediately after mixing. From the fact that the surfaces of the lead oxide particles reflect light better than the surrounding oxidized oil in the dry paint film, it is possible to determine the distribution of the pigment particles in the various coats. It is evident from the photomicrograph that a partial separation of the pigment has taken place.

Red Lead Priming

It is a well-known fact that red lead paint undergoes a marked change on standing. The red lead oxide,

Fig. 4—Mag. 56. Thickness normal film, 0.0089 in., or 0.2260 mm.; ridge, 0.0145 in., or 0.3683 mm.

Fig. 6—Mag. 800. Thickness red lead two coats, 0.0039 in., or 0.1001 mm., sublimed blue lead one coat, 0.0023 in., or 0.0584 mm.

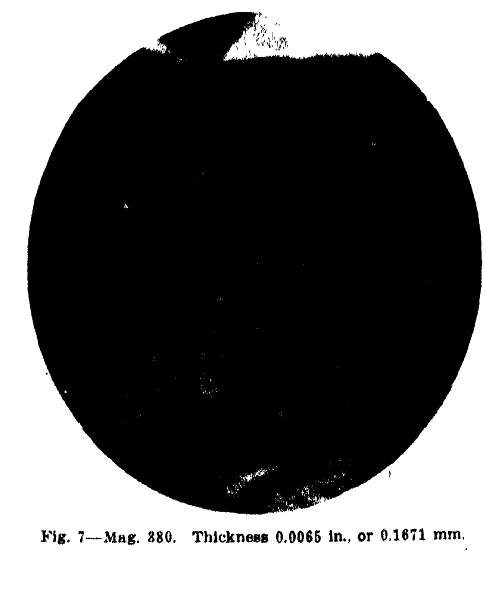

Fig. 7—Mag. 380. Thickness 0.0065 in., or 0.1671 mm.

Pb_3O_4 is slightly soluble in linseed oil, especially if the latter has a moderate or high acid number. The lead monoxide, PbO, having a lower valence, is less acid or may be said to be more basic than Pb_3O_4 and hence is more readily acted upon by an oil of a given acid number than is the higher oxide.

The so-called red leads of commerce vary in composition from less than 75 per cent of Pb_3O_4 to more than 99 per cent, the remainder being largely PbO. The latter oxide will dissolve in the oil to a greater or less degree depending upon the temperature of the system and the relative subdivision of the two oxides. The drying of the paint, promoted by the catalytic effect of lead compounds in the oil, allows less time for the heavier particles to settle out. A more uniformly distributed pigment results.

The marked increase in viscosity due to the interaction of the oil and pigment is often objectionable. In the painting of structural steel it is quite common for the men to complain of great fatigue in the arms, particularly when paste red lead is used, and there is a tendency to flow the material on quite thickly. These thick layers dry in wrinkled, non-uniform films, which are thought to give uncertain protection. Cross-section slides of these ridges were prepared and photographed.

In Fig. 4 may be seen the relative depth of the ridge as compared to the normal film.

A more highly magnified view of the ridge is shown in Fig. 5, where it is apparent that, even with this collection of excess material, the pigment particles are well distributed.

Under conditions of use and exposure these ridges are objectionable for the reason that they collect dust and present an unsightly appearance. It is common practice on steel bridges to use one coat of red lead and follow with a smooth drying paint that covers well, such as sublimed lead or sublimed blue lead. A cross-section of such a film is shown in Fig. 6. In this instance there was used one coat of sublimed blue lead over two coats of red lead. The upper surface of the red lead, which forms the line of contact between the red and blue paint, is irregular, due to the uneven application of the former and the too vigorous drying that followed. The final coat of sublimed lead dried to a smooth and glossy surface, making the retention of dust or moisture less probable.

In the microscopic study of paint films it is often desirable to determine the number of paint coats in a given film. Gardner' photographed a section of a three-coat barytes film and was able to point out three distinct layers. Efforts to duplicate Gardner's results with white lead paint in this laboratory were unsuccessful. The separate coats could not be distinguished at 850 diameters magnification. It was thought probable by the writer that barytes, being a more inert material, would separate out in strata and present a microscopic appearance unlike a typical lead or lead zinc paint.

USE OF STAINS

A three-coat film of white lead paint was made and a cross-section was photographed as soon as the film was dry enough. The pigment particles were apparently dispersed throughout the film as shown in Fig. 7. A section of the same film was stained with alcoholic gentian violet and photographed with results as shown in Fig. 8. The latter picture, although quite unsatisfactory from a photographic standpoint, suggested the

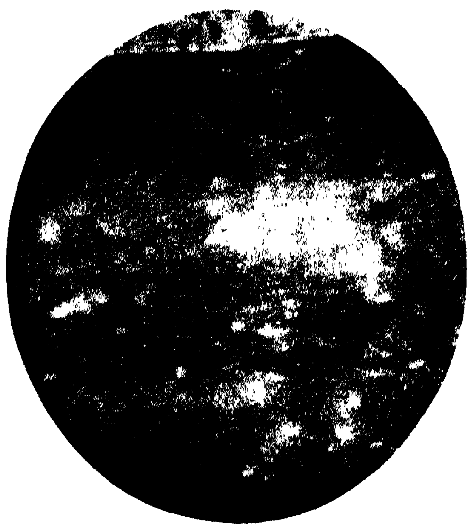

Fig. 8—Mag. 380. Thickness 0.0065 in., or 0.1671 mm.

Fig. 9—Mag. 350. Thickness 0.00511 in., or 0.1305 mm.

Fig. 10—Stained with alk. methylene blue. Same magnifications and dimensions as in Fig. 9

possibility of determining the number of paint coats in a film by dyeing, provided a stain capable of more detail be employed.

Another white lead film prepared from the same material and in the same manner, but at a different time, was allowed to dry for about 75 days. Fig. 9 shows a section of this film not stained, while Fig. 10 shows the appearance after staining with alkaline methylene blue. The following stains were used in attempts to find one best adapted to paint films: gentian violet, malachite green, acid fuchsine, methyl violet, neutral methylene blue and methylene blue made slightly alkaline with sodium carbonate. The latter reagent was found to be uniformly satisfactory.

Summary

In summary, it may be said that photomicrographs of cross-sections of red lead paint films show a setting of the red lead pigment particles in the freshly prepared and applied paint, and the well-distributed pigment particles where the prepared commercial red lead paint has been allowed to stand. Further, it has been found possible to determine the number of paint coats in a white or tinted paint by staining a section of the film with mildly alkaline methylene blue. This method of paint investigation by staining, as here outlined, is believed by the writer to be new.

This work was done in the division of physical chemistry and metallography of the Department of Chemistry, Iowa State College, which is under the direction of Dr. Anson Hayes, to whom the writer is indebted for his criticism of the present paper.

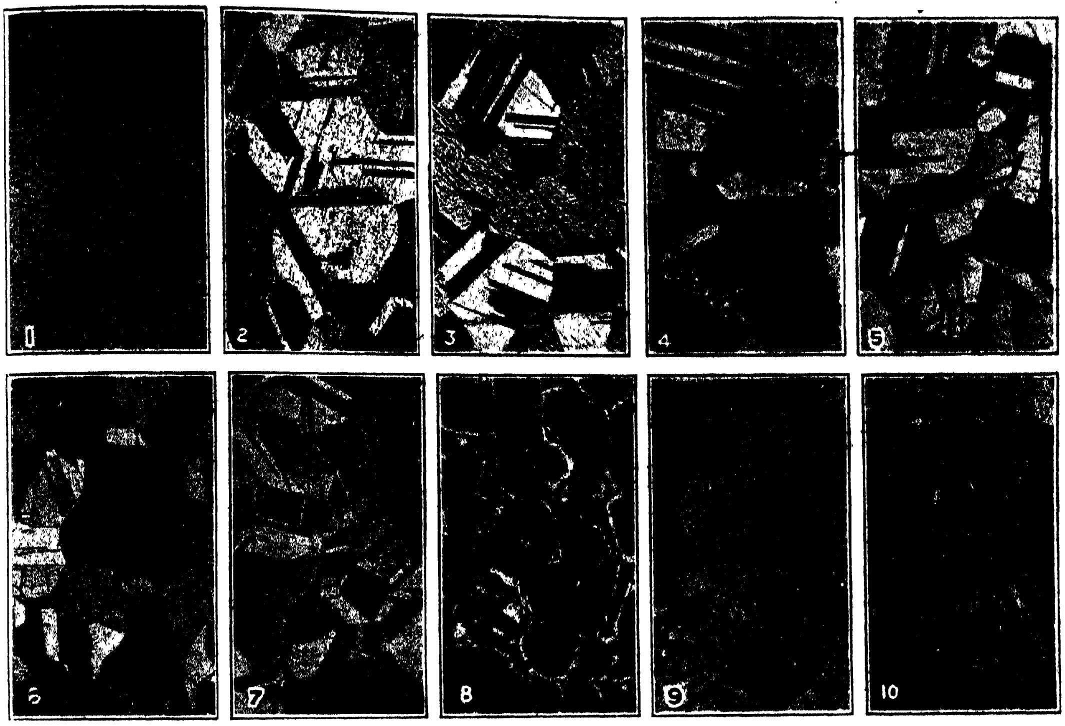
Etching Aluminum Bronze

By Jerome Strauss
Chief Chemist, U. S. Naval Gun Factory

In Scientific Paper 435 of the U. S. Bureau of Standards attention was called to the generally unsatisfactory results obtained in etching rolled aluminum bronze. The usual reagents for developing the microstructure of copper-base alloys had been tried, together with several new combinations, but with rather indifferent results. The present author has been working for several years with various aluminum bronzes and after many unsuccessful attempts has developed a method which, though far from perfect, may still be of some value to those who may use these metals.

Binary alloys of copper and aluminum containing 4 to 8 per cent of aluminum, though relatively strong, possess very low elastic limits, are very soft and extremely ductile; in fact, by suitable methods of preparation, alloys may be had that will show close to 100 per cent elongation on the standard 2-in. gage length specimen. These properties undoubtedly bear a close relation to the polishing characteristics of the metals. It is very difficult, when finishing with the usual grades of levigated alumina, completely to avoid scratches on the polished surface; this is particularly true when minute oxide particles frequently found in these alloys are present. Magnesia, as recommended by Rosenhain for aluminum alloys, to some extent avoids these troubles and at the same time produces a superior surface after etching.

No single etching reagent has been found that will serve even for all the commercial aluminum bronzes. But in the early work, various mixtures of nitric and



FIGS 1 TO 10—ALUMINUM BRONZES × 100

Fig 1—Alloy 283, HF and Reagent B Fig. 2—Alloy 283, HF and Reagent A, magnesia not used in polishing. Fig. 3—Alloy 283, HF and Reagent A, polished with magnesia Fig. 4—Alloy 283 HF and Reagent C. Fig. 5—Alloy 283, HF and Reagent D. Fig 6—Alloy 283, HF and Reagent E. Fig 7—Alloy 283, HF and Reagent F. Fig. 8—Alloy 4981, HF and Reagent B. Fig. 9—Alloy 8086, Reagent D only Fig. 10—Alloy 8086, Reagent A only

chromic acids seemed to give greatest promise and were carefully studied. Ferric chloride solutions yielded fair results with alloys containing a duplex structure, but failed to show some features of the microstructure and in alloys containing over about 3.5 per cent iron it not only dissolved out the third constituent but destroyed its characteristic outlines by the time the general structure had been developed. But all of these reagents leave surfaces which are more or less stained, producing some patches showing a fairly well-defined structure and others with no structure whatever. The behavior was such as strongly to indicate the presence of a protective film, and to destroy this hydrofluoric acid was tried and found suitable. Too great concentration or too long an etching period are harmful, the adopted practice being to immerse the specimen in 10 per cent HF in water for 2 to 5 seconds to remove the film, wash in cold water and quickly transfer to the desired etching solution. Various alkaline solutions have been tried to replace the HF without satisfactory results.

The photographs that are reproduced herewith were obtained with the following alloys and solutions:

Alloys No	Al	Fe	Cu	Condition
283	6.65	0.13	93.32	0 40 sheet-annealed
8086	6.96	1.21	91 86	0 20 sheet-annealed
4981	8 79	3 69	87 53	sand cast

Reagents						
A	50 cc	HNO_3;	20 gm	H_2CrO_4.	30 cc	H_2O
B	5 cc	HNO_3;	20 gm	H_2CrO_4.	75 cc.	H_2O
C	10 gm	$FeCl_3$;	30 cc	HCl.	120 cc	H_2O
D	30 cc	HNO_3;	70 cc	H_2O.		
E	10 cc	NH_4OH;	5 cc.	H_2O_2.		
F	NH_4OH + stream of O_2					

Reagent B develops only the grain boundaries of the 7 per cent aluminum alloy; variations in color or depth of shadow with changes in orientation are absent (Fig. 1). Improvement produced by the use of magnesia as a final polishing agent is readily observed by comparing Figs. 2 and 3. The use of ammonia water (sp.gr. 0.90) through which a flow of oxygen is maintained, as used by Rawdon and Lorenz at the Bureau of Standards, gives the excellent results shown in Fig. 7, but it required a period of 30 minutes to produce this condition. Occasionally specimens may be found which without the use of HF will etch in spots sufficiently well to give fair photographs; the grains, however, are not as clear or as sharply defined as when HF is employed (Figs. 9 and 10).

Fig. 8 shows a sample of aluminum bronze containing a high percentage of iron as well as sufficient aluminum to produce the beta solution. Some reagents may develop single features of this structure, but here are clearly observable the coring of the alpha, the details of the beta, an indication of what are most probably twins in the alpha and the third constituent due to the iron sharply outlined. The latter is found as nodular particles varying in color after etching from blue-gray to dark brown, thus accounting for the light and dark ones appearing in this illustration.

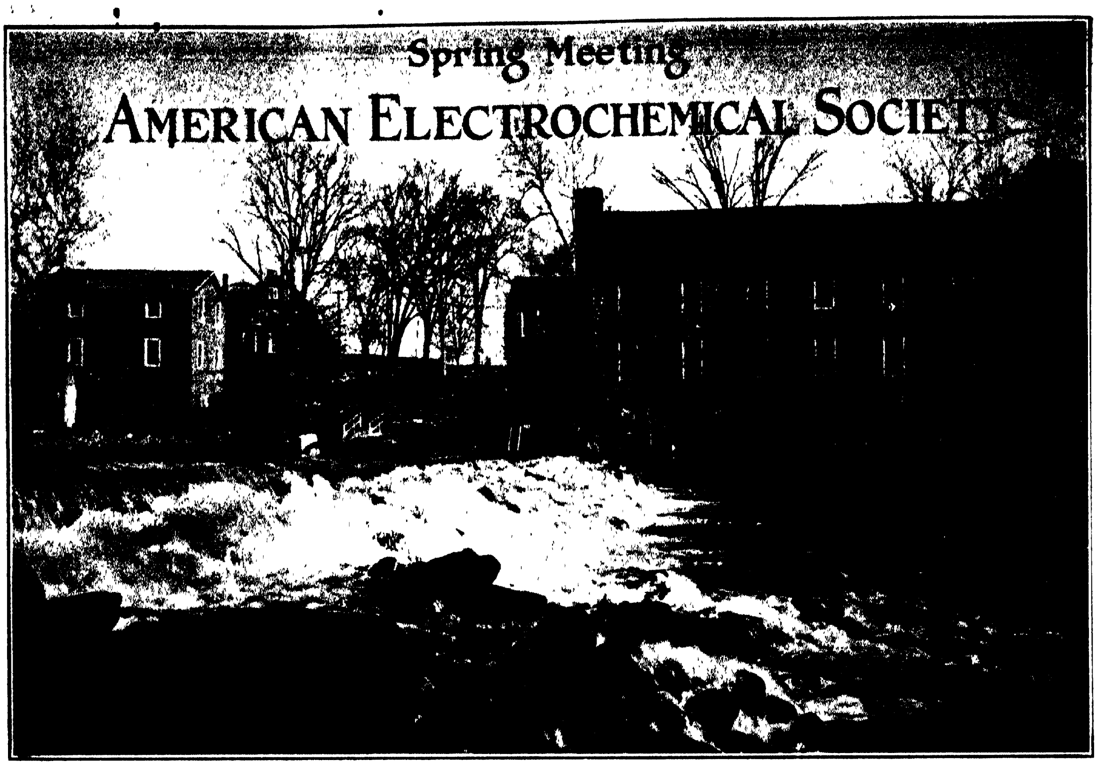
Correction

On page 635 of the April 9 issue of *Chem. & Met.* an article appeared giving figures on aluminum production for 1922. The facts published were abstracted from the United States Geological Survey Bulletin. We wish to take this opportunity of acknowledging the source of this material, credit for which was inadvertently omitted in the published article.



EDITORIAL STAFF REPORT

THE forty-third general meeting of the American Electrochemical Society was held at the Hotel Commodore, New York City, May 3, 4 and 5, 1923. The meeting was unusually well attended, due largely to the very attractive program. The technical papers time and again drew forth animated and valuable discussions. Of particular interest was the session on Electrode Potentials, Thursday morning, and that on the Rare Metals, Saturday morning. The local committee under the very able guidance of its chairman, Irving Fellner, had arranged for a number of social functions that added greatly to the enjoyment and delight of the meeting.

ELECTRODE POTENTIALS

The Thursday morning session was devoted to papers on Electrode Potentials and was in charge of Dr. W. G. Horsch. Prof. Hugh S. Taylor of Princeton presented the first paper, "The Newer Aspects of Ionization Problems." He referred to the work of Born, Fajans, Haber and others on the problem of energy changes accompanying the conversion of some solid crystalline substances and of the hydrogen halides into dissolved ions. In calculating the individual value of the heat of hydration of the hydrogen gas ion, it was apparent that the calculation involved the magnitude of the heat change associated with the electron emission from the metal used as the hydrogen gas electrode. It is well worthy of experimental investigation how or whether the characteristics of the hydrogen electrode change as a consequence of the alteration of the metal used as electrode material. Platinum as electrode has been carefully investigated and tantalum is to be tried next.

In discussing Professor Taylor's paper Dr. S. C. Lind of the Bureau of Mines, Washington, called attention to the fact that we do not know positively whether the chlorine gas ion is identical with the chlorine ion of an aqueous solution. Perhaps with the aid of our newer physical conceptions and our improved methods of investigation this point might be established. Prof. John Johnston of Yale agreed that the ionic theory of 25 years ago was not satisfactory in accounting for many of the newer experimental findings and phenomena observed in electrochemistry. For example, we have no satisfactory explanation for the hydration of ions. Dr. William C. Moore of the U. S. Industrial Alcohol Co. Research Laboratory, referring to the remark by Dr. Lind that sodium ion as gas would according to the Lewis-Langmuir theory be expected to be inert, stated that he had found in his investigation of the flaming arc that the potassium of KCl vapor carried three positive charges. It is possible, however, that the number of charges varies with the temperature, as Wilson had suggested.

H. C. Howard of Princeton University reported briefly on his studies of the "Oxygen Overvoltage of Artificial Magnetite in Chlorate Solution." He found that the oxygen overvoltage of magnetite is much lower than that of smooth platinum. Although it is possible to oxidize chlorates to perchlorates at a platinum electrode, the reaction does not take place if magnetite is used instead. This affords a further confirmation of the hypothesis that there is a direct relationship between the overvoltage of an electrode and its oxidizing or reducing power.

Mr. Howard's paper was discussed by Dr. Max Knobel of the Massachusetts Institute of Technology. He was of the opinion that Howard's conclusions are too general. Dr. Colin Fink of Columbia commented on the great importance of the overvoltage factor in the insoluble anode research. He had found repeatedly that

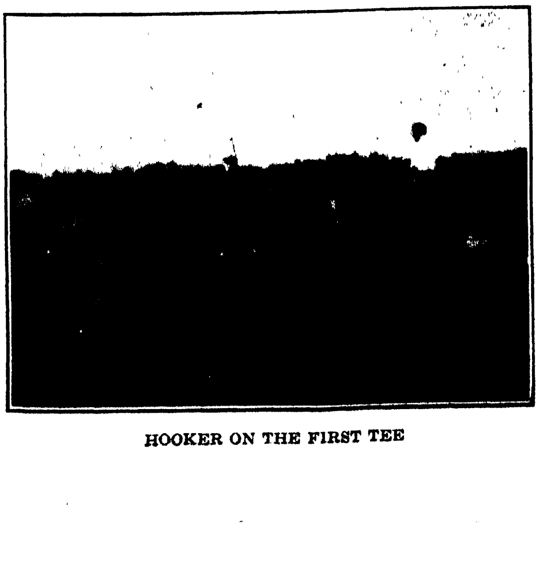
alloys fairly soluble under ordinary conditions could be made to serve as insoluble anode alloys providing a good adherent film was developed which would catalyze the formation and evolution of oxygen gas.

"The Effect of Current Density on Overvoltage" was the title of a paper presented by Dr. M. Knobel covering an investigation that he, together with P. Caplan and M. Eiseman, had carried out. Electrodes of a large variety of metals and alloys were tried out in acid, alkali and salt solutions. In the case of the hydrogen overvoltages it was found that the current density-overvoltage curves, although of a logarithmic nature, cannot be translated into any simple logarithmic equation. Metals generally specified as having a high overvoltage, as Pb, Hg, Cd, rise sharply to a high overvoltage at low current densities and then increase but little with increasing current density. Metals such as Cu, usually reputed as having a "low" overvoltage, show a more gradual increase of overvoltage with current density, but in general, with the exception Pt and Au, finally attain as high an overvoltage as "high overvoltage" metals. Platinized platinum maintains its low overvoltage even at the highest current densities. Even at 1,400 amp. per sq.ft. the overvoltage was but 0.05 volt.

In the discussion Dr. Carl Hering of Philadelphia referred to experiments made with an iron electrode. The current density was increased to a point when arcing through the gas film took place and eventually the iron electrode was melted under the solution.

N. Howell Furman of Princeton submitted his findings on "Electrotitration With the Aid of the Air Electrode." He has found that the "oxygen electrode-calomel electrode" cell may be used to construct titration curves that are in large measure analogous to those obtained in the familiar hydrogen electrode titrations. Satisfactory results were obtained both in absence and presence of oxidizing agents such as chromates.

Commenting on Mr. Furman's investigation, O. C. Ralston of the Pacific Station, Bureau of Mines, stated that the station had been using the air electrode for some time and had found it very satisfactory in following the purification of inorganic salts such as copper sulphate or zinc sulphate. In the case of a solution of copper sulphate plus ferrous sulphate, as soon as you come to the point when most of the ferric salt is hydrolyzed, a distinct kink in the voltage curve is noticeable. For this purpose the air electrode has been more reliable than the hydrogen electrode; and straight chemical



HOOKER ON THE FIRST TEE

THE START OF A GOOD SLICE

methods are very unsatisfactory. In the case of the elimination of iron from aluminum sulphate and following up the purification, the air electrode has been an indispensable piece of apparatus.

An exceptionally interesting paper was that by Prof. A. H. W. Aten of the department of chemistry, University of Amsterdam, Holland. Professor Aten found that when a hydrogen electrode, saturated with hydrogen, is in equilibrium with 0.1 *N* HCl, it is in the same state of equilibrium with 1.0 *N* HCl, and *vice versa*. This is not the case, however, when the solution of an alkali is used in place of an acid. When a hydrogen electrode in equilibrium with 1.0 *N* NaOH is put in 0.1 *N* NaOH, or the reverse, a considerable time period is required to reach a new equilibrium. The same phenomenon is observed in a more marked degree when the electrode is changed from 0.1 *N* NaOH to 0.1 *N* HCl, or the reverse. The explanation suggested is that the electrode must absorb Na or give it off, as the case may be, in order to reach an equilibrium with the final solution.

Professor Aten's paper was discussed at length by Dr. Horsch of the Chile Exploration Co. and by Dr. William Blum of the Bureau of Standards.

"The Reactions of the Lead Storage Battery" were investigated by Dr. Max Knobel, and he reported that his experiments are in entire accord with the theory advanced by Gladstone and Tribe which may be represented by the equation:

$$Pb + PbO_2 + 2H_2SO_4 = 2PbSO_4 + 2H_2O$$

The theory of Fèry based on the assumption that Pb_2O, or Pb_2O_3 is formed appears untenable.

J. R. Brossman of the Pittsfield Works, General Electric Co., pointed out the difficulties he had encountered in trying to separate the different lead oxides. Mrs. Helen Gillette Weir of the National Carbon Co., referring to her own investigations on the lead battery, took exception to a number of the statements made by Dr. Knobel, in particular in regard to his finding less than the theoretical amount of acid. Mrs. Weir stated that under ideal conditions very close to the theoretical amount of acid is consumed.

The concluding paper of the session was that by Dr. Alexander Lowy and H. S. Frank of the University of Pittsburgh. They had investigated the "Electrolytic and Chemical Chlorination of Benzene" and found that it is possible to chlorinate benzene by stirring it in with aqueous HCl and electrolyzing. Aqueous NaCl can also be used.

The yield of chlorbenzene increases with increase of

temperature up to 60 deg. C. and is affected by the rate of stirring. The introduction of iodine as a carrier increases the yield. The amount of higher chlorinated products formed increases in general with rise in temperature. The amount of benzene decomposed to CO by anodic oxidation increases with the temperature. Increase in current density rapidly increases the alkali-insoluble product. Water acts as a carrier in the chemical chlorination of benzene. No substitution takes place when dry chlorine is passed into dry benzene. However, chlorine forms addition products of the type of benzene hexachloride.

Luncheon at McGraw-Hill Co.

Three large buses conveyed the members from the Commodore Hotel to the plant of the McGraw-Hill Co., Inc., where a complimentary buffet luncheon was served, and then the members were conducted through the various departments of the printing and publishing plant. The society enjoyed the visit very much indeed and few members realized the tremendous amount of detail involved in the publishing of a technical paper such as *Chem & Met*. At the conclusion of the inspection trip animated moving pictures were shown depicting the construction and operation of the Diesel engine.

Annual Business Meeting

The first part of the Thursday afternoon session was devoted to the various society reports covering the past year. The report of the secretary showed that since the last spring meeting four volumes of the society had been published, bringing the entire printing up to date. On the basis of the report of the tellers of election the officers of the society for the year 1923-1924 are as follows: President, A. T. Hinckley, Niagara Falls, N. Y.; past president, C. G. Schluederberg; vice-presidents, H. C. Parmelee, A. H. Hooker, W. S. Landis, L. Addicks, G. K. Elliott, Henry Howard; managers, Carl Hering, J. V. N. Dorr, F. A. J. FitzGerald, W. M. Corse, William Blum, F. M. Becket, C. B. Gibson, R. A. Witherspoon; treasurer, F. A. Lidbury; secretary, Colin G. Fink, Columbia University, New York.

The Electrodeposition Division elected the following officers: Chairman, S. Skowronski, Perth Amboy, N. J.; vice-chairman, Charles A Mann; secretary-treasurer, William Blum, Bureau of Standards, Washington, D. C.; members at large, L. Addicks, F. C. Mathers, M. R. Thompson and F. R. Pyne.

The Electrothermic Division's new officers are:

GIBSON AND PRESIDENT SCHLUEDERBERG

FELLNER, GIVEN, ROTH AND MOORE IN GOOD COMPANY

Chairman, G. K. Elliott, Cincinnati, Ohio; vice-chairman, Dorsey A. Lyon; secretary-treasurer, Acheson Smith, Niagara Falls; members at large, F. M. Becket, Bradley Stoughton, J. H. Parker and W. J. Priestley.

Interesting reports were submitted by the committee on dry cells, committee on radioactivity, committee on organic electrochemistry, and others.

E. G. Acheson Made Honorary Member

Immediately following the business meeting, President Schluederberg announced the election of Dr. Edward G. Acheson to honorary membership of the society. The announcement was received with great enthusiasm and sustained applause. Mr. F. A. J. FitzGerald in fitting terms outlined the remarkable career of Dr. Acheson, commenting on his many discoveries and inventions which have made him world famous. President Schluederberg presented Dr. Acheson with the illuminated certificate of honorary membership. In accepting it Dr. Acheson spoke briefly of the early days of the society and of the men who made America the foremost country in electrochemistry.

The retiring president, Dr. C. G. Schluederberg, delivered a very inspiring address on "Opportunities of the American Electrochemist Abroad." He had been very fortunate in studying conditions at close range, having during the past year spent 4 months in the South American republics and another 4 months in Asia. We expect to publish this address in full in an early issue of *Chem. & Met.*

Electrodeposition of Metals

William Blum and H. S. Rawdon made a study of the "Influence of the Base Metal on the Structure of Electrodeposits" and reported at the session on Electrodeposition upon the results obtained. The meeting was presided over by G. B. Hogaboom. Blum and Rawdon had found that if copper is deposited electrolytically upon cast or rolled copper which has been cleaned with alkali, the structure of the base metal does not apparently affect that of the electrodeposit. If, however, the surface of the base metal had also been treated with nitric acid, the electrodeposited copper possesses both the crystal form and orientation of the base metal. A series of microphotographs showed the effect very strikingly.

In the discussion of the paper Charles H. Eldridge, research metallurgist, Metropolitan Museum of Art, suggested that a practical application of the influence of the structure of the base metal might be made in electro-refining of copper, zinc, etc., by the proper selection of starting sheet material. It would seem possible to control thus readily the coarseness of crystal structure of the deposited metal. Dr. A. Kenneth Graham of the

University of Pennsylvania drew a distinction between the structure of a deposit which is an exact reproduction of the structure of the base metal and the structure of the deposit which is a direct continuation in growth of the crystals of the base metal. Dr. W. D. Richardson of the Westinghouse Lamp Co. mentioned that he had observed distinctly different effects depending upon whether the base metal had been cleaned anodically or cathodically. Plating chromium on nickel steel wire, anodically cleaned, produced a very closely adherent deposit so that it was difficult to detect the joint. Mr. Hogaboom, who was the first to observe the effect reported upon by Blum and Rawdon, referred to his experiments on silver plating flat ware. The difference in structure would even become apparent upon polishing.

A second contribution by the Bureau of Standards was a paper on "Current Distribution and Throwing Power in Electrodeposition" by H. E. Haring and W. Blum. "Throwing power" in electrodeposition may be defined as the deviation of the actual metal distribution from the primary current distribution. It was shown mathematically and experimentally to be dependent upon (a) the rate of change of cathode potential with current density, (b) the resistivity of the solution, and (c) the cathode efficiency at different current densities. A simple apparatus for the measurement of throwing power was demonstrated and developed which had been applied to the study of copper sulphate and cyanide solutions.

"Primary current distribution" is that produced when no polarization is involved. It is a dimensional function. "Secondary current distribution" is determined by the composition and electrochemical properties of the solution. "Metal distribution" is determined by the secondary current distribution and the cathode efficiencies.

"The Electrodeposition of Nickel on Zinc" was carefully investigated by Dr. A. Kenneth Graham at the University of Pennsylvania. Dr. Graham found that there was a distinct advantage, when plating nickel or zinc, to use a very high current density at start. The zinc is covered so rapidly at the higher densities that not only is the possibility of secondary reactions reduced to a minimum while plating, but within 75 sec. at 5 amp./sq.dm. and 60 sec. at 6 amp. sq.dm. the potential had become positive enough (—0265 v. to the solution used as compared to —0.473 v. for sheet zinc) to eliminate entirely the danger.

Commenting on Dr. Graham's paper, Charles P. Madsen of New York, originator of the ductile nickel deposits, emphasized the importance of closely adhering to prescribed conditions if good, adherent deposits of nickel on zinc are desired.

M. R. Thompson of the Bureau of Standards submitted a detailed contribution on "The Effect of Iron on the Electrodeposition of Nickel." The work at the bureau indicates that if the p_H is properly controlled, the presence of iron in the nickel solutions does not necessarily cause cracking or peeling of the deposits, as it has often been supposed to do. Deposited iron has a primary effect upon the crystalline structure of nickel deposits, rendering the latter finer grained and therefore probably harder, although more brittle. Occluded basic precipitates containing iron may injure a deposit by making it porous, or dark in color.

THE SOCIETY AT THE WESTPORT PLANT OF THE DORR ENGINEERING CO.

Mr. Thompson's paper gave rise to a very lively discussion. Dr. E. A. Vuilleumier of Dickinson College was of the opinion that the peeling of nickel deposits was dependent upon two factors: the extent to which the metal as deposited tends to contract, and the degree of its adhesion to the surface plated. He found that the addition of 1 gram of ferrous iron per liter greatly increased the deposited nickel to contract. It may be that in Thompson's experiments the adhesion of the metal was greatly improved upon so that the peeling tendency was not apparent. E. O. Benjamin of New York referred to the possibility of the occurrence of small iron crystals in the deposited nickel. Dr. Graham complimented Dr. Vuilleumier upon his contractometer and emphasized the great need of similar apparatus for studying other properties of electrodeposits. Dr. Fink

inquired as to the relative corrodibility of pure nickel plate and nickel plate containing iron and suggested further study on the deposition of nickel-iron alloys with comparatively high percentages of iron along lines similar to those followed by him in the deposition of nickel-cobalt, nickel-chromium and ferrochromium alloys. Dr. Blum of the Bureau of Standards replied that they had found that the addition of iron to the nickel gave rise to a very fine crystalline deposit that was more resistant to corrosion than the ordinary nickel

SPICER, TEMPLE, DORR AND OTHERS AT WESTPORT

plate. Mr. Hogaboom pointed out that the corrosion of the base metal covered with the nickel plate may often be due to porosity of the plate. On that account it was always advisable to flash iron or steel with copper before depositing the nickel. Particles of free graphite on the surface of the iron will coat over readily with copper but not with nickel.

"Notes on the Electrodeposition of Iron" were presented by Harris D. Hineline of Pittsburgh. The problem presented was that of depositing a substantial thickness of iron onto rather irregularly shaped rubber articles, this involving a process for preparing a conducting coating, a plating bath which would give good heavy deposits, in thicknesses up to 12.5 mm. (½ in.), and have a high throwing power to insure filling the crevices.

Electric Furnaces and Insulating Materials

J. C. Woodson of the Westinghouse company discussed at length "Heat Insulating Materials for Electrically Heated Apparatus." Dr. Hering suggested that the thermal ohm was the preferable unit for purely electrical engineering calculations but less serviceable when dealing with calories and B.t.u.'s. There is very often an enormous heat increase at the joint of two materials or pieces of the same material. With fluffy, finely divided or highly porous material the insulating quality improves as the compression increases, reaches a maximum and upon further compression the insulating quality gets worse. F. A. J. FitzGerald of Niagara Falls cited an instance in his experience: Two graphite electrodes were butt-connected. Passing from one to the next electrode there was a very sharp drop in temperature. It would be interesting to ascertain whether a similar drop in electric resistance occurred.

The next paper, by Frank W. Brooke of Pittsburgh, dealt with "Methods of Handling Materials in the Electric Furnace and the Best Type of Furnace to Use."

Prof. M. deKay Thompson and P. K. Froehlich of M. I. T. had investigated the "Conversion of Diamonds to Graphite at High Temperatures" and found that diamonds change slowly at 1,650 deg. C. to a substance that gives the Brodie test for graphite and that the velocity of this reaction is increased about twenty-six times by an increase of 100 deg. above this temperature.

A. E. R. Westman of the University of Toronto gave an account of his findings in the study of the "Relation Between Current, Voltage and the Length of the Carbon Arcs." For currents between 300 and 400 amp. and potential differences over the arc 55 to 20 volts, the potential difference in volts is approximately equal to the distance between the electrodes in millimeters; for currents of 700 amp. or so the voltage is less than the distance.

"Electric Furnace Detinning and Production of Synthetic Gray Iron From Tin Plate Scrap" was the title of the paper submitted by C. E. Williams, C. E. Sims and C. A. Newhall of Seattle. A study was made of the possibilities of converting tin-plate scrap or used tin cans into a marketable steel or cast-iron product by electrothermal means. It was concluded that in the electric furnace complete detinning is impossible and any detinning is impractical. Attempt was made to use NaCl, FeS and oxidizing slags to remove the tin. No tin is volatilized ordinarily when scrap is melted in the electric furnace, although cupola melting may remove up to 50 per cent tin depending on oxidizing conditions. Study was also made of the possibility of producing gray cast Fe without removing the tin, since under conditions prevailing in many parts of the country tin-plate scrap cannot be profitably treated by any established method. Since 1 per cent or less of tin has been found to have no serious effect on cast Fe, scrap may be usefully and efficiently melted in the electric furnace after being diluted with tin-free scrap.

Excursion to Westport, Conn.

The social program arranged for Friday was pronounced by many the liveliest and most enjoyable ever experienced by the society. Dr. Dorr and Mr. Spicer invited all the members to the Westport mill, where amid the most beautiful and idyllic surroundings a bounteous luncheon was served. The mill is situated on a river and many couples spent the afternoon rowing. Others went on to the Westport Country Club, where a very exciting golf tournament was staged by the men while the ladies enjoyed bridge or walks. During the dinner, which was tendered by the New York section of the society and for the arrangements of which Irving Fellner was responsible, the golf prizes were awarded as follows: A beautiful silver loving cup, donated by Mr. Dorr, to Frank J. Vosburgh. A fine golf stick, as booby prize, to Robert Burns. The members were then entertained by a hilariously funny song, a parody of Mr. Gallagher and Mr. Shean, sung by Mr. Lidbury and Mr. Hinckley.

The dance that followed in the evening was so thoroughly enjoyed that when time was called at 9:30 there was universal groaning at the thought of returning home. Members, however, were in such good spirits that they kept up the jollification in the private trolleys and the private coaches, and great was the applause and enthusiasm as Mr. Saunders led the singing of the Famous A.E.S. classic, "We're From Niagara."

Saturday morning was devoted to papers on the rarer metals, their production and utilization. This session will be reported in full in our next issue.

Foundrymen Meet at Cleveland

Hold Very Important Exhibition of Labor-Saving Machinery —Notes on Technical Sessions Devoted to Non-Ferrous Metals and the Testing and Reclamation of Foundry Sand

TECHNICAL and engineering societies in the United States may be roughly divided into two general classes—namely, those not conducted for profit, and those that are in business. The latter in turn may be subdivided into those in the publishing business, and those in the exhibition business. Inspection of the exhibit of the American Foundrymen's Association held early in May and which overflowed the arena, stage, cellar and corridors of the new Cleveland Auditorium, gives the impression that, whatever the balance sheet from a society publication, it certainly must pay to run a "show." The finances of the Foundrymen and of the Steel Treaters—which has been in business only one-quarter as long—reflect this happy state of affairs. It apparently is easier to sell space in an exhibit than in a journal—a conclusion which can be recommended to the careful consideration of professional societies generally. And judging from the throngs of people moving about, the purchasers of space must have obtained "value received."

Labor Saving Equipment Featured

That a newly completed auditorium could be obtained to house a foundry show containing much equipment in operation is evidence that the modern foundry is rapidly growing away from the smoky, dark sheds and dirty, dusty, back-breaking toil of but a few years ago. Well-ventilated steel buildings are housing the new plants, and their equipment consists of a wide variety of labor-saving machinery. Every step of the work can now be done by the aid of special machines—in fact at least two-thirds of the space in the Cleveland Auditorium was occupied by such apparatus. Not so long ago it was necessary to display machine tools at these shows in order to attract the mechanical superintendents and engineers; now the demand for better working conditions to keep contented the dwindling labor supply, and the widespread use of machines where once human labor was the sole motive power, bring all members of the production staff to a meeting where they can absorb new ideas to apply to their individual problems.

Institute of Metals

As usual, the Institute of Metals Division of the Mining Engineers held some joint sessions, where were discussed the problems of the brass founder and the properties of cast alloys.

Junius D. Edwards and C. S. Taylor, of the Aluminum Co. of America, presented a short paper on the Density of Magnesium. Using methods already described in *Chem. & Met.* (vol. 24, p. 61), the following results were secured:

Density at 20 deg. C. (gram per cu. mm)	1.7388
Thermal expansivity (20 to 500 deg) $L_t = L_0\,[1 + (25\ 07t + 0\ 00936t^2)\ 10^{-6}]$	
Density of solid at melting point (650 deg. approx.)	1 642
Density of liquid at freezing point	1.572
Density at 673 deg. C.	1 562
Density at 822 deg. C. (approx.)	1.478

A voluminous study of Linear Contraction and Shrinkage of Light Aluminum Alloys was presented by Robert J. Anderson, of the Bureau of Mines. It was found that under uniformly good foundry practice the linear contraction or patternmakers' shrinkage (defined as the difference in length between a casting and the pattern from which it was produced) varied from 1 to 2 per cent. Consequently it is unsafe to make important patterns for a new analysis unless its behavior is definitely known in advance. (See Table I.) Even then it must be remembered that variation in melting, pouring and molding conditions which cause a greater or lesser number of gas cavities, shrinks and pin holes will greatly influence the patternmakers' shrinkage.

TABLE I—LINEAR CONTRACTION OF CERTAIN ALUMINUM ALLOYS

Analysis	Per Cent Contraction	Analysis	Per Cent Contraction
92 8 Al Mg	1 15	90 8 2 Al.Cu Mg	1 08
92 8 Al Cu	1 34	90 8 2 Al Cu Si	1 17
92 8 Al Sn	1 38	90 8 2 Al Cu Ni	1 25
92 8 Al Ni	1 42	90 8 2 Al Cu Sn	1 26
		90 8 2 Al.Cu Fe	1 29
		90 8 2 Al Cu Zn	1 29
		90·8 2 Al Cu Mn	1 40

A similar list of linear contractions of several brasses and bronzes was presented by R. J. Anderson and E. G. Fahlman. With these, as with aluminum alloys, the shrinkage varies as the pouring temperature and size of casting, but Table II gives representative data.

Alpax

Modified aluminum:silicon alloys (recently discussed at length in our columns) formed the subject of the annual exchange paper submitted by the French Association Technique de Fonderie. It was especially interesting because Dr. Pacz, whose patents cover the methods described for making the so-called alloy Alpax, was in the audience and entered into the discussion. He pointed out that the high-silicon alloys, at or above eutectic composition, need to be "modified," whereupon they become extremely useful because of their low shrinkage and generally excellent founding characteristics, a high elongation and tensile strength, and good

TABLE II—LINEAR CONTRACTION; ALLOYS OF COPPER

Nominal Composition	Pouring Temp., Deg. F.	Linear Contraction, Per Cent High and Low Pouring Temp
56 40·1·1 5:1 5 Cu:Zn·Fe.Al Mn	1,900	2.17—2 19
60.40 Cu:Zn	1,900	1 80—1.89
70·30 Cu Zn	2,000	1 75—1.77
60 38:2 Cu Zn:Sn	1,900	1 69—1.875
70·29:1 Cu:Zn:Sn	1,950	1.65—1 67
86·4:6·3.1 Cu·Ni:Sn·Zn:Pb	2,300	1 43—1.425
85.5:5 5 Cu:Sn·Zn.Pb	2,300	1.425-1.47
87 7·5 1 Cu:Sn:Zn:Pb	2,250	1 40— ....
80:20 Cu·Sn	2,200	1.375—1.55
76 7 4.13 Cu.Sn.Zn:Pb	2,300	1.37—1.37
88·10:2 Cu:Sn.Zn	2,350	1.33—1.30
88:8.4 Cu:Sn:Zn	2,300	1 33— ....
86:11:3 Cu:Sn:Zn	2,300	1.33—1.39
90:6:3:1 Cu:Sn:Zn:Pb	2,300	1 33—1.43
84·10:5.1 Cu:Sn:Zn:Pb	2,300	1 32—1.35
84:11:5 Cu:Sn:Zn	2,300	1 32—1.36
85:15 Cu:Sn	2,300	1.31—1.45
89:8:10:0.2 Cu:Sn:P	2,400	1.275—1.28
90:10 Cu:Sn	2,400	1 275—1.30
89:5:10:0 5 Cu:Sn:P	2,400	1.26— ....
80:10:10 Cu:Sn:Pb	2,300	1.25—1.31

resistance to salt-water corrosion. However, they are not as stiff as other aluminum alloys—thus the proportional limit of a typical Alpax alloy is about 6,000 lb. per sq.in.; 92:8 Al:Cu alloy (No. 12) is 8,000; while heat-treated and aged alloy like duralumin is 15,000 lb. per sq.in. Alloys containing about 5 per cent silicon are also extremely useful in the foundry. Due to their low contraction on freezing they may be used to produce very difficult castings, impossible to be made in other analyses. Their tensile strength is low, but they require no special treatment or "modification."

Melting and Pouring Practice

Some very instructive "Notes on the Proper Melting and Pouring of Brass and Bronze" were presented by F. L. Wolf and William Romanoff, of the Ohio Brass Co. In their opinion the great damage to tensile properties observed after pouring at only 100 deg. F. above the correct temperature is due to gasification occurring in hot furnaces, rather than any chemical oxidation. If overheating is the only thing wrong with a melt, it will produce good results if cooled before being poured. After comparing the action of the indirect arc furnace, the Schwarz gas furnace and the Steel-Harvey crucible furnace, it was hard to decide which was best—any type would give excellent results. Crucible furnaces melted cheapest and gave castings of intermediate strength. Electric furnaces cost most to operate, gave best physical tests, and kept zinc fumes down to the minimum. The authors report they have been able to use any percentage of return scrap in their mixes, as long as it is clean. Expensive fluxes are unnecessary when melting good metal. Deoxidizers must also be used with judgment and in great moderation. Aluminum ruins a water-tight casting; silicon is also bad for a brass containing a little lead.

While it is well known that annealing will reduce internal stresses in worked material, R. J. Anderson has experimented on similar treatment of cast bronze rings. It has been known that 1 year's aging is required to produce stability in size in such castings of 87:7:5:1 (Cu:Sn:Zn:Pb. 3/16-in. rings, 5 3/8-in. diameter, were cast, sawed at one place and definite stresses (below the elastic limit) induced by wedging. It was then found that heating to 400 deg. C. relieves most of this stress quickly, 1 hour at 500 deg. removes nearly all. Very little effect was noted on the ordinary physical properties; suppression of cored structure is the only observable change. Such treatment will insure that a flat casting will remain flat after machining.

Testing of Molding Sand

Several long investigations on the selection of foundry sand and its reclamation after use have been in progress, under the general direction of R. A. Bull. As the result of these labors, a series of tests was reported by R. E. Kennedy, of the University of Illinois, whereby the principal properties of hand-molding sand can be measured.

First, a test for bond: Well-mixed sand, having a known amount of moisture, is riddled into a special molding box 1 in. wide, 10 in. long and 1 1/2 in. high from a known height. As each portion of sand is added, the tops of the little piles in the mold are leveled with a series of strikes, each of which just touches the high spots. In this way the mold is filled with loose sand, a closely fitting cover[1] laid on and the sand compacted under six blows of a 20-lb. weight, falling 16 in. The sides and ends of the mold are then carefully dismantled, and the prism pushed slowly over the end of the bottom board. The average weight of the pieces which overhang and break off is a measure of the bond or cohesiveness. Since the thickness of the compacted sand varies with its origin and moisture content, it is recommended that the weight be figured back to that of a fragment of a prism of dry sand, exactly 1 in. thick.

Second, a test for "grain," or fineness: A sample of dried sand is shaken one hour in a 1/20 per cent NaOH solution to deflocculate the clay or bonding substance contained on the grains. Washing is done by shaking the sand with fresh water, settling for 5 minutes and siphoning off the liquid from a point 2.5 cm. from the residue, repeating the operation until the wash water is clear. The residue is filtered under suction, dried 30 minutes at 105 deg. C. and then screen-sized for 15 minutes in a "Ro-tap" machine. In this way amounts of sand remaining on 6, 12, 20, 40, 70, 100, 140, 200 and 270 screens may be weighed; the results are best expressed by plotting weight of the fractions against the size of sieve opening.

Permeability of Molding Sand

Third, a test for permeability: This property permits the passage of gases and allows the mold to properly "vent." Consequently the test measures the flow of air through a standard sample. First dry the sand carefully, and then mix with a measured quantity of water. This may be done on a plate inclosed in a little tent made of moist muslin. Screen twice and store in an airtight jar while checking the moisture content. A tolerance of ± 0.2 per cent is permissible. Sufficient sand is then placed in a 2-in. brass cylinder to make a briquet 2 ± 0.08 in. high after being rammed three times by a 14-lb. weight dropping 2 in. This briquet is then placed in a container, and air forced through it. A recommended form of apparatus consists essentially of a calibrated vessel from which air is displaced by water flowing in from a reservoir under a constant head of 22 1/2 in. Air so expelled passes through the sand sample, and the resistance to this flow sets up a pressure in the exit tube which is measured by a simple manometer. A stop watch measures the time required to pass each liter of air.

$$Permeability = \frac{Air\ passed \times height\ of\ specimen}{Pressure \times area\ of\ specimen} \times \frac{60}{Time}$$

(All measurements in c.g.s. units.) The committee recommends that 2 liters of air be forced through; and with the standard specimen the equation becomes

$$Permeability = \frac{30{,}070}{Pressure \times seconds}$$

In addition to these three simple tests, an auxiliary test is suggested as desirable. It is called the dye adsorption test, and is a measure of the quality of clayey material present in the sand. In general these materials are hydrated silicates in the colloidal condition; a considerable quantity is usually associated with a sand of strong bonding qualities. To execute the test, a given weight of sand is shaken with water and alkali, and the suspended material removed by siphon or decantation. A measured amount of crystal violet is then added to the liquor and the resulting color compared against standard solutions; 1,200 to 1,500 mg. of dye will be adsorbed by the colloids in 100 grams of sand if it has a strong bond; weak bonds adsorb as little as 200 mg.

[1]A thick block of wood laid edgewise.

Machinery and Appliances for Production and Control

Equipment News

From Maker and User

Materials and Accessories for Chemical Industries

Steel Belt Conveyors

Steel belt conveyors have been made and sold on the European market for a number of years by the Sandvik Steel Works, of Sandviken, Sweden. During the past year this company has brought its product to the American market, and there are already a number of installations in operation and several more are being erected.

These conveyors are similar in design to a flat belt conveyor using a rubber or canvas belt. The novelty consists in the use of a flexible steel belt. This belt is made of cold-rolled, hardened and tempered Swedish charcoal steel. It is supplied in lengths up to 350 ft. and can be easily pieced where greater lengths are required. Widths can be had up to 18 in. and thicknesses from 0.8 mm. to 1.0 mm.

This belt cannot be troughed but it is claimed by the makers that, due to its rigidity, it can be loaded over almost its entire width—so that an 18-in. steel belt has a carrying capacity about equal to a 30-in. flat rubber or fabric belt and the same as an 18-in. troughed fabric or rubber belt. When handling non-abrasive materials the belt can be run at the bottom of a wooden or steel trough, built narrower than the belt and clearing it, or built wider with ample clearance for the edges of the belt and a greater capacity thus obtained than with a standard troughed belt.

The installations of this belt are made in two ways, which are called the "sliding type" and the "rolling type" of conveyor. The sliding conveyor, for handling non-abrasives, has the steel belt sliding on wooden runners which acquire such a high polish that the friction is nearly negligible. In the rolling conveyor belt strands are carried on idlers, according to usual belt conveyor practice. At times these two types have been used in combination.

Where the Steel Belts Are Installed in the United States and Canada

	No. of Units	Material Handled
Mathieson Alkali Works, Saltville, Va.	2	Phosphate rock
Penn-Allen Cement Co., Nazareth, Pa.	1	Limestone
Michigan Portland Cement Co., Chelsea, Mich	3	Hot clinker Cold clinker
Hercules Cement Co., Hercules, Pa	1	Lump coal Hot clinker
Waukesha Lime & Stone Co., Waukesha, Wis.	1	Crushed rock
Phosphate Mining Co., Nichols, Fla.	1	Phosphate rock
Stevens Bros. & Co., Stevens Pottery, Ga.	2	Clay
American Sugar Refining Co., Brooklyn, N. Y.	1	Wet sugar
Kearns-Gorsuch Bottle Co., Zanesville, Ohio	1	Coal
Installations Under Process of Construction

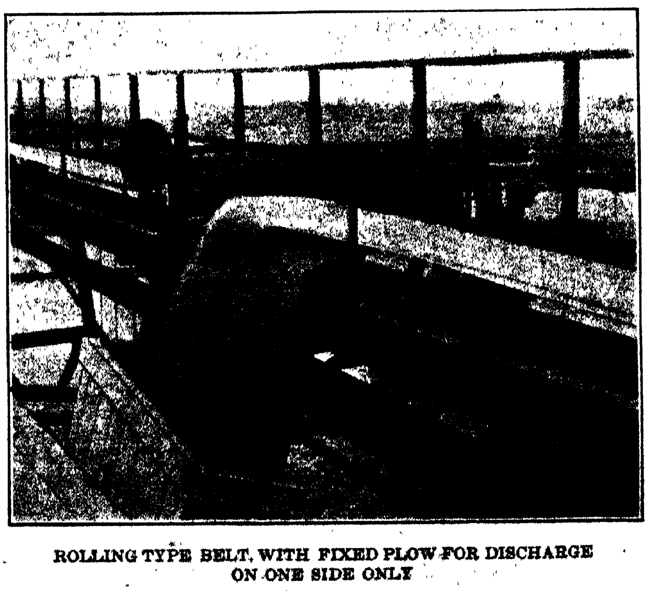
Great Western Sugar Co., Greeley, Colo.	1	Coal

ROLLING TYPE BELT, DISCHARGING HALF BY PLOW AND HALF OVER END



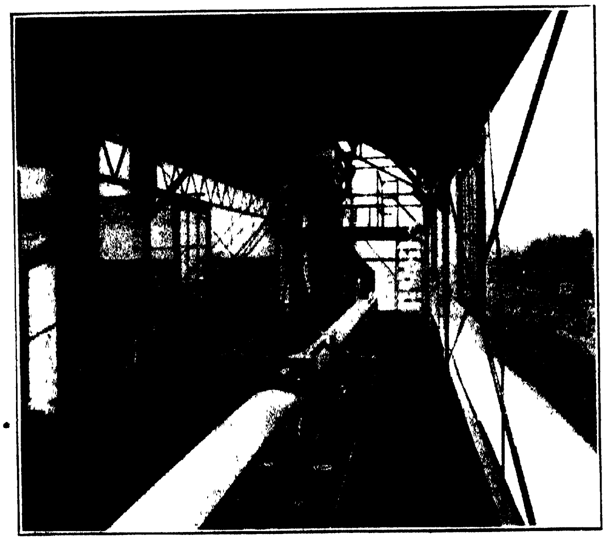
ROLLING TYPE BELT, WITH FIXED PLOW FOR DISCHARGE ON ONE SIDE ONLY

Many advantages are claimed by the makers for the steel belt conveyor. Among these might be mentioned: It can be used for handling hot, sticky or abrasive materials which a rubber or textile belt cannot handle satisfactorily. It is very easily kept clean on account of its smooth surface—such sticky material as sugar, for instance, can be easily and efficiently scraped off with a steel scraper. It is rust resistant—it can be used in the chemical field handling wet and hot materials, and can be run in the open air in all kinds of weather. It can be made perforated without appreciably influencing its life and can be then used handling materials where a great deal of liquid must be eliminated. Another advantage is the discharge feature—materials can be discharged at any desired point without the use of cumbersome and expensive trippers. The belt does not stretch and the

tension devices are very simple; care must be taken only of trifling variations in length, caused by temperature changes.

Conditions Governing Use

The operating speed when using steel belt depends on the length of the conveyor. This speed varies ordinarily between 135 and 300 ft. per minute. For the average conveyor 200 ft. per minute is found to be best. The terminal pulley diameter should be about 1,000 times the belt thickness. In passing over this pulley the belt is subjected to a stress of from 28,000 to 30,000 lb. per sq.in., but it has been found that, with a bending frequency for any section of the belt of about once per minute the molecular structure of the steel is not affected. The manufacturers recommend the belt for a great many materials, among which may be mentioned: clinker, cement, sand, rock, ore and ore concentrates, coal, coke and charcoal, carbide, silica, soda, salt, sugar, cassettes and beet pulp, milk powder, yeast, vegetables, candies and chocolate, deals, battens, slabs, edgings, chips and sawdust, clay, gypsum, brick and briquets, bags, boxes, packages, steel forgings, guncotton and glass. Over 1,400 of these conveyors have been installed in different phases of industry all over the world. A large number have been installed in the South Sea Islands for handling phosphate rock.



SLIDING TYPE BELT, WITH MOVABLE PLOW FOR DISCHARGING ON BOTH SIDES

Water Softeners

At the present time there are several commercial zeolite water softeners on the market. These substances have undergone considerable change since the first successful softener of this type appeared. The different zeolites vary in weight, in ability to absorb hardness from water and in quantity of salt needed to restore the so-called initial exchange capacity. Most of these use the natural green sands or marl beds in the vicinity of Medford, N. J., as the base of their composition. The finished products are usually very fine, greenish to reddish in color, have limited exchange capacity and high physical loss or depreciation in capacity.

Exchange capacity refers to the amount of $CaCO_3$ a zeolite substance will remove in terms of its own dry weight or the number of gallons of water softened per pound of mineral used. The process is sometimes referred to as one of selective absorption or "substitution," as none of the salts in a natural water are eliminated, but only change in form. The exchange capacity depends upon the physical structure of the mineral, which grades from colloidal, to crystalline, to amorphous substances. The latter have a hard bricklike consistency with little exchange value. The former have high reactive value, will soften water instantly and permit water to flow through at a rapid rate. A zeolite distributed by Graver Corporation, East Chicago, Ind., falls into the former class. It is an artificial mineral prepared by the precipitation of sodium aluminate with sodium silicate. The resulting product is filtered, washed and dried and has the appearance of white, small porous granules which do not dissolve in water. This mineral has two to three times the exchange capacity of some other zeolites. Each pound will absorb 9.1 grams of hardness expressed in terms of calcium carbonate. One-tenth of a pound salt is required per pound of mineral, which is equivalent to 5 grams of salt per gram of hardness removed. In some of the older zeolites a salt ratio of 8 to 1 is quite common.

The Graver zeolite will operate uniformly for a period of 10 to 12 hours. It will operate at an overload of 500 per cent in water 30 grains hard and 200 per cent in water of 12 grains hardness per U. S. gallon. This is a valuable property, as it takes care of fluctuating loads or excessive peaks 200 to 500 per cent above normal. It is a quick regenerating zeolite. The salt solution is not over 20 minutes in contact with the mineral bed, and the entire process of regeneration or restoration does not occupy an hour. As the salt requirement is very low, no artificial method of salt recovery or salt reclamation is used to lower the amount of salt required. Such methods are open both to mechanical and chemical objections. A simple gravity flow is used and by means of a specially designed brass lateral system immediately above mineral bed, the top of the salt tank is no higher than top of steel shell. This conserves head room, obviates the necessity of a pit or placing the brine tank on a second floor level. It is more positive than the siphon method used with ground operated salt tanks. This zeolite will regenerate repeatedly without depletion of original exchange ability. Many charges have operated for over 1,000 regenerations and have given a uniform grade of soft water. It produces "zero" water by soap test. By chemical analysis the water does not contain over 0.5 grain of equivalent $CaCO_3$. As many zeolites cannot do better than 0.8 to 1.4 grains, it is possible by the use of a precipitated zeolite almost to approach the distilled water standard.

Catalogs Received

General Electric Co., Schenectady, N. Y.—Catalog 6002. A catalog of railroad supplies covering the General Electric Co.'s full line of supplies for use with electric railways of different types This catalog supersedes all others on the subject, and contains a price list supplement with prices correct to October, 1922.

J. H. R. Products Co., Willoughby, Ohio —Leaflet describing the J. H. R. products, chiefly barium peroxide.

Bristol Co., Waterbury, Conn—Catalog 1006. A new catalog describing the Bristol line of recording gages for pressure and vacuum.

Synopsis of Recent Literature

Aluminum Bronze as an Engineering Material

By aluminum bronze is meant, not the gray-white metallic coating used on radiators, but rather a strong, reliable metal resembling 0.35 per cent carbon Swedish bessemer steel to a remarkale degree. The color, of course, is different, but the mechanical properties are much the same. It resists alternations of stress unusually well and is superior to nearly all of the non-ferrous alloys except Monel metal in this respect. Aluminum bronze is essentially 90 to 92 parts of copper and 8 to 10 parts of aluminum, while Monel metal is approximately two parts of nickel to one part of copper. Naturally, the two metals behave differently with respect to corrosion, but they are much alike in strength and hardness. Both hold their strength much better than other alloys when exposed to elevated temperatures, a fact of importance to the engineer.

Properties — Aluminum bronze is about the color of 10-carat gold, has a tensile strength of 70,000 lb. per sq.in., and an elongation of 15 per cent. Its Brinell hardness number is 100-110. These properties place it in the class of strong bronzes suitable for the most exacting service. Particular mention should be made of its resistance to alternating stress or fatigue. In the Landgraf-Turner endurance-testing machine the aluminum bronzes resisted 4,500 blows before fracture, while the manganese bronze resisted about 500.

The other strong bronze, manganese bronze, has many admirable properties, but it is not adapted for bearing surfaces. Aluminum bronze has proved its worth in this field in such parts as worm-wheel gears. Every day's output of 1,000 Ford trucks carries 12,000 lb. of this metal in gears. Extensive tests of aluminum-bronze gears against phosphor bronze in one-man tanks during the war proved the superiority of the former for this most difficult service.

Almost constant trouble was experienced with large spur gears on the locomotives on the Mt. Washington Railway until aluminum bronze was tried. Its service there has proved eminently satisfactory.

Pickle-crate equipment made of aluminum bronze has been found to withstand the action of sulphuric acid well. This fact, combined with its strength, fits it for this purpose. The property of resisting abrasion is useful for gears, but aluminum-bronze trolley wheels have been found to give remarkable service for the same reason. The toughness of the alloy is useful here as well, because the effect of a severe blow can be readily corrected under the hammer without breakage.

Adaptability—Aluminum bronze is tough when cold, but is more so when red hot. This property makes forgings possible and also helps materially in the manufacture of die castings from this metal. The process is a commercial one, for the dies are made so that they will withstand at least 10,000 openings in most shapes. The solving of the die problem is of equal importance with the metal problem, for one cannot proceed without the other. The property of toughness is useful also in Jordan bars for beating engines. With its freedom from corrosion, the tough aluminum-bronze Jordan bar has been an increasing success in the paper industry.

Machinability—Many excellent properties of aluminum bronze have been mentioned, but it has its drawbacks. First, at least at present, is the difficulty of machining, compared with other bronzes or brasses. This does not mean that it cannot be machined readily under proper conditions, but that, compared with ordinary brass or bronze, its toughness makes it more difficult to handle in the machine shop. Sharp tools, kept so, of the proper angle are essential to success. Ample lubrication is necessary. With these precautions a most excellent job can be done as is evidenced every day at the Ford factory in Detroit. Aluminum bronze most nearly resembles mild steel in its machinability.

When one sees the stacks of golden-bronze worm wheels in the gear department of the Ford company and examines the polished surface of the gear teeth left after the machining operation, there can be no doubt that aluminum bronze as an engineering material has arrived and that its excellent properties have been made available to the engineer because scientific research solved the problems of its manufacture in the foundry.

The second objection to aluminum bronze might be its cost, which is about 25 per cent more than that of brass or bronze. But when compared with special bronzes with somewhat similar properties the difference in cost disappears.

Like all high-grade metals, it must be manufactured under careful supervision, and more than usual care must be used in the casting shop and foundry.

Wrought Aluminum Bronze—Most of the remarks thus far have referred to cast aluminum bronzes, but as rolled or wrought alloys are commercial products and are manufactured in large quantities the author quotes from W. H. Bassett, whose experience with these alloys gives authority to his statements:

"Copper-aluminum alloys can be made in wrought form in any proportions up to an aluminum content of approximately 10 per cent. Three alloys, however, are used principally. These contain 5, 8 and 10 per cent aluminum, respectively. All three alloys hot-roll easily, and these same remarks would apply to the cold-rolling of the 5 and 8 per cent. The 10 per cent aluminum bronze does not cold-roll readily, in fact would not be considered a cold-working alloy.

"The 5 per cent aluminum bronze is furnished principally in the form of sheets. It has, when cold-rolled, a tensile strength as high as 100,000 lb. per sq.in., depending upon the degree of hardness or cold-rolling, and an elongation in 2 in. of 10 per cent. When annealed this alloy has a tensile strength of 55,000 lb. per sq.in. with an elongation of 75 per cent in 2 in. This high elongation for annealed 5 per cent aluminum bronze is characteristic of the material, and it is rarely equaled in the other non-ferrous alloys.

"The 8 per cent aluminum bronze is manufactured extensively in both rod and sheet form, and is supplied, when resistance to wear is also required, in connection with the other general physical properties given for aluminum bronze.

Important Articles In Current Literature

More than fifty industrial, technical or scientific periodicals and trade papers are reviewed regularly by the staff of *Chem & Met*. The articles listed below have been selected from these publications because they represent the most conspicuous themes in contemporary literature, and consequently should be of considerable interest to our readers. Those that are of unusual interest will be published later in abstract in this department, but since it is frequently impossible to prepare a satisfactory abstract of an article, this list will enable our readers to keep abreast of current literature and direct their reading to advantage. The magazines reviewed have all been received within a fortnight of our publication date.

THE MODERN TREND IN FERTILIZER PLANT OPERATION. E. H. Armstrong. *American Fertilizer*, April 21, 1923, pp. 23-25.

"This alloy is in more general use than any of the other wrought aluminum bronzes. In the form of sheets when cold-rolled the tensile strength may be as high as 130,000 lb. per sq.in., with 4 per cent elongation. When annealed this same material has a tensile strength of 60,000 lb. per sq.in. and an elongation of 60 per cent. The generally high tensile strength makes this material very valuable for many engineering purposes.

"Rods in 8 per cent aluminum bronze can also be supplied with approximately the same physical properties as sheet metal. However, it is customary to furnish them in a medium temper with a tensile strength of about 85,000 lb per sq.in. and an elongation of 30 per cent

"The 10 per cent aluminum bronze has, of course, the highest tensile strength and lowest elongation of this series. Owing to the fact that it can be only very slightly cold-worked, it does not have the range in physical properties as shown by the other alloys. Its tensile strength may be taken as 75,000 lb. per sq.in. and elongation as 25 per cent. There is not a great demand for this class of material, but when supplied it is usually furnished in the form of hot-rolled sheets, hot-rolled or extruded rods, and extruded shapes. This alloy can also be heat treated to some extent, in a manner similar to steel. By heating and quenching, its physical properties are improved to some extent, depending upon the exact composition of the material. It has been found that an addition of iron up to about 3 per cent in 8, 9 and 10 per cent aluminum bronzes improves their physical properties, workability, resistance to corrosion, etc."

The author's experience with a large variety of alloys from the manufacturing and the engineering viewpoint confirms his belief that the aluminum bronzes as a class are valuable additions to our list of engineering materials, and if he has pointed out some of the salient points, sufficient to arouse the interest of the engineer to investigate their merits further, the purpose of this paper will have been accomplished.—*W. M. Corse, Chairman, Division of Research Extension, National Research Council, in "Mechanical Engineering," May, 1923.*

Lignite Char: Its Production and Possibilities

At the spring meeting of the American Society of Mechanical Engineers, in Montreal, Canada, O. P Hood, chief mechanical engineer of the U. S Bureau of Mines, will read a paper on this subject. In this paper, preprinted in *Mechanical Engineering* for May, 1923, Mr. Hood says in part that the greatest difficulty with our lignite is the fact that in nearly every district where it should be the natural fuel it is put in competition with high-grade fuel. We are all spoiled by having been blessed with an abundance of the best, so that we are impatient with the limitations of lower-grade fuels. If we had been obliged to go down 2,000 ft. or more and win good coal from thin seams in scattered districts as they do in Europe, we should long ago have worked out a successful technique for utilizing our lignites. Canadian and North Dakota lignite must compete with anthracite and with Pittsburgh and Illinois bituminous coal; our Texas lignite must compete with gas, oil and Oklahoma bituminous coal. It is evident, however, that there must be a price at which the lower-grade fuel will begin to be attractive. In round numbers the ratio is somewhere in the neighborhood of half the price of good coal. With the rising price of bituminous coal we are fast approaching the time when this ratio will be common

The handicaps of lignite are well known but not always properly valued. The heating values of high-moisture fuels are somewhat misleading. The heat carried by the moisture is recovered and measured in the calorimeter, but it is not fully utilized in a boiler funace. The B.t u. ratios, therefore, do not give the relative possible steaming values of the fuels if comparison is made between a high-moisture lignite and a low-moisture bituminous coal. Although the ash percentage may be low, there is usually a larger total amount of ash to handle in a plant using lignite. The fusing temperature of the ash is usually low, making high rates of combustion difficult and requiring larger grate areas and furnace volumes than with higher-grade coal. Notwithstanding these handicaps, with present technique, raw lignite can be used in large operations, and good efficiencies and reasonable capacities can be obtained. The problem is largely an economic one. When raw lignite is cheap enough in comparison with better coals it will be used in large steam-raising operations.

Improvement of Raw Lignite for Fuel Purposes

The search for a means to improve the fuel, however, must continue. A fuel classed as lignite in northern Bohemia, and weathering much as does our lignite, is as carefully prepared for market as is our anthracite. Seven prepared sizes are offered to the market. Raw lignite can probably be somewhat improved for steam raising by sizing the product more closely than is common practice. It is probable, however, that an improved lignite product must first cater to a special trade that will pay a special price. This is illustrated by the vision that has been so frequently held of improving the lignite by some process involving briquetting. Unlike the German "Braunkohle," our lignites do not make a stable and satisfactory briquet simply by drying the lignite and briquetting by heat and pressure. They lack sufficient inherent binder to consolidate and waterproof the mass. The necessary added binder increases the cost and hardly improves the quality. A quite satisfactory fuel can, however, be made by briquetting lignite char, and it is probable that some day such a fuel will be in common use.

There have been hopes that through the recovery of byproducts sufficient credits might be obtained to materially lessen the cost of briquets. Profit can be shown on paper, but such a process is essentially a large-scale operation requiring a large investment and very substantial financial backing by those familiar with technical enterprise. It is difficult, therefore, to start such an industry, for there is no opportunity to begin small and grow up, returning profits into an improved plant. Capital familiar with technical enterprise finds less hazardous ventures, and capital unfamiliar with such enterprise is apt to be misled and lost.

Lignite Char and Its Possibilities

With these facts in mind, the United States Bureau of Mines is investigating the possibilities of a somewhat different program which has for its main features an inexpensive carbonizing device and the use of the lignite char direct, without briquetting. If a market for the char can be developed, and the small mine can produce char, there would be provided means for a natural evolution of an industry that in time might realize the larger vision of briquetting and recovery of byproducts.

Lignite char can best be described in a few words as a fuel rather near in analysis to anthracite coal, but softer, with a little more volatile matter, and thus kindling easier. In size it grades from pea coal to smaller sizes, and is a stable product. Whether a market can be developed for such a fuel at prices around five dollars a ton at the mine remains to be shown, but it is at least encouraging to know that Germany used last year 400,000 tons of similar material for domestic heating and cooking. This fuel burns well with natural draft where a thin fuel bed, about 1½ in. in thickness can be maintained. Base burners, cook stoves and other heaters can be adapted to use the fuel satisfactorily. The Germans have developed a special stove, burning the fuel on a bed of ash in an inclosed drawer. There is no loss of fuel in the ash and our lignite char used in such a stove heats an oven sufficiently for baking operations and will boil water. It makes a very clean fire, is smokeless, and the char is clean to handle. It is, however, slow in getting under way as compared to a gas range.

Production of Lignite Char

To produce the char a very simple oven has been devised that greatly reduces the investment from that needed for ovens heretofore proposed. If lignite be passed through a combustion zone, moisture is first driven off; then combustible gases are distilled, and finally the solid carbon is burned. There is a considerable shrinkage in volume and a complete absence of caking quality. These steps are fairly distinct one from the other, so that the flow of lignite through the combustion zone may be so regulated that but little

of the fixed carbon is burned. The combustion zone can be maintained by burning some of the distilled gases within the moving mass of lignite, and such direct heating is more efficient than where heat must be transmitted through refractory walls. The hot gases of combustion also pass through the mass, driving off the moisture and departing fairly cool. It is something like an open-top lime kiln. The process has proved simple and efficient. Of the gas driven off, much of it is used in the combustion zone, and in addition, less than 5 per cent of the weight of the original lignite is burned. That is to say, the fixed-carbon loss in the process for drying and distilling is lower than is usually found for drying alone where separate driers are used. Passing the combustion zone the lignite enters a lower section protected from the air, where it cools and is then removed. The char obtained by such a process may, of course, be briquetted.

An oven of this sort was operated at Grand Forks, N. D., during the past summer, and about 400 tons of various North Dakota lignites passed through. In February about 100 tons of Saskatchewan lignite was tried to discover whether this presented any special problems.

About 2½ tons of raw lignite reduce to 1 ton of char, and the heating value is about 12,000 B.t.u. per lb. The moisture is very low, and the char can be stored without danger of fire or degradation in size. Where the freight charge is heavy it would be an advantage to ship char instead of raw lignite.

Review of Recent Patents

Decolorizing Acidic Boro-Silicate Glasses With Neodymium Oxide—The color produced by iron oxide in acidic boro-silicate glasses is yellow, whereas in ordinary glasses it is green. Thus manganese dioxide, nickel oxide and selenium, so effective in neutralizing the green tint of ordinary glasses, only intensify the yellow, making the glass more of an amber. William Chittenden Taylor, of Corning, N. Y., has found that neodymium oxide, Nd_2O_3, is quite well suited for decolorizing such glasses. Instead of the pure oxide, there may be used what is commercially known as didymium oxide, a mixture of neodymium oxide and lanthanum. From 0.5 to 1 per cent of N_2O_3 is sufficient for decolorizing, and it has been found advisable to use an oxidizing batch (such as one containing a small amount of $NaNO_3$), as the color produced by neodymium is more nearly complementary to that produced by oxidized iron than by reduced iron. Boro-silicate glasses sufficiently acidic to be decolorized may be grouped as follows according to composition: Not less than 80 per cent silica; not less than 75 per cent silica, with boric oxide not less than 40 per cent of constituents other than silica; not less than 70 per cent silica, with boric oxide not less than the alkali content; boric oxide not less than 50 per cent of total constituents other than silica; not less than 60 per cent silica, with boric oxide not less than 25 per cent of constituents other than silica. A typical composition would be: Silica, 81; boric oxide, 13; sodium oxide, 4; alumina, 2. (1,449,793. Assigned to Corning Glass Works. March 27, 1923.)

Removing Colloidal Matter From Mineral Pulp—Colloidal slimes interfere with many metallurgical operations and it has been proposed to coagulate or flocculate the colloids. According to Walter O. Borscherdt, of Austinville, Va., the presence of the flocculated colloidal constituents in the pulp is very often objectionable and he suggests a procedure that is directly opposed to the one just mentioned. The colloids are dispersed by the addition of a suitable reagent such as silicate of soda and separated from the pulp in decantation tanks or thickeners. The colloid-free pulp may then be submitted to the desired treatment. Partial removal of colloids may be used to assist selective flotation. (1,448,515. Assigned to New Jersey Zinc Co. March 13, 1923.)

Manufacture of Artificial Magnesia Spinel—By fusing together in an electric arc furnace magnesite or any suitable ore high in magnesia and bauxite or other material high in alumina, a molten mass is produced which cools to a rock-like mass of a greenish or brown color consisting of masses of spinel crystals. A typical mixture may consist of 64.7 per cent aluminous abrasive fines and 35.3 per cent of a high-grade calcined magnesite. The fines used contain about 92 per cent alumina and is a byproduct of the abrasive industry. (1,448,010 Frank J. Tone, of Niagara Falls, N Y., assignor to the Carborundum Co. March 13, 1923.)

Aluminous Abrasives — Aluminous abrasives are ordinarily produced by feeding a mixture of calcined bauxite, coke and iron borings into an electric furnace of the arc type having two depending electrodes until the furnace is completely filled. The current is then shut off, electrodes removed and the molten mass allowed to cool into a pig, which is removed, crushed, treated to remove any injurious impurities and made into grinding wheels or other articles. Using carbon to reduce the oxides of titanium, silicon and iron which occur as impurities in the bauxite often results in the formation of aluminum carbide and other reduced alumina material which causes slow disintegration of the abrasive. Thomas B. Allen, of Hamilton, Ont., substitutes metallic aluminum for coke as the reducing agent, thus obviating the possibility of forming aluminum carbide. With a calcined bauxite of the composition H_2O, 0.5; Al_2O_3, 88.0; TiO_2, 4.0; SiO_2, 5.0; Fe_2O_3, 2.5, the proportions used are 1,000 calcined bauxite, 113 aluminum and 100 iron borings. The function of the iron is to alloy with the reduced oxide impurities and by increasing their specific gravity permit a better separation from the aluminous material. They also render the alloy more readily attacked by chemical reagents. (1,448,586. Assigned to Abrasive Co. March 13, 1923.)

Purifying Clay—As a deflocculating reagent for the purification of clay, William Feldenheimer and Walter W. Plowman, of London, England, propose to use solutions of rosin in caustic alkali, alkali silicate or carbonate. It is claimed that these reagents will deflocculate clays which are not amenable to treatment by or which demand comparatively close adjustment of the concentration of reagents commonly used. (1,447,973. March 13, 1923.)

Conical Mills—This invention concerns an apparatus for entraining and removing fines from conical mills. In the conical mill, because of its construction, there is an inherent classifying action in which the fines travel automatically toward the apex of the cone, while the coarser material remains behind until it is reduced to the desired fineness. In some cases this classification of material and subsequent discharge of the fines are not sufficiently rapid and the purpose of this invention is to provide a mechanical means for aiding this action.

A current of what the inventor calls "elastic motive fluid" and might be more simply called "gas" is caused to enter the drum of the mill through a suitable inlet near the inlet of the mill and to flow parallel to the axis of rotation of the mill through the conical outlet and so out. Or an ejector may be set up in the outlet and by this means a suction set up through the mill and a current of air or other gas drawn through it in a similar manner.

This current of air or other gas flows while the mill is rotating and in this way the fines which are practically floating at the apex of the cone are entrained in the current and carried out. As the rotation goes on, fines are brought to the surface, and these are also entrained and carried out. In addition, the air current also penetrates the material to a certain extent and dislodges other fines and carries them away. (1,450,289. Harry W. Hardinge, New York, N. Y. April 3, 1923.)

Conical Mills—In the operation of a conical grinding mill with certain substances, a percentage of over-size material will be discharged with the fines. This invention is concerned with a method for returning this over-size material to the main body of the mill so

that it may be reduced to the desired size. The particular application of this invention is when the mills are operated at an overload.

A classifier of cylindrical, conical or other form is provided at the discharge end of the drum, so that the ground material is discharged into this classifier. In order to return the over-size material from the classifier to the main body of the mill, there is employed a conveyor pipe running into the mill and discharging into the same from the classifier. This pipe is provided with branches inside of the classifier so arranged as to scoop up the over-size material, which will be at the outer periphery of the classifier, and, due to the rotation of the classifier, force this material along the pipe and so deliver it back to the grinder. (1,450,290. Harry W. Hardinge, New York City. April 3, 1923.)

Sizing Composition—If Karaya gum is mixed with a small amount of oxalic acid it becomes soluble in water. In this condition it is suitable for use as a size and as such gives superior results in certain kinds of work. It is especially adapted for use in treating, coating and printing papers and textiles as a substitute for glue, soluble gums, casein and various farinaceous materials. This size is patented by R. Kaiser, of New York City. (1,448,847. March 20, 1923.)

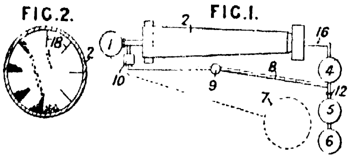
Treatment of Rubber Waste—If finely divided rubber and foreign fiber is treated with water, by sprinkling, it is acted upon by relatively cool and dilute sulphuric acid which will remove the undesirable fiber. The acid, of gravity not exceeding 30 deg. Bé., is poured over the mass, which has previously been placed in bins with screens at the bottom. The mass is left to drain 24 hours and at the end of that time another addition of acid is made. Finally water at a temperature of from 60 to 80 deg. C. is poured over the mass and allowed to percolate through. This invention, made by R. A. Terhune, Fairhaven, Mass., while involving the use of lead-lined bins, results in increased economy of the amount of sulphuric acid used and does away with the injuries effects of the old process in which sulphuric acid was used at boiling temperature. (1,450,462. April 3, 1923.)

British Patents

For complete specifications of any British patent apply to the Superintendent British Patent Office, Southampton Buildings Chancery Lane, London, England.

Carbonization—In the low-temperature carbonization of coal, lignite, peat, shale, wood and similar carbonaceous materials, hot gas after passage through a rotary retort containing the material is cleaned and preheated before being again circulated through the retort, a part of the gas and distillates being removed from time to time.

FIG.2. FIG.I.



Hot gas from a producer 1 is passed through the rotary retort 2 and the resulting gases and vapors passed by a pipe 16 through a tar extractor 4 and forced by a pump 9 along a pipe 8 and through a reheater 10 back to the retort. A portion of the gases may be drawn off by a valve 12 and passed through condensers and scrubbers 5, 6 to a gasholder 7. The reheater may be supplied with gas either from the holder 7 or the producer 1.

The retort may have internal shelves 18 which serve to shower the material and which may be corrugated or set at an angle to the axis of the retort. By this construction when the feed is interrupted, the circulation of gas is continued and the retort maintained at a temperature suitable for carbonization. (Br. Pat. 192,040. W. C. White, Westminster, London. March 14, 1923.)

Dyeing Cellulose Acetate — Goods made from cellulose acetate are dyed with vat or sulphur dyes in hydrosulphite vats kept weakly alkaline by ammonia, only sufficient caustic alkali being present to form the leuco-compound; preferably salts such as barium, calcium or magnesium chloride, and protective colloids such as boiled-off liquor, gelatine, glucose or starch, are added to the vats. Examples are given of dyeing with Bromindigo and Pyrogenindigo. Specification 182,830 is referred to. (Br. Pat. 191,553. R. Clavel, Basel, Switzerland. March 7, 1923.)

Gas Condensers—In a gas condenser having oblong or rectangular tubes, the tubes are fitted at intervals with in-

1,453,764—Liquid for Treating Fabrics A Neusella, Chicago, Ill, assignor of one-half to A. A. Patterson, Chicago, Ill

1,453,766—Catalyst and Method of Making the Same. E. H. Payne and S A. Montgomery, Woodriver, Ill., assignors to Standard Oil Co., Whiting, Ind

1,453,767—Sugar-Packing Machine. C. C. Reese, San Francisco, J. T. Buzzo, Oakland and R. S. Woodward, Crockett, Calif

1,453,789—Preparation of Pure Selenium Oxychloride G. J. Fink, Niagara Falls, N Y., and E D Giauque, Niagara Falls, Ont, assignors to Hooker Electrochemical Co., New York City.

1,453,928—Aluminum-Silicon Alloy and Method of Making It. J. D. Edwards, Oakmont, Pa., assignor to Aluminum Co of America, Pittsburgh, Pa

1,453,976—Composition for Detonators B. Grotta, Tamaqua, Pa., assignor to Atlas Powder Co, Wilmington, Del

1,453,984—Manufacture of Ammonium Perchlorates. R. A. Long, Tamaqua, Pa, assignor to Atlas Powder Co., Wilmington, Del.

1,453,988—Method of Briquetting Sawdust, Peat, Coal Dust and Similar Pulverous Substances. H. A. Mueller.

1,453,993—Metallurgical Refractory Material and Process of Producing the Same. C. Payton, Douglas, Ariz., assignor of fifty-five one-hundredths to Phelps Dodge Corp. of N. Y

1,454,002—Lubricator. C. Verniaud, Quincy, Ill, assignor to G. M. C Metallic Grease Co, Quincy, Ill.

Complete specifications of any United States patent may be obtained by remitting 10c. to the Commissioner of Patents, Washington, D. C.

clined stationary baffle plates for diverting hot air away from the exterior surface of the tubes and allowing cold air to take its place. The inclined baffle plates may extend beyond one or both edges of the sides of the tubes and be connected by horizontal or inclined plates to deflect the heated air further away from the tubes. (Br. Patent 191,-644. W. Blakeley, Beechwood, Church Fenton, Yorkshire, England. March 7, 1923.)

Book Reviews

THERMODYNAMICS AND THE FREE ENERGY OF CHEMICAL SUBSTANCES. By *Gilbert Newton Lewis* and *Merle Randall.* 653 pages. Published by McGraw-Hill Book Co., Inc., New York, 1923. Price, $5.

In disclosing their purpose in writing this book the authors make the following statement in the preface:

> If during the course of the book we help disclose to the student some of the beauty and simplicity of the thermodynamic method, if we convince a few practical chemists of the extreme practicality of the results of thermodynamic calculations, if we contribute in some measure toward making chemistry an exact science, our task is rewarded.

To exhibit the beauty, practicality and exactness of chemistry is a purpose most laudable and one in which the authors have made a conspicuous success.

The material of the book is divided into three parts; the first lays the foundations of thermodynamics, the second is concerned with the applications of these fundamental principles, while the last part is devoted to a systematic consideration of the data of thermodynamic chemistry. The authors state that the average reader is not expected to read the book rapidly and consecutively, for many chapters can be mastered only by arduous study and exercise.

In the first chapter the authors point out several facts that are of extreme interest to the "practical" man. For example:

> The widespread prejudice against any practical use of thermodynamics in chemistry is not without reason, for the propagandists of modern physical chemistry have at times shown more zeal than scientific caution.

This is beautifully illustrated in the almost universal misplaced confidence in the importance of heats of reactions. Thus: "Thermodynamics shows us whether a certain reaction may proceed, and what maximum yield may be obtained, but gives no information as to the time required."

> To the manufacturing chemist thermodynamics gives information concerning the stability of his substances, the yields which he may hope to attain, the methods of avoiding undesirable substances, the optimum range of temperature and pressure, the proper choice of solvent, the limitations of methods of fractional distillation and crystallization.

Who concerned with chemical production would not give his eye teeth to be able to calculate accurately, in advance, just these data? Millions are spent annually for research that produces negative results, which could have been predicted by the man who knows the fundamentals of thermodynamics. Much of the so-called "chemical intuition" is the unconscious knowledge of thermodynamic principles.

It is not only the clearness of thought and expression that the authors use to impart their knowledge, but also the practical problems they have interspersed throughout the text. No one can work these problems and not fail to grasp the facts and principles set forth in the text.

Most engineers are familiar with the "cyclical process" method of teaching thermodynamics, a pitiful system at its best. Thermodynamics is a mathematical science and should be taught that way. No elaborate mathematics is needed, however. The authors have appreciated this viewpoint and the simple calculus used is reviewed in an early chapter, in order that the reader may grasp the real significance of the mathematical operations that are used later. The authors realize, however, the shortcomings of mathematics, as is indicated by the following philosophical statement:

> Mathematics offers a wonderful shorthand for the precise formulation of well-standardized ideas. On the other hand, the expressions of mathematics are lacking in humor, which is to say that they are not a suitable medium for those finer shades of thought which are often necessary in the exposition of ideas on the way toward standardization.

In order to present thermodynamics in a clear and exact manner the authors are forced to devise many quantities and factors that are unfamiliar to chemists not conversant with modern thermodynamics—for example, partial molal quantities, escaping tendency, fugacity, activity and free energy. Great pains are taken to define each term and to point out its practical importance. These new tools are the result of a natural development and serve to broaden the scope of thought.

The authors attack the subject first from a so-called "ideal" state and then lead up to actual conditions. Too often the books on thermodynamics confuse the reader by failing to set up a clear line of demarcation, or by placing too much importance on laws that hold only over limited fields, are filled with empirical constants and have no fundamental or theoretical significance.

"Entropy," that mysterious factor that is used by so many and understood by so few, is spoken of as the "degree of degradation," and some of the mystery has been disseminated. **"Free energy" is treated as simply as heats of reactions and with remarkably practical results. Einstein's principles of relativity are used to show the definite relationship between energy and mass. The second law is stated as follows:**

> When any actual process occurs it is impossible to invent a means of restoring every system concerned to its original condition.

The third law is stated as follows:

> **Every substance has a finite entropy, but at the absolute zero of temperature the entropy may become zero, and does so become in the case of perfect crystalline substances.**

The authors realize that thermodynamics is at the beginning of its development and not at the end. This is evinced by the following statement:

> It is conceivable that systems might be found in which these micro-organisms would produce chemical reactions where the entropy of the whole system, including the substances of the organisms themselves, would diminish. Such systems have not as yet been discovered, but it would be dogmatic to assert that they do not exist.

Approximately one hundred and fifty pages are given over to the calculation and use of free energy values. If this book can further the use of those values that are known and can create a demand for more data, it will have added more to the development of civilization and the increase of human comfort than any other chemical treatise in all history. The ideal text exposing the fundamentals of one great phase of chemistry has been approached as closely as the human intellect can accomplish it at the present day.

DONALD B. KEYES.

New Publications

THE EXPLOSIVES ENGINEER is the title of a new monthly magazine published by the Hercules Powder Co., Wilmington, Del., the first issue of which appeared the middle of March.

"THE NEW ERA IN THE STEEL INDUSTRY," by Leon Cammen, is a pamphlet describing recent developments in the process of casting iron, steel and alloys in rotating molds of metal. It is especially pointed out that thin-walled steel pipe of large diameter may be split, flattened out and marketed as plate.

THE CHEMICAL AGE YEAR BOOK, Diary and Directory for 1923 has recently been issued by *Chemical Age*, Benn Brothers, Ltd., 8 Bouverie St., London, E. C. 4, England. As indicated by its title, the volume contains a variety of material ranging from advertisements of manufacturers of chemicals and plant equipment to technical information of the kind usually appearing in engineering handbooks.

IN *Business Chemistry*, vol. 1, No. 1, sponsored by Skinner, Sherman & Esselen, Boston, Mass., it is stated that its purpose is "to turn the light of modern chemistry on the problems of business and the profits hidden in the waste-piles of industry and latent in its processes and byproducts."

THE UNIVERSITY OF ILLINOIS, Urbana, Ill., has issued Engineering Experiment Station Circ. No. 10, on "The Grading of Earth Roads," by Wilbur M. Wilson, and Bull. No. 134, on "An Investigation of the Properties of Chilled Iron Car Wheels," by J. M. Snodgrass and F. H. Guldner.

THE ASSOCIATION OF BRITISH CHEMICAL MANUFACTURERS, 166, Piccadilly, London, W. 1, England, has published its "Official Directory of Members With Classified List of Their Manufactures." The object of the publication is to facilitate business relations between manufacturers and chemical firms and purchasers all over the world. Copies may be had from the address above at 10/6d.

"WHERE TO BUY" (Everything Chemical) is the title of a book, published in January, 1923, by S. Davis & Co., 30/31 St. Swithin's Lane, London, E. C., England, which contains sections on general chemicals, fine chemicals, plant, material and apparatus and index to trade names. Price 2s.

WERBY LABORATORIES, consulting and analytical chemists and engineers, 88 Broad St., Boston, Mass., have issued a 16-page brochure entitled "Do You Use a Chemist in Your Business?" by James H. Collins.

THE EDISON LAMP WORKS of the General Electric Co., Harrison, N. J., has issued the following booklets: Bull. L. D. 140, Index 74, on "The Lighting of Paper and Pulp Mills"; Bull. L. D. 143, Index 72, on "Lighting of the Food Industries"; Bull. L. D. 110A, Index 68, on "The Lighting of Textile Mills"; Bull. L. D. 144, on "Street Lighting With Mazda Lamps"; Bull. L. D. 141, Index 99, on "Automobile, Garage and Display Room Lighting," and Bull. L. D. 142, Index 63, on "The Lighting of Woodworking Plants."

Men in the Profession

I. V. BRUMBAUGH, of the Bureau of Standards, addressed the Baltimore Section of the American Society of Mechanical Engineers on May 9 His subject was "Causes of Carbon Monoxide Poisoning in Baltimore."

Dr. HARRY A. CURTIS has been appointed to take charge of the investigation of nitrates in the Department of Commerce survey of essential raw materials produced under monopoly conditions abroad. The major purpose of the investigation, Secretary Hoover declared, is to safeguard American consumers, both agricultural and industrial, in obtaining adequate supplies at reasonable prices.

ALFRED C. ELKINTON, president of the Philadelphia Quartz Co. of California, San Francisco, has recently returned to that city after a 7 months' tour of the Far East and antipodes.

ECKARDT V. ESKESEN, president of the New Jersey Terra Cotta Co., New York, has been elected vice-president of the National Terra Cotta Society.

F. FRANK, general manager of the Frank Laboratories, of San Francisco, Calif., expects to leave New York in the near future for an extended trip abroad. He will visit France, England, Germany, Italy, Austria, Rumania and Russia, and expects to be absent about 5 months.

C. D. GARRETSON, vice-president and general manager of the Electric Hose & Rubber Co., Wilmington, Del., has been elected president of the local Rotary Club.

T. C. HAGEMAN of Christiania, Norway, formerly consulting engineer to the Norwegian nitrogen industries, is now in the United States on business. His headquarters are at 564 79th St., Brooklyn, N. Y.

FRED J. HARTMAN, of Pittsburgh, Pa., has resigned as secretary of the Pennsylvania State Industrial Board, effective May 15, a position he has held for the past 4 years, to become assistant to Thomas S. Baker, president of the Carnegie Institute of Technology, Pittsburgh.

Dr. EDWARD P. HYDE, who organized the Nela Research Laboratories in 1908 and who in recent years has occupied the position of director of research of the National Lamp Works of the General Electric Co., has tendered his resignation to take effect June 30 of this year. Dr. Hyde will take a prolonged rest abroad.

Dr. ZAY JEFFRIES gave two lectures at the College of Engineering, Carnegie Institute of Technology, Pittsburgh, Pa., April 30 and May 1, on the subjects of "The Hardening of Non-Ferrous Metals" and "The Hardening of Steel."

RAYMOND B. LADOO, of the engineering staff of the Bureau of Mines, has resigned to become general manager of the Southern Minerals Corporation. Mr. Ladoo has specialized during his service with the Bureau of Mines in the non-metals. The Southern Minerals Corporation is planning the development of some of the non-metalliferous resources of the South. The company is a close corporation, formed by the interests that have made a conspicuous success of the operations of the Magnesia Talc Co. in Vermont. The officers of the company are J. S. Patrick, Burlington, Vt., president; J. T. Smith, Waterbury, Vt., vice-president, and R. L. Patrick, of Burlington, treasurer. For the present the general offices will be maintained in the Continental Trust Building, Washington, D. C.

MARSHALL C. LEFFERTS, president of the Celluloid Co., Newark, N. J., has resigned from this office to become chairman of the board of directors, a position just created. He has been president since the organization of the company in 1890. HENRY RAWLE, vice-president of the company since 1912, has been elected president to succeed Mr Lefferts.

Dr. HENRY LEFFMAN, of the research division of the College of Pharmacy and Science, Philadelphia, Pa., gave an interesting lecture on May 2 in the college auditorium on "Explosives and Explosions."

ARTHUR E. RICE, president of the Pennsylvania Salt Co., Philadelphia, has been elected director of the Market Street Title & Trust Co. of that city.

C. A. ROSE, previously connected with Guggenheim Brothers in an important capacity, has been appointed general manager of the British America Nickel Corporation, Ltd., with offices at Ottawa, Canada.

Dr. C. G. SCHLUEDERBERG, of the Westinghouse Electric & Manufacturing Co., returned to the United States the latter part of April, in time to attend the meeting of the American Electrochemical Society May 3 to 5, in New York.

Dr. E. W. SCHWARTZE, of the Bureau of Chemistry, has received a medical fellowship from the National Research Council for a year's study with Sir William M. Bayliss, professor of general physiology at the University College, University of London.

CARL J. ZIMMERMAN of Long Island City, N. Y., has been elected president of the Carbola Chemical Co., Inc., with mines and plant at Natural Bridge, N. Y. V. E. Maher was former president.

The Chicago Chemists Club, at its annual meeting May 1, elected the following: President, A. V. H. MORY; first vice-president, A. E. SCHAAR; second vice-president, H. G. WALKER; secretary, R. S. SHUEY; treasurer, O. H. WURSTER, and trustees, S. L. REDMAN and F. J. ROOT.

Obituary

Dr. FREDERICK SALATHE, chemist and geologist, died on May 7, at Santa Barbara, Calif., aged 57 years.

JOHN GILBERT WARD, treasurer of the Babcock & Wilcox Co., died on April 22.

Society Calendar

AMERICAN ASSOCIATION OF CEREAL CHEMISTS will hold its ninth annual convention at Hotel Sherman, Chicago, June 4 to 9.

AMERICAN ELECTROPLATERS SOCIETY will hold its eleventh annual meeting at Providence, R. I., July 2 to 5

AMERICAN GAS ASSOCIATION will hold its annual convention the week of Oct. 15 at Atlantic City. An elaborate exhibition of gas-making and gas-utilization equipment is planned.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS will hold its summer meeting June 20-23 at Wilmington, Del.

AMERICAN LEATHER CHEMISTS ASSOCIATION will hold its twentieth annual convention at the Greenbrier, White Sulphur Springs, W. Va., June 7, 8 and 9.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS will hold its spring meeting May 28 to 31 in Montreal, Canada.

AMERICAN SOCIETY FOR TESTING MATERIALS will hold its twenty-sixth annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, beginning Monday, June 25, 1923, and ending either Friday or Saturday of that week.

CANADIAN INSTITUTE OF CHEMISTRY will hold its annual meeting in Toronto, May 29 to 31.

NATIONAL ASSOCIATION OF MANUFACTURERS OF THE UNITED STATES OF AMERICA will meet in annual conference May 14 to 16, inclusive, at the Waldorf-Astoria, New York City.

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (NINTH) will be held in New York Sept. 17-22

NATIONAL FERTILIZER ASSOCIATION will hold its thirtieth annual convention at White Sulphur Springs, W. Va., the week of June 11.

NATIONAL LIME ASSOCIATION will hold its fifth annual convention at the Hotel Commodore, New York City, June 13 to 15.

NATIONAL SYMPOSIUM ON COLLOID CHEMISTRY will be held at the University of Wisconsin, June 12 to 15.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stetters Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month

PACIFIC DIVISION, American Association for the advancement of Science, will hold its seventh annual meeting at the University of Southern California, Los Angeles, Sept. 17 to 20, in conjunction with the summer session of the national association and a meeting of the Southwestern Division of the National Association.

SOCIETY OF CHEMICAL INDUSTRY, Canadian Section, will meet in Toronto, May 29 to 31.

SOCIETY FOR STEEL TREATING — Eastern sectional meeting will be held June 14 and 15, in Bethlehem, Pa.

The following meetings are scheduled to be held in Rumford Hall, Chemists' Club, East 41st St., New York City: May 18—Society of Chemical Industry, regular meeting. June 8—American Chemical Society, regular meeting.

Industry and Trade

Current News and Market Developments

News Section

May 14, 1923

CHEMICAL & METALLURGICAL ENGINEERING

Tenth Avenue at 36th Street, New York

H. C. PARMELEE, *Editor*

Market Section

The Summary of the Week

Intersection meeting of A.C.S. at Urbana, Ill., largely attended and many papers of industrial importance presented.

Suit of government against the Chemical Foundation Inc., postponed till June 4, at Wilmington, Del.

Treasury Department announces it has no authority to transfer calcium arsenate to free list.

Lower duties are asked on linseed oil, cresylic acid, and phenolic resin, under flexible provisions of tariff act.

War Minerals Relief Commissioner recommends award to Grasselli Chemical Co. as partial recompense for losses incurred in operating a pyrites mine during the war period.

A lower price schedule for German potashes was announced last Wednesday.

The Nitrate Association, comprising leading factors in Chile, has issued new prices on nitrate of soda, covering shipments over the next year.

Figures compiled by the Department of Commerce show that exports of chemicals and allied products in March exceeded those of February to the extent of $2,500,000.

The customs service announces that members of the trade may make suggestions relative to the standards of dye strengths, which are to be adopted as a basis of levying duties, up to May 14 instead of May 7, as was first announced.

Importers have not been active in placing orders for future shipments of permanganate of potash and foreign markets are expected to feel the loss of such business.

Domestic producers of arsenic have sold round lots under the prices quoted in the open market. Imported grades are unsettled in price but show no material price changes.

Under the leadership of cottonseed oil, the entire vegetable oil list sold off in price during the week.

The movement of new crop production at a time when consuming demand had fallen off brought out another sharp decline in the prices for pure spirits of turpentine, the decline amounting to 20c. per gallon for the week.

Bichromates, both soda and potash, were advanced in price. Production is reported to be curtailed owing to scarcity of competent labor, and higher producing costs in general add to the strength of the market.

Increasing Output of Carbon Black

INFORMATION to the effect that new companies in Texas, Louisiana and West Virginia were preparing to engage in the manufacture of carbon black has reached the trade within the past 2 weeks. This is encouraging to consumers of this material, as it gives assurance that production will be along broader lines. Consumption of carbon black has increased rapidly in recent years and at times the call for deliveries has proved too heavy to be met by the producing capacity of existing plants. With increased call from the industries, producers did their best to increase the volume of output, but scarcity of offerings still featured the market, and the introduction of new producing factors will be welcomed as an evidence of a more equal balance between supply and demand.

To some extent the greater use of carbon black may be attributed to the natural expansion of the various consuming trades, but more than anything else, it has resulted from an abnormal outlet in the rubber industry. Up to 1914 the rubber trade took but small amounts of carbon black and its value to that trade was solely in the nature of a coloring agent. Then it was found that carbon black possessed qualities that made it an excellent filler for rubber. Later reports were heard that it increased the tensile strength of rubber, gave it increased toughness and resistance to abrasion. As a result the rubber trade in 1921 was classed as the largest consumer of carbon black, with annual requirements of about 20,000,000 lb., as compared with 12,000,000 lb. for the printing ink trade, which was second on the list.

The latest figures on production that are available cover the year 1921 and show that in that year the output was 58,632,700 lb., as compared with 51,321,892 lb. in the preceding year. It is generally agreed that production in 1922 showed a healthy gain over that of 1921, but the advance in production was met with an equal—if not a larger—advance in consuming demand and the rubber trade, especially the rubber tire branch, was responsible for absorbing this record output. The various trades which are consumers of carbon black have been operating on an unusually active scale so far this year and it is reasonable to suppose that their increased use of raw materials has extended in a proportionate way to carbon black. To take care of increased home consumption and to conserve our export trade, it is necessary to keep production figures at a level which will permit of unrestricted buying and the news that several new companies were entering the carbon black industry is of interest to consumer and producers alike.

Treasury Decision Retains Calcium Arsenate on Dutiable List

No Authority Under Tariff Act to Transfer It to Free List—Consumers Are Expected to Petition for Reduction in Duty

CALCIUM ARSENATE will remain on the dutiable list of the 1922 tariff act, there being no authority in the law to transfer it to the free list, according to a decision announced May 9 by McKenzie Moss, Assistant Secretary of the Treasury.

Southern Senators and Representatives and others acting in behalf of cotton planters who consume considerable quantities of calcium arsenate in combating the boll weevil had asked the Treasury Department to reverse its ruling that the commodity is dutiable at 25 per cent ad valorem as a chemical compound, under the basket clause of paragraph 5 of the new tariff. They pointed out that at the request of Southern Senators, white arsenic, the principal ingredient of calcium arsenate, had been put on the free list before the act was passed and that omission of specific mention of calcium arsenate obviously was an oversight.

Attorney-General Daugherty was asked for an opinion by Secretary Mellon. He replied that the matter was one for the Treasury to handle. After consideration, Assistant Secretary Moss decided that the decision holding calcium arsenate dutiable at 25 per cent must stand, as under the law all commodities not mentioned or described in the free list must be classified in the dutiable list, and there is no paragraph of the free list into which calcium arsenate might be read.

While the Treasury decision came as a disappointment to the petitioners for removal of duty, it is reported that plans are now being worked out to secure relief from the duty as now operative. It is probable that application will be made to the Tariff Commission, asking for a reduction in duty of the maximum amount of 50 per cent allowable under the flexible provisions of the tariff act.

Award to Grasselli Co.

Recovers Part of Losses for War-Time Operation of Pyrites Mine

An award of $44,244.05 to the Grasselli Chemical Co. has been recommended by the War Minerals Relief Commissioner. The recommendation covers a portion of the losses of that company in connection with the war-time operation of a pyrites mine at Mineral, Va.

Under former owners the property had been one of the largest producers of pyrites in the South. When the Grasselli company took it over, practically all of the ore had been removed from the old workings, which necessitated the deepening of the shaft and the opening of the ore bodies at lower levels. The Grasselli company paid $100,000 for the lease of the property and the option to purchase it on payment of a further $200,000.

Under the War Mineral Relief Commissioner's interpretation of the act, no part of the actual purchase is an allowable item. He holds, however, that the chemical company is entitled to a fair rental for the machinery and equipment in addition to the net operating loss.

Since the War Minerals Relief Commissioner must establish whether or not other war-time operations resulted in profit, an affidavit was secured from Charles M. Hicks, in charge of the ore department of the Grasselli company, to the effect that all of these mining operations were unprofitable. He stated that the company has made no claim for losses on other properties because the operations were undertaken without government stimulation.

Frank H. Rosengarten Dies

Frank H. Rosengarten, 80 years old, prominent as a chemist before his retirement from business in 1897, died on Monday, May 7, at his home 1905 Walnut St., Philadelphia, Pa., following an attack of heart disease. Mr. Rosengarten was a native of Philadelphia, being the son of the late George D. Rosengarten, founder of the firm of Rosengarten & Sons, manufacturing chemists. The Rosengarten firm in 1905 was consolidated with the firm of Powers & Weightman, becoming Powers, Weightman & Rosengarten. He was a member of the Union League. A sister, Miss Fannie Rosengarten, and two sons, J. Clifford and Samuel R., all of Philadelphia survive him. The funeral was private.

New York Chemists' Club Holds Annual Election

The New York Chemists' Club, meeting on May 2, was presented with 500 shares of the stock of the Chemists' Club Building Corporation. Dr. W. H. Nichols, the donor of this stock, which is valued at $25,000, was one of the charter members of the club. The annual election held on the same evening awarded the chairs for the coming year as follows: President, F. J. Metzger; resident vice-president, Allen Rogers; non-resident vice-president, E. R. Weidlein; treasurer, A. G. Robinson; secretary, Herbert G. Sidebottom; trustees, A. A. Holmes and Thomas R. Duggan. The latter was appointed to the place left vacant by the death of Stephen K. Reed, who died after his nomination had been announced.

Calendar

The following important technical meetings are scheduled for the immediate future:

SOCIETY OF CHEMICAL INDUSTRY Chemists' Club, New York City, May 18

AMER. SOCIETY MECHANICAL ENGRS Montreal, May 28-31

CANADIAN INSTITUTE OF CHEMISTRY Toronto, May 29-31

SOCIETY OF CHEMICAL INDUSTRY Canadian Section Toronto, May 29-31

AMER. ASSN CEREAL CHEMISTS Chicago, June 4-9

AMER. LEATHER CHEMISTS ASSN. White Sulphur Springs, W. Va., June 7-9

NAT'L FERTILIZER ASSOCIATION White Sulphur Springs, W. Va., June 11-16

NATIONAL LIME ASSOCIATION New York City, June 13-15

SOCIETY FOR STEEL TREATING Eastern Sectional Meeting Bethlehem, Pa., June 11-15

AMER. INST CHEMICAL ENGRS. Wilmington, Del., June 20-23

AMER SOC. FOR TESTING MATERIALS Atlantic City, June 25-29

Engineering Societies Will Investigate Coal Storage

Appointment of four members to conduct an investigation of the storage of coal is announced by the Federated American Engineering Societies. They are: P. F. Walker, dean of engineering, University of Kansas; S. W. Parr, professor of applied chemistry, University of Illinois; H. Foster Bain, director of the U. S. Bureau of Mines; L. E. Young, Union Light & Power Co., St. Louis. The chairman is W. L. Abbott, chief operating engineer of the Commonwealth Edison Co., Chicago.

A bibliography of the subject is already in course of preparation, as well as a compilation of data and records that have already been made by other organizations. Plans are being developed for securing additional original information which, when enlarged and approved by the committee at a meeting in May, will be put into operation immediately.

New Price Schedule for German Potash

The Potash Importing Corporation of America, which took over the sale and distribution of German potash, on May 1, has announced a new and lower price schedule, covering shipments from May to September. The new prices are on a basis of $34.55 for muriate 80-85 per cent; $43.67 for sulphate 90-95 per cent; $25.72 for double manure salt 48-53 per cent; $16.03 for manure salt, minimum 30 per cent; $10.55 for manure salt, minimum 20 per cent; $7.22 for kainit 12.4 per cent. These prices are per ton of 2,000 lb., net weight, c.i.f. Atlantic and Gulf ports. The prices are subject to discounts of: 1 per cent on purchases of 1,000 tons; 3 per cent on purchases of 3,000 tons; 4 per cent on purchases of 10,000 tons; 6 per cent on purchases of 15,000 tons; and 10 per cent on purchases of 20,000 tons.

Official Figures Verify Expansion In Export Trade for Chemicals

March Exports Valued at $2,500,000 in Excess of February Totals—Soda Compounds Figure Prominently in Outward Movement

CHEMICALS and allied products to the value of $11,857,049 were exported in March. This is an increase of $2,500,000 over the value of similar exports in February, and an increase of nearly $1,500,000 over the value of these exports in March of 1922. March exports of coal-tar products were valued at $1,133,815, as compared with $986,-545, the value of coal-tar products exported in February.

Sodas and sodium compounds to the extent of 35,329,636 lb. were exported in March, an increase of nearly 2,000,000 lb. over February and of nearly 4,000,-000 lb. over March of 1922.

Exports of pigments, paints and varnishes during March showed an increase of $500,000 over the export movement in February, with practically the same increase over those of March, 1922. The value of the exports of pigments, paints and varnishes in March of 1923 was $1,583,169.

Fertilizer exports contributed their part to the March increase. In that month these exports were valued at $1,715,186. This compares with $1,448,-804 in February, and $1,520,188 in March, 1922. Exports of sulphate of ammonia in March were valued at $959,-663. The increase over February, however, was in value rather than in tonnage. Exports, in the order of their importance, were to the following countries: Japan, Dutch East Indies, China, Phillippine Islands and Cuba. Spain, which was a large consumer in March, 1922, was the destination of no shipment of sulphate of ammonia in March of 1923.

There was a decided upturn in the amount of explosives exported in March. In that month 3,254,747 lb. was shipped out of the country, whereas in February the movement totaled 1,485,011 lb.

Some of the more striking contrasts in export movement during March, 1923, as compared with the corresponding month of 1922, are shown by the following figures compiled by the Department of Commerce:

	1922 Lb	1923 Lb.
Aniline oils and salts	10,660	89,515
Misc intermediates	22,033	153,198
Coal-tar dyes and stains	712,404	1,606,168
Sulphate of quinine	* 41,872	148,225
Sulphuric acid	1,003,128	702,355
Aluminum sulphate	1,788,040	2,396,408
Acetate of lime	2,541,897	1,964,833
Calcium carbide	1,106,905	442,531
Copper sulphate	915,482	153,346
Dextrine	926,398	2,099,563
Chlorate of potash	61,764	1,618,054
Bichromate of potash	648,086	1,033,857
Cyanide of soda	74,102	273,320
Borax	778,194	4,185,983
Caustic soda	18,612,225	9,855,416

Carbon and lamp black	2,364,444	1,696,174

* Ounces

Institute Holds Busy Zinc Meeting at St. Louis

The fifth annual convention of the Zinc Institute was held at St. Louis May 7 and 8. The technical addresses included one on "Zinc Oxide and Lithopone" by E. V. Peters of the New Jersey Zinc Co.; one on "Zinc" by C. H. J. Trench of the American Metal Market, and one on "Improvement of Milling Practices" by H. H. Wallower of the Golden Rod Smelting & Refining Corporation, Joplin, Mo.

H. H. Wallower was elected president for the coming year. A. P. Cobb, New Jersey Zinc Co., New York; J. G. Starr, Quinton Spelter Co., Joplin, Mo., and C. F. Kelley, Anaconda Copper Mining Co., New York, were elected vice-presidents.

H. I. Young, American Zinc, Lead & Smelting Co., Mascot, Tenn., was re-elected treasurer, and S. S. Tutthill, New York, was re-elected secretary.

Chicago Chemists' Club Elects New Officers

At the annual meeting of the Chicago Chemists Club, Tuesday evening, May 1, the following were elected officers: President, A. V. H. Mory; first vice-president, A. E. Shaar; second vice-president, H. G. Walker; secretary, R. C. Shuey; treasurer, O. H. Wurster; trustees, S. L. Redman and F. J. Root. Formal business concluded, the remainder of the evening was devoted to a lively round-table discussion of club plans and activities.

Johns Hopkins to Give Course in Gas Engineering

Various gas industries and public service corporations have guaranteed Johns Hopkins University $6,000 a year for 5 years for a chair in gas engineering. The donors are located in sixteen Southern states.

The principal purpose of the new courses will be to train graduate students in this special field. It is hoped that the development of these courses will include particular attention to research in the problems arising in the gas industry. The university is particularly well equipped for this work, as it has had for several years a laboratory for experiments in the recovery of the various byproducts of gas manufacture.

A 4-year undergraduate course in gas engineering will also be offered. During the first 3 years these courses will be closely related to the courses already existing in mechanical engineering and chemistry. During the fourth year principal attention will be given to training in the methods of gas manufacture and usage.

News Notes

Reparations dyes will not be sought by the United States before Congress again convenes. The State Department expains that this is due to lack of machinery for suitable distribution of such dyes should they be obtained.

A new calorizing company has been formed in Deleware to take over the Calorizing Company of Pittsburg. The latter concern has developed a commercial heat-treating process for surfacing iron, steel and other metals with aluminum.

"Nothing takes the place of leather" is the slogan of the Tanners' Council of America in launching its $1,250,000 campaign for the education of the American people in the uses of this commodity and in the status of the industry. Every modern means of gaining publicity is to be utilized.

Alabama's iron industry is picking up. The Sloss-Sheffield Steel & Iron Co. is to start fires in one of the Sheffield furnaces about June 15, according to a recent report. Belief exists at Sheffield that the Sloss company ultimately will erect a steel plant or rolling mills there. The new units which the company has acquired gives it an output of pig iron in this district of about 1,000 tons daily.

The Newark Technical School is to confer the degree of Bachelor of Science upon eleven graduates from the college of engineering at its first commencement on May 14. The event is of interest because chemical engineers are included in the first class to graduate from this school.

Picric acid export taxes during the war were properly levied, according to a decision handed down on May 3 by Federal Judge Learned Hand. The suit of American Synthetic Dyes, Inc., was thereby lost. A total sum of $15,000,-000 from this and from similar suits is said to be gained by the government by this decision.

Damage of $100,000 was done by fire in the plant of the United States Cast Iron Pipe & Foundry Co., at Scottdale, Pa., on May 2. A building filled with valuable patterns and which also included a molding floor was destroyed.

Face brick interests held a meeting on May 11 with the division of simplified practices of the Department of Commerce at Washington. At the conference the advisability and practicability of reducing the number of types and sizes of brick were discussed.

The Syracuse Section of the A.C.S., meeting at Barone Hall on April 27, elected as officers for the ensuing year: President, Ross A. Baker; vice-president, W. B. Hicks; secretary, J. H. Nair; treasurer, P. S. Craig; local councilor, A. W. Kimman.

The fall meeting program of the A.C.S. is already being planned by the various divisions. The meeting is to be held at Milwaukee Sept. 10 to 14.

Intersectional Meeting at Urbana Draws Large Attendance

Good-Fellowship Keynote at 2-Day Meeting of Mid-Western Chemists—Group Programs So Arranged as to Permit Ample Time for Presentation

CENTERING about the Chemistry Building at the University of Illinois, Friday and Saturday, May 4 and 5, there transpired a series of events which again serves to demonstrate beyond all doubt the value of intersectional meetings in the American Chemical Society. In response to an invitation from the Illinois Section, about 150 members representing ten other sections gathered at Urbana for 2 days of inspiration and good-fellowship. Including local members, the total attendance was well over 200, which indicates a most hearty interest in these meetings.

In welcoming the visiting chemists, Prof. W. A. Noyes outlined briefly the organization of the chemistry department at Urbana, indicating in a general way the character of the research work being conducted in the various departments. President E. C. Franklin outlined some of the fundamental facts concerning the ammonia system of compounds upon which his attention has centered for many years. Dr. L. F. Nickell, of the Monsanto Chemical Works, followed with a talk on the present needs of the organic chemical industry. Census figures for 1921 indicate an alarming drop in the production of many organic intermediates and finished products. Dr. Nickell attributed this to such factors as loss of export, duplication of effort through the production of the same commodity by too many firms, the employment of untrained chemists, failure to scrap obsolete equipment and processes. Until these conditions are rectified, development of the organic chemical industry will be hampered.

Time Found for Social Gathering

At the conclusion of the general meeting automobiles were in readiness to carry the party to the Urbana Country Club, where an exciting game of indoor baseball was soon in progress between teams representing Chicago-Illinois on the one hand and Indiana on the other. The final score stood 18 to 6 in favor of Chicago-Illinois. Returning indoors, a social hour before the open fireplace preceded the buffet supper. Then followed an informal talk by President Franklin, an amusing selection of home-grown poetry by Prof. W. Lee Lewis and entertainment by members of Alpha Chi Sigma, Iota Sigma Pi and Gamma Pi Upsilon fraternities.

Saturday morning's activities opened with a popular lecture by Dr. P. N. Leech, of the American Medical Association, on "Home Remedies — Their Claims Versus Composition." At 9:30 group meetings began, the programs presented being as follows: Physical and inorganic, 9 papers; industrial, 8; organic, 5; educational, 4. Some of the papers are given in abstract in the following paragraphs.

Industrial Group Meeting

Experiments on the combustion of hydrogen and carbon monoxide in the presence of various heated oxides were reported by M. J. Bradley, of the University of Illinois. Many oxides were tried either alone or with small amounts of other oxides as catalyzers, but the best results were obtained with copper oxide which was in process of being slightly reduced. Application of these findings in the developments of an improved apparatus for fuel gas analysis was discussed by F. E. Vandeveer, also of the University of Illinois.

As reported by Prof. C. W. Parmelee, investigations in progress in the ceramic department, University of Illinois, include the determination of the heat energy required to burn pure grades of clay to different temperatures, viscosity and surface tension of glass, a phase-rule study of the system Na_2O-CaO-SiO_2, translucency of porcelain by the use of a photo-electric cell.

Acid Car Construction Described

Expense of maintaining muriatic tank cars led the Monsanto Chemical Works to investigate methods for increasing the life, and a design which promises to solve the difficulty was described by Dr. L. F. Nickell. A tank is built up of 3⅞-in. fir staves and heads, the latter being reinforced with 4x6 yellow pine checkerwork. The inside is then treated with a coating of Positive Seal B asphalt cement, which is thoroughly ironed in. The wooden tank is then slipped into a steel tank car which allows 3 in. clearance on all sides. After filling the wooden tank with water to prevent softening of the cement, 160 deg. pitch is blown into the spare between the tank and the steel shell, completely filling it. With this construction, the inevitable acid spills corrode only the outside of the steel shell. A spare 4 ft. square immediately under the dome is bricked over in order to prevent penetration of the cement coating when iron measuring rods are used. The cars are emptied by siphoning out with rubber hose. They have been in service for some time with excellent results.

Dr. E. W. Engle discussed a new electrolytic rectifier using tantalum and lead electrodes in a sulphuric acid solution which has now been placed on the market as a result of investigations of the behavior of tantalum as an electrolytic valve.

A new development in the agreement whereby the Public Health Institute of Chicago maintains research fellowships on organic arsenic and mercury compounds at Northwestern University is the full-time employment by the institute of a chemist whose sole duty is to prepare for the research students intermediate products which are not obtainable in the market. This arrangement, which greatly increases the time devoted to pure research, was discussed by Prof. F. C. Whitmore.

Practical data on the construction of granular graphite resistor furnaces for temperatures up to 1,600 deg. C. were given by M. M. Austin, of the University of Illinois. The furnace must be easy to repack, and this should be done on every other heating. The incoming electrode must be pushed tightly against the graphite. Electrodes should be very rugged in construction in order to carry current up to 500 amp. without the necessity of water cooling, which is troublesome.

Frank P. Brock, of the Redmanol Chemical Products Co., concluded the program with some interesting reminiscences of the problems that attended the early attempts to place Redmanol on the market.

Steel Institute Announces May Program

On Friday, May 25, the twenty-third general meeting of the American Iron and Steel Institute is to be held in New York. The following papers are to be presented at the Hotel Commodore, where the Institute's headquarters are to be:

Address of the president, Elbert H. Gary, chairman, United States Steel Corporation, New York; "The Value of Chemistry in the Iron and Steel Industry," W. A. Forbes, United States Steel Corporation, New York; "Motor-Driven Rolling Mills," H. E. Davis, electrical engineer, Interstate Iron & Steel Co., South Chicago, Ill.; "The Standardization of Steel Mill Practice by Time Studies," Robert Gregg, president, Atlantic Steel Co., Atlanta, Ga.; "Gas Producer Practice in Steel Works," Waldemar Dyrssen, United States Steel Corporation, New York; "Methods in Waste Elimination," H. T. Morris, metallurgical engineer, Bethlehem Steel Corporation, Bethlehem, Pa.; "The Disintegration of Fire-brick Linings in Blast Furnaces," C. E. Nesbitt and M. L. Bell, research engineers, Carnegie Steel Co., Pittsburgh, Pa.

Dye Strength Suggestions Close May 14

The time limit for the receipt of criticisms of its tentative list of standard dye strengths has been extended by the customs service until May 14.

Many requests for an extension of time have been received since May 7 was set as the last day suggestions might be received, with the result that this extension has been granted.

H. D. Ruhm Elected President of N. Y. Paint Club

Widely Known Chemical Expert Chosen to Direct Local Organization —Has Acquired Enviable Reputation in Engineering and Chemical Manufacturing Circles

HERMAN DAVID RUHM, who may boast of 29 years of civil, mining and chemical engineering experience, now heads the Paint, Oil and Varnish Club of New York. At the annual meeting, held on Thursday evening, May 10, at Delmonico's, the members were unanimous in electing Mr. Ruhm the thirty-sixth president of the club. The Paint, Oil and Varnish Club of New York is one of the most influential organizations in trade circles and a pioneer in promoting better relations and a spirit of co-operation among members of the industry. The club is affiliated with the National Paint, Oil and Varnish Association, whose membership includes 1,500 firms. Mr. Ruhm became associated with the New York club in 1916 and his rapid rise to highest honors is a tribute to his ability, pleasing personality and untiring efforts in behalf of the organization.

Mr. Ruhm is well known in the field of chemical engineering, yet, in a truly modest way, he said that he could not quite understand why a chemist should have been singled out to guide the club for the ensuing year. But in the course of an interview he was not at all backward in upholding his profession and pointed out that it is a grave error to differentiate between chemistry and industry. Perhaps it was just this thought that prompted the committee on nominations to select Mr. Ruhm to head the club.

He was born on June 6, 1871, at Nashville, Tenn. After receiving his preliminary education at Fogg High School, he entered Vanderbilt University of Nashville, and was graduated with the class of 1892.

Early in his business career he devoted some time to civil engineering and engaged in construction work for the Nashville & Western Railway Co. and the North Carolina & St. Louis Railway. Later, while a member of the firm of Ruhm & Wilson, engineers and surveyors, he assisted in the United States Government survey of the Cumberland River.

The development of the phosphate rock deposits at Mt. Pleasant and Centerville, Tenn., always has been one of the subjects uppermost in the mind of Mr. Ruhm and he has been identified with this industry since 1893. In the way of achievement in the chemical industry he holds the honor of being the first man to perfect a method of producing caustic potash in this country on a profitable basis as well as on a commercial scale. From 1909 to 1916 he was vice-president and general manager of the Niagara Alkali Co., Niagara Falls, N. Y. In 1916 he became associated with the Marden, Orth & Hastings Corporation as manager of the chemical department. Mr. Ruhm also was vice-president of the Calco Chemical Co., producing coal-tar products.

In 1920 Mr. Ruhm again went into business for himself as a broker and dealer in chemicals and consulting mining and chemical engineer. He is vice-president of the Ruhm Phosphate & Chemical Co.

A Southerner by birth, he has shown more than passing interest in the fight to exterminate the boll weevil and is working out a plan to combine calcium arsenate with calcium phosphate so that the distribution of the poison may be accomplished in a more economical way. He is the author of several brochures on the development of a potash industry in the United States.

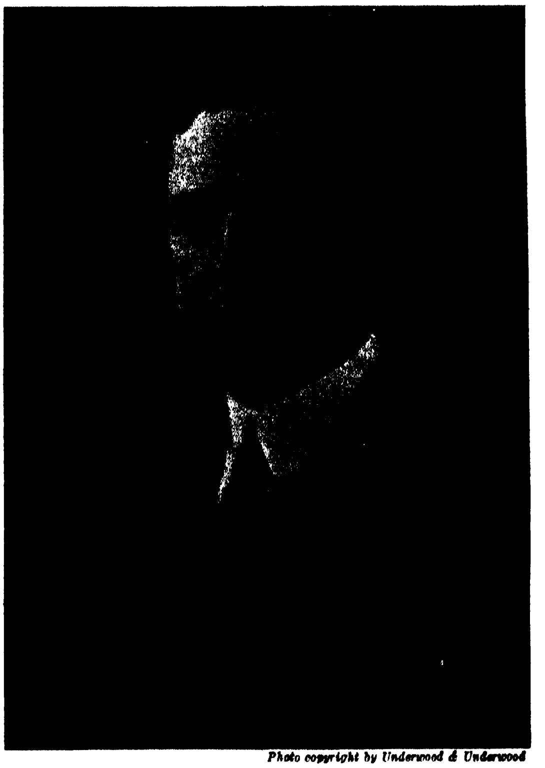

Photo copyright by Underwood & Underwood

Herman David Ruhm

Mr. Ruhm is a member of the American Chemical Society, New Jersey Chemical Society, American Institute of Mining Engineers, Drug and Chemical Club, Chemists' Club, American Association for the Advancement of Science, American Electrochemical Society, Beta Theta Pi Club, Englewood Golf Club and Columbia Yacht Club.

Mr. Ruhm, in conducting the affairs of the Paint Club for the coming year, will be assisted by Charles J. Roh, vice-president; H. G. Sidebottom, secretary, and G. H. Tomlinson, treasurer. The newly elected executive committee comprises E. V. Peters, chairman; A. G. Fairweather, R. W. Murray, H. G. Sidford, A. S. Somers and Frank Waldo. The arbitration committee will have G. W. Fortmeyer as chairman and will be rounded out by D. E. Breinig, J. B. Bouck, Jr., H. Gates and Eugene Merz. Other committees will be appointed later by President Ruhm.

At the meeting Thursday night delegates were selected to represent the local club at the thirty-sixth annual convention of the National Paint, Oil and Varnish Association, which will be held in Chicago next November. R. O. Walker, an ex-president of the local club, heads the delegates and eight other ex-presidents of the club are included among the delegates.

Lower Duties Asked for Linseed Oil, Cresylic Acid and Phenolic Resin

Tariff Commission Will Grant Hearings on These Commodities—Efforts to Place Calcium Arsenate on Free List Unsuccessful

RENEWING its consideration of applications for changes of duty under the flexible tariff section of the new law, the Tariff Commission has ordered inquiries into several chemicals and other commodities.

Among these investigations is one into linseed oil, paragraph 54, in which an application for a decrease in duty has been filed by the Bureau of Raw Materials for American Vegetable Oils and Fats Industries, representing paint, varnish and soap manufacturers. The duty under the 1922 act is 3.3 cents per pound, which compares with an equivalent of 2 cents per pound in the act of 1909 and 1⅓ cents per pound in the act of 1913. Not only is the duty higher than ever before but a withdraw on the cake residue from the crushed flaxseed is permitted when this product is exported, thus indirectly increasing the protection of linseed.

A reduction in duty on synthetic phenolic resin, a coal-tar product in paragraph 28, dutiable at 60 per cent ad valorem, American valuation, plus 7 cents per pound, or an increase in products made of this resin was asked by the National Importing Co., New York. Under the special act of 1916, the duty on this resin was 30 per cent, foreign valuation.

James F. Ballard, Inc., St. Louis, applied for a reduction in duty on phenol, a coal-tar intermediate in paragraph 27, dutiable at 55 per cent, American valuation, and 7 cents per pound. The duty in the act of 1916 was 15 per cent, foreign valuation.

A reduction in the duty on cresylic acid, in the same paragraph with phenol and with the same comparative duties, was asked by the Insecticide and Disinfectant Manufacturers' Association, New York.

Other Investigations Ordered

Investigations also have been ordered by the commission into smokers' articles made of synthetic phenolic resin, reduction asked by Kaufman Bros. & Bondy and others; briar wood pipes, equalization because of alleged unfair practices of foreign manufacturers asked by the Reiss-Premier Pipe Co.; taximeters, increase asked by the Pittsburgh Taximeter Co.; and print rollers, increase asked by the National Print Cutters' Association, Jersey City.

There has been persistent opposition to reopening tariff discussions on vegetable oils, but this has been directed more against the oils that enter into edible trades than against linseed oil. Last Monday a delegation headed by Thomas G. McLeod, Governor of South Carolina, filed with the President a protest against docketing an application that sought a reduction in the duties on vegetable oils. The President replied that filing petitions for modifications could not be prohibited, but he called attention to the fact that the Tariff Commission makes a preliminary survey to determine whether the facts warrant recommending a hearing. He also gave assurance that tariff modifications, either way, would be justified only on the most striking evidence of the necessity for such changes.

Calcium arsenate is another chemical on which tariff changes have been asked. It differs from most of the other materials under discussion, inasmuch as the flexible features of the tariff law have not been invoked, but rather an official ruling that it has not been specially provided for in the tariff and should be placed on the free list because it is an arsenic derivative and arsenic is duty free. According to Treasury decisions, calcium arsenate is classified as a chemical compound, not specially provided for, and is held to be dutiable at the rate of 25 per cent ad valorem.

Cotton growers in the South brought the question before Attorney-General Daugherty with the request that he hand down a decision on this question. Early last week the Attorney-General declined to pass on the matter and gave as an opinion that it was the duty of the Treasury Department to classify merchandise under the proper paragraphs of the tariff act.

To Record Coal-Tar Imports at Port of New York

The Chemical Division of the Department of Commerce has expanded its service at the port of New York so as to record imports of the coal-tar products covered in paragraph 27 and paragraph 28 of the tariff act. Paragraph 27 comprises a lengthy list of coal-tar intermediates and products, while paragraph 28 adds coal-tar colors, dyes or stains, together with numerous coal-tar chemicals.

Increased Call for Zinc Dust in South Africa

Reports from Johannesburg state that zinc dust is being used more extensively in the production of gold. The installation of Crowe and Merrill processes on two new mine extensions has been completed and other mines are expected to follow suit. It is found that nearly 0.1 lb. of zinc dust is used for each ton of ore milled, and when all the mines of the Transvaal and Southern Rhodesia are using zinc dust, they will consume about 2,000 tons of the latter annually.

To Establish Plant for Glass Making in Peru

A company has now been formed in Lima for the establishment of a glass factory, the machinery and plant for which will be purchased in the United States. It is purposed to turn out all types of coarse bottles for industrial purposes, as well as window and sheet glass. No attempt will be made to produce fine colored glasses or glasses for optical purposes. Tank furnaces will be employed heated by producer gas. A fine greenish glass can be turned out locally from sand, limestone or chalk and dry sodium carbonate. Of other materials used—marl, clay, barium sulphate and basaltic rock—many are readily obtainable. Wide-mouthed jars and bottles will be produced by machinery, but it is not expected that for some time to come the output will obviate importations from abroad.

Chemical Foundation Suit Adjourned Till June 4

Testimony of Badische Representative Held Under Advisement by Judge Morris in District Court

The government's suit against the Chemical Foundation, Inc., for the return of 4,700 patents has opened. Whether or not these patents, purchased for $250,000, shall be placed again in the hands of the Alien Property Custodian is the question to be decided.

At a hearing held May 8 by Judge Morris in the United States District Court in Wilmington, Del., Dr. Karl Holderman, head chemist and general manager of the Badische company, testified that the patents taken by the United States during the war were worth $17,000,000 to the German chemical industry. Mr. Kresel, attorney for the Chemical Foundation, stated that this estimate was made 10 years ago and that the patents are practically worthless now. Dr. Holderman admitted that he was one of "a community of interests" of German chemical and dyestuff manufacturers. Kresel contended that Holderman was not a competent witness because the Badische company was interested in another suit to recover the patents.

A motion to lay aside Holderman's testimony was taken under advisement by Judge Morris. June 4 was set for hearing arguments on the motion.

It will be remembered that of the 4,700 patents seized only about 8 per cent have been used. In most cases the only object in obtaining these patents in this country was to protect Germany's home industry. For that reason the key step in various procedures was ordinarily left out of the American patent. Of the patents involved, those concerning manufacture of Salversan, of ammonia by the Haber process, of synthetic tanning materials and of various dyestuffs and pharmaceuticals are of considerable importance.

Fertilizer Merger Is in Sight

A number of small but important companies in the fertilizer trade are negotiating a merger. The total capitalization involved amounts to approximately $50,000,000. John J. Watson, Jr., vice-president of the International Agricultural Corporation, which, with the Davison Chemical Co., is expected to form the nucleus of the consolidation, said recently that plans for bringing other companies into the combination are being discussed in the belief that present conditions in the industry afford an excellent opportunity to bring them together under one management.

It was stated that neither the American Agricultural Chemical Co. nor the Virginia-Carolina Chemical Co. will be included in the projected amalgamation. The independents named as likely to enter the merger along with International Agricultural and Davison Chemical are the Phosphate Mining Co., the Standard Acid Phospate Co., of Baltimore; the Federal Chemical Co., Louisville, and the Reed interests, of that city. It is also reported in the financial district that the fertilizer department of Swift & Co. has been approached.

Stabilization the Object

The purpose of the proposed merger, according to the promoters, is to stabilize the fertilizer industry, which, despite prosperity in other lines of business, is not operating on a profitable basis. This has been reflected in recent weakness of the securities of the fertilizer companies. It is believed that a combination of producers of raw materials, including phosphates with mixers, would cut overhead and make for steady prices in a market that is now extremely irregular. Competition among the independent mixers, particularly in Baltimore, has been an unsettling factor in the fertilizer situation for some time.

The International Agricultural Chemical Corporation owns extensive deposits of phosphate rock in Florida, while the Davison Chemical Co. is an important producer of sulphuric acid.

Use of Gas Increasing

Contrary to the belief of many, the gas industry is growing steadily and at quite a rapid rate. Facts of national interest appear in a recent report of the New York State Committee on Public Utility Information.

"While use of gas for illumination has gradually decreased, amounting to only 20 per cent of the total production in 1921," it states, "the advantages of gas over coal for cooking, house heating and numerous industrial processes have brought demands which are causing utility companies to operate their plants at capacity a considerable part of each year and to build larger ones in many cities.

"Reports to the Census Bureau give the total value of products of gas plants as $411,195,500 for that year, as compared with $829,278,000 for 1919, and $220,237,700 for 1914, an increase of 25 per cent from 1919 to 1921, and of 87 per cent for the 7-year period, 1914 to 1921.

"The total production of manufactured gas for 1921 was more than 326,000,000,000 cu.ft., of which the companies of New York State produced more than 100,000,000,000 cu.ft., or nearly one-third.

"Total sales of manufactured gas for 1922 by the entire industry are estimated by engineers of the industry at $450,000,000, with a production of about 375,000,000,000 cu.ft. The increased efficiency of the industry is indicated both by the larger yearly output and the decreasing number of wage earners required to make it."

Financial Notes

Devoe & Raynolds Co., Inc., has listed an issue of $2,000,000 first preferred stock of the company for trading in the New York Stock Exchange.

Fluctuations in the stock of the Mathieson Alkali Works have directed attention to the operations and unofficial reports say the company's earnings are on a basis of approximately $10 per share. Dividends on the common are not looked for this year.

The Eastman Kodak Co. has declared its regular quarterly dividend of $1.25 per share and, in addition, an extra dividend of 75c. per share.

In a report to stockholders, H. B. Thompson, president of the United States Finishing Co., said: "We closed our year with more goods on order than we have had since 1920, and the outlook for the coming year is favorable. Our printing business, which has on the whole been subnormal for the past 2 years, indicates a revival, particularly in dress fabrics."

The Diamond Match Co. is reported to have made arrangements to retire, on Nov. 1, the outstanding $5,735,200 15-year 7½ per cent debentures, due 1935. The retirement price is given as 105.

Ceramic Laboratory Proposed

At the recent annual meeting of the United States Potters' Association at New York, F. P. Judge, president of the association during the past year, urged that the organization give serious consideration to the establishment of a ceramic-chemical laboratory. Such an institution would be designed for the benefit of members who do not employ ceramic engineers or chemists. It would be primarily for the manufacturers of general ware and would be utilized for the most part for the solution of problems arising in this branch of production. It is purposed to give attention to the recommendation and to work for the establishment of the laboratory.

Trade Notes

Further reductions have been made in export tax on copra from Fiji. The rate is now 5s. per ton or fraction thereof.

The Federal Trade Commission has given Dings & Schuster of Long Island City 30 days to file an answer to charges of misbranding certain of its products. The commission charges that the respondent has placed upon the market two brands of shellac, the first composed solely of shellac gum dissolved in alcohol, while the second is made up of shellac gum and substitutes and is marketed with no qualifying words to indicate that the product is made of other than pure shellac gum.

The steamship "Kongosan Maru" arrived at San Francisco on May 7, from Dairen, with 500 bbl. soya bean oil, 1,125 cs. camphor, 50cs. menthol, 470 bbl. perilla oil and 3,058 bg. linseed.

C. M. Struven, of C. M. Struven & Co., Baltimore, dealers in fertilizer materials, was in New York last week.

An American Chamber of Commerce has been formed at Port-au-Prince, Haiti. There are 98 charter members, and an active campaign is planned to develop commercial relations between Haiti and the United States.

J. F. Wischhusen, manager of the Superfos Co. of New York City has gone to Europe in the interests of his company. Mr. Wischhusen will visit central European countries as well as northern Europe and plans to be away about 10 weeks.

Joseph Guerin, president of the Guerin Mills, died at his home in Woonsocket, R. I., on May 6. He controlled seven large yarn, worsted weaving and dyeing plants, capitalized at $7,000,000.

The Northern Chemical Works of Chicago has filed application calling for the dissolution of that company.

Hoskinson Gates, who for the past 13 years has been associated with the Eagle Picher Lead Co., has severed his connection with that company. Mr. Gates is a former president of the Paint, Oil and Varnish Club of New York.

M. Winter has been elected president of the Texdel Chemical Co. He succeeds J. M. Marshall. The plant of the company has been moved to Nutley, N. J.

Eugene Suter, head of Eugene Suter & Co. of New York, left for Europe on Saturday.

Albert J. Berwin has been appointed receiver for the Jacksonville Chemical Co. of 246 Water St., New York. The liabilities of the company are placed at $35,000 and assets at about $10,000.

On May 1 the Potash Importing Corporation formally entered the potash field by taking over the marketing and distributing business, in this country and Canada, of the German Potash Syndicate.

Facts and Figures That Influence Trade in Chemical Products

The Trend of Business

Slowing Up in Demand Creates Easier Feeling in Market for Chemicals

Lower Prices Established for German Muriate of Potash—Shipment Prices Over Next Year Announced for Nitrate of Soda—Arsenic Sells at Lower Prices—Permanganate of Potash Weak—Bichromates Higher

CONSUMING demand for chemicals has reached the stage where many sellers describe the market as slow. Call for contract deliveries is holding up well and this is accounting for a good part of the domestic output. New business, however, has fallen off in volume and this fact, combined with competition from foreign offerings, is giving an easy tone to many materials in the chemical list.

Exchange Weakens Foreign Markets

Declines in exchange has had some effect in lowering values for many chemicals of foreign origin. This has been manifest more by causing importers to hold off placing orders, rather than in drastic price changes for imported goods, but the effect is noticeable in opinions widely held that selling pressure will arise in foreign centers, which in turn will bring about price concessions. In some cases imported goods held in the spot market have been pressed for sale, in an effort to bring buyers into the market. Among the items so affected may be mentioned permanganate of potash, hyposulphite of soda, prussiate of soda and prussiate of potash.

New Contract Prices

New price schedules were announced during the week on important materials. The Nitrate Association in Chile made public its quotations on nitrate of soda, covering shipments for the year from July to June. These prices had been generally anticipated and were about in line with the quotations which importers had been making recently. The sales agents for German potash producers also announced a new price schedule for potash salts. The revised prices showed a decline as compared with the prevailing quotations but suffer somewhat with the prices which have prevailed in recent transactions in the local market.

Higher Producing Costs

Domestic producers of bichromates advanced prices in the preceding week and followed this with another rise in quotations last week. Higher producing costs was given as the explanation for the advances. Similar conditions are reported in the case of caustic potash, oxalic acid, acetic acid, acetate of lime, and numerous other commodities, so that it may be said that weakness in price is evident largely in the case of chemicals where a good part of domestic requirements are filled by imported manufactures.

The metal markets were lower during the period, but this was not followed closely by the metal salts, although some of the latter may be revised downward unless the metals show immediate signs of recovery.

Acids

Acetic Acid—There has been no further change in acetate of lime and acid producers who use the latter have had no occasion to change their asking prices. The lower grades of acetic acid are finding less competition than the higher grades and are firm at 3.38c. per lb. for 28 per cent, with corresponding increases based on quantity and package. For 56 per cent the quotation for round lots is 6.75c. per lb. Glacial shows more of a range according to seller, with 12c. per lb. as an inside figure, although most producers are quoting above that price.

Boric Acid—The tone to prices remains easy and consuming demand has not been stimulated to any extent by the recent reduction in price. Round lots in bbl. are offered at 10½c. per lb.

Citric Acid—Domestic makers are pretty well sold ahead and while they are holding prices on an unchanged basis of 40@50c. per lb., the quotation is little better than nominal in some quarters. Imported has been meeting with an improved call and prices show a tendency to stiffen, with 52c. per lb. generally quoted for spot or shipment.

Formic Acid—Arrivals of imported material reached the local market during the week but offerings for nearby shipment are not free and predictions of higher prices are heard, especially if buying becomes more active. Imported on spot was held at 14¾@15c. per lb. Domestic is unchanged at 16c. per lb. and upwards according to quantity.

Oxalic Acid—Increasing costs of production are given as the reason for higher prices for domestic oxalic and the best price heard is 13½c. per lb., f.o.b. works. Imported oxalic was in poor demand throughout the week and holders were open to bids with the result that 13¼c. per lb. could be worked by buyers.

Tartaric Acid—The advance as announced last week has been well maintained in the case of domestic made goods and 37½c. per lb. is asked for powdered and crystals. Imported was higher this week and cables received were on a basis of 37c. per lb., duty paid.

Potashes

Bichromate of Potash—Prices were again higher and in some directions 11¼c. per lb., works, was held as an inside price. It was possible, however, to do 11⅛c. per lb. Increased cost of manufacture is given as an explanation of the stronger position of the market.

Caustic Potash—The market presents an unusual appearance, inasmuch as goods of domestic manufacture are firmly held and 9c. per lb. and upwards is asked at the works. Sellers say the higher prices are rendered necessary by increased cost of operating. Imported caustic is decidedly easy. Goods afloat were offered late in the week at 8c. per lb., but in the spot market there were offerings as low as 7⅝c. per lb. The weakness in imported material serves to detract from the strength in domestic.

Carbonate of Potash—The feature in this market is the fact that there are spot offerings of 90-95 per cent at 6½c. per lb., whereas 80-85 per cent is generally held at 7c. per lb. For the 96-98 per cent there were sellers at 7½c. per lb. Inquiry is more active for the 80-85 per cent than for the other selections.

Chlorate of Potash—Sales of imported chlorate were made at 7¼c. per lb. and on firm bids it was reported that this price could be done at the close. The general asking price, however, was higher, with 7¾c. per lb. generally held as the open quotation. There was no revision in prices for domestic, and

"Chem. & Met." Weighted Index of Chemical Prices

Base = 100 for 1913-14

This week	177.69
Last week	179.28
May, 1918	270.00
May, 1919	248.00
May, 1920 (high)	280.00
May, 1921 (low)	143.00
May, 1922	159.00

Weakness in linseed oil, cottonseed oil, and chemically pure glycerine caused a downward revision in the week's index number of 159 points.

sellers continued to ask 8½c. per lb., works, for round lots, with the usual premiums for smaller lots.

Muriate of Potash—On Wednesday a new price list covering German potashes was issued. Muriate 80-85 per cent is quoted at $34.55 per short ton, in 200-lb. bags, f.o.b. Atlantic ports. This price is subject to discounts, varying according to the amounts purchased. Alsatian muriate is offered rather freely and the market is largely a matter of private terms, with sales reported under the level quoted for German.

Permanganate of Potash — Demand has not been heavy enough to hold prices on a steady basis. Advices from primary points say that no material changes have taken place but it is thought that selling pressure will appear at any time and some well posted members of the trade say the drop in values will become more pronounced unless buying orders come to hand in sufficient volume to uphold the market. On spot permanganate is held at 21c. per lb., but this is not a firm price. Shipments are freely offered at 20c. per lb. but are not attracting attention. About a month ago shipments sold at 18½c. per lb. and buyers are looking for values to drop back to that level.

Prussiate of Potash — Yellow prussiate was a little easier with sellers openly offering at 36½c. per lb. Demand is slow and this adds to the general weak appearance of the market. Red prussiate was still available at 70c. per lb., although there is considerable range for the latter according to seller.

Sodas

Bichromate of Soda—There were spot offerings at 8¼@8½c. per lb., with sales at the inside figure. The market, however, was higher, with first hands marking up quotations to 8½c. per lb., carlots, at the works. Competition among producers is not keen and the absence of selling pressure combined with higher production costs has established the market on a higher price level.

Caustic Soda — Export buying was again of smaller proportions and this gave an easy tone to f.a.s. quotations. Outside brands were offered at 3.30c. per lb., f.a.s., and standard makes were quoted at 3.40@3.45c. per lb. A report from Brazil, which has been a prominent buyer of caustic, states that the market there is dull. The report further states that the caustic soda war has been ended, and the leading British and American exporters have agreed that prices are not to drop below 0.950 milreis per kilo. In the domestic trade prices are holding at 2½c. per lb., carlots, works, basis 60 per cent.

Chlorate of Soda—Imported chlorate is meeting with a slow call from consumers but this is offset by firm markets abroad and also by the fact that spot holdings have been reduced. Prices are generally given at 6¾c. per lb., but it is probable that 6½c. per lb. could be done. Some offerings of inferior grade have been on the market and this has made buyers cautious. Domestic chlorate is firmly held at 6¾@7c. per lb., works, with a seasonable movement to consumers.

Cyanide of Soda — A very routine market is reported. Arrivals of imported are noted, with prices for the latter ranging from 20c. to 22½c. per lb., according to grade and sellers. Domestic cyanide is moving fairly well, but trading is not active and prices are stationary at 19½c. per lb. and upwards on a quantity basis.

Nitrate of Soda—A graded scale of prices for the coming year was made operative during the week. These prices were fixed by producers in Chile and are as follows, the quotations referring to metric quintals: July, 19s. 8d.; first half of August, 18s. 5d.; second half of August, 19s. 7d.; first half of September, 19s. 9d.; second half of September, 19s. 11d.; first half of October, £1 3d.; second half of October, £1 3d.; first half of November, £1 5d.; second half of November, £1 7d.; first half of December, £1 9d.; second half of December, £1 11d.; Jan. 1-June 15, £1 1s.; second half of June, 19s. 3d.

These prices work out at a range of $2.47½ to $2.60 per 100 lb. for Atlantic coast ports and are about in line with what the trade had expected.

Prussiate of Soda—Domestic producers are holding values steady at 17½c. per lb. There is some competition from imported material and sales of the latter were reported at 17¼c. per lb. There also were offerings of imported for shipment at 17¼c. per lb. Buying is not active either in domestic or foreign.

Miscellaneous

Acetate of Lime—Producers still complain of high producing costs and report that the market is well maintained at the higher price level as recently announced. Quotations are 4@4.05c. per lb. for acetate.

Arsenic—Domestic producers have sold large amounts for nearby shipment at 12½c. per lb. They also have sold smaller amounts for immediate shipment at prices ranging from 13½c. to 14½c. per lb. On deliveries over the second half of the year they quote 11c. per lb. In the open market prices were generally held at 15c. per lb. with spot sales reported at that figure. Prompt shipment from Canada was offered at 14¾c. per lb. Heavy arrivals from Japan were noted during the period and some of this material was sold ex-dock with prices irregular, although it is admitted that there were offerings as low as 14¾c. per lb.

Copper Sulphate—It was reported that distressed imported material sold at concessions early last week. Towards the close, however, prices showed no important change contrasted with those of a week ago. Imported was offered at 5½c., all positions. A cable from Hamburg quoted 11¾c. per kilo on copper sulphate. Domestic producers took little note of the increased competition with the foreign goods and prices were maintained at 6@6½c. per lb., according to the seller, etc.

Cream of Tartar—The advance in tartaric acid has had no influence on cream of tartar. Producers still quote 26½c. per lb. Imported grades are offered at 26@26½c. per lb. with a rather firm tone to cables from producing centers.

Formaldehyde—While some scattered lots might have been picked up at 14¾c., most traders refused to shade 15c., the price demanded in producing circles. Demand was routine only, but prices reflected a steady situation in raw materials.

Glaubers Salt—Buyers have been showing very little interest in the market and prices are unsteady. The nominal quotation is $1 per 100 lb. for imported offerings, but this price is decidedly weak and according to reports it was possible to do 85c. per 100 lb.

Lead Acetate—The sharp decline in pig lead offset the strength in the other basic materials and talk of a higher market seems to have vanished. Demand was up to normal for this season of the year. Leading producers continued to quote the white crystals at 13½c. per lb., in barrels. On the brown, broken, in casks, 12½c. was asked.

Sal Ammoniac—Importers continued to quote on the basis of 7c. per lb., but admitted that some material changed hands around 6¾c. The foreign markets underwent little change. Cable advices from Hamburg quoted 11c. per kilo. The duty on this commodity is 1½c. per lb.

Tin Oxide—There was an irregular market for the metal, but net changes for the week were not important enough to bring out a revision in the prices for tin oxide. Demand was limited all week, yet leading factors held out for 50c. per lb.

Alcohol Steady

Offerings of denatured alcohol were not pressing on the market and while business could not be called active, prices generally closed steady. Producers offered the No. 1 special at 38c. per gal. in drums, or at 39c. per gal. in barrels. The completely denatured, 188 proof, No. 1, held at 41c. per gal., in drums. Ethyl spirits, U. S. P., 190 proof, was available at $4.70 per gal., cooperage basis. Methanol was unchanged at $1.18 per gal. for the 95 per cent and $1.20 per gal. for the 97 per cent grade.

Canada Increases Exports of Calcium Carbide

A report from the Dominion Bureau of Statistics at Ottawa, Canada, states that there has been an important increase in exports of calcium carbide from Canada. During March outward shipments amounted to 59,994 cwt. (112 lb.), valued at $250,563.

Coal-Tar Products

Heavy Imports of Crude Naphthalene—Market Abroad Barely Steady—Spot Phenol Nominal at 55c.—Cresylic Acid Unsettled

THE movement of naphthalene into this country from foreign sources has taken on larger proportions, and this has served to take the edge off the market. Some traders even reported a slightly easier import basis for the crude. Cresylic acid was unsettled at the close and lower prices were named on scattered lots of foreign material. The decline in exchange had some influence on the situation. The announcement from Washington that the Tariff Commission has ordered an investigation into the phenol, cresylic acid and phenol resin situation led many to believe that the rates of duty on these commodities will ultimately be lowered. It is understood in trade circles that domestic producers of cresylic acid will offer no objections to a reasonable reduction in the existing tariff rates. Salicylic acid presented a firmer appearance, reflecting the strength in basic materials, but first-hands maintained prices at former levels. Demand for salicylic was routine only.

Benzene was in better request, the movement into channels situated outside of the motor fuel field improving steadily, the prices for the pure closing firm in all directions. The decline in gasoline should have little or no influence upon the benzene situation, according to producers. The output of solvent naphtha is moderate and a tight situation is reported, yet prices are not likely to change. Xylene, pure, is in a strong position because of the limited output. Demand for benzyl chloride is fair and consumers are now interested in offerings for shipment, notwithstanding the recent uplift in prices. Beta-naphthol is barely steady. Aniline oil is nominally unchanged.

Benzene — Intermediate makers showed more buying interest, and some traders reported a fair volume of orders. The demand from motor fuel quarters also picked up a little. The drop in gasoline prices had no influence upon the situation. The 90 per cent grade, held at 27@30c. per gal. in tanks or drums f.o.b. works. For the pure prices ranged from 30@33c. per gal., as to quantity and style of container.

Aniline Oil—A steady undertone featured the market and small lots changed hands on the basis of 16½c. per lb., immediate delivery. On round-lot transactions it would have been possible to do 16c. per lb., prompt and nearby delivery.

Cresylic Acid—The spot market on imported material was unsettled toward the close. Demand was routine only and there was more disposition to offer this material. The offerings from the other side were freer. Closing quotations ranged from $1.20@$1.35 per gal., as to quality, etc. Domestic makers reported a sold-up condition, with prices wholly nominal.

Beta-Naphthol - The market was barely steady, with sellers at 22½@23½c. per lb., immediate delivery. Producers, as a rule, held out for 23@23½c., the price depending upon the quantity.

Benzyl Chloride—No further price changes were made. First hands offered July shipment benzyl chloride on the basis of 45c. per lb., 95 to 97 per cent refined.

Naphthalene—Sales of flake on spot went through at 9c. per lb. For the ball the market settled at 9¼@9½c. per lb., some traders reporting business at the outside figure. The demand was good early in the week, but slackened later. The importations of crude were quite heavy and with cables no longer so firm offerings here increased. Nominal import prices on crude for shipment ranged from 3@3½c. per lb., as melting point.

Phenol — Scattered lots of U.S.P. phenol sold on spot at 55c. per lb., indicating that the market underwent scarcely any change. There was a fair inquiry for spot as well as nearby material, but the ideas of buyers were a shade under the market. The prospects for a larger supply in the near future made buyers cautious.

H-Acid—Offerings were moderate because of the restricted output, and prices held at 85@90c. for spot goods. On shipment business 80c. might have been done.

Salicylic Acid—The demand again was quiet, but prices ruled firm in all directions. Leading makers quote 47@48c. per lb. as the firm trading basis on the technical variety.

Xylene—The spot market for the pure was wholly nominal and second hands said that $1 per gal would have to be paid for outside lots. Producers have been taking on contract business in the pure at 75c. per gal.

Extend Time for Filing Export Licenses for Ruhr Trade

Unofficial advices have reached the National Council of American Importers & Traders that the time limit for filing export licenses covering shipments from the occupied sections of Germany would be extended. The recent ruling in regulations governing foreign trade with these sections of Germany was that foreign buyers, at their option, were authorized to apply for export licenses antedating Feb. 10, 1923, such applications to be filed not later than May 10. Those securing these licenses will be called upon to pay only such duties as were in effect at the time the order was placed.

Urges Rubber Growing in Philippine Islands

Harvey S. Firestone, president of the Firestone Rubber Co., in an address last Wednesday before the Chamber of Commerce of the United States urged American rubber manufacturers to take some action to bring about better conditions in the rubber industry. He stated that the Philippines offer natural advantages for growing rubber. He referred to a recent statement made by Pedro Guevara, Resident Commissioner of the Philippines, who declared that the islands have the greatest possibility in the world for the successful production of rubber.

Freight Rates on Barytes Held Unreasonable

Freight rates on barytes in carloads from Evington, Va., to South Charleston, W. Va., in the opinion of Interstate Commerce Commission Examiner Paul O. Carter, were unreasonable during a portion of 1919 and he has recommended that the carriers reimburse the Rollin Chemical Corporation for all freight charges collected to the extent that they exceeded $2.50 per ton.

Vegetable Oils and Fats

Lower Prices Named for Linseed, Cottonseed, Coconut, Corn and Palm Oils—China Wood Weak—Tallow 8c.

WITH no improvement in demand and general weakness in outside speculative commodity markets the tendency of prices again was downward. Prospects for ample stocks of flaxseed brought out an easier feeling in futures in the linseed oil trade and large consumers refused to take hold. Cottonseed was subjected to pressure on the decline in lard. Coconut oil was available at lower prices both here and on the Pacific coast. Corn and sesame oils were easier in sympathy with cottonseed oil, while the decline in palm oils could be traced to the weakness in tallow. Late in the week extra tallow sold down to 8c. delivered. Fish oils were neglected.

Linseed—Crushers announced a 3c. reduction in spot prices, establishing the carload quotation at $1.14 per gal., cooperage included. June delivery oil was revised to $1.12 per gal. while on July forward nominal quotations ranged from $1.03@$1.05 per gal., carload lots, cooperage basis. In the absence of any important buying futures were regarded as wholly nominal, especially in view of the fact that the prevailing price for October seed in the Duluth market permits of the production of oil at approximately 90c. per gal., based on a fairly low price for the cake. Buenos Aires quoted June shipment seed (option market) at $1.93 per bushel, a decline of almost 10c. for the week. The Argentine shipments since January 1, 1923, have reached a total of more than 28,000,000 bushels, a record quantity for 4 months. Argentine shipments to the United States since the first of the year amounted to 12,500,000 bushels. Receipts of domestic seed at Minneapolis and Duluth from September 1, 1922, to date amounted to approximately 8,200,000 bushels. With indications of a larger acreage in the United States and freer offerings from Argentina as well as India, traders seem to favor the bear side, notwithstanding the liberal increase in domestic consumption of linseed oil. Imported oil was neglected and "distressed" material sold on spot at less than $1.00 per gal. Foreign markets were lower, while easier exchange also was a market factor.

Cottonseed—Weakness in grains and lard had a depressing influence on the option market on the Produce Exchange and prices were irregular nearly all week. For a time the May position steadied on reports that a short interest was about to come in, but subsequent pressure from local bears made quite an impression on the list. The liberal hog movement surprised the longs. Cash trade in cottonseed oil and its products was routine only. The drop in tallow was a market factor. Crude cottonseed sold at 9⅝c. per lb., sellers' tanks, f.o.b. mills Texas. A round-lot of bleachable was disposed of on the basis of 10¼c., Texas common points, with rumors of one transaction as low as 10c. per lb. New crop offerings of crude could not be located, but an easy feeling prevails on prospects for a 10 per cent increase in the cotton acreage. Lard compound was lowered to the extent of ½c. per lb., establishing the carload trading basis at 13@13¼c. Prime summer yellow on spot, in barrels, settled at 11⅞@12¼c. per lb. Lard in the Chicago market was easy around 10⅝c., May option.

China Wood Oil—Several bulk shipments of China wood oil arrived at New York last week. The spot market was easier on resale offerings and it would have been possible to shade 35c. On nearby oil there were sellers at 32@34½c. per lb. On the Pacific coast there were offerings of June-July oil at 25c., tank car basis. Prices were considered too high by varnish makers and no important buying took place.

Coconut Oil—Prices weakened in all quarters until the market reached 8½c. asked, coast, and 8⅞@9c. per lb., New York, basis sellers' tanks. The decline of ¼c. failed to arouse buying interest and at the close prices were little more than nominal. Copra was offered at 5½c., c.i.f. New York, shipment from Manila.

Corn Oil—Crude corn oil sold at 10c., sellers' tanks, f.o.b. point of production in the middle west, a decline of ½c. for the week.

Palm Oil—No buying interest was shown in futures and another drop in tallow brought out an easier feeling. Lagos for shipment from abroad, May-June, closed at 7⅞@8c. per lb. Niger for shipment was offered at 7⅝c. per lb., with no buyers.

Sesame Oil—Spot oil, refined, was lowered to 11⅞@12c. per lb., cooperage basis, without arousing any business of consequence. On forward shipments the market settled at 11⅜c., c.i.f. New York.

Soya Bean Oil—The coast market was easier, May-June-July closing at 10¼@10⅜c. per lb., sellers' tanks, duty paid. Demand was quiet. The output of soya beans in Manchuria is estimated at 89,000,000 bushels, a normal crop.

Fish Oils—The market for crude menhaden futures was a dull affair, reflecting unsettlement in competing oils and facts. The producers continued to name 50c. as the nominal quotation, tank car basis, f.o.b. factory. Newfoundland cod oil was nominally unchanged at 70c. per gal., in barrels, spot New York.

Tallow and Greases—The sale of 5 cars of extra special tallow was reported at 8c. per lb., delivered, a decline of ½c. in less than 10 days. City special settled nominally at 7⅜c. At the weekly London auction 1,560 casks were offered and 554 casks were sold at a decline of 6 pence. Yellow grease in the local trade was lowered to 7⅜c. Oleo stearine closed at 10¼c. asked. No. 1 oleo oil was quiet at 14¼c. per lb.

Miscellaneous Materials

Casein—Importations continued at a healthy rate and with domestic offerings on the increase the market presented an unsettled appearance. Leading domestic producers offered the technical grades at 22½@25c. per lb. Demand was described as fair.

Glycerine—Refiners established the market for chemically pure glycerine at 17½c. per lb. in drums, carload lots, a decline of ½c. from the nominal quotation of a week ago. There was some misunderstanding in connection with the price during the week, as an outside party came out with a quotation of 17c. The 17c. basis was not recognized by leaders in the trade. In some directions it was said that quite a number of contract orders went through. Chicago quoted c.p. at 17½c. per lb. in drums, carload lots. Dynamite settled at 16¼c. per lb. in drums, carload lots, f.o.b. point of production, but trading continued quiet. Crude soap-lye, basis 80 per cent, loose, held at 11@11¼c. per lb., New York territory. One car was traded in early last week at 10⅞c. Saponification, 88 per cent, held at 12½c., loose, with no sales.

Shellac—Sentiment generally was bearish and with trading inactive prices at the close were more or less nominal. T. N. on spot closed at 64@66c., as to quantity and seller. Superfine orange was offered at 70c. on spot and 68c. for shipment. Bleached, bonedry, closed at 78@80c. per lb.

Naval Stores—Another sharp downward revision in prices occurred in the market for turpentine, which, naturally enough, did not encourage buyers to take hold. Spirits of turpentine settled at $1.08@$1.10 per gal., a drop of 20c. per gal. in one week. The new crop offerings increased in all directions. Rosins also went off, registering declines of 10@15c. per bbl.

Lithopone—With no change in the barytes situation the market held on a fairly steady basis. The arrival of 1,580 casks of lithopone from Antwerp was reported here last week. Domestic makers quote 7@7¼c. per lb., the inside figure obtaining for round-lots in bags.

White Lead—The decline in pig lead caused much comment in trade circles and led many to look for a lower trading basis in the lead pigments. But, up to the close, corroders announced no changes. The metal closed the week at 7¼c., New York, which compares with 7⅝c. a week ago. The decline was attributed to the developments in the European situation. Standard dry white lead (basic carbonate) held at 9⅝c. per lb., carload lots, in casks.

Imports at the Port of New York
